aged 30-49.

Total: 19.0, highest 24.4 in persons aged 30-49.

Source: Adapted from Ministry of Health and Welfare, Report on 1998 National Health and Nutrition Survey (Dietary Intake Survey), Korea Health Industry Development Industry.

Conclusion: There is presently no conclusive evidence showing human health benefits from consumption of Korean fermented soyfoods. Address: 1. PhD, Food Toxicology Div., Dep. of Food and Nutrition; 2. Research Inst. of Home Ecology. Both: Seoul National Univ., Seoul, Korea.

1666. Minamiyama, Yukiko; Okada, Shigeru. 2003. Miso: Production, properties and benefits to health. In: Edward R. Farnworth. 2003. Handbook of Fermented Functional Foods. Boca Raton, Florida: CRC Press. 390 p. See p. 277-86. [45 ref]

• ***Summary:*** Contents: Introduction. Miso: The history of miso, manufacturing miso, home production of miso, effects of miso on health (gastrointestinal diseases, cancer prevention, elimination of radioactive materials, effect on cholesterol levels and aging, harmful effects of tobacco). Conclusions. Acknowledgments.

Total commercial production of miso in Japan is presently about 600,00 tonnes (metric tons) per year, produced by over 1,500 miso factories and plants (p. 278).

History: At some time between 200 B.C. and 300 A.D. the soybean was probably introduced to Japan, most likely from northern China, through Korea. The earliest known book about miso is "thought to be the *Taiho-ritsyryo* compiled in A.D. 702, but by that time a type of miso was already known in Japan." The technique for preparing miso was introduced from either Korea or China. One theory is that miso developed from Chinese jan [sic, jiang]. In about 550 to 600 A.D., Japanese came to know about jiang, however at this time jiang was being made in Buddhist temples in China. It is believed that in 753, a Chinese Buddhist named Ganjin [Chinese: Jianzhen] (688-763) came to Japan to promote Buddhism and at the same time brought jiang to Japan.

Elimination of radioactive materials: Miso exports to European countries increased after the April 1986 accident at the Chernobyl nuclear power plant in Northern Ukraine, because it was believed that miso consumption could ameliorate the harmful effects of exposure to atomic radiation. Researchers studying the activities of microorganisms have shown that miso consumption helps to eliminate radioactive substances from the body. Address: 1. PhD, First Dep. of Pathology, Okayama Univ. Medical School; 2. Dep. of Pathological Research, Graduate School of Medicine and Dentistry, Okayama Univ. Both: Okayama, Japan.

1667. Evans, Barry. 2004. Failure of nori crop in Kyushu, Japan. Sea vegetables imported to America today (Interview). *SoyaScan Notes.* Jan. 12. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** About 40% of all the nori produced in Japan comes from the Ariake Sea off the western coast of Kyushu, where it has been cultivated on nets for more than 25 years. This bay was ringed by wetlands, which were gradually filled in by developers. In early 2001 the entire nori crop in that bay failed because of an unseasonal outbreak of red tide–which had several causes, including a land reclamation project which destroyed wetlands that are no longer able to purify the sea water. The Japanese believe that nori will never be grown in that bay again–a huge disaster for thousands of nori farmers! This had led to more of the sea vegetables imported to the USA coming from China and Korea. Barry thinks that 80-90% of all the sea vegetables now consumed in Japan comes from China.

It is generally believed in Japan that, of the various sea vegetables, the kombu crop is the cleanest and most free of heavy metals such as lead, mercury, and arsenic. That is because most of the kombu harvested in Japan comes from the area around Hokkaido, Japan's northernmost large island, where the cold, clear current flows down from the north. Japan has made a big effort, over the past 10-20 years, to clean up its environment and coastal waters.

China, on the other hand, has little pollution control. Its main goal is to be the low-cost producer of any product that consumers desire–worldwide. It produces a growing percentage of the world's sea vegetables–but heavy metal content is an issue.

Eden Foods, which is the leading seller of sea vegetables in the USA, buys all of its sea vegetables from Japan and pays more for them than if it bought them from China or Korea. In recent years, Great Eastern Sun (GES) has built its seaweed business on having less expensive products, imported from China. The only sea vegetable GES imports from Japan (Mitoku) is arame, which is not available from China. Address: Owner, American Miso Co., Inc. and Great Eastern Sun, Asheville, North Carolina 28806. Phone: 704-252-3090.

1668. Wais, Asmat. 2004. Tofu and soybeans in Uzbekistan (Interview). *SoyaScan Notes.* Feb. 11. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** Mr. Wais, a native of Afghanistan and an experienced businessman, is thinking about starting a tofu manufacturing plant in Uzbekistan. There is presently only one such plant in Uzbekistan; it is run by a Korean man and it serves a population of about 250,000 Koreans now living in Afghanistan. He thinks that Stalin forcibly removed them from North Korea to do forced labor in Uzbekistan. He would like to buy a tofu shop that makes 1 ton/hour. He would prefer to buy tofu equipment made in the USA since OPAC, a U.S. government agency, finances 80% of U.S.

© Copyright Soyinfo Center 2021

made equipment purchased for use overseas.

Mr. Wais speaks good English and is an experienced businessman. He earned a degree in business administration at Michigan State University. Then he returned to Afghanistan, where he eventually owned 3 businesses, including a raisin processing plant.

Soybeans have been grown on a fairly small scale in Uzbekistan since 1991, when the country declared its independence from the Soviet Union. All land is still owned by the government; the people lease it from the government.

He travels frequently to Afghanistan and Central Asia. Most people in Afghanistan–except warlords, a few Taliban supporters, and criminals–are extremely grateful to the USA for liberating them from the Taliban. But life in Afghanistan is still difficult and dangerous. Address: 6309 Barnsdale Path, Centerville, Virginia 20120. Phone: 703-815-1360.

1669. Calvi House, Korean BBQ Restaurant. 2004. Meal (Ad). *Pacific Daily News* (*Agana Heights, Guam*). Feb. 12. p. 33.

• ***Summary:*** Includes:

"Dolsot Bibimpap–$15
"Yuekhoe Bibimpap–$20
"Haemool Bibimpap–$20"
"Doenjang Jige–$12
"Kimchi Jige–$14
"Bulgogi–$14" Address: 2nd Floor, Royal Orchid Hotel.

1670. Ra, Kyung-Soo; Oh, S.H.; Kim, J.M.; Suh, H.J. 2004. [Isolation of fibrinolytic enzyme and β-glucosidase producing strains from doenjang and optimum conditions of enzyme production]. *J. of the Korean Society of Food Science and Nutrition* 33(2):439-42. Feb. [16 ref. Kor; eng]

• ***Summary:*** "Bacterial strains showing the fibrinolytic and beta-glucosidase activity were screened from Doenjang. The strain of KH-15 revealed a high level of fibrinolytic and beta-gluocosidase activity. The isolated bacterium was identified and designated as Bacillus sp. KH-15." Address: 1. Dep. of Food and Nutrition, Daegu Technical College, Daegu 704-721, Korea.

1671. Drosihn, Bernd. 2004. Update on soyfoods in Europe. Part II (Interview). *SoyaScan Notes.* March 15. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** Soymilk: A major new soymilk maker in Europe is named Wild (www.wild.de), an old German food company that specializes in fruits and ingredients; their retail soymilk is named Soy and Joy. Their most famous brand is Caprisun, a non-soy drink in a foil pouch, well known in the USA. They and So Good, the Australian soymilk now made with Solae, are both strong competitors of Alpro.

Several weeks ago Hain-Celestial of New York purchased two German soymilk makers, both owned by Bruno Fischer, Jr.: Natumi and Gut Honneroth. He sold both companies at a low price–probably because he had to. Bruno had gotten his soymilk into Aldi, the mother company of Trader Joe's and the No. 1 discounter in Germany–and maybe in all of Europe, and he developed a large soymilk business with Aldi–perhaps so large he could no longer handle it himself. Bruno also made a lot of private label soymilk. With Hain, Bruno found a large German dairy to make soymilk for Aldi under a new Aldi brand. The new European CEO of Hain-Celestial is Philippe Woitrin, who was CEO of Lima Foods when Hain acquired it.

Triballat makes the best soy yogurts (Sojasun brand) in the world–in Bernd's opinion. They have a new brand, Sojadé, which are delicious creamy yogurt drinks–maybe organic. The Japanese Yakult concept of drinking live beneficial probiotic bacteria each morning has now caught on in a big way in Europe. Yakult is one of the best entries into the European food market in years. Bernd just saw White Wave's Silk Alive [the name was soon changed; it was sold commercially only under the name "Silk Live"], a similar product, at the Anaheim Natural Products Expo. But he liked the Wildwood smoothie even better, and the WholeSoy fermented soymilk best of all American products.

In France a small company named Sojami (pronounced so-zha-MEE), which started about 10 years ago, makes very creative, unique, and interesting soy cheeses and cultured soy yogurts. The founder has a university research background and is a very nice guy.

Tofu: Tofu consumption in Europe has expanded steadily over the past 5-7 years, but it is still a very small product. The largest maker of the tofu and tofu products sold in Germany is Life Food GmbH / Taifun Produkte, run by Wolfgang Heck and Guenter Klein. Heuschen-Schrouff B.V. (Landgraaf, Netherlands) and Viana are tied for second place. About 10 years ago, Heuschen-Schrouff started selling their tofu under the organic So Fine brand (www.sofine.nl). An Indian-run company in Kerkrade, Netherlands, run by the brothers Singh (both Sikhs), makes tofu mostly for the Asian (Indonesian) market. In 2001 Viana started selling its tofu to the mainstream market under the Veggie Life brand; this English-language brand name communicates well to people speaking many different languages throughout the EU (European Union)–though distribution is still limited to Germany and Austria. Soto Tofu, formerly run by Rolf Barthof has been sold to a very large dairy company, Algäuland. Viana's main products are tofu and tofu products–such as meat and cheese alternatives. Viana is #1 in Germany in meat alternatives. Germans buy soyfoods for three main reasons: They are good for one's health, they taste good, and good for the environment. Bernd is a vegan, but about 90% of Viana's products are sold to non-vegetarians.

Early tofu companies still active in Europe include Sojafarm (founded and still run by Lothar Stassen), Albert's Tofuhaus (Albert Hess; exports lots of his products to France). A basic problem with the smaller, early tofumakers

© Copyright Soyinfo Center 2021

in Germany is that they didn't have the creativity or power to put a brand on the market. So both these companies produce a lot of tofu under private labels. Lothar bought the Svadesha brand (Svadesha was the first German tofu company) and produces tofu under the Svadesha brand. About 2-3 years ago he also purchased the Nagel's Tofu brand from Christian Nagel, who now markets the tofu under his former brand. So Lothar makes tofu under 3 brands. Berief Feinkost (in Beckum [Bochum?], northern Germany), started 10-15 years ago, tries to cover the mainstream tofu market, but not very successfully. Kassel Tofu Kato (started by Gyoergy / Yuri Debrecini, who was at Soyastern). Thomas Karas is no longer involved with soyfoods; he tried to enter the computer business but Bernd does not know what he is doing now. In Spain, the market leader is Natursoy near Barcelona. Nearby is Salvador Sala of Vegetalia. In Spain, there is a lot of interest in and rapid growth of soyfoods and organic foods. In Italy the Ki Group (Schenker) owns a tofu company–fairly old but not very creative.

In the United States, Pulmuone now has three U.S. factories; their first one in Southgate, southern California, a new one at Fullerton, California, and a 3rd one in New York. The Fullerton factory is the most modern Bernd has ever seen. There they make Gourmet Tofu, introduced in about Jan. 2004, which is presliced and marinated, in 4 flavors / styles: Baked, Sliced, and Marinated.

Meat alternatives: Nestle now owns Osem which owns Tivall, the Israeli maker of meat alternatives. Since all of Tivall's products are held together by eggs or egg whites, none of them are vegan–and none are organic. Quorn, which also contains lots of egg protein, is owned by AstraZeneca [Marlow Foods]–which wants to sell the company because growth and profits have been lower than expected. DE-VAU-GE in Germany is a very big company, they make large amounts of meat alternatives (incl. burgers), and they do a lot of business with Aldi in breakfast cereals–not in soyfoods. Bernd thinks they are good, and very economical manufacturers, but they are not very creative and they have no USP (unique sales point); moreover, many of their products contain egg protein, but their quality is lower than that of Tivall. Bernd believes his meat alternatives are as good as Tivall's, but more expensive, in part because of organic ingredients. Tivall makes its raw materials in Israel, then exports these to Europe for cutting and flavoring.

Klaus Gaiser owns Topas which sells Viti brand meat alternatives based on wheat gluten, with no soy; he owns the brand and markets the products, but he has meat companies manufacture them. However, when his typically 3-year contract with the manufacturer expires, he has to find a new manufacturer, but the previous one keeps making his products under their own brand. In the USA: At Turtle Island Foods (Hood River, Oregon), Bernd met Hans Wrobel, a German who does product development. Note: Hans and Rhonda Wrobel of The Higher Taste developed Tofurky in Portland, Oregon. Bernd makes Pizzarella, a tofu-based cheese alternative. Address: Founder and president, Viana Naturkost GmbH, 54578 Wiesbaum / Vulkaneifel, Germany. Phone: +49 06593-99670.

1672. Lee, Sarah. 2004. NAL now has the log and all accompanying photographs from the Dorsett–Morse expedition to East Asia, 1928-1932 (Interview). *SoyaScan Notes.* April 14. Conducted by William Shurtleff of Soyfoods Center. [2 ref]

• ***Summary:*** Special Collections at NAL has two sets of albums. Originally they had 7 photo albums (containing at least 1,000 original photos in albums), which they had labeled the Dorsett collection because they didn't have any records to accompany the albums, but they found that many of the captions mentioned "Dorsett." NAL has since found the text that originally accompanied the photos (the log of the Dorsett–Morse expedition to East Asia)–more than 2,000 pages. Some of these photos are displayed on their webpage, www.nal.usda.gov/ speccoll/ findaids/Dorsett/ index.html. A finding aid has been created for the collection, and it is on the website. The gallery on the web gives sample photos from each of the 7 albums. NAL does not know the source of these photo albums; they have been in the library for a long time [and may well have been a gift of Dorsett and Morse].

Recently the American Soybean Association gave NAL 17 travel books that are the log of the trip. There are many photographs in the log itself.

Copies of the photos, which are made by a vendor, cost about $30 each.

Talk with Prof. Ted Hymowitz. 2008 Nov. 16. Dorsett and Morse may have taken the first color motion pictures ever. The film was given to them by Eastman Kodak. Address: Special Collections, National Agricultural Library (NAL), Beltsville, Maryland.

1673. Kim, Sun-Young; Kim, S.J.; Lee, J.Y.; et al. 2004. Protective effects of dietary soy isoflavones against UV-induced skin-aging in hairless mouse model. *J. of the American College of Nutrition* 23(2):157-62. April. [28 ref]

• ***Summary:*** A soy isoflavone extract was administered to female hairless mice which were then irradiated with ultraviolet light for four weeks.

"Results: In the isoflavone treated group, the skin had a better appearance and less wrinkling than that of the control group" [which received no soy isoflavone extract].

"Conclusions: It appears that isoflavones had an anti-aging effect on the UV-damaged hairless mice model,..." Address: Pharmaceutical & Health Research Inst., AmorePacific Corp. R&D Center, Yongin, Kyounggi, Korea.

1674. Kim, Yoon; Cho, J.Y.; Kuk, J.H.; Moon, J.H.; Cho, J.I.; Kim, Y.C.; et al. 2004. Identification and antimicrobial activity of phenylacetic acid produced by *Bacillus*

© Copyright Soyinfo Center 2021

*licheniformis* isolated from fermented soybean, Chungkook-Jang. *Current Microbiology* 48(4):312-17. April. *
• ***Summary:*** "A bacterial strain, B65-1, which showed strong antimicrobial activity, was isolated from Chungkook-Jang, a traditional Korean fermented-soybean food with antimicrobial properties. Based on carbon utilization pattern and partial 16S rRNA sequence analysis, the B65-1 strain was identified as *Bacillus licheniformis*... Our results indicated that the phenylacetic acid produced by *B. licheniformis* during fermentation of soybean is one of the main compounds of antimicrobial activity of Chungkook-Jang."

1675. Lee, Cherl-Ho. 2004. The role of biotechnology in modern food production. *J. of Food Science* 69(3):CRH92-CRH95. April. 12th World Congress of Food Science and Technology. [18 ref]
• ***Summary:*** "Modern food production technology is given great challenges by the emerging fields of biotechnology and molecular biology. Knowledge of conventional fermentation technology is upgraded by the gene level explanations of enzyme actions and physiological functions of biomaterials derived therefrom. The use of genetically modified organisms (GMOs) and their products in food widens the availability of resources while also raising public interest about safety and labeling. As an example of the application of molecular biology in conventional fermentation technology the selection of proteases from a Bacillus species grown in Korean traditional soybean fermentation starter, Meju, and the production of peptides with blood cholesterol lowering effect, obtained from soybean protein hydrolysate, are presented. Recent developments in the Korean bioindustry are reviewed as an example of the role of biotechnology in the food industry. The present status of GMO enzymes in food production is reviewed and safety issues about GMO use in the food system are discussed."

Note: Soy is mentioned 19 times in this document. Address: Graduate School of Biotechnology, Korea Univ., Seoul, 136-701 Korea.

1676. Hymowitz, Theodore. 2004. Speciation and cytogenetics. In: H. Roger Boerma and James E. Specht, eds. 2004. Soybeans: Improvement, Production, and Uses. 3rd ed. Madison, Wisconsin: American Society of Agronomy. xxv + 1144 p. See p. 97-136. Chap. 4. [195 ref]
• ***Summary:*** Contents: 1. Origin of the soybean and its dissemination. 2. *Glycine* species. 3. Generic relationships. 4. Origin of the genus *Glycine*. 5. Genomic relationships among diploid species. 6. Polyploid complexes. 7. Gene pools. 8. Intersubgeneric hybrids. 9. Cytogenetic techniques. 10. Karyotope analysis. 11. Chromosome aberrations–numerical changes. 12. Chromosome aberrations–structural changes. 13. Chromosome aberrations–aneuploidy. 14. Conclusions. Acknowledgments.

Note: The first section of this chapter consists of an excellent, concise history of the soybean.

1500-1100 B.C.–Soybean emerges as a domesticate during the Zhou dynasty in the eastern half of north China.

1st century A.D. soybean probably reaches central and south China and the Korean peninsula. Address: Prof. of Plant Genetics, Dep. of Crop Sciences, Univ. of Illinois, 1102 South Goodwin Ave., Urbana, IL 61801.

1677. Koo, Chun-Sur. 2004. Ganjang and Doenjang: Traditional Fermented Seasonings. *Koreana* 18(1):62-67. Spring. Available online.
• ***Summary:*** "As recently as 10 years ago, it was not difficult to see *hangari* (crockery pots) when driving around the countryside of Korea. They were invariably located in an area that received ample sunlight and was also well ventilated. If a house had a big enough yard, the hangari were often placed along the rear wall. In such case, the hangari would sit on an elevated base, made from stones and earth, so that they could receive more direct sunlight. This elevated base was commonly known as *jangdokdae*, or crockery jar terrace.

"Since ganjang is a liquid and doenjang a paste, the two can be easily distinguished. However, they both share a common origin. Tradition calls for Koreans to prepare the *mejubap* needed to make doenjang in the tenth lunar month, by boiling and grinding soybeans. The ground soybeans are formed into a block (20 x 15 cm) or round shape, and left to dry for a week in a cool place. Then, the meju is bound with rice straw and hung to dry from the eaves of their homes for about 40 days. When the meju is thoroughly dried, it is stored in a warm place so that it can ferment. The rice straw is not removed since it serves to facilitate the fermentation process.

"When the fermentation process is complete, the meju is placed in salt water. The water's salt content is proper when the meju will float to the surface. The fermented meju and salt water would gradually mix together over an extended period of time. When the salt water takes on a dark brown color, it is ganjang [soy sauce]. Once the soaking and mixing process is completed, the meju is removed. The removed meju is doenjang, while the dark brown salt water is ganjang. Ganjang is then boiled and stored in a large hangari on the jangdokdae.

"Doenjang, which is also made from the fermented meju, has the consistency of a thick paste. Charcoal and red peppers are placed in a ganjang pot. Charcoal is added because it is effective in absorbing impurities, while peppers are included for their sterilizing capability. These ancient methods of preparing jang have been scientifically proved to produce fermented foods with impressive health benefits.

"Great Taste, Good Health: Mention of Korean jang can be found in the *Book of Wei and Dongyi Tribes, Sanguozhi*, a Chinese document compiled by Chen Shoo in AD. 290.

© Copyright Soyinfo Center 2021

This would seem to confirm that jang-making methods were developed a long time ago, indeed: Doenjang, which is neither hard nor soft, was also called tojang in the past. In the days of old, the Chinese used to refer to doenjang as the smell of Korea; thus indicating their acknowledgement of the fact that doenjang originated on the Korean peninsula. The technique of preparing meju was eventually introduced to Japan, such that the mention of *jang, si* and *maljang* is included in the Japanese Daihoritsuryo, or Daiho Code published in 701. Maljang was introduced to Japan as well. However, according to a Shosoin document published in 739, the Japanese referred to maljang as miso. *Touga* by Arai Hakuseki in 1717 stated: 'Maljang, which originated from Goryeo, made its way to Japan, where it was pronounced as miso, in accordance with the local dialect'

"In the olden days, doenjang was said to possess five virtues. The first of these is *dansim,* meaning that doenjang will maintain its own taste and aroma even when combined with other tastes. The second is *hangsim,* that doenjang would never go bad. If stored properly, doenjang actually develops a more intense. taste over time. Third is *bulsim,* that doenjang can eliminate the unpleasant odor of fish and meat. Fourth is *seonsim,* in which doenjang is said to make spicy food more savory, And fifth is hwasim, meaning that doenjang can be used to complement any type of food.

"A recent report revealed that doenjang has the most significant anti-carcinogenic efficacy of all Korean fermented foods, followed by gochujang (red-pepper paste) and ganjang. In the case of doenjang and gochujang, homemade items were found to have greater anti-carcinogenic effectiveness than the commercial products sold in stores. Moreover, traditional doenjang is also known to be effective for restoring liver damage." Address: Director, World Food Culture Research Institute.

1678. Pulmuone Co., Ltd. 2004. Pulmuone 2003 annual report. Chungcheongbukdo, Korea. 43 p. 28 cm.
• ***Summary:*** Contents: Corporate profile. To our shareholders, customers and employees. Pulmuone values and strategy. History: Staying the 20 years progress. How Pulmuone puts its values into action. Pulmuone people: Won Kyung Sun. Overview–Pulmuone packaged-fresh foods businesses. Pulmuone brand–Soy protein business unit. Pulmuone brand–HMR [Home meal replacement, esp. noodles, dumplings, desserts] business unit. Pulmuone brand–Sojae business unit [incl. bean sprouts, mushrooms, kimchi, fresh eggs, nori seaweed]. Pulmuone brand–Green vegetable juice. Pulmuone global brand (Soga)–Pulmuone

© Copyright Soyinfo Center 2021

USA, Inc. EMCD–Food service. Foodmerce–General food distribution, Financial section. Board of directors. Pulmuone network. Corporate information.

"Corporate profile: Pulmuone Co. Ltd. is one of the world's leading providers of fresh, close-to-nature products with shelf lives of fewer than 15 days." This unique business model, and the foresight to realize in 1984 what consumers want, stems from: "(1) The special Korean culinary style of cooking, with a heavy dependence on fresh, close-to-nature products. Traditional Korean foods are considered on of the world's healthiest diets, with a heavy dependence on soybean-related ingredients. (2) The Pulmuone founder's vision that emphasizes a 'love for our neighbors' and a 'respect for all living beings.' (3) The mixing of corporate values with strong results..." The heavy emphasis on innovation. "May 2004 marks Pulmuone's 20th anniversary... We'll offer the best Asian-type tofu and related products for Asian consumers, and at the same time provide the best alternative soybean protein-protein based food sources for the rest of the globe." Seung-Woo Nam is chairman of the board and CEO. Last year Pulmuone's revenues increased by 30.2%. Net income (profit) however decreased slightly.

A timeline (p. 8-9) shows 35 important milestones in Pulmuone's history from 12 May 1981 to 2004. Of these, 26 are for Pulmuone companies and 9 are for "affiliates."

Values into action: "Since 1993, our company has donated 0.1% of sales on products bearing the 'Love Earth' seal to needy neighbors and to environmental causes." Examples of projects are shown.

Pages 12-13: "Won Kyung Sun: The founder of Pulmuone Cooperative Farm. A true teacher: Born into an indigent farm family in the southern part of Pyong Yang province in 1914, Won Kyung Sun began raising silkworms at the age of six to support his family after the death of his debt-ridden father. The Korean war [June 1950 to July 1953] had a grave impact on him when his eldest son died at age six. In 1955 [when post-war hunger and starvation were widespread in South Korea], Mr. Won organized Pulmuone on 33,058 square meters [8 acres] of usable land to provide a 'rebirth' for those who had been struggling with Christian values. The land was formed into a cooperative farming community. In 1976, Pulmuone adopted an organic farming approach by using organic fertilizers. In the late 1970s Mr. Won solidified his Pulmuone values to be these: Love for our neighbors, because when our neighbors are not happy, we can never be happy, and Respect for all living beings, because everything is interdependent with each other. When we do not protect nature, which in turns supports all living beings, the well being of our future is jeopardized. The top leaders in Korea regard Mr. Won as one of the most profound teachers in 20th-century Korea."

Five small color photos show Mr. Won. A full-page black-and-white photo shows him walking on a road, carrying a hoe over one shoulder. "In 1995 Mr. Won received the UN's 500 Award for Environmental Achievement."

Soy protein: "A key impetus that drives the domestic market (KRW 490 billion) is the switch by consumers from unpackaged to packaged tofu products. Further, the recent mad cow disease scare... A major concern for Korean consumers is whether soybeans are produced in Korea and if these soybeans are genetically modified (GMO). That our tofu products are free from any GMO–meaning their GMO Level tests less than 1%–has won widespread trust among consumers. As a result, our company gained nearly 75% of the national tofu market with a nationwide, chilled supply-chain system capable of delivering products on a daily basis to maintain freshness. In 2003, we completed the world's largest state-of-the-art automated tofu plant at Eum Sung. It is capable to producing 200,000 pieces of tofu daily.

Soga: In 2003 Pulmuone USA's tofu sales increased by 22% to over $250 million. Color photos show the company's tofu plants at South Gate, California, Fullerton, California, and Tappan, New Jersey. Homepage: www.pulmuone.co.kr. Address: 80-1, Samhori, Daesomyun, Eumsunggun, Chungcheongbukdo, Korea. Phone: 82-043-879-4500.

1679. Pulmuone USA, Inc. 2004. Pulmuone USA, Inc. proudly announces their new strategic alliance with Wildwood Natural Foods Inc. (News release). Fullerton, California. 1 p. July 20.
• ***Summary:*** "Pulmuone USA, Inc., the largest tofu company in the world, is proud to announce their strategic alliance with Wildwood Natural Foods, Inc. By joining forces, both companies will collaborate on research, production, marketing, and sales to build an even stronger presence in the United States."

T.J. Song, executive vice president of Pulmuone USA is "proud and very excited to have Wildwood join the Pulmuone family... This alliance will make both companies leaders in the natural foods market."

Pulmuone, Inc., founded in 1981, has worldwide annual revenues of more than $400 million. "With an ever-expanding American market base, Pulmuone South Korea established Pulmuone USA in 1991, to distribute natural food products from South Korea to the American market. The company is the leading manufacturer of tofu, fresh noodles, meatless products, and soy milk-based items.

Pulmuone, with manufacturing facilities in California and New York, makes products under the Pulmuone, Kimbo, Nigari, and Soga brands, with Pulmuone, Kimbo and Nigari catering to the ethnic market and the Soga brand focusing on developing and making quality soy products for the mainstream American market. Address: Fullerton, California.

1680. Wildwood Natural Foods, Inc. 2004. Wildwood Natural Foods enters into a strategic alliance with Pulmuone U.S.A., Inc. (News release). Watsonville, California. 1 p. July 20.
• ***Summary:*** "Wildwood Natural Foods, Inc. ('Wildwood'), formerly known as Wildwood Harvest Foods, Inc., is pleased to announce that it has entered into a strategic alliance with Pulmuone U.S.A., Inc. The relationship provides for significant equity investments into Wildwood as well as a broad collaboration on research, production, marketing, and sales."

Billy Bramblett and Jeremiah Ridenour (founders of Wildwood) and Tom Lacina (COO of Wildwood) express enthusiasm for the alliance. Dan Winegarden, President of the Iowa Agricultural Finance Corporation, supports the alliance. "Separately, Wildwood announces the appointment of Paul S-U Kang as President and CEO. Paul's experience includes brand management at Procter & Gamble Co. in Cincinnati, Ohio, and mergers and private equity at Goldman Sachs & Co. in New York. He received his A.B. from Harvard Univ. in Massachusetts and his M.B.A. from Stanford Univ. in California.

Other investors in Wildwood include the tecTerra Food Equity Fund I, the Iowa Farm Bureau, soybean farmers, and over a dozen physicians interested in the health benefits of soy.

"Wildwood was founded some 25 years ago and has been a pioneer in the natural and organic food category. Pulmuone U.S.A., Inc., with three factories in the U.S., is a subsidiary of the publicly-listed Pulmuone Co., Ltd., with revenues of $250 million. Pulmuone Co. Ltd. is the largest player in the global tofu industry and is a part of the Pulmuone Group with businesses in fresh juices, bottled water, fresh noodles, food supplements, and food services." Address: Watsonville, California.

1682. *SoyaScan Notes.* 2004. Chronology of major soy-related events and trends during 2004 (Overview). Dec. 31. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** Jan/Feb.–*Biodiesel* magazine starts publication in the USA.

Feb. The excellent European periodical *Soyafoods*, edited by Heather Paine of England, changes its title to Soy & Health, when the American Soybean Association stopped funding. Past and current issues can be downloaded from the Soy Conference website www.soyconference.com.

April–Yamasa Corporation purchases San-J International (Richmond, Virginia).

April–Pulmuone U.S.A. makes a significant financial investment in Wildwood Harvest Foods, Inc. In July the two companies announce their merger. Both tofu companies are based in California.

April–The Food and Drug Administration (FDA) confirms that it is in the process of reviewing a petition for a health claim that suggests the consumption of soy protein-based foods may reduce the risk of certain types of cancer, including breast, prostate, and colon cancer. The Solae Company submitted the petition.

June–"The Whole Soy Story: The Dark Side of America's Favorite Health Food," an article by Kaayla T. Daniel is published in *Mothering* magazine. Her unbalanced approach is to collect, often misinterpret, and publish in one place all the negative information she can find about soy.

July 20–Wildwood Natural Foods, Inc. and Pulmuone

© Copyright Soyinfo Center 2021

U.S.A. announce their merger.

July–Soyfoods Center "publishes" on its Internet website (www.soyfoodscenter.com) the entire (previously unpublished) manuscript of its book *History of Soybeans and Soyfoods*, by William Shurtleff & Akiko Aoyagi (2,500 pages). It is now available worldwide for all to use free of charge. Research and writing of this book began in Oct. 1980.

Nov. 10–USDA's Animal and Plant Health Inspection Service [APHIS] confirms the presence of soybean rust on soybean leaf samples taken from two plots associated with a Louisiana State University research farm.

World Wildlife Fund establishes the Roundtable on Responsible Soy to address the impacts of soy production [as on the Amazon rainforest] and identify solutions.

Trends: (1) The low-carb diet continues its popularity and upward trend in the USA. Soy protein is being used to replace carbohydrates is a wide array of products from taco chips to bread, from healthy soft drinks (Snapple-A-Day) to vegetable juice (V8 Splash Smoothies). Consumption of meat, which is also low in carbohydrates, is now coming back into popularity. Few, if any, nutritionists, think that low-carb diets are healthful. (2) The anti-soy faction continues to have an active and one-sided web presence–and a negative effect on the growing interest in soyfoods. Leaders are Sally Fallon, Kaayla T. Daniel, Richard and Valerie James, and a few others. (3) Ten million more people were hungry in 2004 than in 2003, according to Bread for the World Institute's 2004 Hunger Report. At the same time the World Food Program announced that food aid has decreased every year since 1999. Hunger is a growing issue. Hunger and poverty are inextricably linked; if there are no resources, there is no food.

1683. Lee, J.-D.; Park, S.-K.; Hwang, Y.-H. 2004. Evaluation of agronomic characteristics for development of small seed-size soybeans by interspecific crosses. *Korean J. of Breeding* 36(4):207-13. [23 ref. Eng]*

• ***Summary:*** "In general, it is known that smaller soybeans produce a higher sprout yield. The small soybean germplasm with seeds weighing below 100 mg per seed is limited, so wild soybeans (*Glycine soja*) are useful genetic source for the breeding of small seed-size soybean for sprout." Address: 1. Kyungpook National Univ., Daegu, Republic of Korea [South Korea].

1684. Lee, Min June; Kim, M.J.; Min, S.H.; Yoon, S. 2004. [A study on the attitude of soy food and estimated dietary isoflavone intake among Korean adolescents]. *Korean J. of Community Nutrition* 9(5):606-14. [Kor]

• ***Summary:*** "This study was conducted to investigate the attitude to various soy foods and to estimate dietary isoflavone intake among Korean adolescents. The survey was carried out by self-administered questionnaire with 800 middle-school and high-school students residing in urban and rural areas and 714 questionnaires were collected: resulting in 89% response rate. The dietary isoflavone intake was estimated by food frequency questionnaire developed for rapid assessment of isoflavone intake. Soybean paste, soybean curd, soy milk, bean sprouts and dambuk... Stuffed rice in fried soybean curd got the highest score and miso soup got the lowest in preference. More than 50% of the subjects consumed soybean paste stew/soup and soybean curd over twice per week and 12.3% of the subjects consumed soybean over once a day. The estimated daily intake of isoflavones ranged from 0 to 227 mg, and the mean daily isoflavone intake of the subjects was 28.1 mg (16.3 mg genistein and 12.0 mg daidzein) whereas the median value of isoflavone intake was 19.7 mg." Address: Korea.

1685. Shin, D.H. 2004. [Change in preparation methods and bioactive function of fermented soyfoods]. *Korea Soybean Digest* 15:1-12. [Kor]*

1686. Bensky, Dan; Vlavey, Steven; Stöger, Erich; Gamble, Andrew. comp. and trans. 2004. Chinese herbal medicine–Materia medica. 3rd ed. Seattle, Washington: Eastland Press. xxxi + 1311 p. Illustrations adapted by Lilian Lai Bensky. Index. 29 cm. [200+* ref]

• ***Summary:*** Note that this book was compiled and translated. In the chapter on "Herbs that release the exterior" we find: Pharmaceutical name: "Sojae Semen preparatum" (*dan dou chi*). English: prepared soybean. At the start is an illustration of the leaves of a soybean plant with pods and flowers. The text in which it first appeared is: *Treasury of Words on the Materia Medica.* There follow 2 pages about its: (1) Actions and indications. (2) Other combinations. (3) Commentary. (4) Mechanisms of selected combinations. (5) Nomenclature & preparation; Black soybeans are used. (6) Quality criteria; Use loose black soybeans "with a thin membranous skin and a strong aromatic fragrance."

Soy is next mentioned on pages 65-67. Pharmaceutical name: Sojae Semen germinatum (*da dou juan*). English: Young soybean sprout, dried soybean sprout. Text in which first mentioned: *Divine Husbandman's Classic of Materia Medica.* The same categories of information are given.

The third and last mention is on page 977-78 in the chapter on "Substances that extinguish wind and stop tremors." Pharmaceutical name: "Glycinis Testa" (*lu dou yi*). English: soybean skin. "It is made by soaking black soybeans until they sprout, after which the skins are shucked off, collected, and dried in the sun. They should be stored in a dry place as they readily absorb moisture."

Appendix 6 is the "Historical and source text bibliography," sorted by English title. It is a table with the following six columns: English title. Chinese title. Pinyin title. Author (English). Author (Chinese). Date/Dynasty. For example *Treasury of Words on the Materica Medica* (*Ben*

• ***Summary:*** Koji (and koji starter) is mentioned on pages 4, 482, 485-86, 503, 541-43, 544-51, 554-59, 562-63, 575 and under the subheads: making koji, red koji, salted koji, seed koji, soybean koji, starter koji, washed koji, and wheat koji.

Miso is mentioned on pages 39, 41, 79, 549-52, 555, 557-61, 568, and under the subheads fermentation management, manufacturing miso, mixing, packaging, production, red miso, salty miso, soybean miso, soybean steamer, standardization, sweet miso, water content and texture, white miso.

Natto is mentioned on pages 533-40, and 568, and under the subheads *Bacillus natto*, biochemical changes, Daitokuji natto [not a type of natto; fermented black soybeans], daiyohukuzi natto [sic], enzymes, flavoring compounds, gamma-polyglutamic acid, general description, incubation room, inoculation, management, manufacturing, niowanatto, packing, production, sticky substances.

Soy foods: Asian, Chinese, Japanese, jiang, Korean, miso, natto, soy nuggets, soy paste, soy sauce, soy yogurts sufu, tempeh, types.

Soy nuggets: doushi, history, production, toushih.

Soy protein, p. 393.

Soy sauce: classification, chemical method, common soy sauce, composite soy sauce, In-yu. koikuchi soy sauce, light-colored. processed, raw, Siro [sic, Shiro], soy sauce paste, special, tamari, traditional fermentation.

Soy sauce fermentation.

Soy sauce filter cake.

Soy sauce koji, microflora.

Soy sauce manufacturing processes.

Soy sauce processing.

Soy yogurt, p. 498, and under the subheads composition, microorganisms, production.

Stinky tofu.

Sufu [fermented tofu], pages 571-576, and under the subheads fermentation, fermented tofu, general description, hard tofu, Kwantung sufu, manufacturing, moldy tofu, packaging, product quality and composition, production, red koji, rose sufu, sanitary tofu, seasoning, sesame oil, Tsao sufu.

Tempeh (tempe) pages 4, 39, 41, 82, and under the subheads basic changes, changes in carbohydrates, changes in lipids, changes in proteins and amino acids, changes in vitamins, consumption, cost, general description, history, issues and problems in production, microorganisms related to, presence of antibiotics, presence of antioxidants, production procedures in Indonesia, production procedures in the US, production, reduction of phytate. Address: 1. Science Technology System, West Sacramento, California.

1689. Demick, Barbara. 2005. Americans find a door to N. Korea: a Chinese city is filled with people from the U.S. who want to reach out to the impoverished, forbidden country across the river. *Los Angeles Times* (*California*). Jan. 3. p. 15 (A3).

• ***Summary:*** A huge photo shows a demolished bridge across the Tumen River that once joined China and North Korea. Peter Han, a retired L.A. County social worker, "runs two bakeries in North Korea that produce rolls with raisins–from California, of course–for schoolchildren. He has a factory in the North Korean city of Rajin that makes *doenjang*, a soybean paste, and an experimental farm for soybeans and corn."

Han "was born in the North Korean city of Wonsan but left as a child..." Address: Times staff writer.

1690. Moskin, Julia. 2005. Artisanal, creamy, sweet tofu? Fresh bean curd is still misunderstood in America. *New York Times.* Jan. 5. p. F1, F5.

• ***Summary:*** A song of praise to fresh tofu! A new generation of New York City restaurants are serving fresh, natural tofu (often made locally or in-house the same day it is served). That old, unappealing term "coagulated bean curd"

© Copyright Soyinfo Center 2021

"doesn't begin to convey the pleasures of silken tofu–tender mouthfuls of freshly made kinugoshi-dofu (in Japanese), sundubu (Korean), or doufu (Chinese)."

And customers are coming to appreciate "the simple virtues of fresh tofu." Some restaurants known for their tofu (addresses and phone numbers are also given) are: Book Chang Dong, Cho Dang Gol, En Japanese Brasserie, Honmura An, Kasadela, Li Hua, Megu, Seoul Garden, Spicy and Tasty, and Temple.

Tofu is made in much the same way as cheese, except from puréed soybeans instead of cow, sheep, or goat milk as its raw material. "Because of its ability to produce so many different forms of nourishment, the soybean has long been called 'the cow of China,' and tofu was first developed there by Buddhist monks about 2,000 years ago" [doubtful; no citation given].

Chinese names for tofu, that indicate the esteem in which it is held, include "meat without bones" and "meat from the fields."

Address: 4567 Firestone Blvd., South Gate, California.

1692. Ridenour, Jeremiah. 2005. Pulmuone first invests in Wildwood Natural Foods in April 2004 (Interview). *SoyaScan Notes.* Feb. 13. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** Jeremiah met Tom Lacina and his partner / brother-in-law one day when they showed up at the Wildwood plant in Santa Cruz. Jeremiah took them on a tour of the plant, then they went out to lunch. Tom was one of those rare people who was both an attorney and a farmer. He owned a farm and had built a small tofu shop on his land. He was selling about $50,000/year worth of soy products at the most. They said they were struggling in Iowa trying to make their tofu plant work, and they were losing tons of money. Somebody (Shurtleff) told Lacina that if he wanted to be successful, he should model his company after Wildwood. After visiting Wildwood, they visited San Diego Soy Dairy and Luke Lukoskie. He then called Jeremiah and said that if he was ever in the Midwest, he was welcome to stop by for a visit. On a trip to the East, Jeremiah stopped in to see Tom, who introduced him to venture capitalists (VCs) in Des Moines who scouted for companies potentially suited for Iowa state money. The VCs grilled Jeremiah about his business. To get money from the state of Iowa, a company had to have more than $5 million/year in sales. Jeremiah really liked Tom and the Soy Sisters (Tom's wife and sister). Wildwood had run out of capacity, working around the clock 7 days a week, so it was "grow or else." Wildwood and Midwest Harvest Corp. (Tom's company) ended up merging, becoming an Iowa corporation and getting money from the state of Iowa for job creation in Iowa and value-added products made in Iowa from Iowa farm crops. A certain percentage of that money had to be spent in Iowa, but Jeremiah was able to get enough to buy a used meat-packing plant in Watsonville, about 25 miles southeast of Santa Cruz. First the new corporation bought 10 acres of land in Grinnell, Iowa, 1½ miles down the road from Tom Lacina's

© Copyright Soyinfo Center 2021

farm and in 2001 built a state-of-the art plant (22,000 square feet) where only soymilk and cultured foods (such as soy yogurt) were made–the only such plant in the USA. Jeremiah has long had a strong commitment to organic farming and the use of organic ingredients wherever possible in his products. On his 320-acre farm, Tom Lacina grows some of the organic soybeans that Wildwood makes into cultured soyfoods in Iowa. This is the type of vertical integration that Jeremiah had long sought. Jeremiah used to contract with various organic farmers, but he gradually found problems keeping the protein levels of his two select varieties high enough and ensuring the cleanliness of the soybeans he wanted. So 5-6 years ago he started to buy his soybeans through a broker, and giving very clear specifications–such as at least 43% protein in the soybeans to be used in making tofu. That system has proven to be much better.

While building his first factory in Iowa, Jeremiah bought an old meat-packing plant in Watsonville, California and began to renovate it for food processing. Building two plants at once turned out to be a big mistake. The usual cost overruns occurred. After building plans had been approved by the inspectors and the meat-packing plant renovation was almost finished, inspectors came back in and said that about $1 million worth of earthquake retrofitting would have to be done. Jeremiah did the work and finished the plant. But now he needed the last million dollars of marketing money that he had been promised by Iowa. But Iowa refused to pay that money, arguing that it would take more than that amount for the company to reach the break-even point. What Wildwood couldn't see, was that politics was at work behind the scenes; Iowa wanted to get out. The money guys told Jeremiah he would have to find a strategic partner. Jeremiah suddenly found himself short of cash and in a financial crisis.

So he made a short list of potential partners who might invest money. House Foods America Corporation (Los Angeles) showed some interest then backed off. Jeremiah had first met Pulmuone in the spring of 2003 at the Natural Products Expo West in Anaheim; their booths happened to be across the aisle from one another. They had a smoothie product and Wildwood had introduced a smoothie the year before; Jeremiah thought that Pulmuone's wasn't very good. Some people from the Pulmuone booth came over to visit. They said that their CEO was coming from Korea and invited Jeremiah to meet him. But for some reason it never happened. So Jeremiah never thought of putting Pulmuone on his short list of potential partners.

Meanwhile, the Iowa cultured products plant was not doing well. "This discipline required to make cultured soyfoods is like that in an operating room." Jeremiah's basic concept was to make these cultured soy products probiotic, which would give them functional value. At his first meeting with the employees he asked how many people had heard of "probiotics," Nobody. Woops. How many had heard of "antibiotic." Everybody. He knew from that moment he would have marketing problems. Jeremiah and a PhD in microbiology had traveled to the plant, established the sanitation protocols, and trained the workers. But soon after he left, the quality control problems returned. Tom Lacina was more interested in having the paperwork done well than in enforcing the sanitation rules. This led to a loss of business and of money.

There was another factor. Jeremiah has come to believe that many, if not most, Midwesterners see anyone from California as a hippie. Hippies don't know how to run businesses and don't understand most Midwesterners. At one point the VCs put their foot down and told Jeremiah, "Too much travel. We don't want you to come here anymore." At that point things got out of control.

Stonyfield Farms was planning to have their soy yogurt made at Wildwood's Iowa plant–a huge potential account. But the people in Iowa could not produce the quality that was required. They missed a huge opportunity to make the Iowa plant successful. Jeremiah's wishes he had waited until the Iowa plant was making good quality products before bringing in Stonyfield.

Today, the Iowa plant is doing very well in every way; sales grew 400% last year. Pulmuone sent their R&D experts there and turned things around in short order. (8) In April 2004 Wildwood sold a controlling interest to Pulmuone. It was a matter of economic survival. So Wildwood has become an international company, with Korean partners. To celebrate the deal, Jeremiah went on a tour of Pulmuone's facilities in Korea. (9) Origins of Pulmuone in 1955 in Korea as a Christian Farming Cooperative. Their mission is "Love Thy Neighbor" and they are deeply committed to pure foods, organic agriculture, and no artificial ingredients. The saintly Mr. Won. Alex Nam went to college with Mr. Won's son. Pulmuone now has 12 organic food products.

In the early days, the Soyfoods Association was unable to attract any Asian soyfoods companies. Today both Asian companies, huge American food processors (Kellogg, ADM, DuPont, Kraft), and even state soybean boards are members. Address: 412 E. Riverside Drive., Watsonville, California 95076.

1693. Wildwood Natural Foods. 2005. Wildwood Natural Foods (Website printout–part). www.wildwoodnaturalfoods.com Retrieved Feb. 13.

• ***Summary:*** Contents: Home page. 1. Our products. 2. Wildly healthy! 3. About Wildwood. Atop the home page is a new Wildwood logo: "Organic since 1978." "Our mission is to nourish health & well being through supporting dietary & agricultural change." "Founded in 1978 on the edge of Marin County's wild watershed, Wildwood Natural Foods' first goal was to provide fresh vegetarian food to local communities. Today, Wildwood is famous for producing the best tasting, freshest organic tofu, vegetarian products, and soy milk you can buy. Ask a tofu eater which tofu is best. We're confident

© Copyright Soyinfo Center 2021

that they will say 'Wildwood!' because we've heard that response for over 2 decades.

"In shepherding the products from the farmers' fields to your table, we've discovered a variety of non-GMO higher-protein low-fat soybeans. We contract directly with organic family farmers to grow these beans. Wildwood further ensures the freshness of our products by delivering to your store several times per week. Our commitment is to your health and well-being, while emphasizing great taste, because our reputation is in your next bite."

2. About Wildwood. One page gives 5 Wildwood locations (addresses but no phone numbers or e-mails). Another gives a ½-page company history, starting in 1978. "2001–Focusing on unique products that nourish the body & protect the environment, Wildwood builds two new state-of-the-art certified organic plants–one in Watsonville, California, and one in Grinnell, Iowa. Under Tom Lacina's guidance, the Iowa plant becomes the first dedicated cultured soy plant in the US.

"2004–Wildwood teams up with Pulmuone, a respected leader and innovator in the organic and soy food industry. A fourth team member, Paul Kang, joins Billy, Jeremiah & Tom to continue the wildwood mission born over 25 years earlier; to bring Wildwood's wildly delicious and healthful products to every table in America." Address: 412 E. Riverside Dr., Watsonville, California 95076.

1694. Bernard, Richard L. 2005. New garden-type soybean varieties. Urbana, Illinois. 2 p. Unpublished typescript. Feb. 28 cm.

• ***Summary:*** "Because of their high nutritional value and health benefits there has been considerable recent interest in soyfoods. Most of this attention has focused on soybean products such as tofu, soy milk, soy-protein fortified flour, or meat analogs constructed from extracted soy protein, and it is not generally recognized that soybeans are an excellent vegetable and may be eaten directly much as other beans or peas. The mature dried soybean may be used just as other beans except that to avoid rancidity they should not be pre-soaked but put directly into boiling water for about 40 minutes at which point they are ready to eat. Probably the best way to use vegetable soybeans is to pick the immature pods (after the seeds have reached full size but before any yellowing begins) and boil them for only 4 to 5 minutes (in lightly salted water if your taste prefers) after which the seeds may be easily squeezed out (the shells are inedible) and eaten as a 'finger food' or added to soups, salads, fried rice, or other dishes of your choice. They taste good cold or hot, and the attractive bright green color enhances the appearance of the food. After cooking they may be frozen in or out of the pod for later or out-of-season use. The advantage of eating the immature seeds over the ripe seeds besides the better taste and appearance and much shorter cooking time is that they are more digestible since the complex carbohydrates (oligosaccharides) of the mature seeds have not yet formed.

"While all soybeans are edible, certain soybean varieties with larger seeds and milder taste have been developed for human food usages especially in Japan and Korea. These Asian food varieties have desirable seed traits but are not well adapted to our climate, insects, and diseases. US soybean breeders have crossed some of these large-seeded Asian varieties with adapted US grain varieties and developed some better adapted vegetable types. At the University of Illinois we have made selections from hybrid populations involving these large-seeded soybeans and now have a number of promising vegetable-type lines adapted to Illinois. Thirteen varieties have been released, named with the prefix Gardensoy, ranging from early maturing (maturity group 0) to late (group IV). They have seeds from about 50% larger to twice as large as the common grain types grown in Illinois but yield only about 80 to 60% as well and therefore are not competitive for production for processing.

Any one variety will have an optimum harvest period for green pods of just a few days since all the pods on a soybean plant tend to develop together. The advantage of growing several varieties with different maturity dates is a longer time of harvest. This may also be accomplished by having several planting dates (estimate 3 days delay in planting for one day delay in harvest but this will vary widely). Like all soybeans these varieties are self-pollinating and true-breeding, and therefore you may let a few plants ripen without picking and use these seeds for next year's planting.

"Because of their bigger seed size and better taste the Gardensoy varieties are being offered to home gardeners for small scale production and hand harvest. As harvest machinery and techniques are developed larger scale commercial production may become practical. We will provide 30 to 50-seed packets of these varieties (free of charge) to anyone wishing to try them.

"The table below provides some data based on tests at Urbana in 2000 to 2004 on average yield of ripe seeds, mature seed size (centigrams per seed), date of maturity (plus maturity group), stem type, plant height, and mature seed composition (protein and oil).

"We will be interested in any taste preference, observations, or comments that you wish to send to us after trying them. Please send comments and requests for seeds to the address below.

1696. Gibson, Lance; Benson, Garren. 2005. Origin, history and uses of soybean (*Glycine max*). Revised. Dep. of Agronomy, Iowa State University. 2-3 p. March. https://web.archive.org/web/20120614193010/www.agron.iastate.edu/Courses/agron212/Readings/Soy_history.htm

• ***Summary:*** "History and Origin:

"The first domestication of soybean has been traced to the eastern half of North China in the eleventh century B.C. or perhaps a bit earlier. Soybean has been one of the five main plant foods of China along with rice, soybeans, wheat, barley and millet. According to early authors, soybean production was localized in China until after the Chinese-Japanese war of 1894-95, when the Japanese began to import soybean oil cake for use as fertilizer. Shipments of soybeans were made to Europe about 1908, and the soybean attracted world-wide attention. Europeans had been aware of soybeans as early as 1712 through the writing of a German botanist [Engelbert Kaempfer, lived 1651-1716]. Some soybean seed may have been sent from China by missionaries as early as 1740 and planted in France.

"The first use of the word 'soybean' in U.S. literature was in 1804. However, it is thought that soybean was first introduced into the American Colonies in 1765 as 'Chinese vetches'. Early authors mentioned that soybeans appeared to be well adapted to Pennsylvania soil. An 1879 report from the Rutgers Agricultural College in New Jersey is the first reference that soybeans had been tested in a scientific agricultural school in the United States. For many years, most of the references to this crop were by people working in eastern and southeastern United States where it was first popular. Most of the early U.S. soybeans were used as a forage crop rather than harvested for seed. Most of the early introductions planted in these areas were obtained from China, Japan, India, Manchuria, Korea, and Taiwan.

"For many years, soybean acreage increased very slowly. There were only 1.8 million acres in the United States in 1924 when the first official estimate became available. At that time, most of the crop was used for hay. It was not until the 1920's that soybean acreage expanded to any great quantity in the U.S. Corn Belt.

"Before World War II, the U.S. imported more than 40% of its edible fats and oils. Disruption of trade routes during the war resulted in a rapid expansion of soybean acreage in the U.S. as the country looked for alternatives to these imports. Soybean was one of only two major new crops introduced into the U.S. in the twentieth century. The other major crop, Canola was initially developed in Canada and is now grown on some U.S. acres. Soybean was successful as a new crop because there was an immediate need for soybean oil and meal, its culture was similar to corn, and it benefitted other crops in a rotation.

"Following World War II, soybean production moved from the southern U.S. into the Corn Belt. The major soybean producing states of Iowa, Illinois, Minnesota, Indiana, Ohio, Missouri, and Nebraska produced 67 percent of the U.S. total in 2003; the southern and southeastern states of Arkansas, Mississippi, North Carolina, Kentucky, Tennessee, Louisiana, Alabama, and Georgia produced 14 percent. Other states with significant soybean acreage are South Dakota, Kansas, Michigan, Wisconsin, and North Dakota.

"A record 2.9 million bushel soybean crop was produced in 2001 on 74.1 million acres with an average per acre yield of 39.6 bushels. The leading soybean states are Iowa and Illinois. In 2003, Iowa had 10.6 million acres of soybeans while Illinois had 10.3 million. The highest state yield ever achieved was 50.5 bushels per acre produced by Iowa farmers in 1994.

"The U.S. dominated world soybean production through the 1950's, 60's, and 70's, growing more than 75 percent of the world soybean crop. The U.S. was the major supplier of animal feed protein in the world during this period. A worldwide shortage of feed protein in the early 1970's led to the initiation of large-scale soybean production in several South American countries, most notably Argentina and Brazil. By 2003, the U.S. share of the world's soybean production had shrunk to 34 percent, while Argentina's and Brazil's had increased to 18 and 28 percent, respectively. Most of the land suitable for soybean production in Argentina has been put into production. Brazil has an estimated additional 100 million acres of land that can still be put into soybean production. This land, which comprises an area larger than the U.S. Corn Belt, is remotely located in the interior of the country and faces many obstacles to further soybean production. One of the greatest problems is the lack of an efficient transportation system.

"Uses of Soybean:

"Early Uses. Soybeans were grown for centuries in Asia mainly for their seeds. These were used in preparing a large variety of fresh, fermented and dried food products that were considered indispensable to oriental diets. Soybeans were not used to any great extent for forage in Asia.

"Early use of soybeans in the United States was for forage and to some extent, green manure. It was not until 1941 that the acreage of soybeans grown for grain first exceeded that grown for forage and other purposes in the United States.

"Present Uses. Soybeans are the United States' second largest crop in cash sales and the number one export crop. In 2003, the export value of soybeans was more than

© Copyright Soyinfo Center 2021

9.7 billion dollars, or about one-sixth of all agricultural exports. Normally, more than half of the total value of the U.S. soybean crop comes from exports as whole soybeans, soybean meal, and soybean oil. About 40 percent of the world's soybean trade originates from the U.S.

"China has become the largest single country customer for U.S. soybeans with purchases totaling nearly $3 billion. Mexico, the European Union, and Japan are the second, third, and fourth largest international markets, respectively. Major export markets for soybean meal are the Philippines and Canada. Mexico and Korea are large customers of U.S. soybean oil.

"The majority of the soybean crop is processed into oil and meal. Oil extracted from soybeans is made into shortening, margarine, cooking oil, and salad dressings. Soybeans account for 80 percent or more of the edible fats and oils consumed in the United States. Soy oil is also used in industrial paint, varnishes, caulking compounds, linoleum, printing inks, and other products. Development efforts in recent years have resulted in several soy oil-based lubricant and fuel products that replace non-renewable petroleum products.

"Lecithin, a product extracted from soybean oil, is a natural emulsifier and lubricant used in many food, commercial, and industrial applications. As an emulsifier, it can make fats and water compatible with each other. For example, it helps keep the chocolate and cocoa butter in a candy bar from separating. It is also used in pharmaceuticals and protective coatings.

"The high protein meal remaining after extraction can be processed into soybean flour for human food or incorporated into animal feed. Soybean protein helps balance the nutrient deficiencies of such grains as corn and wheat, which are low in the important amino acids, lysine and tryptophan.

"Use of vegetable proteins for human consumption continues to expand in the United States. They can be used as meat and dairy substitutes in various items. Most people are aware of the use of soy proteins in baby formula, weight-loss drinks, sport drinks, and as a low-fat substitute for hamburger.

"Soy flour and grits, made from grinding whole soybeans, are used in the commercial baking industry to aid in dough conditioning and bleaching. They have excellent moisture-holding qualities that help retard staling in bakery products."

Note: This document, unfortunately, contains many errors–and no bibliographic references. Above all it fails to mention that the soybean was introduced to North America [Colony of Georgia] by Samuel Bowen in 1765. Address: Iowa State Univ.

1697. Mine, Yoshinori; Wong, A.H.K.; Jiang, B. 2005. Fibrinolytic enzymes in Asian traditional fermented foods. *Food Research International* 38(3):243-50. April. [39 ref]

• ***Summary:*** "Fibrinolytic enzymes are agents that dissolve fibrin clots. Recently many food derived fibrinolytic enzymes have been found in various traditional Asian foods. Fibrinolytic enzymes can be found in a variety of foods, such as Japanese Natto, Tofuyo [Okinawan fermented tofu], Korean Chungkook-Jang soy sauce [sic, natto],... These novel fibrinolytic enzymes derived from traditional Asian foods are useful for thrombolytic therapy. They will provide an adjunct to the costly fibrinolytic enzymes that are currently used in managing heart disease, since large quantities of enzyme can be conveniently and efficiently produced. In addition, these enzymes have significant potential for food fortification and nutraceutical applications, such that their use could effectively prevent cardiovascular diseases." Address: Dep. of Food Science, Univ. of Guelph, Guelph, Ontario, Canada N1G 2W1.

• ***Summary:*** About Ota Tofu and Dae Han Tofu, both in Portland. At Ota Tofu in southeast Portland, there are 13 workers on a work floor of just over 900 square feet. "Since 1918, the family business has focused on the local market, never expanding outside Portland." Ota tofu is fresh and unpasteurized, curded with a refined form of nigari.

Ota Tofu doesn't deliver or advertise; it doesn't have to. People and businesses who want Ota Tofu come to the shop to pick it up. Today, the restaurants Sweet Basil, the Farm Café, Old Wives' Tales, Fong Chong, and Curry in a Hurry have all stopped by to pick up buckets or water-filled bags of fresh tofu. All day long, vans and trucks from catering services, Asian markets and other restaurants from as far away as northern Washington drive to the front of Ota to load up on tofu.

A large color photo shows Ota employee Wai Yang as she uses long chopsticks to deep-fry tofu pouches (agé) in a rectangular stainless steel fryer.

Dae Han Tofu, owned by Calvin Chun, started in 1993 and now has four employees. Chun, who moved to Portland from South Korea in 1989, rolls up his sleeves and helps with all parts of the work. Dae Han's work space is a bit larger than Ota's and streamlined for higher volume. In addition to regular types of tofu, the company produces specialty tofus such as teriyaki, hot and spicy, extra firm, and low fat (made from dehulled soybeans).

Contact information: Ota Tofu, 812 S.E. Stark St. Phone: 503-232-8947. Dae Han Tofu, 3340 N.W. Yeon Ave. Phone: 503-223-0044.

1701. Barrett, Walter. 2005. Re: Work with soybeans in Central Asia. Letter (e-mail) to William Shurtleff at Soyfoods Center, Oct. 3. 1 p.

• ***Summary:*** In 1991, at age 44, Walter sold his ownership share of a soil testing laboratory in the Midwest. Since that time has been doing volunteer work with soybeans in Eastern Europe, Central Asia, and Afghanistan, mostly with 3 NGOs (non-governmental organizations): Winrock International, Mercy Corps, and ACDI / VOCA.

"All countries in Central Asia are somewhat familiar with the soybean but few countries, with the exception of Kazakhstan, are growing the soybean for commercial purposes.

"The soybean is most familiar among Korean communities that are scattered throughout parts of Central Asia. While in Turkmenistan, I came across a Korean lady who grew soybeans in her garden for her own use (see photos 77, 78, and 81). Note that she is cooking a native, green-seeded variety. She was one of the very few people growing soybeans in Turkmenistan before my arrival. Even now, progress is very slow because of government mandates to grow cotton.

"I work with both farmers and university researchers on soybeans. Most countries in Central Asia have a few native varieties (see attached photo 63, which shows a Tajikistan researchers with a native Tajik variety). I am guessing that most of these varieties were developed during Soviet times [before 1991]. I would like to know more about the origin of these varieties but that information is not easy to come by. I think, though, that the information would be available if one had the time and means to pursue it.

"I am a retired production agronomist, not a plant breeder. I have a lifetime of experience with growing corn and soybeans but do not consider myself to be a soybean guru by any means. I find my volunteer work in Central Asia very enjoyable and rewarding..." Address: 2804 Trent Drive, Fort Wayne, Indiana 46815. Phone: 260-484-7493.

1702. Barrett, Walter. 2005. Work with soybeans in Central Asia (Interview). *SoyaScan Notes.* Oct. 4 and 6. Conducted by William Shurtleff of Soyfoods Center. Preceded by letter (e-mail) of Oct. 3.

• ***Summary:*** Walter has worked with soybeans in 4 Central Asian nations: Kazakhstan, Uzbekistan, Turkmenistan, and Tajikistan. Kazakhstan and Georgia have the most history with commercial soybean production, because Soviet planners made it happen there. They designated other Central Asian countries for cotton production, in part because cotton needs less water. Latitude is part of the reason. The climate is also very dry, so that all soybeans (and almost all crops) in these countries must be irrigated, but with river water carried by gravity. Of all the Central Asian countries, Kazakhstan has been the most successful at understanding a market economy and making it work.

Walter has many contacts in these countries. He is willing to help Shurtleff try to get a better history of soybeans in each of these countries. First, Shurtleff will send Walter an e-mail containing a table showing the dates he has for the earliest document seen showing soybeans in each in each country, and soybean cultivation in each country. Then the earliest date seen for soybean cultivation in each country. Walter will forward this e-mail to an intermediary (Winrock International or Mercy Corps), who will then mail or phone or hand deliver the message to the network of indigenous researchers Walter has developed over the years. The message will encourage them to contact other researchers who might be interested; then Walter will wait for replies.

Walter believes that Korean communities in at least four of these countries (Turkmenistan, Uzbekistan, southern Kazakhstan, and Tajikistan) were growing soybeans for their own use at an early date–probably since the early 1900s and using them almost entirely for food–such as tofu, soy sprouts, Korean-style miso and soy sauce, green vegetable soybeans, etc. The Koreans raise chickens, for example, but they forage for food and are not fed soybeans. Walter has no idea when, or, why, or how these many Korean communities came to be established in Central Asia. He has no idea where the soybean varieties they grow came from. These Korean communities are all found within a horizontal oval that cuts across national boundaries, and includes the cities of Almaty [Alma-Ata] (in southwest Kazakhstan), Toshkent [Tashkent] (capital of Kyrgyzstan), Dushanbe (capital of Tajikistan), and Ashgabat (capital of Turkmenistan). In this area are numerous Korean restaurants where Walter has eaten; but he has no idea how many Koreans live in this area. Most individual Korean communities grew only one variety, but each Korean community had its own variety. By contrast, there are not many Chinese communities in these areas.

Walter expects his next trip to Central Asia to be in the spring of 2006–probably Uzbekistan and possibly Turkmenistan or Tajikistan. He is given drivers and

© Copyright Soyinfo Center 2021

interpreters by the NGO sponsoring his trip. One of the ongoing problems he faces is the limited abilities of interpreters; communication is often difficult, and it is hard to pursue agricultural or academic questions with farmers. It is less difficult with educated researchers or academicians (best is Tajikistan, followed by Turkmenistan–who might help find others). The researchers in these countries don't talk much with each other, either within a country or among countries. They have few opportunities to travel, and little access to the Internet or e-mail. This is because of government restrictions, difficulty of getting visas or money, etc. Researchers are lucky if they have a working computer, but most have a telephone and some have a cell-phone.

Of all Central Asian countries, Kazakhstan is the one in which the soybean is the most important as a commercial crop–by far. They probably have at least several thousand hectares planted to soybeans. The soybeans in Kazakhstan are run through an extruder (extrusion cooker) to make soybean oil and meal. These same extruders are also used to process cottonseed. Soybeans are grown in Central Asia largely because of the demand for meal by the local poultry industry for use in chicken feeds. Poultry is the driving force, and Central Asia is a "protein-poor" region. Walter's main reason for being there is because of poultry and (to a lesser extent) livestock; it is to help educate them about the soybean, its value for producing soybean meal and oil, and about the importance of protein. He helps farmers to grow soybeans and to develop markets for their beans. Actually, there is a ready-made market from poultry growers–who now have to pay a lot of freight to import their soybeans from Kazakhstan, Iran, Turkey, or India. The key is for Walter to serve as the bridge–to help bring the poultry growers and the potential soybean farmers together, to discover that they have a common interest, and then to work out agreements.

NGOs do lots of impact studies; they want their volunteers to work on projects that will have economic impact. They believe that increasing poultry production will have a positive impact on the economy and the people. The oil is also appreciated, and refined using modern technology within each country for use as a high-quality edible oil, sold in bottles at retail stores. Kazakhstan is about one-half the size of the United States, and is quite a progressive country with a market economy, fairly advanced education and technology. Soybeans are grown mostly in the very south. They were a major crop during Soviet times (Russia was a major market for the oil and meal), but after Kazakhstan became independent in 1990, soybean production fell off to near zero. The economies of Central Asian countries plunged at about the same time (1989-91). They are now slowly getting back to where they once were.

The second most important country for soybeans (a very distant second, with maybe 300-500 hectares planted to soybeans) is the Republic of Georgia, where the western half is quite moist and the eastern half is very dry. They have a long history of growing soybeans. Walter knows of one company there that is processing soybeans using an extrusion cooker (similar to that made by Insta-Pro).

In third place might be Uzbekistan, followed by Turkmenistan, and Tajikistan–but all with only about several hundred hectares in soybeans.

Walter believes that soybeans could become a valuable double crop in Central Asia, planted after the wheat harvest in June. That would earn farmers more income, improve the soil, and break various insect and disease cycles. They need a legume in the rotation. The government does not help. They seem interested only in short term profit, keeping the status quo, and staying in power, not in innovation or long-term thinking.

In Tajikistan, he met a village farmer, Mr. Mahmadullo, who had the ability to build machines. He already had a small business making wheat flour using two motor-powered millstones. He worked with Walter to build a revolving soybean drum roaster; the outside was heated by natural-gas flames. After roasting a batch of about 20-25 kg of soybeans, he ground them into roasted soy flour.

In Turkmenistan, Dr. Ashraf spent quite a bit of time working with a Korean community in the town of Dashoguz in making tofu. She also worked a lot with Peace Corps Volunteers (PCVs) in that same town; one of the PCVs was a Korean-American. Walter has not heard of any TVP being made in Central Asia; if its is made, it must be in very small quantity. In Uzbekistan, technologically the most developed, soybeans are being grown–often spread by volunteers. Address: 2804 Trent Drive, Fort Wayne, Indiana 46815. Phone: 260-484-7493.

• ***Summary:*** Solid state fermentation (SSF) started with the ancient Egyptians making bread by 2600 BC.

In the Orient SSF has been widely used to make traditional foods and beverages: tempeh and ontjom in Indonesia, miso, soy sauce and saké in Japan. The koji process (fermentation of steamed rice as solid substrate by a fungal strain of *Aspergillus oryzae*) was taken from China to Japan by Buddhist priests in the 7th century. "Koji is used as a starter in the soy sauce (shoyu) industry, in fermentation of miso (a semisolid cheeselike food), brewing of the Japanese rice wine (saké) and many other Oriental foods (4)."

"*Aspergillus oryzae* and *A. niger* have been employed for the synthesis of alpha-galactosidase, and soy flour and soy beans are considered as the most ideal substrate for enzyme production as a three-fold increase in enzyme production was recorded with these substrates." Address: Center for Marine Biotechnology and Biomedicine, Scripps Institution of Oceanography, Univ. of California San Diego, La Jolla, California.

• ***Summary:*** Contents: Foreword, by Kwon Tai-wan.

1. "History of the uses of soybeans," by Lee Cherl-ho and Kwon Tai-wan.
2. "Prehistoric and ancient soybean remains," by Cho Hyeon-jong.
3. "Sauce culture and earthenware," by Shin Suk-jeong.
4. "The history of soybean cultivation," by Hong Eun-hi.
5. "Soybean cultivars and breeding," by Kim Seok-dong and Lee Young-ho.
6. "Characteristics of soybean processing," by Kim Woo-jeong.
7. "History and current state of soymilk and soybean curd," by Son Heon-su.
8. "Fermented soybean foods," by Shin Dong-hwa and Lee Piyo-ji.
9. "The health functionality of fermented soybean products," by Park Kun-young.
10. "Korean foods made with soybeans," by Lee Hyo-ji
11. "Soybean cuisine in other countries," by Cho Jung-soon.
12. "The nutritive value and functionality of soybean foods," by Seung Jeong-Ja;
13. "Industrial uses of soybeans," by Chee Kew-man,
14. "Soybean oil and its by-products," by Lee Gyeong-il.
15. "The current state and future outlook of soybean production and distribution," by Cho Se-yeong.

Each chapter lists 30-60 references and has 10-figures.

© Copyright Soyinfo Center 2021

Note: This book was conceived of by the Committee for the establishment of a Korean Soybean Museum. The authors of the various chapters include most of the major soybean specialists in the Korea. It is intended to be a comprehensive work on all major aspects of soybeans and soyfoods.

1718. Lee, Jeyseon; Lee, Kangjin. 2005. Korean dictionary and phrasebook. New York: Hippocrene Books. 311 p. [17 ref]

• ***Summary:*** This is both a Korean-English and an English-Korean dictionary. Korean characters are given for each word in both parts.

Page 21: *gan-jang* means soy sauce.

Note: This is the earliest English-language document seen (May 2021) that uses the term *gan-jang* to refer to Korean soy sauce.

Page 35: *doen-jang* means soybean paste. *doen-jang jji-gae* means soybean paste stew.

Page 80: *kong-na-mul* means [soy] bean sprouts.

English-Korean–Page 93: The Korean word for "bean" is *kong* and for bean sprout is *kong-na-mul.*

Page 135: The Korean word for "pea" is *kong.*

Page 151: The Korean word "soy sauce" is *gan-jang* and for "soybean" is *kong.*

Page 260: The Korean word for "bean sprout soup" is *kong-na mul-kkuk* and for "boiled tofu" is *du-bu jo-rim.*

Page 263: The Korean word for "red-pepper paste" is *go-chu-jang,* for "soybean paste" is *doen-jang,* and for soy sauce (again) is *gan-jang.*

Also (p. 263): The Korean word for "sesame oil" is *cham-gi-reum* and for "sesame seed" is *kkae-so-geum.*
Address: 1. Lecturer in Korean and supervisor of Korean language courses, Univ. of California at San Diego.

1719. Park, Kun-Young; Jung, Keun-Ok. 2005. Fermented soybean products as functional foods: Functional properties of doenjang (fermented soybean paste). In: John Shi, C.-T. Ho, and F. Shahidi. 2005. Asian Functional Foods. Boca Raton, Florida: CRC Press. xxi + 647 p. See p. 555-96. Chap. 20. [121 ref]

• ***Summary:*** Contents: Introduction. History of Korean soybean fermented foods. Manufacturing methods and characteristics of doenjang fermentation. Functional properties of doenjang: Nutritional and functional components in soybean and doenjang, safety of doenjang, antimutagenic activity of doenjang. Anticancer effect of doenjang. Increased chemopreventive effect of doenjang: Antioxidant effects, reduced cardiovascular diseases (fibrinolytic effect {as in chungkookjang and natto which secrete strong fibrinolytic enzymes}, antihypertensive effects, reduced serum cholesterol level), other possible functions of doenjang. Conclusion.

Doenjang is "Korean fermented soy paste" and kanjang is Korean-style fermented soy sauce that is obtained by filtering off the liquid from doenjang. "Historically soybeans and processed soybean foods have been the main protein sources in the Korean diet" (p. 555). "The medicinal functions of doenjang were first described in the *Dongeuibogam* [*Dongui Bogam* (*RR*), *Tongui Pogam* (*MR*)] (1613 A.D.), which was a popular traditional Korean medical text" [no citation given].

The section titled "History of Korean soybean fermented foods" contains what promises to be a number of references to early and possibly very interesting documents that mention soybeans and soyfoods in Korea. Yet the authors fail to cite any of them properly, so for the time being, we must accept their account of what the documents say. The problems are: (1) None of these documents (except one, Ref. #46) is cited in the long list of references at the end of the chapter. (2) The title of all these documents is given only in Korean, even though at least two should have Chinese titles; one of those two (described as "The Chinese agricultural technology book, *Jeminyosul* {A.D. 530 to 550} written by a governor, Maeeunsa,...") is actually the famous *Qimin Yaoshu,* by Jia Sixie. (3) We are never told in what language the original document referred to is written. (4) The page number(s) on which the ancient, important information appears is not given for any of these documents. (5) For some documents no date is given, whereas for others no author is given. (6) It is not clear what names were used to refer to each of the various soyfoods in the original documents. (7) The authors never tell us whether they examined the original document, or read a contemporary version, or simply got the information from a secondary source.

For example (all dates are A.D.): 99–It has been reported [by what document?] that soybeans were cultivated–Where were they cultivated?

530-550–The *Jeminyosul* [*Quimin Yaoshu*] states (in Chinese) that shi [fermented black soybeans], soybeans fermented with bacteria, in Korea were disseminated to China and Japan.

683 Feb.–An article [no title given] by King Sinmoon, that appeared in the 3rd year of his reign (during the Silla dynasty), mentioned the words *jang* (mold-fermented soybeans) and *shi* (bacteria-fermented soybeans).

701–*Daeboyulryong* mentioned the words jang, shi, and maljang, which referred to soybean products.

739–*Jungchang Wonmooseu* also mentioned the word maljang.

*Donga* (no date given), which was written by Shinjungbaesuk (is that the writer's real name?) in Japan, "indicated that maljang was imported from Korye (the old name of Korea);" it was renamed "miso" (Source: Ref. #46–35th Chronicle of Korea Soy Sauce Industrial Cooperative. 1997. Seoul. p. 27-32). Korean jang is said to have developed into traditional Japanese miso using meju made of soybeans and rice instead of maljang, which was made from soybeans only.

© Copyright Soyinfo Center 2021

918-1392–During the Korye [Goryeo] dynasty, [in Korea] the name "maljang" changed to "maejyo" and then to "meju" [meaning soybean koji in the shape of balls or cones]; it was soaked in brine in a clay pot and ripened [then filtered]. The liquid was called *kanjang* (soy sauce) and the solid sediment was called *doenjang* (soy paste).

1613–*Donguebogam* [see above], written by Hurjun, described how to make medicinal doenjang using soybeans and how to fix soured doenjang.

1760–*Jungbosan Limkyunge,* written by Yojungim, "introduced 45 different processing methods for soybean foods, describing how many days fermentation for jang, selection of water, salt quality, how to handle the pottery, fixing jang with an off-taste, etc."

1790 ca–*Kyuhap Chongseo,* written by Madam Lee (lived 1759-1824) described the proper methods for making the various types of jang in great detail.

1930 ca.–Commercial production of fermented soybean products ("jang" in Korean) started in Japanese-built jang factories in Korea during the occupation (1909-1945) to supply soybean products for the Japanese in Japan.

1945–After gaining independence from Japan, Koreans took over the factories. Since the Korean war (1950-1953) military personnel and people living in large cities have mostly consumed commercial fermented soybean products, whereas families living in rural areas still prepare their own. Address: Pusan National Univ., Busan, Korea.

1720. Shi, John; Ho, Chi-Tang; Shahidi, Fereidoon. 2005. Asian functional foods. Boca Raton, Florida: CRC Press. xxi + 647 p. Illust. Index. 24 cm. Series: Nutraceutical Science and Technology.

• ***Summary:*** Contents: Preface. About the editors. Series introduction. Contributors. Table of contents. 1. Functional foods and their impact on nutrition and health: Opportunities in the Asia Pacific... Contains two chapters on fermented soyfoods (Chap. 19, Miso, and Chap. 20, Doenjang) which are cited separately.

The Preface begins (p. v): "Health and 'healing' foods have a long history in Asian cultures." Asians such as the Chinese and Indians have long known that food and medicine come from the same source; they can treat illnesses and build a healthy life. Since ancient times, Chinese have compiled a remarkable amount of information about the materia medica, the use of natural substances–plants, animals, and chemical–to treat illness.

Kudzu (*Pueraria lobata, ge geng*), one of the earliest medicinal plants used in traditional Chinese herbal medicine, is discussed on pages 83-86.

In chapter 7 titled "Traditional Functional Foods in Korea," the section on "Fermented soybean foods" (p. 165-66) states that typical daily per capita consumption of these foods are: Soy sauce 20 ml, soy paste 20 gm, and hot soy paste 10 gm. In recent years there has been a decrease in soy intake due to increased use of Western seasonings such as mayonnaise, tomato ketchup, meat sauces, etc.

In Chapter 8, titled "Evolution of Korean dietary culture and health food concepts," the section on "Food as medicine" begins (p. 210): In traditional Korean culture, food was regarded as the basic source of health. It was believed that all diseases could be cured by foods. Korean knowledge of the medicinal effects of foods came, not through the sciences of nutrition, medicine, chemistry, or physiology, but through long human experience. Moreover, a key practice and discipline has long been to eat only when hungry, and not to overeat. The enormous size of the health food market in Korea today reflects the country's long tradition of 'food as medicine.'"

Page 229: "Micronutrients." Asian fish sauces are good sources of vitamin B-12 (cobalamine) because they are made from animal protein. Fish sauce from Thailand contains 1.91 mcg (micrograms) per 100 ml. This amount protects the Thai population from megaloblastic anemia caused by vitamin B-12 deficiency. The estimated average requirement for vitamin B-12 is only 2 mcg per day. However fermented soybean sauce contains very little (0.14 mcg per 100 ml); the small amount present is attributed to microbial synthesis.

Page 230: "The high salt problem." Japanese men rank highest in daily per capita sodium intake at 5.4 gm; the United States, Thailand, and New Zealand each average about 3.9 gm.–72% as much, or 28% less. Some cultures consume as little as 0.69 gm / day.

Pages 248-49: "Future potential for fish sauce." It is unclear whether fish sauce was first developed in Asia or Europe. But while it has vanished in Europe, it has become a thriving industry in Southeast Asia–perhaps because the extensive use of bland-tasting rice requires a salty and tasty protein-rich seasoning. Several species of anchovy are the preferred raw material for fish sauce. Some say that soy sauce was first developed in Japan. Address: 1. Research Scientist, Federal Dep. of Agriculture and Agri-Food Canada, Ottawa, Ontario, Canada; 2. Rutgers Univ., Rutgers, New Jersey; 3. Memorial Univ. of Newfoundland, St. John's, Newfoundland, Canada.

spiritual health and social harmony. New York: Lantern Books. xvii + 318 p. No index. 23 cm. [170 ref]
• ***Summary:*** One of the best books seen on vegetarianism and animal rights. A very powerful statement. Contents: Food's power. Our culture's roots. The nature of intelligence. Inheriting our food choices. The intelligence of human physiology. Hunting and herding sea life. The domination of the feminine. The metaphysics of food. Reductionist science and religion. The dilemma of work. Profiting from destruction. Some objections answered. Evolve or dissolve. Journey of transformation. Living the revolution.

From the publisher: "Argues that war, terrorism, genocide, disease, environmental degradation, and other problems affecting the world are a direct result of an unwillingness by people to make the connections between what they eat and how it got on their plates."

On pages 260-62 is a section about the author's visit to The Farm in Summertown, Tennessee, and the profound impact it (and its vegan diet and soy dairy) had on him. Page 254 describes how, in 1974 at Colby College, in Maine, he wrote his senior thesis titled "Organizational Behavior on The Farm." He examined "the theory and practice of a community based on cooperation rather than owning, sharing rather than owning, and compassion rather than competition."

About the author: On the back cover is a small portrait photo of the author with these words: "Will Tuttle has a masters degree in humanities from San Francisco State University and a PhD in the philosophy of education from the University of California, Berkeley. A professional pianist, composer, and teacher, he has for the last fifteen years presented at progressive churches, vegetarian and human potential conferences, and intentional communities throughout the country. He trained in Korea as a Zen Buddhist monk..."

Soybean(s) are mentioned on 8 pages of this book, soy on 6 pages, tofu on 4 pages and tempeh on 4 pages.

Note: This book is weakened by lack of an Index.

Note: As of Dec. 2015 Will travels and speaks worldwide. He has a home at Hidden Lake, California [formerly at Healdsburg, Sonoma Co., CA]. Address: PhD, professional pianist, composer and teacher.

1723. Yu, Ki-Yull. 2005. Seed production and distribution in Korea. Seoul, Korea: Sein Pub. Co. 143 p. Illust. 23 cm. [10+ ref]*
• ***Summary:*** Soybean is mentioned on pages 36, 70, 108 and 6 others. Ganjang (soy sauce) is mentioned on page 108.

1724. Park, Eo-Jin; An, S.H.; Park, G.S. 2006. [Quality characteristics of cuttlefish inky tofu prepared with various coagulants]. *J. of the Korean Society of Food Culture* 21(6):653-660. Jan. [24 ref. Kor; eng]
Address: 1. Dep. of Hotel, Food Service and Culinary art, Catholic Sanji College, Korea.

1725. Bramblett, Billy. 2006. The real history of Wildwood Natural Foods after its merger with Midwest Harvest to become Wildwood Harvest in 2001 (Interview). *SoyaScan Notes.* Feb. 17. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** This history in quite different from the one told by Jeremiah Ridenour in Feb. 2005 when everything looked bright. Both Billy and Jeremiah have left Wildwood / Pulmuone and have each started new businesses–although Billy has a contract to serve as a consultant for 3 years. Jeremiah took severance on 30 June 2006. Billy is working with his wife on a rug company that imports Tibetan-style rugs from Kathmandu, Nepal. Jeremiah has started Wise Decisions and does work with soy diesel.

Pulmuone's founder, Mr. Won [full name: Won Kyung Sun], who had started a farmers' cooperative after the Korean war, has been honored by the United Nations for organic agriculture. He founded Pulmuone on Christian principles: "Love your neighbor" and "Respect the environment." Years later, Mr. Won's son tried to develop a company out of this cooperative. He started by opening some stores, but eventually he fell upon hard times and was about to lose it all. But by great good fortune his roommate was a law student named Seung-Woo Alex Nam. Alex said, "I'll bail you out, but I want control." So Mr. Nam took control of what became Pulmuone and built it into a billion dollar company.

Tom Lacina has a brother named Sam Lacina who is a physician in Grand Rapids, Michigan. They have a third generation soybean farm in Iowa and Tom converted to organic. Tom is a musician (concert pianist) and an attorney. Tom and Sam Lacina bought out Paul Rosenmayr and Paul Orbuch of Wildwood.

Wildwood reincorporated in Iowa, then got money from Iowa through tecTerra (which is managing the fund for the state of Iowa). They put in a lot of money, then Wildwood leveraged that to borrow more money and they built two plants, one in Iowa and in one Watsonville, California. The financial status of the Watsonville plant depends on who you ask. Wildwood thought it was doing quite well since it was generating quite a bit of margin–although not as good as it used to when Wildwood was in Fairfax or Santa Cruz. The overhead now costs much more.

In 2002 Wildwood moved all the value-added production, which had been in both Fairfax and Santa Cruz, to Watsonville. We started making these value-added products in October 2002. Tofu production didn't move until Feb. or March 2003 because Jeremiah built a tofu system that didn't work; it never worked properly although it partially works. That was a big problem for the first year or so. Wildwood had to go back to making tofu by hand. It has computer generated and controlled grinding and cooking.

© Copyright Soyinfo Center 2021

Then there are four 250 gallon vats on a second level that hold the soymilk at a specific temperature. Theoretically the nigari (magnesium chloride) coagulant is injected into these tanks then mixed into the soymilk mechanically; blades inside spin around. That part of the plant all worked pretty well. But getting the curds down to the forming boxes was the problem; they could never figure it out. But Wildwood had to get out of its Santa Cruz plant. So Rick Loncarich, the plant manager in Santa Cruz, finalized the move.

So at this point the soymilk is just pumped down to the curding vats, the coagulant is stirred in and curding is done by hand. Then the curds are run through a conveyorized process. Billy thinks this is the best way. He has watched the Pulmuone style which is all mechanical, with injection of coagulant (mostly calcium sulfate and GDL) and little fingers stirring the mixture. Wildwood has long believed that nigari is the best coagulant because it makes the firmest tofu and you can handle it and reprocess it without any crumbling. It also makes tofu with the best flavor.

But in the end Wildwood ran out of money; always a big problem–long before Pulmuone came along. Basically, tecTerra in Iowa kept Wildwood afloat, but in exchange, tecTerra wanted control of the company and said that Wildwood had to find a buyer. That was a dark day; tecTerra ran Wildwood for over a year, and they really messed things up. They were using taxpayer money and they had been sharply criticized in the newspapers many times. So they were under a lot of pressure to make a success out of something. Their basic approach was to lay off lots of people to stop the financial bleeding; that is sensible from a strictly financial point of view but sort of stupid in terms longer-term thinking about what's going to happen in the future.

Then tecTerra said. "We're not going to put any more money in, and you have to sell the company." Then a Japanese man was CEO of Wildwood Harvest for about 3 months. Jeremiah's main work was helping to run the plant and doing some sales work too. Jeremiah had been CEO when Wildwood failed, so it was felt that he had had his chance.

The major problem was the plant in Iowa, not the plant in Watsonville, California. In Iowa, it took them a year build a new plant and to get quality that was consistent, and they still have problems. Leading the project were Jeremiah Ridenour, Tom Lacina, and Doctor Gandhi (who comes from India, had been making dairy yogurt for years, then sold that and started working with soy. He has a huge facility up north–perhaps Minnesota). Using Gandhi's technology, the three planned to make a cultured soy product. It took them almost 18 months, after the plant was built, to work through all the quality and microbial problems. Wildwood was burning through money faster than they had it to burn. The plant in Watsonville was late and over budget. The plant in Iowa was on time and on budget, but it took them more than a year to get the product going. Tom Lacina kept making tofu at his original tofu shop; the new facility was only for cultured soy products. The new plant is still running, but they have very low volume and very high overhead. The cost of making a product is more than the sale price. The cultured products plant in Iowa is still losing money hand over fist.

Meanwhile, Wildwood had already met Pulmuone U.S.A. (founded in Jan. 1991, a subsidiary of Pulmuone Co., Ltd. of Korea). at expos. Pulmuone began to take an interest in Wildwood, Wildwood told them everything and showed them everything–complete transparency. The first important thing Pulmuone did, in April 2004, as part of a strategic alliance, was to make an equity investment in Wildwood; they purchased shares of stock, but they ended up owning less than 50% of the shares.

At Yansei University Pulmuone has 85 PhDs doing everything you can think of all the time. So they send their people over and those people make reports and complete a very detailed analysis of the situation. Billy thinks they spend way too much time analyzing everything.

To celebrate the Pulmuone's 25th anniversary, Pulmuone took Jeremiah, Tom Lacina and Billy to Korea for 4-5 days first class. Also on the trip were Rachel Stauffer, of Cybus Capital (that ran the tecTerra fund for the state of Iowa) and Paul Kang, who would soon be CEO of the merged company.

Tom Lacina's records show (e-mail of 21 March and 2 April 2013): "April 19, 2004 is the date of acquisition by Pulmuone U.S.A. of controlling interest in Wildwood Natural Foods (there was a name change at that time from Wildwood Harvest to Wildwood Natural Foods).

"We arrived in Seoul the eve of May 10, 2004 and left Seoul on the morning of May 14, 2004. While there we joined in celebrating Pulmuone's 25th Anniversary and toured its largest plant, distribution center, R&D center, and stores. We visited the founder of Pulmuone and met some of the Board of Pulmuone.

"The first meeting of the Board of Directors of Wildwood Natural Foods, Inc., after the acquisition by Pulmuone occurred on May 12, 2004, at Seoul, South Korea.

"Billy stole all the attention because he looked like a rock and roll star!

"The next step was that Wildwood Natural Foods exchanged stock for the assets of Pulmuone U.S.A. in order to have Wildwood Natural Foods serve as the operating entity and Pulmuone U.S.A. serve as the holding company. This was an Asset Purchase Transaction, not a statutory merger. The documentation became messy during this transition at the end of 2004, but a reasonable date to use is December 16, 2004. I reference December 16, 2004, because that is the date when Wildwood Natural Foods resolved to use a fictitious name–PMO Wildwood–which was later adopted as the corporate name on October 6, 2005, and then changed to Pulmuone Wildwood on December 1, 2005. In fact, the process of collecting all the signatures on the asset

© Copyright Soyinfo Center 2021

purchase document took a couple weeks.

"We've re-purposed the tofu facility on my farm into an artist residency–GrinCityCollective.org. I continue to work for Pulmuone, but just as general counsel in the USA."

Returning to Billy's recollections: In Korea (May 2004) Pulmuone showed them everything, treated them with great respect, included them in everything. Billy clearly remembers mandated boilermakers and karaoke performances. Aside from that, Billy, Jeremiah, and Tom thought things looked very promising. "We were very upbeat about it" (Continued). Address: Pulmuone Wildwood.

1726. Bramblett, Billy. 2006. The real history of Wildwood Natural Foods after its merger with Midwest Harvest to become Wildwood Harvest in 2001 (Interview). *SoyaScan Notes.* Feb. 17. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** Continued: They had the official first board meeting of the newly merged company at a high-class restaurant owned Pulmuone in Korea; the five board members were Paul Kang, Mr. Seung-Woo Alex Nam, Jeremiah, Tom Lacina, and Billy. Pulmuone also owns a chain of natural food retail stores (like Whole Foods) in Korea, and three tofu factories in Seoul.

It seemed like a good fit. In mid-2004 the decision was made to merge Wildwood Harvest Foods Inc. and Pulmuone U.S.A. On 20 July 2004 each company issued a news release announcing the new merger. The deal was struck by a man named Paul Kang, who was an investment banker, who was a Korean-American, and who speaks English very well and has a good relationship with the Korean company; he had already done some other deals with Pulmuone. Wildwood Harvest Foods, Inc. was renamed Wildwood Natural Foods and Pulmuone U.S.A. was give two seats on Wildwood's board. Pulmuone decided to make Paul Kang the CEO of the new, combined company. He many various changes to the logo.

"Pulmuone's plan was to go public in a few years, and we were all going to be able to cash in our chips." Billy and Jeremiah both owned shares in Wildwood which, over the years through hard work and good management (up to a point) had become a valuable company.

In the USA, Pulmuone was doing very well in the Korean market but they were struggling in the mainstream and natural foods markets. Paul Kang was a very smart person but he had never been a CEO before–especially of a food manufacturing company. Paul Kang went to Korea with Billy, Jeremiah, etc. Then they all went to Natural Products Expo East in the fall of 2004 and to Expo West in the spring of 2005. After about 8 months with him at the helm, Pulmuone realized they had made a mistake, so by June 2005 they sort of demoted him to COO (chief operating officer) of Pulmuone U.S.A. and brought in another person Y.C. Kang; they are not related. Y.C.'s first title was CRO (chief reorganization officer). He tried to reorganize things and put a whole new program into place. It got really crazy. It was a wild year; Mr. Nam would come over every couple of months and have personal meetings with Billy, Jeremiah, and Tom. It is kind of a hit and miss style. After doing all this analysis, they say "OK, let's do this." They try it for some time and if it is not working they say, "OK, let's change everything."

Billy and Wildwood have a deep understanding of their customers and the natural foods market, which has enabled them to stay ahead of the curve all these years.

At the time of the merger: Since Wildwood didn't have any money, they gave Pulmuone stock–so that Pulmuone has almost all the stock. Then they made Jeremiah and Billy into executive sales persons, who would manage different sales in different geographical areas. Jeremiah was in charge of Northern California. Paul Kang took southern California. Tom Lacina took everything out of California. Billy took ingredient, foodservice, and private label. Billy had already been doing this kind of work for a number of years, in part because nobody else was covering that particular channel. The ingredient people would come to Billy and tell him they needed a particular ingredient. He would work with them to develop their products, etc. Trader Joe's had been Billy's account from the beginning; they came onto the scene because Wildwood won the *San Francisco Chronicle* Baba Ganooj tasting contest many years ago. So Wildwood started making soy products (such as baked tofu–teriyaki and Thai–and burgers under the Wildwood label) for them over the years. For a while Wildwood did Soy Sour Cream made in Iowa for Trader Joe's. So in about Feb. 2005 Pulmuone gave all the new salespeople budgets and said, "OK, you make your top line and your contribution margin goals and we're going to promote you and give you money, bonuses, and stuff like that." Paul Kang didn't do very well, so they moved him back to the Korean company to do investment work. Jeremiah didn't do so well so they put him in public relations. Tom Lacina didn't do very well either in the East, although he has a really great guy working for him there named Jim Williams. The company is in a lot of Whole Foods and UNFI warehouses east of the Mississippi. But he wasn't making his goals–so that put him in charge of all sales and marketing. Billy did very well–110% of the goals he was given. But they wouldn't give him credit for it (later they ended up giving him the bonus they had committed to). Billy still does not understand why. Then they took the Trader Joe's account away from him–an account where he had long, positive experience and good contacts. "They said they had a guy in southern California who would call on Trader Joe's. OK, whatever. So things got a little scratchy there." All this happened in the fall of 2005. Right now, Billy's share is not worth much. However if Pulmuone is successful in turning Wildwood around, the value will return and Pulmuone has given Billy and Jeremiah even more options. Billy owns

© Copyright Soyinfo Center 2021

shares in the new corporation which is named Pulmuone Wildwood Inc.; that's a U.S. corporation. Originally the corporate name was PMO Wildwood–because so many Americans can't pronounce Pulmuone. That was perceptive. But then Mr. Alex Nam who is really the head honcho of the whole shebang (CEO of Pulmuone Co., Ltd. Korea), as soon as they fired Paul Kang, decided to change the name back to Pulmuone Wildwood. Remember–every time you change a company name you have to change your labels, letterhead, etc. It's a huge job. Bill's told them he thought the best name was "Wild One." Nobody got it. But they did allow Billy to develop a few more products, so that was nice, until he came up with "Sloppy Jofu"–which has been selling very well since 2004. Last year he developed a chili, which they marketing department had trouble launching. Wildwood had been selling tofu to the organic division of Seeds of Change for about 7 years; they have used it in their rice bowls and noodle bowls. They wanted a flavored cube, so he just developed a product for them named "Tofu Barbecubes." He makes the tofu, cuts it into 3/4-inch cubes, marinates the cubes and then bakes them in shallow hotel pans in a conveyorized oven. Wildwood has been baking tofu for 20 years, but never in cubes before this. He just made 8,000 pounds of it for them and sent it to them. They liked it and soon ordered 8,185 pounds more. That was kind of his swan song.

Pulmuone's positive attitude started to decrease about a year ago. Pulmuone offered him a pretty good deal, which he took. But Billy is a consultant for three years; they are paying him about two-thirds of his salary and he doesn't really have to do anything. There is a non-compete clause concerning soyfoods that are the same or similar to those of Pulmuone-Wildwood in form and function; now he has two other clients, one of which is Seth Tibbott of Turtle Island. Billy is going with him to Anaheim in March. Billy is a guitar player. His latest project is with some folks who have a little campaign to get organic foods into school lunch programs in southern California. They call it "The Organic Rebellion." Billy told them he'd write a theme song for them. He just finished it and has recorded the basics. He's now getting kids lined up to do the vocals with him. It starts: "Sign me up for the organic rebellion."

Jeremiah just took a severance pay package; his last day at Pulmuone-Wildwood was Jan. 30, 2006. Jeremiah started a new business, Wise Solutions, developing plant-based industrial products. He has several soy-diesel cars and he has been involved in the promotion of soy diesel for a number of years. Address: Pulmuone Wildwood.

1727. **Product Name:** Re: Ethnic Koreans growing soybeans in Tajikistan or Turkmenistan, and her work introducing soyfoods to these countries.
**Manufacturer's Address:** Letter (e-mail) to William Shurtleff at Soyfoods Center, Feb. 18.
**Date of Introduction:** 2006 February.
**New Product–Documentation:** In Tajikistan she met a couple who lived near Dushanbe. The husband, Victor, was planning to grow soybeans. She gave him some seed grade soybeans to grow, although she had the impression that he hadn't grown soybeans before. She sensed that he wanted to grow them because of increased interest in soybeans–for reasons she does not understand. She gave him the seeds that Walter Barrett had given her, because the soybeans she had found in Tajikistan were not of good quality.

Victor led her to a Korean tofu maker, a woman who didn't speak Korean. She supplied tofu to a Chinese restaurant in Dushanbe. She told Helen that she bought her soybeans from Uzbekistan, and said they were expensive. Helen did not ask the woman when she had started to make tofu commercially or what the name of her small business was. Helen does not recall exactly where it was located.

Vera, Victor's wife, sold Korean salads at a green bazaar in Dushanbe. She and other Korean salad vendors at the green markets sold a type of dish made from Chinese TVP, which is white in color and imported from China.

At an import supermarket called Holland Market in Dushanbe, Helen found several Russian-made TVP products and soymilk powder. She also saw soymilk sold in Tetra Pak cartons.

In Ashgabat, Turkmenistan, two Korean men came to talk with Helen at the Winrock office about a soymilk machine.

In the Dashoguz region of Turkmenistan, Helen met two different groups of Koreans (a least 30 people total) who wanted to see her presentation and demonstration of soymilk and tofu production using a SoyJoy machine, along with a display of soy products such as tofu (in a Tetra Pak carton), TVP, soynuts, soy flour, soy protein isolates, energy bars, soy sauce, etc. In some presentations at farms or for women's groups (including the Korean groups), she also prepared soyfoods or Turkmen foods that included whole soybeans.

In Tajikistan, she gave 3 presentations / demonstrations: One at "Salsa Restaurant" in downtown Dushanbe, and two at a cafeteria and at the meat processing lab of the Khujand branch of the Technical College of Tajikistan. She usually ended her presentations with a meal with the participants. Her menu included Pulov [pilaf] (rice with some meat, soybeans, carrots, and onions), soup, salad, and a crepe (using a mixture of wheat flour, soy flour, and some type of local jam).

At the Agricultural University of Tajikistan in Dushanbe, and at the Khujand branch of the Technical College of Tajikistan, she gave technical presentations using an overhead projector with PowerPoint slides showing the nutritional composition of soybeans, and techniques for the preparation of traditional soyfoods and commercial products such as soy oil, soy protein, lecithin, etc.

In Turkmenistan: She gave food preparation

© Copyright Soyinfo Center 2021

presentations: (1) At a farm in the Mary district. (2) At apartment style homes in the cities (Mary district, and Dashoguz). (3) At the Winrock office in Dashoguz for different groups of women. (4) For 2 groups of Peace Corps volunteers in Dashoguz. "Peace Corps was interested in soyfoods because it was suspected that the protein intake of PCVs in that country was not sufficient."

While in Tajikistan and Turkmenistan, Helen did not see any soybeans being cultivated, nor any bundles of soybean plants harvested for green vegetable soybeans.

After her visit: (1) Her soy recipes were translated into the Turkmen language by Winrock staff, but (as far as she knows) they were not printed or reproduced. (2) A 30-page Russian-language brochure on soybeans was created (using desktop publishing) by a group of Peace Corps volunteers in the Dashoguz area. It included planting information and recipes, with colorful pictures and diagrams; about 200 to 300 copies were printed. The produced was funded by the Peace Corps and Helen, however Helen does not have a copy with her in Mexico. (3) Helen prepared a trip report, which is now the property of Winrock International. She did not write much about Koreans in that report.

She includes a Russian-language article on soya from the newspaper *Asia-Plus* (23 Sept. 2004, p. 4).

Note: This document mentions the earliest known commercial soy products in both Tajikistan and Turkmenistan.

1728. Setchell, Kenneth D.R. 2006. Re: The safety of soy infant formulas. Letter to Michael D. Shelby, PhD, NIEHS EC-32, P.O. Box 12233, Research Triangle Park, North Carolina 27709, March 1. 9 p. Typed, without signature on letterhead. [19 ref]

• ***Summary:*** Note: NIEHS stands for the National Institute of Environmental Health Studies; it is part of the National Institutes of Health (NIH), which is under the U.S. Department of Health and Human Services. The mission of the NIEHS is to reduce the burden of human illness and disability by understanding how the environment influences the development and progression of human disease.

This long letter begins: "Dear Dr. Shelby,

"I have read with interest the NTP-CERHR Expert Panel Report on the Reproductive and Developmental Toxicity of Soy Formula and have the related draft report on Genistein. Both of these reports are lengthy reviews of the literature and provide investigators with a useful reference source of this field. I would like to offer some of my own perspectives on this overall and important issue of the safety of soy formula.

"Neither of the Draft Reports came to my attention until very recently and there has been insufficient time to make a detailed response to the documents. I want to focus my attention on the Draft Report dealing with soy infant formulas and offer some general thoughts and comments based on my 30 year experience of this field and with reference to my work. Regarding the Genistein Draft Report, in the absence of being able to read this document thoroughly, I have just brief comments at this time.

"Genistein is clearly a bioactive molecule, one that appears to display many of the characteristics of selective estrogen receptor modulators (1) and not of estrogens as is so often portrayed by the media. This distinction is important to realize, because it has implications for the potential clinical actions of the molecule. Genistein, with few exceptions is not a major dietary constituent of soy foods unless these have undergone fermentation, as in foods such as tempeh, natto, and to some extent miso, consumed mainly by Asians (2). It accounts for <2% of the isoflavone content of the soybean, soy proteins and most western soy foods, including soy infant formulas (3, 4). The liberal use of genistein in the form of supplements for adults, or food additives should be of some concern, and it is debatable whether it should be regulated as a pharmaceutical, rather than fall under the radar as a dietary supplement. While innumerable studies of genistein in animal models clearly show that adverse reproductive effects can be demonstrated, these findings should be cautiously extrapolated to humans consuming soy foods, and especially to infants feeding on soy formulas.

"It is difficult to understand the agenda driving the negative campaign on soy infant formulas, especially given that this is a feeding regimen that has been in use routinely for over 40 years without any solid evidence of toxicity in healthy full-term infants, or in adults later in life. In 2001, at the invitation of the Korean Academy of Pediatrics I was asked to address the issue of the safety of soy infant formula and isoflavones and learned, to my surprise, that unlike other Asian countries, Korean infants (90%) are predominantly bottle-fed, and of these, almost half are fed soy formula and this practice has been in use for over 30 years. One of the leading brands of soy formula in Korea is made from whole soybeans, and its isoflavone content we found to be 5-fold higher than Western soy formulas that are formulated with isolated soy protein (Setchell unpublished data). The earliest soy formulas used in the USA were formulated with soy flour, which would also have had a higher isoflavone content than current formulas. I would estimate that about 20-30 million infants worldwide have been raised on, or exposed to soy infant formulas and their constituent isoflavones. The magnitude of this 'cohort' is such that adverse effects would surely have been noticed, even by default–certainly had this been a drug / pharmaceutical study spanning 40 years with this statistical power, soy formula would have been considered a completely safe entity. Before alarming the public, it is my view that any perceived negative effects of soy infant formula on reproductive health should be demonstrated by toxicologists and public interest groups leading this 'anti-soy' campaign, and not be assumed based on the biological actions of genistein in animal models, most of which are inappropriate as a model for the human infant.

© Copyright Soyinfo Center 2021

"In considering the published literature, I would recommend that much of what has been shown in immature and adult rodents be disregarded as irrelevant to the human newborn and infant."

The last page of the 9-page letter states:

"In my opinion, extrapolating the findings of deleterious effects on reproduction observed in animal studies of genistein, to a human infant fed soy formula, is making a quantum leap of faith and is irresponsible. While many of the findings are interesting, they are not at all surprising, and have absolutely no relevance to this clinical situation. Infants are just not fed or injected with genistein.

"Soy infant formulas, and for that matter soy foods, have a long history of safe use and are nutritionally sound (18, 19). Women throughout Asia are exposed to soy isoflavones through many soy foods throughout pregnancy and isoflavones readily cross the placental barrier and reach the fetus, a critical period for reproductive development. I am unaware of any deleterious effects of feeding soy formula to healthy full-term infants, but rather than suggest that we have not looked for effects, it should be incumbent on toxicologists to present definitive cases of adverse effects of feeding soy formulas to healthy infants before creating the sort of media circus we have seen in recent years. If the hypothesis is that soy formulas are unsafe that should be proven. Save a few exceptions, and these relate to infants with pre-diagnosed disease, there is a paucity of conclusive evidence for negative effects of soy formula on growth and development, pubertal development, reproduction, thyroid function, and cancer of humans. I cannot comment on immune responses since this is outside of my area of expertise, while we are fully aware that allergy to soy, the frequency of which is much lower than allergy to cows milk, is perhaps the only solid concern for soy products.

"Only a long-term prospective study in humans will clarify this issue. We clearly do not need further rodent studies which serve little value, other than wasting tax payers money–money that could and should be spent addressing soy formula and human infant studies if this issue is to be successfully resolved. Indeed, it would be my prediction that if a long-term prospective human study was performed we might be surprised to find that there are significant health benefits from early feeding of soy formula, and for that matter soy foods in children and young adults, that relate to longer term disease prevention. Anecdotally, there is evidence showing that as the Japanese are changing the traditional diet and eating less soy foods, there has been a notable increase in the incidence of the chronic diseases of Westerners who generally are not exposed to soy foods. This of course is not proof but interesting association of the potential of including soy foods in the diet for disease prevention. To condemn soy formula based on scant clinical data and animal data that has questionable validity to the human infant would border on irresponsibility and would do a disservice to the pediatric population. In the absence of solid proof to the contrary, common sense should prevail and this panel should look at the bigger picture of soy food consumption worldwide when making a decision on safety.

"Sincerely,

"Kenneth Setchell. Ph.D.

"Professor of Pediatrics..."

No industry funding or conflict of interests. Address: Dep. of Pediatrics, Children's Hospital Medical Center, Cincinnati, Ohio.

1729. **Product Name:** Soga All Natural Twin-Pack Tofu [Extra Firm, Firm, Soft].
**Manufacturer's Name:** Soga Soyfoods [Pulmuone U.S.A.].
**Manufacturer's Address:** 4585 Firestone Blvd., South Gate, CA 90280. Phone: 866-356-2800.
**Date of Introduction:** 2006 March.
**Ingredients:** Feb. 2007: Water, organic soybeans, calcium sulfate, glucono delta lactone, magnesium chloride. Certified by Quality Assurance International.
**Wt/Vol., Packaging, Price:** 15.5 oz (439 gm) packed in molded plastic tray with heat-sealed, peel-off plastic film lid. Retails for $0.99 (2007/02 Lafayette, California).
**How Stored:** Refrigerated.
**Nutrition:** Per 3 oz (85 gm): Calories 80, calories from fat 45, total fat 5 gm (8% daily value; saturated fat 1 gm), cholesterol 0 mg, sodium 5 mg (<1%), total carbohydrate 2 gm (dietary fiber <1 gm [3%], sugars 0 gm), protein 9 gm. Vitamin A 0%, vitamin C 0%, calcium 15%, iron 6%.. Percent daily values are based on a 2,000 calorie diet.
**New Product–Documentation:** Letter (e-mail) from John Sim, head of sales at Pulmuone. 2007. April 5. These three products were introduced in about March 2006 at the Natural Products Expo West, at Anaheim, California. Their innovative package was first introduced in Oct. 2002 with their Organic Twin Pack.

1730. Kim, Jae-Hun; Kim, Sun-Im; Kim, Jong-Gun; et al. 2006. [Effect of green tea powder on the improvement of sensorial quality of Chungkookjang]. *J. of the Korean Society of Food Science and Nutrition* 35(4):482-86. April. [34 ref. Kor; eng]
• ***Summary:*** "The results of sensory evaluation approved that the addition of Choi-cha or Powder-cha green tea powder reduced the off-odor of Chungkookjang. Therefore, Choi-cha and Powder-cha could be used as the effective natural additives for the improvement of the sensorial quality of Chung-kookjang." Address: Dep. of Radiation Food Science & Biotechnology, Advanced Radiation Technology Inst., Korea Atomic Energy Research Inst., Jeonbuk 580-185, Korea.

rats]. *J. of the Korean Society of Food Science and Nutrition* 35(4):410-15. April. [36 ref. Kor; eng]
• ***Summary:*** "The effects of cheonggukjang (traditional fermented soybean food, CK) and cheonggukjang added *Phellinus linteus* (CKP) on lipid metabolism were investigated in adult male rats. Twenty weeks old Sprague-Dawley rats were fed a purified hyperlipidemic diet (control diet: 0.5% cholesterol, 10% fat, 18% casein) for 4 weeks... These results showed that both the feeding of cheonggukjang and cheonggukjang added Phellinus linteus decreased the triglyceride, total cholesterol and LDL-cholesterol in serum as well as the triglyceride and cholesterol in liver, and increased the HDL-cholesterol to total-cholesterol ratio in serum of the rats." Address: Dep. of Life Science, Silla Univ., Busan 617-736, Korea.

• ***Summary:*** "Chunggugjang prepared at 40ºC showed high sensory evaluation result in microorganism growth, appearance, taste and viscosity and particularly had low off-flavor." Address: Rural Resource Development Inst., National Inst. of Agricultural Sciences and Technology (NIAST), RDA, Sowan, Korea.

1734. Ma, Yan-Song; Wang, W.-H.; Wang, L.-X.; Ma, F.-M.; Wang, P.-W.; Chang, R.Z.; Qiu, L.-J. 2006. Genetic diversity of soybean and the establishment of a core collection focused on resistance to soybean cyst nematode. *J. of Integrative Plant Biology* 48(6):722-731. June. [26 ref]
• ***Summary:*** "The best method of control of SCN is through the development of resistant cultivars. However, limited progress has been made in soybean breeding in China because most modern cultivars have no resistance to SCN. The distribution and phenotype of 432 immune or highly resistant Chinese accessions were surveyed and a primary core collection was selected as a representative sample for further analyses. Using evenly distributed simple sequence repeat markers, five selection methods were applied to the primary core collection and the optimal method was chosen to establish a core collection, which consisted of 28 accessions. These encompassed 70.8% of the allelic variation present in the overall resistant collection. The 28 accessions differed from the reference resistant accessions at the genomic level, indicating that Chinese resistant accessions are distinct from known resistant accessions."

"Soybean cyst nematode (SCN) was first found in Northeast China in 1899 (Dai et al. 1958) and later spread to Korea, the US, Columbia, Brazil, Argentina, and other countries." Address: 1-2. Inst. of Crop Science, Chinese Academy of Agricultural Sciences, National Key Facility of Crop Gene Resources and Genetic Improvement, Crop Germplasm and Biotechnology, Ministry of Agriculture, Beijing 100081, China.

1735. Hymowitz, Ted. 2006. Early archaeological evidence of the soybean (wild or domesticated) in Korea (Interview). *SoyaScan Notes.* Sept. 1. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** An Israeli (who may be a member of a team) has recently reported this archaeological discovery in Korea dating from about the beginning of the Christian era, or maybe a little earlier. It is not yet clear whether they have found the wild soybean (*Glycine soja*) or the cultivated soybean (*Glycine max*). If it is the cultivated soybean, this would be the earliest archaeological discovery of soy in Korea. It would indicate that, in the Chinese expansion and conquest, they took their plants, indeed the soybean, south into today's Korea. This is much earlier than we expected. But this is about the only archaeological information on the soybean that Ted has ever found.

Ted's friends in China continue to hypothesize all sorts of crazy ideas and theories (maybe the soybean came from southern China, around Shanghai), but they have no evidence. Ted knows it bothers the Chinese that they have been unable to find archaeological evidence. It is partly a matter of national pride / nationalism. It bothers them so much that, for example, in the international meetings dealing with exchange of germplasm, the Chinese have said they have removed the soybean from free exchange. They are allowed to withhold it, since it is clear that the soybean is of indigenous Chinese origin. Rice and soy are dear to the hearts of the Chinese; they don't exchange much germplasm of either of these two crops. Address: Prof. of Plant Genetics (retired), Dep. of Crop Sciences, Univ. of Illinois, Urbana, Illinois.

1736. Wilson, Audrey. 2006. Soy sauces are not all the same:

© Copyright Soyinfo Center 2021

Let's talk food. *Hawaii Tribune-Herald* (*Hilo, Island of Hawaii*). Oct. 3. p. 17.
• ***Summary:*** "When we think of shoyu or soy sauce, we think of Kikkoman, Aloha Shoyu, or if you read my column, saltless shoyu."

"Korean soy sauce is Joseon Ganjang" and is a by-product of 'doenjang,' or Korean bean paste, is thin and dark brown in texture and very salty. In Korea, the fermented soybean liquid is called soybean liquid and the solids are called soybean paste. The traditional soy bean fermented liquid is rich in protein and amino acids. It became a substitute for Buddhists who were not allowed to eat meat.

"In Singapore and Malaysia, dark soy sauce is called 'douyou' and light soy sauce is called 'juangqing.'"

"In Thailand, black soy sauce is called 'Siu dahm' and is the most widely used soy sauce for Thai dishes." It contains "only 55 mg. of sodium per tablespoon."

1737. Fruin, W. Mark. 2006. Thoughts on the early history of soy sauce and kecap / ketjap (Interview). *SoyaScan Notes.* Oct. 6. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Mark knows a woman professor Tashiro in Japan who is doing research on the early history of soy sauce (e-mail shiro@flet.kweio.ac.jp). She and others she knows are interested in the "leaky sieve" theory which basically says "Yes, we had this very controlled system during the Tokugawa / Edo period, but lots of things were going on that were not official–such as exporting outside of Deshima. You could call them pirates or extra-legal exports. Many of these exports went to places like Korea, or the Korean islands between the Korean mainland and Japan, all of which were near Japan. Mark suggests I write her and mention his name.

Remember that there is a difference between Kansai shoyu (lighter in color and saltier, *usukuchi*) and Kanto shoyu (darker in color, *koikuchi*). Whatever they shipped out of Deshima and Nagasaki was more likely to be Kansai shoyu than Kanto shoyu.

Also remember that soy sauce was widely made locally by small makers. One of the bigger castle towns (*jôka-machi;* "castle + under") or commercial towns (*shukuba-machi*) of Kyushu or southern Japan probably provided the early shoyu exported by the Dutch East India Co. (VOC). These were the two types of cities in Tokugawa Japan; there had to be one castle per fiefdom (*han*). Address: Palo Alto, California.

1738. Cwiertka, Katarzyna J. 2006. The soy sauce industry in Korea: Scrutinising the legacy of Japanese colonialism. *Asian Studies Review* 30(4):389-410. Dec. [81 + 27 endnotes. Eng]
• ***Summary:*** Excellent; very original, carefully researched, well documented, and well written! Contents: Introduction. Fermented soyfoods in Korea. The soy sauce industry in Japan. The Japanese soy industry in colonial Korea. The soy sauce industry in South Korea. The hidden legacy of Japanese colonialism.

In about the 9th century, two major fermented soyfoods–kanjang (soy sauce) and toenjang (soybean paste) began to be made in Korean homes. The third fermented soybean product, *koch'ujang* (red chili pepper paste), started to be made much later, after red peppers were introduced to Korea at the end of the 16th century. However the earliest known references to this new fermented soybean product are found in the 2nd half of the 17th century.

Since that time, these three types of *jang* have held a central place in Korean cookery. They were traditionally made in individual homes by women, and helped to mark the cycle of the seasons. Meju started to be made in early winter. Whole soybeans were soaked in water, boiled, mashed, shaped into lumps of various shapes, dried in the sun for several days then hung in a dry place for up to about 4 weeks until the surface was covered with a bloom of *Aspergillus* oryzae mold and various species of *Bacillus* bacteria multiplied inside each lump.

In the early spring, the meju was mashed or crushed into small pieces; 2 parts by weight of meju were mixed in distinctive earthenware crocks with 4 parts of water and 1.2 parts of salt. Each crock was covered and the mixture was then allowed to ferment outdoors for several months. A strainer was pressed down into the mash and the liquid soy sauce (*kanjang*) that collected in it was siphoned off, boiled, and left to mature for 40-60 days. The solids that remained in the crock were mixed with more salt, packed tightly, then left to ferment in the sun for another month. The result was Korean soybean paste (*jang*). The taste of each family's *jang* was unique.

The first commercial soy sauce brewery in Korea was the Yamamoto Soy Sauce Brewery, established in 1886 in the port city of Pusan. Many more such breweries were established in Korea during the following decades; commercial soy sauce began to replace its traditional homemade counterpart.

A significant growth in commercial breweries took place after Korea became Japan's protectorate in 1905. By the 1920s more than 100 commercial soy sauce breweries were operating throughout Korea; they made soy sauce according to the traditional Japanese method–not the Korean method. They were clustered around urban areas having a large concentration of Japanese residents: Pusan, Ulsan, Taegu, Miryang, Masan, Kwangju, Mokp'o, Kunsôn, Taejôn, Ch'ônan, Inch'ôn, Seoul, Haeju, Chinnam'po, P'yongyang, Sinûiju, Wônsan, Hamhûng and Kyôngsông.

Tsushima (1943, p. 12) listed 276 soy sauce factories in operation throughout Korea during 1942; this figure is higher than that given by other sources.

The first soy sauce brewery in P'yongyang, Miyagawa Shoyu Miso Brewery, was established in 1905 and remained the only commercial brewery in the city until Feb. 1936,

© Copyright Soyinfo Center 2021

when Kunishi Shoyu Co. set up a modern factory employing more than 100 workers.

The article concludes: "The overwhelming presence of factory-made *jang* in South Korea today is a mundane reminder of the impact of Japanese colonialism" on Korean cuisine. Address: Centre for Japanese and Korean Studies, Leiden Univ., P.O. Box 9515, 2300 RA Leiden, The Netherlands. Phone: +31 71 527 2599.

1739. Ahn, Y.S.; Kim, Y.S.; Shin. D.H. 2006. Isolation, identification, and fermentation characteristics of *Bacillus* sp. with high protease activity from traditional Cheonggukjang. *Korean J. Food of Science and Technology* 38:82-87. [Kor; eng]*

• ***Summary:*** "Abstract: Four lactic acid bacteria (LAB), *Lactobacillus paraplantarum* KM, *Enterococcus durans* KH, *Streptococcus salivarius* HM and *Weissella confusa* JY, were isolated from humans and tested for their capabilities of converting isoflavone glucosides to aglycones in soymilk... Especially, *L. paraplantarum* KM seems to be a promising starter for bioactive-fermented soymilk based on its growth, acid production, and isoflavone conversion within a short time." Address: Div. of Applied Life Science, Graduate School, Inst. of Agriculture and Life Science, Gyeongsang National Univ., Jinju 660-701, Korea.

1758. Barrionuevo, Alexei. 2007. To fortify China, soybean harvest grows in Brazil. *New York Times.* April 6. p. A1, C7.
• ***Summary:*** An excellent article on the major changes taking place in world soybean production and trade. For about 3,000 years, China has produced enough soybeans for its own needs. But since about 1995, China has emerged into the world's largest net soybean importer–by far. Three main forces have driven this change: (1) As Chinese workers become more affluent, their appetite for meat increases; therefore more soybeans are needed as animal feed. (2) Fresh water in China has become increasingly scarce. In northern China, where soybeans have traditionally been produced, water tables are dropping at a rate of 3-10 feet/year. "It takes a thousand tons of water to produce one ton of grain," says Lester Brown, president of the Earth Policy Institute, a U.S. environmental research and advocacy group. "So the most efficient way to import water is in the form of grain." (3) China's population, the largest in the world at 1.3 billion people, continues to grow.

Since 2001/02, the USA has been the largest soybean exporter to China. But last year (2005/06), Brazil became China's largest supplier of soybeans; the trade grew 50% over the year before and nearly doubled since 2004. China seeks a long-term, low cost supplier. Brazil still has large amounts of land that could be planted to soybeans, and China hopes to export soybeans directly from Brazil, in its own ships, thereby bypassing the international grain traders such as Cargill, Bunge, and ADM.

But Brazil has drawbacks as a soybean supplier: (1) It has a transportation bottleneck; its infrastructure for transporting the soybeans from field to port in trucks over long (up to 1,000 miles), bumpy, dirt roads, and its congested ports where some ships must wait for up to a month before loading soybeans. (2) Brazil would strongly prefer to export value-added soybean products such as oil and meal rather than raw, unprocessed soybeans. (3) Soybean farmers in Mato Grosso, though producing huge amounts of soybeans, are deeply in debt and losing money, as they become slaves to the big trading companies. (4) The strong Brazilian currency keeps prices high.

Graphs show: (1) The world's net soybean importers (in descending order): China (by far), European Union, rest of the world, Japan, Taiwan, South Korea. (2) World's net soybean exporters (incl. projections to 2007/08): Brazil, USA, Argentina, rest of world. A map shows world soybean trade. China is the leading destination for both U.S. and Brazilian soybeans. A large color photo shows a truck loaded with soybeans near Rondonopolis, Mato Grosso, Brazil.

• ***Summary:*** "The potential to produce biogenic amines was investigated in microbial strains isolated from fermented soybean paste, cheonggukjang [often spelled "chongkukjang]." The typical levels of 11 biogenic amines, including putrescine, histamine, and tryptamine, were

© Copyright Soyinfo Center 2021

analyzed in commercial cheonggukjang." Address: Test and Analysis Center, Busan Regional KFDA.

1761. *Iowa Soybean Review* (*Iowa Soybean Association, Urbandale, Iowa*). 2007. Another record year–1.11 billion bushels of U.S. soybeans exported in 2007 marketing year. Investing checkoff dollars. 19(2):20-21. Nov.
• ***Summary:*** A sidebar shows: "Top 10 U.S. Export Destinations of 2007 were:

"1. China–420 million bushels
"2. Mexico–141 million bushels
"3. Japan–116 million bushels
"4. Taiwan–71 million bushels
"5. Indonesia–53 million bushels
"6. Netherlands–52 million bushels
"7. Germany–38 million bushels
"8. Egypt–28 million bushels
"9. Korea–21 million bushels
"10. Turkey–19 million bushels

"The United States set another record for exports of soybeans during the 2007 marketing year, which was completed Aug. 31, 2007. The U.S. exported 1.11 billion bushels of soybeans with an approximate value of $10 billion. This is 18 percent higher than last year's exports, and it is the second record in three years.

"Soymeal and oil sales are ahead of last year's pace, but that marketing year ended Sept. 30 and year-end figures are not yet completed. Soymeal exports are 5 percent ahead of last year, and soy oil exports are up 77 percent even with the increased soy oil use in biodiesel.

"'Soybeans are the highest-valued U.S. agricultural commodity export and contribute a great deal to the balance of trade,' says Brent Babb, director of internal operations and program development for the U.S. Soybean Export Council (USSEC). 'On average, 43 percent of U.S. soybean production is exported each year.'"

"'Promotion and market development efforts in overseas markets are vital for the competitiveness of the soybean farmers in Iowa,' says Ray Gaesser, past president of the Iowa Soybean Association. 'With every other row of soybeans exported, Iowa farmers depend on overseas markets to utilize part of the 500 million bushels of soybeans we harvest.'

"In addition to record exports for 2007, the United States is starting the 2008 marketing year with a record amount of export sales commitments of 297 million bushels. The chart above shows 2008 export commitments as of Aug. 16, 2007.

"Chinese Imports Crucial: Chinese soybean buyers, visiting the Midwest last May, exceeded expectations by signing 17 contracts worth $2.07 billion with eight U.S. soybean export companies at the Chicago Board of Trade [Illinois]. The same trade delegation signed another round of contracts at the Iowa Statehouse that same week.

"The contracts signed by Chinese companies apply to the 2007-2008 market year, and the volume totals 5.76 million metric tons, or about 210 million bushels, about one-half of the 420 million bushels of soybeans that U.S. farmers sold during the 2006-2007 market year.

"The 14-company buying delegation was organized by the American Soybean Association–International Marketing, the international arm of the U.S. Soybean Export Council, with the China Chamber of Commerce for Imports/Exports of Foodstuffs, Native Produce and Animal By-Products.

"The Chinese delegation visit builds on an increasing trade relationship between the U.S. and China, which went from practically zero U.S. soybean imports in 1998 to 435 million bushels in the 2004-2005 market year.

"'The U.S. soy export program to China is a great example of how U.S. agriculture is deeply involved in the economic development of our trading partners,' Babb says. 'Our ASA- International Marketing activities in China provide training And expertise in animal production and aquaculture that provide improved nutritional and economic benefits. Through USSEC's network of eight overseas offices and with support from the soybean checkoff and several state soybean organizations, we promote soy product usage in animal feed, soyfood and industrial uses in more than 80 countries.'" Address: ISA Communications Manager.

1762. Kwak, Chung Shil; Lee, M.S.; Park, S.C. 2007. Higher antioxidant properties of Chungkookjang, a fermented soybean paste, may be due to increased aglycone and malonylglycoside isoflavone during fermentation. *Nutrition Research* 27(11):719-27. Nov. [54 ref]
• ***Summary:*** Chungkookjang (CKG), a popular Korean fermented soybean paste, has long been considered to be more healthful than soybeans. CKG was much richer in antioxidants than unfermented steamed soybeans, probably due to its increased aglycone isoflavone and malonylglycoside isoflavone, which resulted from fermentation, as well as total content of polyphenols. Address: 1. Institute on Aging, Seoul National Univ., Seoul 110-810, South Korea.

1763. Meerak, Jomkhwan; Iida, H.; Watanabe, Y.; Miyashita, M.; Sato, H.; Nakagawa, Y.; Tahara, Y. 2007. Phylogeny of gamma-polyglutamic acid producing *Bacillus* strains isolated from fermented soybean foods manufactured in Asian countries. *J. of General and Applied Microbiology* (*Tokyo*) 53(6):315-23. Dec. [23 ref]
• ***Summary:*** Natto and closely related fermented soyfoods are made and consumed in many Asian countries. In this study, 34 *Bacillus* strains capable of producing gamma-polyglutamic acid (PGA) were isolated from natto and its relatives in mountainous areas of South Asia and Southeast Asia and from soils in Japan. This phylogenetic analysis shows the similarity among strains of *Bacillus subtilis* isolated from various sticky fermented soyfoods of Asia.

© Copyright Soyinfo Center 2021

This suggests that *B. subtilis* strains responsible for the fermentation of sticky Asian soyfoods might have originated from the same stock.

The foods examined include: Kinema from Darjeeling (West Bengal, India) and Dhankuta (Nepal). Thua-nao from Maehongsorn and Chiangmai, Thailand. Tan-douchi from Ruili, Yunnan province (near the border with Myanmar). Chungkuk jang from Taegu, Korea. Also, soil was examined from Hokkaido, Iwate, Nagano, and Yamagata, Japan. Address: 1-3, 7. Dep. of Applied Biological Chemistry, Faculty of Agriculture, Shizuoka Univ., Shizuoka 422-8529, Japan.

1764. Cho, K.M.; Seo, W.T. 2007. Bacterial diversity in a Korean traditional POI soybean fermented foods (Doenjang and Ganjang) by 16S rRNA gene sequence analysis. *Food Science and Biotechnology* 16:320-24. *

1765. Kim, Kyung Seon; Park, Jae Bok; Kim, Suna. 2007. [Quality characteristics of kochujang prepared with Korean single-harvested pepper (*Capsicum annuum* L.)]. *J. of the Korean Society of Food Science and Nutrition* 36(6):759-65. [38 ref. Kor; eng]
• ***Summary:*** "This study was conducted to analyze the chemical properties of single-harvested pepper (YW211, YW213), and to investigate the change of kochujang quality by the addition of single-harvested peppers. Capsaicinoids content of YW211 was 271.65±25.10 mg/100 g and ASTA color value of YW213 was 212.71±2.38, which were comparatively higher values than commercial red peppers."

Note: The meaning of "single-harvested pepper" is unclear. A Google search does not help. Address: 1. Korea Food Research Inst., Gyeonggi 463-746, Korea.

1766. Mitsuboshi, Saori; Kiuchi, K. 2007. [Development of new itohiki-natto and odor of natto type foods]. *Journal of Japan Association on Odor Environment* 38(3):151-62. [28 ref. Jap; eng]
• ***Summary:*** "Domestic availability of industrial-grade *Bacillus subtilis* (natto) is limited to only three varieties of those suited for automated Itohiki-natto production, and scarcity of varieties of strains is causing difficulties in development of new varieties of Itohiki-natto. For that reason, we have been involved in research in distribution of *Bacillus subtilis* (*natto*) in the regions of Southeast Asian where the bacteria are in wide distribution. Available natto preparations include Chinese Douchi and Korean Chungkuk-Jang. In this connection, we have collected Douchi, isolated a new variety of the bacteria, and manufactured new Itohiki-natto. As the result, we have discovered *Bacillus subtilis* (*natto*) KFP843, which is expected to be capable of producing a new, soft variety of Itohiki-natto. We expect that this product may win a place in the diet of the aged who are experiencing difficulties in mastication or mastication and deglutition..." Address: Faculty of Home Economics, Kyoritsu Women's Univ., 2-2-1, Hitotsubashi, Chiyoda-ku, Tokyo, 101-8437, Japan.

1767. Park, Min Kyung; Song, Y.; Joung, H.; Li, S-J.; Paik, H.Y. 2007. Establishment of an isoflavone database for usual Korean foods and evaluation of isoflavone intake among Korean children. *Asia Pacific J. of Clinical Nutrition* 16(1):129-39. [37 ref. Eng; [kor]]
• ***Summary:*** "Asian populations including Koreans are assumed to have a higher isoflavone intake due to the higher consumption of soybean. However, it is difficult to estimate isoflavone intake because there is no isoflavone database in Korea. In this study, an isoflavone database was established with systematic review. Literature with analytical values of Korean soybeans and its products were collected and evaluated to establish an isoflavone database. A total of 142 food items containing isoflavones were selected among 2,932 food items in the Korean Nutrient Database. Among these, only 25 food items were evaluated with analytical values and the remaining 98 items were replaced with adaptations or calculations from similar items. Dietary intake of isoflavones was assessed for 426 boys and 365 girls aged 8 to 11 years with 3-day food records. The daily mean isoflavone intake was 8.3 mg among boys and 7.2 mg among girls. More than 70% of subjects had a daily isoflavone intake below 10 mg. The most contributory food item to the isoflavone intake among adolescents was tofu in quantity and soybean sauce in frequency. This database could be used to estimate isoflavone intakes from dietary data among various populations and to evaluate the relationships between isoflavone intake and chronic disease." Address: 1. Dep. of Food and Nutrition, Seoul National Univ., San 56-1, Shillim-dong, Kwanak-ku, Seoul 151-742 Korea.

1769. Hui, Yiu H.; Chandan, Ramesh C.; Clark, Stephanie; et al. ed. 2007. Handbook of food products manufacturing: health, meat, milk, poultry, seafood, and vegetables. 2 vols. Hoboken, New Jersey: John Wiley & Sons, Inc. Illust. (color). 22 cm.
• ***Summary:*** In Chapter 46, "Bioactive peptides from food proteins," we read (p. 15): "... ACE-inhibitory activity has been isolated from soybeans fermented with *Bacillus subtilis* and *chunggugjang* [Korean natto] fermented with

© Copyright Soyinfo Center 2021

*Bacillus subtilis."* In both studies, the optimal conditions for production were 60 hours fermentation at 40ºC (Cho et al. 2000). Address: Senior Scientist, Science Technology System, West Sacramento, California.

1770. Kurihara, Harumi. 2007. Harumi's Japanese home cooking. 1st American ed. New York, NY: Home Books. A division of the Penguin Group (USA) Inc. 160 p. Illust. (color). No index. 26 cm.
• ***Summary:*** A translation of *Kurihara Harumi no japaniizu hoomu kukkingu.* One chapter is titled "Soup, eggs & tofu." The book (which is crippled by the lack of an index) contains 7 recipes for miso, 5 for tofu, 2 for teriyaki sauce, and 1 for edamame. Soy sauce is used as an ingredient in many recipes such as Chicken with soy and balsamic dressing. The short glossary mentions Kochujan (Korean miso [actually red-pepper paste]).

Harumi Kurihara, a housewife, is Japan's most popular cooking expert. Her first book in English, *Harumi's Japanese Cooking* won the Gourmand World Cookbook award in 2004. Address: Japan.

1771. Losso, Jack N.; Shahidi, Fereidoon; Bagchi, Debasis. 2007. Anti-angiogenic functional and medicinal foods. Boca Raton, Florida: CRC Press. 715 p. See p. 131. Illust. 24 cm. [30+ ref]*
• ***Summary:*** Section 6.2.2 "Fermented soy foods (Doenjang, chonggukjang, and ganjang)" has the following contents: 1. General characteristics of doenjang, chonggukjang, and ganjang. 2. Health promoting effects of doenjang, chonggukjang, and ganjang.

Doenjang is Korean soy paste [somewhat like Korean miso]; it is made from meju (a fermented mass of cooked soybeans [soybean koji]) and takes several months to ferment. In traditional meju the main microorganisms are *Aspergillus oryzae, Aspergillus sojae* and *Bacillus subtilis.* "In the past, doenjang was obtained by separating the soy sauce (ganjang) after fermentation of meju in brine for several months. However, commercial doenjang is now produced as a sole product without separation of ganjang, and other cereals are often added to soybeans as a substrate [as is also the case for Japanese miso]. Modern meju is prepared on an industrial scale by inoculating" the substrate with *Aspergillus oryzae* "and *Bacillus* rather than depending on natural contaminant flora."

Chonggukjang is another type of fermented soybean paste; in Korea it is typically consumed as the basis of a soup and takes only a few days to ferment. The fermented soybeans are typically mixed with salt, garlic, ginger, and red chili pepper before being used as a soup base. Chonggukjang was first mentioned in the *Sanlim Gyongje,* by Hong Man-Sun, an agricultural encyclopedia published in 1715. Note: It could be called Korean natto.

Ganjang is Korean soy sauce. Traditionally it was made by separation of the liquid from doenjang [From Google Books Preview].

1772. Robinson, Martin; Bartlett, Ray; Whyte, Rob. 2007. Korea. 7th ed. Footscray, Victoria, Australia; London: Lonely Planet. 440 p. Illust. (some color). Maps (some color). Index. 20 cm. [30+ ref]
• ***Summary:*** This is a travel guidebook to Korea, including North Korea (p. 344+). Many maps. Page 23: The Korean word *doenjang* means "soybean paste;" it is used as a base for soups.

Page 62: In Korea, chili pepper usually takes the form of *gochujang* (red pepper paste). It is a popular topping for Bibampap

Page 71-72: Soups and stews–haejangguk = bean sprout soup. doenjang jjigae = soybean paste stew. dubu jjigae = tofu stew. sundubu jjigae = spicy uncurdled tofu stew [sic, tofu / soymilk curds in spicy stew]. sundubu = uncurdled tofu [sic, soymilk curds]

Page 177: "Tofu lovers and vegetarians will want to head for 'Tofu Village,' a cluster of restaurants that feature tofu."

Page 180: The Korean word for soymilk curds (or unset tofu) is *sundubu.*

Page 181: In Gang-Won-Do a restaurant named Yujeong Cheonggukjang serves a superb spicy soup that resembles miso soup but is actually made with Korean natto (*cheonggukjang*).

Note: This is the earliest English-language document seen (Jan. 2012) that uses the word "cheonggukjang" to refer to Korean-style natto.

Page 222. The Korean word for tofu is *dubu.*

The interesting section on North Korea starts on page 344.

Page 389: In the box titled "Unusual festivals" [in North Korea]–Chodang's Uncurdled Tofu Festival; exciting only for vegetarians.

Also: Tofu (dubu) is mentioned on pages 63-66, 71-72, 90, 125, 151, 170, 174, 175, 177, 180, 185, 192, 222, 283, 288, 321, 326, 389.

• ***Summary:*** A remarkable, very important book. A must-read for all who care about the fate of their planet and civilization.

Contents: Preface. 1. Entering a new world. I. A civilization in trouble: 2. Deteriorating oil and food security. 3. Rising temperatures and rising seas. 4. Emerging water shortages. 5. Natural systems under stress. 6. Early signs of decline.

II. The response–Plan B: 7. Eradicating poverty, stabilizing population. 8. Restoring the earth. 9. Feeding eight billion well. 10. Designing cities for people. 11.

© Copyright Soyinfo Center 2021

Raising energy efficiency. 12. Turning to renewable energy.

III. An exciting new option. 13. The great mobilization (as during World War II). Notes. Acknowledgments. About the author.

The section titled "The changing food prospect" (p. 36-38) notes that even though there has been a drop in grain production per capita, this has been partially offset by the enormous growth in world soybean production, from 68 million tons in 1984 to 222 million tons in 2007. In Brazil and Argentina, the growth of soybean production since about 1980 has been spectacular; by 2005 soybean production in both countries was rivaling or exceeding grain production. Increasingly, high-protein soybean meal is used to feed livestock, poultry, and fish. Feed rations containing about 80% grain and 20% soybean meal are now standard fare worldwide. "This allowed the global diet to improve even as the grain supply per person was declining." The world's farmers are now struggling to expand production fast enough "to feed 70 million more people each year and to allow billions of low-income consumers to move up the food chain. But they are being further challenged by the explosive "demand for grain to produce fuel ethanol for cars."

Tables: 1-1 (p. 16). Top 20 failing states, 2006. From worst to better: Sudan, Iraq, Somalia, Zimbabwe, Chad, Ivory Coast, Democratic Republic of the Congo, Afghanistan, Guinea, Central African Republic, Haiti, Pakistan, North Korea, Burma, Uganda, Bangladesh, Nigeria, Ethiopia, Burundi, Timor-Leste [East Timor]. Some 17 of these countries have rapid rates of population growth; they are caught in the demographic transition trap. 7-1 (p. 150). Plan B budget: Additional annual funding needed to reach basic social goals. Total: 77 billion dollars. 8-1 (p. 170). Plan B budget: Additional annual funding needed to restore the earth. Total: 113 billion. 12-1 (p. 261). World energy from renewables in 2006 and Plan B goals for 2020. 13-1 (p. 274). Plan B carbon dioxide emissions reductions and sequestrations in 2020. Reduction of 81.5% from 2006 baseline. 13-2 (p. 282). Plan B budget: Additional annual expenditures needed to meet social goals and restore the earth. Total: 77 + 113 = 190 billion. 13-3 (p. 284). Military budgets by country and for the world in 2006 and Plan B budget. Total: 1,235 vs. 190. / Can we save the earth? "It depends on you and me, on what you and I do to reverse these trends. It means becoming politically active. Saving our civilization is not a spectator sport.

"We have moved into this new world so fast that we have not fully grasped the meaning of what is happening... The two overriding policy challenges are to restructure taxes and reorder fiscal priorities." Taxes must be restructured "to get the market to tell the ecological truth." Fiscal priorities must be reordered "to get the resources needed for Plan B." (p. 285-86). Address: President, Earth Policy Inst., 1350 Connecticut Ave., N.W., Suite 403, Washington, DC 20036. Phone: 202-496-9290.

1774. Ness, Carol. 2008. House organic crowned top tofu: Taster's choice. *San Francisco Chronicle.* Jan. 23. p. F2.
• ***Summary:*** For tasting they chose 15 brands of firm tofu, served plain. The ranking was: House organic 79 ($2.49 for 14 oz at Andronico's). House 74 (non-organic, $1.69 for 14 oz). Soy Deli organic 73 ($1.99 for 12 oz). Whole Foods 385 67 ($0.99 for 14 oz), Azumaya 66 ($1.79 for 14 oz). Trader Joe's organic 64. Wo Chong 57. White Wave 55. Soy Fresh 40. Golden Gate 38. Soga (extra firm [made by Pulmuone]) 38. Mori Nu (box, silken) 36. Nasoya 21. Wildwood 20. Small Planet 2. Address: Chronicle staff writer.

1775. Chung, Jeff. 2008. Think you're a true Korean-food fan? Try this stew. *Honolulu Advertiser* (*The*) (*Hawaii*). Jan. 27. p. 60.
• ***Summary:*** The stew is called "cheongukjang stew. It's nothing exotic but simply a stew made from fermented soybean paste with a smell so pungent it could get you kicked out of your condo.

"Many local Korean restaurants will give you a complimentary order of stew if you order at least two meat dishes, such as kal bi. This can be either kim-chee stew or another common dish, a bean-paste stew called *doenjang.* Its very similar but can't even compare with cheongukjang."

1776. Kim, Seong-Ho; Jung, S.H.; Kim, I.H.; et al. 2008. [The effects of Chungkookjang biopolymer on blood glucose and serum lipid lowering in Streptozotocin-induced diabetic rats]. *J. of the Korean Society of Food Science and Nutrition* 37(1):35-41. Jan. [31 ref. Kor; eng]
• ***Summary:*** "The rats were divided into three experimental groups; a normal group (N), diabetic control group (D), and a diabetic group with the supplementation of Chungkookjang viscous biopolymer (DCB). The groups were given experimental diets for four weeks... These results indicate that dietary supplementation of Chungkookjang viscous biopolymer improved glucose lowering and lipid metabolism in diabetic rats." Address: Dep. of Bio-Food Science, Kyongbuk College of Science, Chilgok 718-851, Korea.

1777. **Product Name:** Wildwood Tofu-Veggie Burgers (Organic) [Original].
**Manufacturer's Name:** Pulmuone Wildwood, Inc.
**Manufacturer's Address:** Fullerton, CA 92833.
**Date of Introduction:** 2008 January.
**Ingredients:** Jan. 2008: Tofu* (filtered water, soybeans*, nigari {magnesium chloride, a natural firming agent}), vegetable oil* (sunflower or canola), yellow onion*, carrot*, kale*, tapioca starch*, sea salt, garlic powder*. * = Organic.
**Wt/Vol., Packaging, Price:** 6.5 oz (184 gm) vacuum packed. Package of two retails for $2.69 (2008/01 Lafayette, California).
**How Stored:** Refrigerated.

© Copyright Soyinfo Center 2021

**New Product–Documentation:** Product with Label purchased at Trader Joe's, Lafayette, California. 2008. Jan. 16. Green, tan, red, orange, and blue. Front panel: "2 ready-to-enjoy burgers. 25% organic vegetables." "100% U.S. grown organic soybeans." USDA Organic logo. Certified organic by Oregon Tilth. www.wildwoodfoods.com. "Dairy free, gluten-free & soy-isolate free, organic, vegan."

1778. Lee, Hyun-Joo; Kim, S.I.; Park, J.G.; Park, J.N.; Han, I.J.; Song, B.S.; Kim, J.H.; Byun, M.W.; Lee, J.W. 2008. Effect of Choi-cha on fermentation characteristics and sensory quality of Chungkookjang (Korean fermented soybean). *Korean J. of Food Preservation* 15(1):144-49. Feb. [27 ref. Kor; eng]

• ***Summary:*** "Physiological, sensory and microbiological evaluations were conducted during fermentation of Chungkookjang with Choi-cha (non-fermented green tea) powder in efforts to improve the sensory quality of Chungkookjang. Growth of fermentative microorganisms in Chungkookjang was inhibited by Choi-cha; the pH and VBN value decreased as the concentration of Choi-cha increased... This result indicated that the sensory quality of Chungkookjang was improved by fermentation with 3% (w/v) of Choi-cha powder." Address: Dep. of Nutrition and Culinary Science, Hankyong National Univ., Anseong 456-749, Korea.

1779. Shurtleff, William; Aoyagi, Akiko. 2008. Le livre du tofu: La source de protéines de l'avenir–dès maintenant! [The book of tofu: Protein source of the future–now! Translated from the English by Nathalie Tremblay]. Varennes, Quebec, Canada: Éditions AdA Inc. 430 p. Illust. by Akiko Aoyagi. Index. Feb. 28 cm. [53 ref. Fre]

• ***Summary:*** Contents: Preface. Acknowledgments. Part I. Tofu: Food for mankind. 1. Protein East and West. 2. Tofu as a food. 3. Getting started. Our favorite tofu recipes (lists about 80 recipe names for each of the different types of tofu, plus soymilk, yuba, whole soybeans, gô, okara, and curds; very favorites that are also quick and easy to prepare are preceded by an asterisk).

Part II. Cooking with tofu: Recipes from East and West (500 recipes). 4. Soybeans: History, cooking with whole dry soybeans, roasted soybeans (*iri-mame*), fresh green soybeans (*edamame*), kinako (roasted full-fat soy flour), soybean sprouts (*daizu no moyashi*), natto (sticky fermented whole soybeans, with "gossamer threads"), tempeh (fermented soybean cakes), Hamanatto and Daitokuji natto (raisin-like natto), modern western soybean foods (natural soy flour [full-fat], soy granules, defatted soy flour and grits, soy protein concentrates, soy protein isolates, spun protein fibers, textured vegetable protein (TVP), soy oil products). 5. Gô (*purée de fèves de soya fraîches;* a thick white puree of well-soaked uncooked soybeans). 6. Okara or Unohana. 7. Curds and whey (*Caillé et petit-lait*). 8. Tofu (includes history, and preparatory techniques: Parboiling, draining, pressing {towel and fridge method, slanting press method, sliced tofu method}, squeezing, scrambling, reshaping, crumbling, grinding).

9. Deep-fried tofu (*Tofu frit*)*:* Thick agé or nama agé (*Agé épais* {*côtelettes de tofu frit*}), ganmo or ganmodoki (*burgers de tofu frit;* incl. *hiryozu / hirosu*), agé or aburagé (*pochettes de tofu frit;* incl. "Smoked tofu," p. 197). 10. Soymilk (*Lait de soya*). 11. Silken tofu (Kinugoshi ou tofu soyeux) ("*Kinu* means 'silk'; *kosu* means 'to strain'; well named, kinugoshi tofu has a texture so smooth that it seems to have been strained through silk"). 12. Grilled tofu (*Tofu grillé*). 13. Frozen and dried-frozen tofu (*Tofu surgelé et tofu surgelé séche*). 14. Yuba (incl. many meat alternatives such as Yuba mock broiled eels, Buddha's chicken, Buddha's ham, sausage). 15. Tofu and yuba in China, Taiwan, and Korea (incl. Savory tofu {*wu-hsiang kan*}*;* see p. 258 for illustrations of many meat alternatives, incl. Buddha's fish, chicken, drumsticks, and duck, plus vegetarian liver and tripe, molded pig's head, and molded ham). 16. Special tofu (*Tofu particuliers*).

Part III–Japanese farmhouse tofu: Making tofu for more and more people. 17. The quest. 18. Making community tofu. 19. The traditional craftsman. 20. Making tofu in the traditional way. Appendices: A. Tofu restaurants in Japan (many are vegetarian). B. Tofu shops in the West (Directory of 43 shops in the USA, in Europe {Germany 11, Austria 1, Belgium 2, Denmark 1, Finland 1, France 6, Ireland 1, Italy 3, Netherlands 4, Portugal 1, Spain 6, Switzerland 4, UK 9, Wales 1}, and 3 in Latin America {Brazil, Colombia, El Salvador, Guatemala, Mexico}). C. People and institutions connected with tofu. D. Table of equivalents. Bibliography. Glossary. Index. About the authors (autobiographical

sketches; a photo shows Shurtleff and Aoyagi, and gives their address as New-Age Foods Study Center, 278-28 Higashi Oizumi, Nerima-ku, Tokyo, Japan 177). Sending tofu in the four directions.

Pudding recipes include: Rice pudding with gô and apple (p. 76, incl. 2 cups soymilk). Tofu chawan-mushi (p. 147; Steamed egg-vegetable custard with tofu). Tofu fruit whips (p. 148). Tofu rice pudding (p. 150, incl. 1 cup soymilk). Tofu custard pudding (p. 152). Soymilk custard pudding (p. 208). Brown rice pudding (p. 208, with 2 cups soymilk). Soymilk chawan-mushi (p. 209). Chawan-mushi with yuba (p. 249).

Dessert recipes include: Tofu whipped cream or yogurt (p. 148; resembles a pudding or parfait). Tofu ice cream (p. 149, with chilled tofu, honey, vanilla extract and salt). Banana-tofu milkshake (p. 149). Tofu cream cheese dessert balls (p. 149). Tofu icing (for cake, p. 149). Tofu cheesecake (p. 150). Tofu-pineapple sherbet (p. 151). Also: Soymilk yogurt (cultured, p. 205). Healthy banana milkshake (p. 206). On p. 160 is a recipe for "Mock tuna salad with deep fried tofu."

Note. This is the earliest French-language document seen (Sept. 2013) that mentions soy cream cheese (p. 125), which it calls *Fromage à la crème au tofu.* Address: Soyinfo Center, P.O. Box 234, Lafayette, California 94549 USA. Phone: 925-283-2991.

1780. *Morning Star* (*The*) (*Bernon, British Columbia, Canada*). 2008. Traditional cuisine on the menu. March 23. p. 44.
• ***Summary:*** Korea–A wide variety of foods and dishes can be found throughout Korea. In Korea "various fermented and preserved foods, such as kimchi (fermented spicy cabbage), jeotgal (seafood fermented in salt), and doenjang (fermented soy bean paste) are notable for their specific flavor and high nutritional value."

1781. Nichols, Rick. 2008. Korean evolution: food. *Philadelphia Inquirer* (*The*) (*Pennsylvania*). March 30. p. M01, M03.
• ***Summary:*** Much of this article is about Everyday Good House, a Korean restaurant.

"There was a splendid bulgogi, thinly sliced rib eye tenderized by a marinade of Asia pear juice, sesame oil, garlic and soy [sauce] that had the perfect balance of tart and sweet."

There was "soodubu casserole filled with a pudding of silken tofu turned sunburst red by kochukaru spice powder; doenjang chigae, a Koreanized variation on miso soup, spiked with the tang of fermented soybean paste;..."

A large, elegant color photo shows "Soodubu, a spicy tofu soup."

1782. Kim, Nam Yee; Song, E.J.; Kwon, D.Y.; Kim, H.P.; Heo, M.Y. 2008. Antioxidant and antigenotoxic activities of Korean fermented soybean. *Food and Chemical Toxicology* 46(3):1184-89. March. *
• ***Summary:*** The Korean fermented soy product, Chungkookjang, will be evaluated in vitro and in vivo. It was found "to be a promising functional food which can prevent oxidative stress." Address: College of Pharmacy, Kangwon National Univ., Chunchon, Republic of Korea.

1783. *Daily Herald* (*The*) (*Provo, Utah*). 2008. Recently reviewed: Fusion Asian Grill. April 17, p. 47.
• ***Summary:*** "This Korean restaurant is full of smells–ones you'll like but not necessarily ones you'll recognize.

"Korean food includes some ingredients and dishes that might not be familiar to the casual diner, such as kimchee (made from cabbage) and doenjang (fermented soybean paste)..."

"We liked the BiBimBop and BolGoGi, both traditional Korean meat dishes. Main entrees are around $9..."

• ***Summary:*** A rediscovery of 88 Tofu House, which opened in 2000 and has now achieved cult classic status. It is located at 5490 Buford Highway. Phone: 770-457-8811.

"... spicy bowls of kimchi, pickled tofu, daikon, salted fish, sprouts and more–helps focus one's attention."

1785. Xiao, Chao Wu. 2008. Health effects of soy protein and isoflavones in humans. *J. of Nutrition* 138(6):1244S-1249S. June. [77 ref]
• ***Summary:*** "Epidemiological investigations suggest that soy consumption may be associated with a lower incidence of certain chronic diseases. Clinical studies also show that ingestion of soy proteins reduces the risk factors for cardiovascular disease. This led to the approval of the food-labeling health claim for soy proteins in the prevention of coronary heart disease by the U.S. FDA in 1999. Similar health petitions for soy proteins have also been approved thereafter in the United Kingdom, Brazil, South Africa, the Philippines, Indonesia, Korea, and Malaysia. However, the purported health benefits are quite variable in different studies. The Nutrition Committee of the American Heart Association has assessed 22 randomized trials conducted since 1999 and found that isolated soy protein with isoflavones (ISF) slightly decreased LDL cholesterol but had no effect on HDL cholesterol, triglycerides, lipoprotein(a), or blood pressure. The other effects of soy consumption were not evident. Although the contributing factors to these discrepancies are not fully understood, the source of soybeans and processing procedures of the protein or ISF are believed to be important because of their effects on the content and intactness of certain bioactive protein subunits.

© Copyright Soyinfo Center 2021

Some studies have documented potential safety concerns on increased consumption of soy products. Impacts of soy products on thyroid and reproductive functions as well as on certain types of carcinogenesis require further study in this context. Overall, existing data are inconsistent or inadequate in supporting most of the suggested health benefits of consuming soy protein or ISF." Address: Nutrition Research Div., Food Directorate, Health Products and Food Branch, Health Canada, 2203E Banting Research Centre, Ottawa, Canada.

1786. Min, Hyun-Kyeng; Kim, Hyo-Ju; Chang; Hae Choon. 2008. [Growth-inhibitory effect of the extract of porphyran-chungkookjang on cancer cell]. *J. of the Korean Society of Food Science and Nutrition* 37(7):826-33. July. [40 ref. Kor; eng]

• ***Summary:*** "Porphyran, which was prepared from laver (*Porphyra yezoensis*), decreased the viability of the cancer cells, however, it did not affect the viability of normal cells... However, the methanol and the water extracts of porphyran-chungkookjang did not inhibit the growth of normal cell. Moreover, the methanol extract of porphyran-chungkookjang at 1.0 mg/mL showed 1.2 to 1.5 fold higher anticancer effects than that of the chungkookjang." Address: All: Dep. of Food and Nutrition, Chosun Univ., Gwangju 501-759, Korea.

1787. Baek, Lag Min; Park, L.Y.; Park, K.S.; Lee, S.H. 2008. [Effect of starter cultures on the fermentative characteristics of *Cheonggukjang*]. *Korean J. of Food Science and Technology* 40(4):400-05. Aug. [33 ref. Kor; eng]

• ***Summary:*** The effects were examined by using three *Bacillus subtilis* strains. Strain B-59 was isolated from rice straw. The total amino acid contents of the *cheonggukjangs* were highest in the B-59 strain. "Glutamic acid and lysine contents were higher in the B-59 sample than in the control. Finally, the *cheonggukjang* fermented using the B-59 strain had improved sensory qualities such as color, taste, texture and overall acceptability compared to the control and Kn-10 samples." Address: Faculty of Food Technology and Service, Catholic Univ. of Daegu [Korea].

1788. Wilson, S.; Martinez-Villaluenga, C.; de Mejia, E.G. 2008. Purification, thermal stability, and antigenicity of the immunodominant soybean allergen P34 in soy cultivars, ingredients, and products. *J. of Food Science* 73(6):T106-T114. Aug. [51 ref]

• ***Summary:*** "Protein P34 (Gly m Bd 30K) is the immunodominant allergen in soybean (Glycine max L.)"

"Among soy consumer products, soymilk presented the highest P34 antigenicity, ranging from 7 to 23 mg/g extracted protein, followed by tempeh (8 mg/g extracted protein), soy infant formula (3.4 mg/g extracted protein), soy powder [soy flour] (2 mg/g extracted protein), and soy cheese products (0.50 mg/g extracted protein). Korean miso, soy sauce, soy chili mix, soy nuts, soy cream cheese, soy meat patty, texturized soy protein, and soy cereal exhibited undetectable P34 antigenicity (detection limit = 0.45 ng). Selecting soybean varieties with low levels of this allergen, or via processing, could potentially make soybean products less antigenic."

Note: "Less antigenic" means less likely to cause allergic reactions. Address: Dep. of Food Science and Human Nutrition, Univ. of Illinois at Urbana-Champaign, 228 ERML, MC-051, 1201 W. Gregory Drive, Urbana, IL 61801.

1789. Cwiertka, Katarzyna J.; Moriya, Akiko. 2008. Fermented soyfoods in South Korea: The industrialization of tradition. In: Christine M. Du Bois, C.-B. Tan, and S.W. Mintz, eds. 2008. The World of Soy. Urbana, Illinois: University of Illinois Press. viii + 337 p. See p. 161-181. [47 ref]

• ***Summary:*** Contents: Introduction. The soul of Korean cuisine. The industrialization of *Chang* manufacture. Conclusion–*Chang* and Korean identity. Notes.

Photos show: (1) One of the Starbucks outlets in Korea's capital. (2) Industrially produced soybean paste and hot red pepper paste on shelves in a modern retail store. (3) A traditional home in the Hahoe Folk Village near Andong. Meju [soybean koji] is hanging under the eaves and sauce pots stand in the courtyard. Liquid soy sauce is *kanjang.* Korean miso is *toenjang* or *doen jang.* Hot red pepper miso is *koch'ujang*, which was first mentioned in the 2nd half of the 17th century.

Although foreign foods are widely consumed in Korea today, soybeans and soyfoods remain a fundamental part of the Korean diet, and appear in a wide range for forms. Whole soybeans are boiled with other beans, rice, and other cereals to make *k'ongbap* [*kongbap*]. Whole soybeans are also mashed or ground into a creamy soup called *k'ongguksu* [*kongguksu*] which is served in the summer with noodles, soymilk, and julienned cucumber. Soybean sprouts (*k'ongnamul*), long a favorite in Korea, are used as an ingredient in a variety of soups, stews, and stir-fried. Seasoned soy sprouts (*k'ongnamul much'im* [*kongnamul muchim*]), a popular dish at many Korean meals, is made with blanched soybean sprouts seasoned with green onions, garlic, salt (or sometimes soy sauce), sesame oil, and crushed sesame seeds. Several kinds of tofu (*tubu*) are used in Korean cooking; they can be fried, braised, or simmered. To make Tofu kimchi (*tubu kimch'i*), cut fresh tofu into squares and arrange with pieces of kimchi; it serves as a popular snack with alcoholic beverages. Minced or mashed tofu mixed with minced meat can be used as a filling for dumplings called *mandu* [like Japanese manju], which are then fried or steamed. Roasted soybeans (*pokkun k'ong*) and roasted soybean flour (*k'ongaru*) are indispensable ingredients in many traditional desserts such as *kwaja* and *ttok.* During the

© Copyright Soyinfo Center 2021

last two decades, soymilk has become a popular product in Korea.

Footnote 16 describes the four basic types of Korean soy sauce: *ch'ong kanjan, chung kanjan, chin kanjang,* and *chin kanjang* (written with a different ideogram than no. 3). There is also *honhap kanjang* (a mixture of Japanese soy sauce and its chemical counterpart) and *choson kanjang* (a product manufactured on the basis of traditional Korean methods) (p. 172-73). Address: 1. Leiden Univ., Netherlands, lecturer at the Centre for Japanese and Korean Studies.

1790. Kaplan, Lawrence. 2008. Legumes in the history of human nutrition. In: Christine M. Du Bois, C.-B. Tan, and S.W. Mintz, eds. 2008. The World of Soy. Urbana, Illinois: University of Illinois Press. viii + 337 p. See p. 27-44. [40 ref]

• ***Summary:*** Contents: Introduction. Legumes in early prehistoric nutrition. Food grain legumes native to the Americas: Radiocarbon dating, beans in American archaeology, history and protein structure. The Near Eastern pulses: The classical texts, the broad bean (*Vicia faba*), lentil, pea, chickpea. The Asiatic and African pulses: Cowpea (*Vigna unguiculata* subspecies *unguiculata*), yard-long or asparagus bean (*Vigna unguiculata* subspecies *sesquipedalis*), mung bean or green gram (*Vigna radiata*), black gram (*Vigna mungo*), adzuki bean black gram (*Vigna angularis*). Note.

Throughout the world and throughout history legumes accompany cereal grains as primary components of human diets. "So pervasive is the combination of the combination of these complimentary food resources that they are often assumed to have been combined since the very beginnings of agriculture." In developing countries, "the proportion of protein derived from pulses appears to be in steady decline."

"Soy consumption is highest in industrialized, technologically developed Japan and the Republic of Korea [South Korea] (supply per capita per year of 7.53 kg and 8.10 kg, respectively) because of its central role in the traditional diet of these countries." Address: Emeritus Prof. of Biology, Univ. of Massachusetts, and former editor of the journal *Economic Botany*.

1791. Park, Jun-Seong; Park, H.Y.; Kim, D.H.; Kim, D.H.; Kim, H.K. 2008. ortho-Dihydroxyisoflavone derivatives from aged Doenjang (Korean fermented soypaste) and its radical scavenging activity. *Bioorganic & Medicinal Chemistry Letters* 18(18):5006-09. Sept. [20 ref]

• ***Summary:*** "One new ortho-dihydroxyisoflavone, 7,30,40-trihydroxyisoflavone (2), and two known ortho-dihydroxyisoflavone derivatives were isolated from 5-year-old *Doenjang* (Korean fermented soypaste), and evaluated as potent antioxidant by comparing with other known isoflavones... This study shows that the position of hydroxyl substituent at the aromatic ring of isoflavone plays an important role in radical scavenging effect." Address: 1. • ***Summary:*** "To develop soybean products containing high isoflavone contents, the effects of germination and osmopriming on the isoflavone contents of 3 soybean cultivars (Ilmi, Daehwang, and Taekwang) were investigated."

"We concluded that cheonggukjang would contain higher isoflavone contents after the treatment of germination and osmopriming." Address: General Affairs Team, Ourhome Ltd., 5444-1 Sangdaewon-dong, Jungwon-gu, Seongnam-city, Kyunggi-do 462-120, Korea.

1796. NEI–Nutrition & Education International (Website printout–part). 2008. www.nei-intl.org Retrieved Nov. 19.
• ***Summary:*** A very inspiring and interesting website about an organization created by Dr. Steven Kwon that is introducing soybeans and soyfoods to Afghanistan as a way of combating that country's serious malnutrition problems. Dr. Kwon has taken early retirement after 22 years working for Nestlé. Please watch the 10-minute video at the bottom of the homepage first. Then read several of the most recent newsletters. The January/March 2008 newsletter notes that farmers working cooperatively with NEI expect to harvest 2,000 tons of edible soybeans in Oct. 2008. NEI is working closely with the Ministry of Women's Affairs (MoWA). A map shows that NEI has four soymilk feeding facilities in various parts of Afghanistan, a soy flour factory in Kabul, and soybean fields in most of the provinces (*weleyats*) in the northern half of the country.

"Afghanistan has one of the world's highest maternal mortality rates. One out of fifty women die during childbirth. Because expectant mothers are malnourished, they are unable to pass on vital nutrients to their babies during pregnancy or breast-feeding. Not surprisingly, one in four Afghan babies die before the age of five, and 54% of these under-five children are chronically malnourished. (UNICEF Humanitarian Action Report Update for Afghanistan. 17, Jan. 2008)."

1797. Lyddon, Chris. 2008. Global grain trade review: Volatility the dominant factor in the 'wildest 12 month history of the grain market.' *World Grain* 26(11):26-33. Nov.
• ***Summary:*** A table titled "Global grain trade activity (in 1,000 tonnes)" gives the following statistics for soybeans: 2007-08 Top exporters: 1. United States 31,434. 2. Brazil 25,500. 3. Argentina 13,500. 4. Paraguay 5,080. 5. Canada 1,825. World total 78,968 (+15% over last year).

Top soybean importers: China 36,500. E.U.-27 15,400. 3. Japan 4,050. 4. Mexico 3,750. 5. Argentina 2,950.

Also gives the top 5 importers and exporters of soybean meal for 2007-08. Exporters include: 4. India 4,850. 5. Paraguay 1,112. World total 56,2062 (+6%). Top importers: 1. E.U.-27 23,900. 2. Indonesia 2,400. 3. Vietnam 2,400. 4. Thailand 1,950. 5. Korea 1,835.

Various factors have been cited as the cause of this volatility: (1) Energy policy–using maize, rapeseed, and soybeans to make biofuels. (2) Commodity speculators–who can make prices rise faster than they would otherwise. (3) Hedge fund position limits. (4) Government intervention by embargoes and export taxes. (5) The low value of the U.S. dollar. (6) The long term trend (spanning about 15 years) of declining wheat acres. (7) Fundamentally tight stocks. (8) Disruption of supply by things like floods. Address: European editor; chris.lyddon@ntlworld.com.

1808. Kim, Mi Kyung; Kim, J.H.; Nam, S.J.; Ryu, S.; Kong, G. 2008. Dietary intake of soy protein and tofu in association with breast cancer risk based on a case-control study.

© Copyright Soyinfo Center 2021

*Nutrition and Cancer* 60(5):568-76. *

• ***Summary:*** "Soy food and its constituents may protect against breast cancer, but the association between soy intake and decreased breast cancer risk is inconsistent. We evaluated the relationship between breast cancer risk and the dietary intake of soy protein as measured by total soy food and tofu intake. Histologically confirmed cases (n = 362) were matched to controls by age (within 2 yr) and menopausal status. High soy protein intake was associated with reduced breast cancer risk in analyses adjusted for potential confounders including dietary factors among premenopausal women (odds ratio [OR] = 0.39 in the highest quintile, 95% confidence interval [CI] = 0.22-0.93, P for trend = 0.03) and postmenopausal women (OR = 0.22, 95% CI = 0.06-0.88, P for trend = 0.16). We also found an inverse association between total tofu intake and breast cancer risk among premenopausal women (for total tofu intake, OR = 0.23 in the highest quintile, 95% CI = 0.11-0.48, P for trend < 0.01; for at least 1 serving of tofu as the main ingredient per day, OR = 0.26, 95% CI = 0.13-0.55, P for trend < 0.01). We concluded that increased regular soy food intake at a level equivalent to traditional Korean consumption levels may be associated with a reduced risk of breast cancer, and this effect is more pronounced in premenopausal women." Address: 1. Dep. of Preventive Medicine, College of Medicine, Hanyang Univ., Seoul, Korea.

1809. Lee, Cherl-Ho. 2008. Chongkukjang [Korean-style salted natto]. In: Kan Kiuchi, Toshirô Nagai, and Keitarô Kimura, eds. 2008. Natto no Kagaku: Saishin Jôhô ni yoru Sôgôteki Kôsatsu [The Science of Natto: A Comprehensive Examination of the Latest Information]. Tokyo: Kenpakusha. viii + 285 p. See p. 224-26. 22 cm. [Jap]

• ***Summary:*** Cherl-Ho Lee (PhD of Korea Univ., Seoul) kindly sent us his English-Language copy of this chapter. Cc = Chinese characters "1. The origin of Chongkukjang

"Chongkukjang (3 Cc) is a branch of Korean soybean fermented products (Cc). It is a bacterial fermented soybean food, similar to Natto of Japan, but different in the usage. Chongkukjang is made by rapid fermentation of cooked soybean to produce soybean paste (*Doenjang*) by mixing salt after the bacterial fermentation. Therefore, it is one of the fermented soybean condiments stemmed from the long history of soybean fermentation in Korea as classified in Figure 1.

Shi (Cc) is prepared by fermenting individual cooked soybean whole grain with bacteria, *Bacillus subtilis*, while Maljang is made by Meju, cooked and pounded soybean ball grown with mold, *Aspergillus oryzae*, outside and bacteria, mainly *Bacillus* species, inside. The term "Shi (Cc), the Chinese letter indicating fermented soybean, first appears in Jijiupian (3 Cc) written in Han period (Cc 206 B.C.-208 A.D.) of China. Bowuzhi (3 Cc) of Jin (Cc 265-420 A.D.) of China describes that Shi was originated from foreign country, and the letter is a dialect. Xintangshu (3 Cc) of Tang (618–807 A.D.) in China names Shi as a special product of Balhai or Bohai (2 Cc 688–826 A.D.), a nation founded by the refugees from defeated Kokuryo (3 Cc 37 B.C.–668 A.D.). Chi-Min-Yao-Shu (4 Cc) written by Jia-Si-Xie (3 Cc 550) of Late-Wei (2 Cc) in the 6th century, describes several methods of Shi preparation (Lee, C.H., 2001)

"It is generally recognized that Koreans were the first people to experiment with soybean fermentation, sparking the beginning of the soy sauce culture of the Orient. The history book of Wei (2 Cc) praises the fermentation skill of the Korean people (8 Cc). The techniques were transferred to Japan around 2-3 Century A.D. from Kokuryo. The Japanese term for soybean paste, Miso was originated in Korean language Maljang, an old term indicating fermented soybean products as shown in Figure 1.

"Masakurainbunsyo (5 Cc) written in Japan in 752, describes Miso as a dialect from Koryo (2 Cc), and called as Koryojang (3 Cc) (Lee, S.W., 1990). Although the term `jang (1 Cc)' is used for the fermented condiments in general in the Orient, in this classification it is the soybean products fermented with other cereals using Koji, mostly developed in Japan.

"Chongkukjang is termed as Yumshi (2 Cc) in the earlier Korean literatures like Samkuksaki (4 Cc) written by Kim Bu-Shik (3 Cc, 1075 -1151). The 18th century literatures like Sanlimkyungje (4 Cc, 1715) describe it as Jeonkukjang (3 Cc), reflecting the need for rapid processing of soybean paste during the war time of Byungjahoran (4 Cc). Food historians believe that the phonetic change from 'Jeonkuk (2 Cc)' to 'Chongkuk (2 Cc)' took place at that time. Another story is that the Qing (Cc) army used to carry the instant fermented soybean as military ration, so people called it Chonkukjang (3 Cc). What all these names imply is that this product was made for extraordinary situation, for example war time or famine conditions, for the urgent supply of nutritious savory food ingredient.

"2. Methods of preparation

"The first written record on the preparation of Jeonkukjang appeared in *Jeungbosan limkyungje* (3 Cc) written by Yoo Jung-Im (3 Cc) in 1765. Newly harvested soybean is cooked and covered with straw mat, and placed on the warm *ondol*, typical Korean stone floor heated by fire underneath, for 3 days until the mucous string is formed with strong fermented smell. It is mixed with decoupled and roasted soybean powder, and pounded in a stone mortar with the addition of salt, and sun dried. The mixing ratio of fermented soybean and roasted soybean powder is 2 to 1, and the amount of salt addition is determined by taste. The product appears to be in dried form, easy for storage and transport, and suitable for the military use. This process is slightly different from the method practiced today. Today, the process is very simple as shown in Figure 2. Soybean is cooked and covered with straw mat or cloth, and placed on

© Copyright Soyinfo Center 2021

the warm *ondol* for 3-4 days until mucous strings are formed. It is mixed with chopped ginger, chopped garlic and salt, and pounded slightly until the bean kernels are separated into halves, and stored in an earthen jar. Industrially, inoculation is made by adding pure culture of *Bacillus subtilis* or placing pieces of rice straw to cooked soybean. Rice straw is the source of Bacillus subtilis, which grow fast at 40ºC and becomes naturally dominating flora in the system (Lee H.C., 1995) The strong smell of the bacterial fermented soybean is partially masked by ginger and garlic, and turned to the characteristic Chongkukjang flavor. The spicy seasoning is thus prepared in 3-4 days, while ordinary soybean paste, Doenjang, which uses Meju as fermentation starter, takes over 6 months to complete ripening.

"3. Usage and function *Bacillus subtilis* produces strong proteolytic enzymes, and soybean proteins undergo rapidly partial hydrolysis into peptides and even to amino acids and ammonia in the short fermentation period of Chongkukjang. This process produces the typical Chongkukjang flavor, strong meaty and sharp smell. It is used for making Chigae, a stew of vegetables, meats, fish and shell-fish, same as Doenjang. Chongkukjang-chigae is one of the most favorite menu in Korea, especially for the aged group. The amount of Chongkukjang added to the stew is large enough to supplement protein to the diet significantly. The fermented bean halves floating and mixing in the vegetable stew gives healthy sign of the dish. The strong desire on Chongkukjang of old Koreans may be not only the sensory nostalgia, but the physiological demands for their better health.

"Recently scientists discover the health beneficial physiological functions of some components produced in Chongkukjang. The soybean peptides are inhibiting angiotensin converting enzyme (ACE), and thus expected to suppress the incidence of high blood pressure. The mucous substance in Chongkukjang is peptido-polysaccharides produced by *Bacillus subtilis*, and contains enzyme kinase which has fibrinolytic and immune-modulating activity. The isoflavonoides in soybean support estrogen hormone function and relieve the malfunction of human menopause (Lee C.H., 2004).

"It is not surprising to find that fermented soybean products have been used as medicine in many Oriental medicine subscription, such as those in Dongeuibogam (4 Cc), a Classic of Eastern Medicine written by Hur Jun (2 Cc) in 1611. Recently, the dried form of the bacterial fermented soybean, either in granules, pills or powder form, are sold as health food in Korea.

1811. Pettid, Michael J. 2008. Korean cuisine: An illustrated history. London: Reaktion Books. 223 p. Illust. (color). Maps. Index. 23 cm. [118 + 110 endnotes]

• ***Summary:*** This is the best book seen to date on this subject. "Korean words are transliterated into English using the McCune-Reischauer system and Chinese words by the Pinyin system." The book uses Korean words liberally, which we find very helpful. The many color photos on glossy paper also help to clarify the text. Contents: Daily foods. Ritual and seasonal foods. Regional specialties. Drinks. Foods of the royal palace. The kitchen space and utensils. Food in contemporary Korea.

Page 36: Rice mixed with beans (*k'ong pap*) was another way to stretch the rice supply; today it is common in many homes and restaurants. Black [soy] beans were generally used to make this dish. They were soaked overnight before being cooked with the rice. However, on the Harvest Festival (*Ch'usok*), the 15th day of the 8th lunar month, beans that are not quite fully ripened are added to the rice and cooked as is–to make the special holiday dish named *ch'ongdae k'ong pap.*

Pages 38-39, 101: The popular rice dish, Pipim pap [Bibim pap], probably developed from foods eaten by farmers when cooked rice (or other grains) was mixed with whatever vegetables were at hand. Nowadays, soybean sprouts (*k'ong namul*) are an essential ingredient.

Page 107, 109: In Pyongyang Province of today's North Korea, one of the most famous foods is *mandu* dumplings; in this area they are stuffed with beef, pork, kimch'i, [soy] bean sprouts, and the like.

Page 109: In Hamgyong Province, which occupies the northernmost reaches of the Korean Peninsula, the climate is harsh and the winter are long and cold. Rice is rarely grown here, but dry-field crops such as soybeans, millet and potatoes are grown in abundance.

The foods of northern Korea tend to be less spicy than those grown in the south. "Perhaps most important to the flavour of Korean foods are the seasonings made from soybeans: toenjang (soybean paste) and kanjang (soy sauce). Sprouts from soybeans (*k'ong namul*) are eaten as a side-dish or added to soups and stews..." (p. 40).

Note: We find it interesting that in this detailed book

© Copyright Soyinfo Center 2021

on Korean cuisine, no mention is made of *chungkukjang / chongkukjang* (Korean natto). This may be an indication that this food is no longer of much importance in Korean culture. Address: Asst. Prof. of Korean, Dep. of German, Russian, and East Asian Languages, Binghampton Univ., England.

1812. Pettid, Michael J. 2008. Korean cuisine: An illustrated history. Tofu (Document part). London: Reaktion Books. 223 p. [118 + 110 endnotes]

• ***Summary:*** This is the best book seen to date on this subject. Tofu is mentioned as follows:

Pages 41-42: Tofu (Korean: *tubu*) arrived relatively late in Korea, first becoming widely used during the early part of the Choson dynasty (1392-1897, i.e. late 1300s or early 1400s). The earliest Korean document seen that mentions tofu is the literary collection of Yi Saek, who lived 1328-1396.

Endnote 16 (p. 202): This collection is titled *Mogun-jip* [*Collected Writings of Mogun*] after his pen name, Mogun. "Yi was one of the leading Confucian literati of the late Koryo period and is appraised as one of the exemplary literary talents of the Koryo dynasty."

In Korea's dynastic records, an entry from 1434 states that an emperor from China's Ming dynasty (1368-1644) sent some serving women to the Choson court to prepare various foods; one of these was tofu. "The account states that all the dishes were harmonious and served beautifully and the means of preparing the tofu was even more exquisite."

Endnote 17 (p. 202): *Sejong Sillok* (*Veritable Records of King Sejong*), p. 66, 27b-28a (1434-12-24).

Note: This document contains the earliest date seen (1434) for tofu in Korea.

Of the many foods that the women brought to the Choson court from the Ming court, only tofu was singled out for praise in this particular entry. After this time, it is thought that dishes featuring tofu became common at the palace and then were disseminated throughout Korean society.

Pages 57-58: Korean soups can be classified into four broad categories. Stews, known as *tchigae* are thicker than regular soups, and are a common part of Korean meals. They are generally served as a shared side dish, rather than in individual bowls as soups typically are. "In general, *tchigae* are cooked and served in the same vessel, a glazed earthenware pot (*ttukpaegi*)." This earthenware pot, compared to a regular metal cooking pot, retains heat much better and enables the stew to continue cooking after it has been removed from the heat source.

One of the most popular Korean stews, *Toenjang tchigae*, is made with Korean miso (*toenjang*). Historically, there have been many different ways of preparing this stew throughout Korea and it remains a staple in Korean homes today. Basically, *toenjang* is added to water and boiled with one's choice of seasonal vegetables, seafoods, and often tofu, resulting in a thick, hearty stew that nicely complements rice and side dishes.

Page 107: In the chapter on "Regional specialties," under Pyongyang province (in North Korea) we read that special foods include a type of sausage named *sundae,* which "is made with pork entrails, clotted cattle blood, tofu, glutinous rice, and various seasonings." The contents are put into a casing, which is "tied at both ends before it is boiled. The sausage is then sliced and eaten with a seasoning of salt, chilli pepper, and black pepper."

Pages 113-14, 122, 124: The chapter on "Drinks" describes unfiltered rice wine (*makkolli* [like Japanese *doboroku*]) which was milky white, simple to make, and hence the drink of farmers and the common people. It was by far the most representative alcoholic drink of Korea, and was enjoyed by all classes at various times. Moreover, it goes well with warmed tofu topped with kimch'i [kimchi] and sesame seeds (*tubu kimch'i*)–a color photo of which is shown on p. 124.

Pages 130-31: The chapter on "Foods of the royal palace" states that great attention was given to foods and their preparation at the royal places of Choson (1392-1897) and Koryo (918-1392). There were many official boards and related positions. "For example, attached to the Board of Personnel (*Ijo*) were positions charged with the procurement of rice and the preparation of meals for the royal family." In addition, beyond the official posts, there were hundreds of palace women and slaves who actually prepared and served food to the royals. Indeed there were positions responsible for very specific tasks such as the preparation of tofu, liquor, tea and *ttok* (rice cakes [like mochi]; see photo of pounding rice, p. 36).

Page 171: The section on "Food in Korea today" discusses *pudae tchigae,* or military camp stew, which originated during the period after the Korean War. A color photo shows this hodge-podge of ingredients, which may include Spam, hot dogs, ramen noodles, tofu, rice cakes (*ttok*), vegetables and noodles in a spicy broth.

The "Recipes" section includes recipes for *Tubu chorim* (Spicy braised tofu, with "210 gm firm tofu {extra firm is even better}, sliced into pieces about 1 cm thick") and *Tubu kimch'i* (Tofu with kimchi, with 420 gm firm {or extra firm} tofu {1 block}, sliced into pieces about 1 cm thick, p. 196-97). Address: Asst. Prof. of Korean, Dep. of German, Russian, and East Asian Languages, Binghampton Univ., England.

1813. Pettid, Michael J. 2008. Korean cuisine: An illustrated history. Korean-style soy sauce, miso, and red pepper sauce (Document part). London: Reaktion Books. 223 p. [118 + 110 endnotes]

• ***Summary:*** This is the best book seen to date on this subject. There are many records of the early Korean kingdoms using soy products; for example a record of 683 CE states Korean-style jang (*toenjang*) and soy sauce

© Copyright Soyinfo Center 2021

(*kanjang*) were among the presents exchanged in a royal wedding (p. 40, endnote 15. See: Kim Pusik, *Samguk sagi* {"History of the Three Kingdoms"} translated into modern Korean, Yi Pyongdo {Seoul, 1996}, Vol. 1, p. 201).

The section on "Condiments and seasonings" (p. 42) begins: An old Korean proverb states, "Food is only as good as the *jang"* (sauces based on soybeans).

Korean cookery has a wide range of flavors which include the stronger flavors of soybean paste stew (*toenjang tchigae*) and *kimch'i.* Moreover, even among the soy sauces (*kanjang*) and Korean-style misos (*toenchang*) there is a tremendous range of varieties and regional specialties, with many distinctive flavors.

A work titled *Chungbo sallim kyonje* (Farm management, supplemented and enlarged), written in the early 1800s points out the importance of *jang.*

*"Jang* is the source of all flavors. If the taste of a house's *jang* is not good, even if there are good vegetables or flavorful meats, one cannot prepare good food. The household head must always keep in mind the fermentation of *jang,* and through this will be able to have well-aged and good *jang."*

Likewise, Yi Pinghogak (1759-1824) in her *Kyuhap ch'ongso* ("Encyclopedia for Women's Daily Life") discusses the best days to make *jang* and also the importance of having the *changdoktae,* the terrace upon which earthenware jars of soy sauce and other *jang* are kept, face in an auspicious direction, as determined by the yearly calendar.

The three main types of *jang* are *toenjang, kanjang* and *koch'ujang.* The suffix *-jang* refers to a fermented sauce based on soybeans; *toenjang* means 'thick' soybean sauce and *kanjang* means 'salty' liquid soybean sauce.

The basic ingredient used to make both these sauces is soybean koji (*meju*) which was traditionally made in the late autumn and allowed to ferment until past the lunar New Year, about 3 months in all. The blocks of *meju* were then soaked in large earthenware pots of brine to make *jang* and *toenjang.*

In Korea, there are three basic types of soy sauce (*kanjang*)*:* (1) a strong-flavored sauce with a dark color (*chin kanjang*), (2) a medium-flavored sauce with a light-brown color (*chung kanjang*), and (3) a weak-flavored sauce with a light, clear color (*mulgun kanjang*). Type (1) requires at least five years of fermentation, and because of its sweet flavor and dark color it is used for boiling, fermenting, or as a seasoning in medicinal rice (*yak pap*). Type (2) was traditionally used as a seasoning for vegetables or stews, whereas type (3) which was fermented for 1-2 years used mainly as a seasoning for soups.

Given the importance of soy sauce in Korea, it us no surprise that recipe books of the Choson

Joseon period (1392-1910) offer dozens of variations on the basic recipe. For example, *Sallim kyongje* ("Farm management") alone offers some 25 variations.

In each household, soy sauce was prepared with great care, and each step in the process was carefully followed according to the family tradition. If a daughter-in-law failed to match the preferred taste of the soy sauce in her husband's household, it was seen as a bad omen for the family. Many families even made small ritual offerings to the household gods when making soy sauce in order to ensure success. Other customs such as hanging gold-colored thread, red chili peppers, or traditional socks–all believed to repel malevolent spirits–around the earthenware pots of soy sauce were done to keep away malicious spirits.

During the period 1910-1945, when Korea was a colony of Japan, Japanese-style shoyu was introduced to Korea and mass-produced in factories. However the flavor of this new soy sauce did not match the tastes of the Korean people, so despite the rationing of crops for the military, Koreans continued to make their traditional soy sauce, thereby preserving this important element of Korean food culture.

A detailed discussion of Korean-style miso (*toenjang*) is given next, followed by a shorter discussion of *koch'ujang* which is made by mixing *meju* powder, glutinous rice or regular boiled rice, and red chilli pepper powder–and then fermenting the entire mixture. Address: Asst. Prof. of Korean, Dep. of German, Russian, and East Asian Languages, Binghampton Univ., England.

1814. Rennie, Frank; Mason, Robin. eds. 2008. Bhutan: Ways of knowing. Charlotte, North Carolina: Information Age Publishing, Inc. xii + 304 p. See p. 221, 229, 230. Illust. 24 cm. [30+ ref]

• ***Summary:*** Each chapter is on a different basic subject by a different author or person interviewed. In Section III, Chapter 26, titled "Food Crops in Bhutan," by Karma Lhendup begins with a definition of *Dru na gu,* the nine traditional food crops cultivated in Bhutan. The last of these is: "Pulses or legume crops such as *lebe* (soybean), *gakpu* (mung bean / green gram), *orey* (red kidney bean / *rajma*), and *baesrem* (peas)..." in the national language (Dzongkha) (p. 221). A table (p. 223) shows that each of the nine crops has a different name in the country's three other major languages.

"The immature peas and soybean pods are boiled and the inner part [the green beans] is eaten" (p. 229).

"The most important use of red kidney beans (*orey*) and soybeans (*lebe*) is processing them into *Lebe Yhitpa* by fermenting the half-boiled beans naturally in bamboo containers." The resulting fermented food "typically has a pungent smell and can be used to prepare varieties of curry and *aezay* [red chili paste, a mixture of chilli powder, cheese, tomato, onion, and salt (p. 228)]. *Lebe Yhitpa* is considered to be similar to natto of Japan and Chungkok-jang of Korea" (p. 229-30). Address: British Open Univ. [UK].

Phospholipid Technology and Applications. Bridgwater, England: The Oily Press. xii + 201 p. See p. 21-40, Chap. 2. Illust. 24 cm. Series: Volume 22 in The Oily Press Lipid Library. [38 ref]

• ***Summary:*** Contents: Introduction. Occurrence: Glycerophospholipids, sphingophospholipids. Phospholipid processing: Vegetable phospholipids (fluid {crude} lecithins, solvent technologies {membrane degumming, membrane de-oiling, acetone de-oiling, carbon dioxide de-oiling, alcohol fractionation, chromatographic purification}), animal phospholipids (egg phospholipids, milk phospholipids, marine phospholipids, brain phospholipids). Modification of phospholipids: Chemical modification (chemical hydrolysis, acetylation, hydroxylation, hydrogenation). Commercial uses (summarized in tables 2.10 and 2.11).

Figures: 2.1. Model of a biological membrane (from *Scientific American*).

2.2 Structure of diacylglycerophospholipids; X is residue from choline (PC), ethanolamine (PE), inositol (PI), glycerol (PG), water (PA).

2.3 Structure of sphingomyelin.

2.4 Vegetable lecithin processing (including crude soya lecithin, standard lecithin, modification (hydroxylation), acetylation, hydrolysis), fractionation (with acetone, or ethanol), and compounding (using emulsifiers, carriers, or fats and oils).

2.5 Egg yolk phospholipid processing principles (in order to get various products, such as egg yolk powder or yolk lipids).

2.6 Milk fat globule membrane (remarkable complex).

Tables: 2.1 Phospholipid content of biological materials (% of dry matter; soybeans 0.5, sunflower seeds 0.2, rice bran 1, egg yolk 17, salmon roe 8, milk 0.1).

2.2 Main phospholipid classes of commercial interest and their abbreviations: The two main classes are (a) glycerophospholipids and (b) sphingophospholipids. In class (a) are: phosphatidylcholine (PC), phosphatidylethanolamine (PE), phosphatidylserine (PS), phosphatidylinositol (PI), phosphatidylglycerol (PG), diphosphatidylglycerol (DPG). phosphatidic acid (PA), N-Acyl-phosphatidylethanolamine (NAPE). In class (b) are: ceramide phosphocholine (sphingomyelin).

2.3 Phospholipid composition in oil-free polar lipid extracts for commercial raw materials (%). Gives values for soya [soybeans], rapeseed, sunflowerseed, corn, egg, milk, salmon roe. For example, egg is the richest source of PC (74%) whereas soya has the lowest content of PC (22%).

2.4 Main fatty acid composition of phospholipid mixtures (%). Gives values for soya, rapeseed, sunflowerseed, corn, egg, milk, and salmon roe. For example, egg is the richest source of 16:0 (30%) compares with only 20% for soya.

2.5 Composition of commercial fluid soya lecithin (%). It contains 52% of 6 phospholipids, 6% glycolipids, 4% carbohydrates, 38% neutral lipids, and five fatty acids (palmitic acid 18%, stearic acid 5%, oleic acid 11%, linoleic acid 59%, and linolenic acid 7%).

2.6 Typical composition of a commercial de-oiled soybean lecithin (%). It contains 81% phospholipids, 10 glycolipids, etc.

2.7 Alcohol fractionation of soybean lecithin.

2.8 Chromatic systems for phospholipid fractionation / purification.

2.9 Lipid composition of commercial marine phospholipid products (%). Gives values for krill, fish processing by-products, and salmon eggs.

2.10 Commercial phospholipid products and their predominant use. 18 commercial products are listed. The uses are: Food, animal feed, industrial, cosmetics, pharma [pharmaceutical], and dietetics. For example: The main uses / applications of fluid soybean lecithin (oil containing) are animal feed, food, industrial, cosmetics, pharma. and dietetics. By contrast, de-oiled soybean lecithin fractions (PC 50-80%) are food, cosmetics, pharma, and dietetics.

2.11 Major companies employing a range of phospholipid preparations. The companies are: ADM (US), Solae (US), Cargill (Germany), Lipoid (Germany), Phospholipoid (Germany), Chemi (Italy), Lecico (Germany), Tsuji Oil Mill (Japan), Fresenius-Kabi (Sweden), Doosan (Korea), Nippon Oils and Fats (Japan), Biofer (Italy), Avanti Polar (USA), Belvo (Italy), Enzymotec (Israel), Lipogen (Israel), and Neptune (Canada). For each company is given: Website, country, and which of 13 commercial phospholipid products it sells. Address: Lecithos–Functional Lipid Innovation and Consulting, Freinsheim, Germany.

1816. Young, Jin Song. 2008. The food and cooking of Korea: Discover the great tastes of one of the world's great cuisines... Leicestershire, England: Hermes House, and imprint of Anness Publishing. 256 p. Illust. (color photos by Martin Brigdale). Index. 30 x 23 cm.

• ***Summary:*** An elegant book, with more than 800 color photos on glossy paper–plus 150 authentic recipes.

Doenjang (soya bean paste, p. 21, 38-41, 97, 174, 181, 213). Soy sauce (includes both dark and light, p. 21, 38, 41). Wheat noodles in soya bean soup (with "1 cup [whole] soya beans," p. 100). Soyabean sprouts (p. 53, 99, 126, 142, 194, 225). Soya bean paste (see *doenjang*).

One chapter is titled "Vegetables, salads & tofu" (p. 201+). Tofu (p. 53, 201). Tofu recipes: Tofu and stir-fried kimchi (p. 75). Pan-fried kimchi fritters (with "2 oz. firm tofu," p. 79). Steamed tofu and chive dumplings (p. 80). Braised tofu (with "1 block firm tofu, diced," p. 211). Spicy soft tofu stew (with "1 block soft tofu," p. 212). Soya bean paste stew (with ½ block firm tofu, p. 213). Vegetable and tofu cake with mustard dip (p. 214-15). Blanched tofu with soy dressing (p. 216). Stuffed pan-fried tofu (p. 217). Address: Owner of several Korean restaurants in Asia.

1817. Conlon, Michael. 2009. The history of U.S. soybean exports to Japan. *GAIN Report* (*Global Agriculture Information Network*) No. JA9502. 14 p. Jan. 20. [42 ref]
• ***Summary:*** An excellent, very readable historical summary. Contents: Introduction: The amazing soybean. The Auckland. Perry and the black ships. William Morse: USDA's plant explorer in Japan and the father of soybeans in America. U.S. Market development efforts in Japan. Recent activities in market development. End notes.

Page 7: "In the late 1940s, ASA began to look at international markets because of the sharp increase in domestic production and Japan offered terrific opportunities for U.S. producers. Japan began importing small quantities of U.S. soybeans in 1946, when it bought 3,441 metric tons. By 1955, that quantity had soared to 572,050 metric tons, making Japan the largest overseas market for U.S. soybeans. Nonetheless, there were issues such as high foreign matter content and the lack of understanding on the part of American growers about Japan's soybean needs (endnote 25). William Termohlen, the agricultural attaché in Japan at the time, believing that there were tremendous opportunities in Japan for U.S. soybeans requested that an ASA representative be sent to Japan to study the market. In late 1955, George Strayer, ASA's first executive officer, with funding from FAS, spent almost two months in Japan talking to soybean product producers and government officials. From his time in the country, Strayer became a major proponent for U.S. soybeans in Japan. In a 1955 edition of *Soybean Digest*, he announced to the American farmer that "Soybeans are the life blood of Japan. They are an absolute necessity, for they are the food of the people" (26).

"On February 7, 1956, ASA and FAS signed a cooperator agreement, allocating $100,000 in P.L. 480 proceeds to cover activities in Japan and Germany for one year (27). The first activities in Japan included funding a survey on quality of soybeans exported from the United States under the new grain grading standards for soybeans, sending a Japanese team to the United States, and establishing an office in Japan to carry out the program.

"Japanese manufacturers and associations were quick to realize the benefit of increasing domestic soybean consumption. In April, 1956, ASA entered into an agreement with several Japanese industry organizations to create the Japanese American Soybean Institute (JASI). JASI was composed of the leading Japanese soybean user organizations: soy oil/meal processors, producers of tofu, miso, and soy sauce, and the oil and fat importers and exporters. Expenses of the new office were borne jointly by ASA and the Japanese industry. Before JASI, there had been no such thing as a soy food association in Japan where producers of the various soy foods met to discuss common problems and areas of cooperation. Thus, JASI opened new channels of communication among Japanese involved with soybeans as well as among Americans and Japanese."

Page 9: "In 1957, ASA and FAS sponsored Dr. A.K. Smith of the USDA's Agricultural Research Service (ARS) to visit Japan to study soybean utilization. He found that only a limited amount of U.S. soybeans were used to produce soy foods (36). The following year, under a cooperative agreement between FAS, ARS and ASA, two Japanese scientists went to work with Dr. Smith at USDA's Peoria [Illinois] Labs for ten months to determine which U.S. soybean varieties were good for tofu and miso. The scientists identified two varieties, Hawkeye and Harosoy, and the Japanese industries started using these varieties of soybeans for food products (37). By the late 1950s, the image of soy food changed to 'wholesome and nutritious.'"

Page 10: "In 1965, ASA sponsored six technicians of the Japanese Margarine Makers Association to visit the Miami Margarine Company in Cincinnati, Ohio to study how to make margarine using soy oil (40). Upon their return, they made "Uni-Soya" margarine from soy oil, which was cosponsored by ASA, JOPA, and the Margarine Association. Uni-Soya margarine was distributed to consumers in Tokyo and Osaka and became the first margarine in Japan made from soy oil. Because of this project, soy oil use for margarine production significantly increased."

Page 11: "The 1973 U.S. soybean embargo, unfortunately, caused some anxiety in the strong relationship between the United States and Japan. Soybeans were in short supply in the middle of 1973, and as an inflation-fighting measure, on June 27, the U.S. Secretary of Commerce imposed an export embargo on soybeans, cottonseed, and various meal and oil products from these commodities. Less than a week later, on July 2, the embargo was lifted. The embargo actually did not affect the volume of soybean exports to Japan as the country imported a record volume from the United States in 1973. However, since Japan relied on the United States for this food staple (in 1973 the United States accounted for over 88 percent of Japan soybean imports) the embargo sent shock waves through the Japanese government and food sector.

"USDA took quick action to relieve Japan's feeling of vulnerability. In early 1974, Secretary of Agriculture Earl Butz took a trip to Asia and Japan to assure the Japanese that "we made a mistake" and that the United States would never embargo food products again and that we were a reliable supplier. Secretary Butz and the Japanese Minister of Agriculture Abe met in Washington, DC on August 12, 1975. The Butz-Abe Understanding grew out of this meeting, where the United States agreed to supply Japan with certain minimum levels of grains and soybeans that were discussed in the August 12th meeting. The annual amounts were 3 million tons of wheat, 3 million tons of soybeans and 8 million tons for feeding. In all three years of the Understanding (1976-78) the minimum levels were exceeded.

© Copyright Soyinfo Center 2021

"Every year since 1985, ASA Japan has hosted a Soybean Quality Conference to discuss customer concerns, provide the latest information on the quality of the new U.S. crop, and get the Japanese industry's insights and estimates of future needs. Around 200 participants, from crushers and traders to food manufacturers and the media, attend each year. The Conference in Japan has proved so successful that ASA now holds them in South Korea, China and Taiwan."

Figures show: (1) Bar chart of U.S. soybean exports to Japan (1,000 metric tons). They grew from 3.4 in 1946, to 572 in 1955, to 1,021 in 1960, to 2,001 in 1968, to 3,126 in 1972 to a peak of 4,646 in 1983, falling to 3,325 in 2007.

Photos show: (1) A farmer on a treadmill in a canal causing water to be lifted from the canal to irrigate a field of crops (Source: The Dorsett-Morse Expedition, at USDA National Agricultural Library). (2) A horse pulling a plow in a wet field as two farmers work with it. (3) George Strayer and his wife en route to Japan in 1955. (4) ASA Kitchen on wheels in Japan. (5) U.S. Soybean Seminar at the U.S. Trade Center in Tokyo.

A table shows the names ASA Japan country directors and the years each served. 1956-69 Shizuka Hayashi. 1972-73 Scott Sawyers. 1973-74 Howard Ackers. 1974-78 Lloyd Reed. 1978-83 Gil Griffis. 1983-87 Gunnar Lynum. 1987-93 Lars Wiederman. 1994-98 Kent Nelson. 1998-01 James Echle. 2001-02 Keiichi Ohara. 2002-08 Takehiko Nishio. 2008 Oct. 24-present LaVerne Brabant; he was named by the U.S. Soybean Export Council. Address: Agricultural Trade Officer, FAS, Japan.

1818. Longone, Janice B. 2009. The remarkable life of Ilhan New after he left La Choy Food Products Co. in about 1930 (Interview). *SoyaScan Notes.* Jan. 23. Conducted by William Shurtleff of Soyinfo Center.

• ***Summary:*** The Korean gentleman (Ilhan New) and the American gentleman (Wally Smith) were students at the Univ. of Michigan, where they became friends. Wally Smith's family had a grocery store, and they were looking for local fresh food. So New and Smith decided to grow mung bean sprouts. That is how La Choy started. They worked together for many years. In 1925 he married an American-born Chinese woman, who later became a physician

Then [in about 1930] Mr. New sold his share in La Choy to Smith, returned to Korea [the land of his birth] and he became a multi-millionaire. In Korea he made money in some sort of business, such a importing or engineering company. His business became very profitable and he started the New Han Engineering High School; its goal was to teach Koreans to be good in modern things like science, engineering, and business practices. Students could attend his university free of charge. "When he died–and this is the thing that grabs me–he left all of his money to the Korea Social and Educational Trust Fund, except for the money he left to his granddaughter, to get a college education."

There is a biographical dictionary of Korean leaders in which there is an entry for him. Jan will try to find a more specific reference. Address: Curator, William L. Clements Library, The Univ. of Michigan, 909 S. University Ave., Ann Arbor, MI 48109-1190. Phone: 734-764-2347.

1819. Malnutrition Matters. 2009. Alpro Soya & Malnutrition Matters food technology solutions: Brief overview 2009–Budget and plans for 2009. Ottawa, Ontario, Canada: Malnutrition Matters. 16 p.

• ***Summary:*** See next page. Page 2. New VitaGoat Installations–2008. Africa: Mozambique–1. Zimbabwe–1. South Africa–2. Zambia–2. Congo–5. Kenya–1. Asia: India–6. North Korea–20. Thailand–1. USA -1.

Page 3. VitaGoat Sites Status–January 2009. A map shows Africa, the Middle East, and South Asia. Blue triangles show in which countries 84 VitaGoats have been installed between 2004 and 2008. Red ovals show in which countries 45 VitaGoats have been committed to by 2009.

Page 4: Projects in Africa:

Zambia projects are well established (Africare and World Vision)

Congo project (United Methodists / WISHH) is being installed

New projects in Zimbabwe and South Africa

Mozambique (Humana) now has two VitaGoats

Most recent installations have been done by MM's partner Eden Foods (based in South Africa). A photo shows one African man seated on a VitaGoat while another pours soaked soybeans into the hopper which leads to the grinder.

Page 5:

Projects in Asia

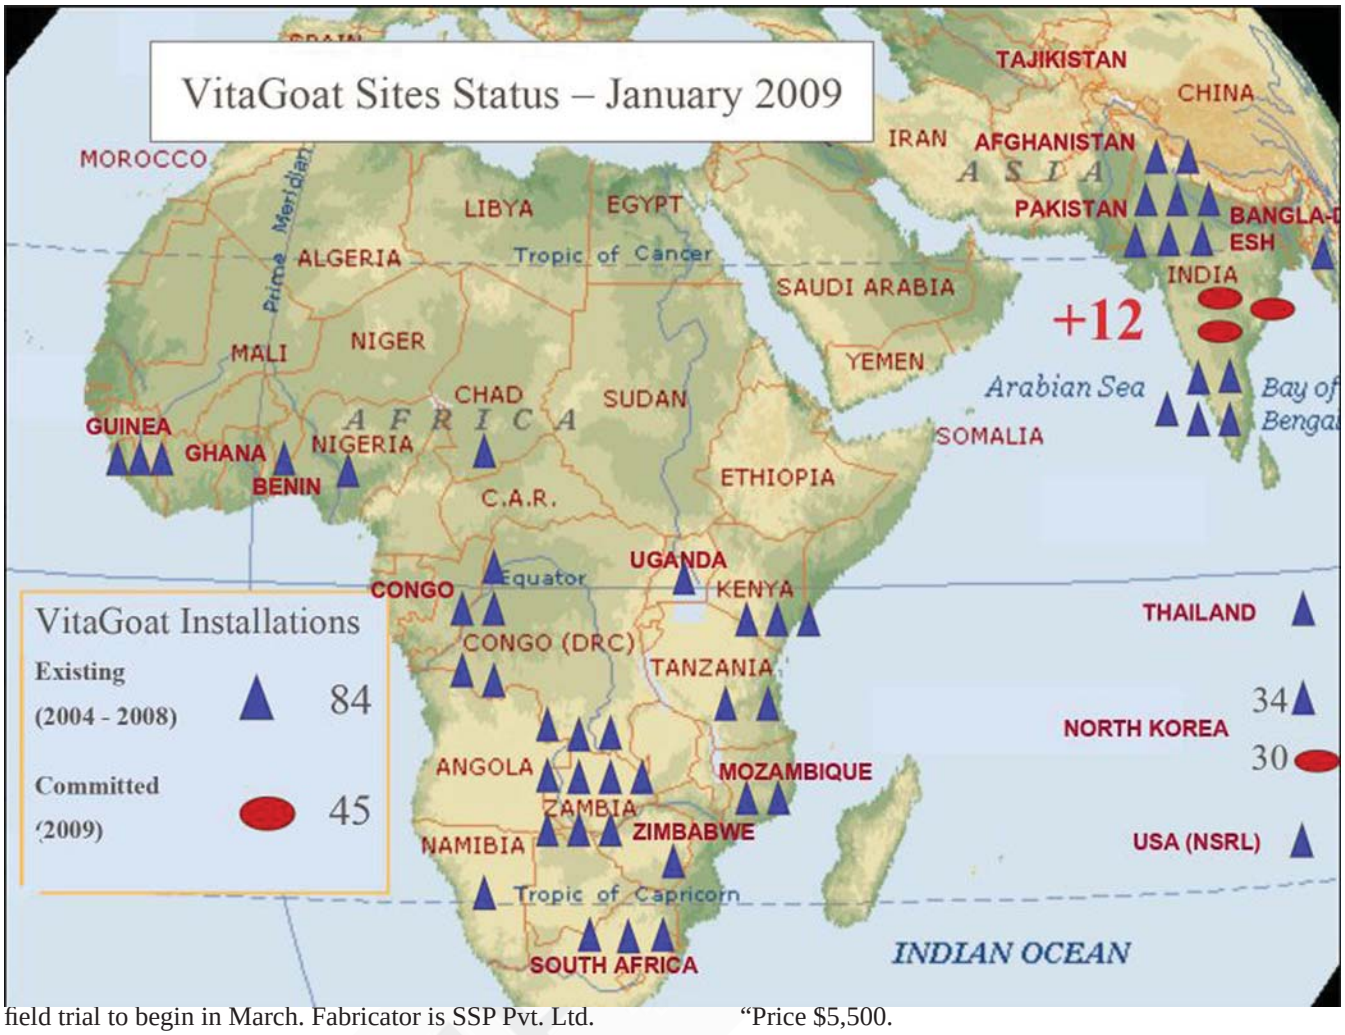
North Korea–First Steps project: 34 VitaGoats installed, 30 on order (including SoyCows). Acute malnutrition in many areas of the country. Over 50,000 people benefit from the soymilk daily (20 earlier VitaCows are also present).

"Thailand–VitaGoat recently installed in Karen refugee camp near border with Myanmar; additional installations likely.

A photo shows: "Karen refugee children receiving soymilk in Mai La Oon refugee camp, near Mai Sarang, Thailand."

Page 6: Projects in India:

"World Bank project in Orissa: 20 VitaGoats in total, 8 installed now. Sustainable project to provide midday meals fortified with micronutrients to 15,000 students (micro-finance, school budget).



"Child Haven/Donner project: 8 VitaGoats–third phase in progress

"Informal alliance with GAIN (Global Alliance to Improve Nutrition) is proving helpful.

"Other new project opportunities include Naandi Foundation and Maharashtra government.

"SolarFlex Dryer: Now also manufactured in India, first

© Copyright Soyinfo Center 2021

field trial to begin in March. Fabricator is SSP Pvt. Ltd.

Page 7: "Other Milestones–2008 (not project specific).

"SoyCow `M' hybrid concept completed; first systems with electric grinders shipped to North Korea in 2008.

"SoyCow `E' (fully electric) also complete–electric boiler and electric grinder; first 5 systems shipped in January 2009.

"SolarFlex Dryer designed, built and tested; tech transfers to South Africa and India well advanced.

Page 8: "SoyCow `M' (VitaGoat hybrid) Newly developed configuration for installations with reliable electricity.

"Output soymilk and derivatives only.

"Electric grinder instead of cycle grinder.

"Hourly output 35L.

"Equipment cost approx. US $3,900 (same as standard VitaGoat). A photo shows this system. "Tofu box included but not shown in photo."

Page 9:

"SoyCow `E' (fully electric).

"Electric boiler instead of multi-fuel boiler.

"Electric grinder.

"Hourly output of 40 L.

"Price $5,500.

A photo shows this system. "Tofu box included but not shown in photo.

Page 10: "Comparison of systems." A table has 4 columns. Food produced. SoyCow E. SoyCow M. Vitagoat. The rows are: "Soymilk (including tofu, yoghurt, etc).

"Vegetable and fruit juices, purees & sauces

"Coarse flours (cornmeal, rice, soy, wheat). Peanut butter. Ground beans. (coffee, roasted soybeans)

"Electricity required

"Capacity [in liters/hour]

"Approximate price (+ taxes, shipping and duties).

Page 11-13: SolarFlex Dryer–2008.

Page 14: "Review of plans for 2008 / 2009:

"Double the estimated beneficiaries from 20,000 to 40,000. Beneficiaries increased to over 60,000.

"Increase corporate sponsorship to support enlarged programs; SolarFlex. Dryer funding effort underway–positive feedback already received. SSP has agreed to fund 50% of a $60,000 pilot project. 2 dryers to be installed in Orissa under World Bank project in 2009.

"Complete tech transfers for SolarFlex dryer to African, Indian and Colombian (FUPAD) partners; first locally built

© Copyright Soyinfo Center 2021

kits to be installed. African and Indian tech transfers well underway–local systems to be installed in India in Feb/March. FUPAD transfer did not materialize.

"Possible SolarFlex Dryer spin-off to profit-making company to enhance MM's corporate sustainability. SolarFlex Inc incorporated in June, 2008 (25% of equity owned by MM)

"Install 40 additional VitaGoats / SoyaGoats in sustainable projects worldwide.

"Done! (SoyCow E and M instead of SoyaGoats).

Page 15: "Review of plans for 2008 / 2009 [continued].

"Successfully implement World Bank Orissa project, including health study (completion 2009). Project well underway with 8 installations, but some delay.

"Obtain endorsement(s) from one or more State governments in India for VitaGoat school feeding programs. Done for Orissa; pilot project approval in Maharashtra.

"Initiate VitaGoat projects in Guatemala, Colombia and elsewhere in Latin America. Not done to date.

"Initiate projects in Southeast Asia (Cambodia) and Ghana. Thailand project initiated, Ghana expected in first half 2009

"Explore other technology transfers. Lower cost VitaGoat design project underway in India.

1822. Shurtleff, William; Aoyagi, Akiko. comps. 2009. History of miso, soybean jiang (China), jang (Korea) and tauco (Indonesia) (200 BC-2009): Extensively annotated bibliography and sourcebook. 2 vols. Lafayette, California: Soyinfo Center. 1,378 p. Subject/geographical index. Printed 16 April 2009. 28 cm. [4362 ref]

• ***Summary:*** A history of the many types miso and its relatives, worldwide.

Miso, or "fermented soybean paste," is one of East Asia's most important soyfoods. Miso is an all-purpose high-protein seasoning, which has no counterpart among Western foods or seasonings. Made from soybeans, rice or barley, and salt, its smooth or chunky texture resembles that of soft peanut butter. It comes in a wide range of warm, earthy colors ranging from light yellows to rusty reds, rich chocolate browns, or loamy blacks. Each miso has its own distinctive flavor and aroma, which for the darker, more traditional varieties is savory, and sometimes almost meaty,

© Copyright Soyinfo Center 2021

while for the lighter-colored types is subtly sweet and delicately refreshing. Miso's range of flavors and colors, textures and aromas, is at least as varied as that of the world's fine wines or cheeses. Address: Soyinfo Center, P.O. Box 234, Lafayette, California 94549. Phone: 925-283-2991.

1825. Illinois Soybean Association. 2009. Soybean history at a glance (Website printout, part). www.ilsoy.org/_dl/Kids/Sixth_Grade_History_as_a_Glance2.pdf Retrieved May 29.
• ***Summary:*** This is the #1 worst 1-page history or chronology of the soybean we have ever seen. Professionals on the subject have pointed this out to the Illinois Soybean Board and they have chosen to disregard the suggestions. So here goes with some incorrect, undocumented, and false myths under the title: "Soybean history at a glance."

"A historical chronology of the soybean's migration from Asia to modern-day use in America:

"An ancient Chinese legend tells that the wild soybean's nutritious properties were first discovered by a band of traveling merchants.

"2838 B.C. Chinese emperor Sheng-Nung [sic, Shen-Nung] writes Materia Medica–the first written record of soybean cultivation. In that record, soybeans were noted as being valued for their medicinal properties.

"Soybeans were first cultivated in northern China. From there, use spread into Japan, Korea and the rest of Southeast Asia."

"The soybean is mentioned in medical records from China, Egypt and Mesopotamia that date from 1500 B.C. or earlier. In ancient times, moldy and fermented substances from soybeans were commonly used as primitive antibiotics to treat wounds and reduce swelling."

The rest is not so bad, but there is no mention of The Book of Odes, of Samuel Bowen, etc.

To get to this page from the home page click: Classroom materials > K-6 Materials > Sixth grade. How's that for a strange view of the importance of history!

1826. Kim, Tae-Woon; Lee, J.H.; Kim, S.E.; Park, M.H.; Chang, H.C.; Kim, H.Y. 2009. Analysis of microbial communities in doenjang, a Korean fermented soybean paste, using nested PCR-denaturing gradient gel electrophoresis. *International J. of Food Microbiology* 131(2-3):265-71. May 31. [36 ref]
• ***Summary:*** "Doenjang is a traditional Korean fermented soybean paste that provides a major source of protein. The microbial diversity of 10 samples of doenjang (5 commercially manufactured products and 5 homemade products) was investigated using nested PCR-denaturing gradient gel electrophoresis (DGGE). In the first step, the nearly complete 16S rRNA and 18S rRNA genes were amplified using universal primers... The nested PCR-DGGE technique was used for the first time in this study to assess a microbial community in doenjang and proved to be effective in profiling microbial diversity." Address: 1-3. Inst. of Life Sciences & Resources and Graduate School of Biotechnology, Kyung Hee Univ., Yongin 446-701, Republic of Korea.

1827. Simon, Karen. 2009. Optimism abounds: Higher living standards create demand for soy in China. *Iowa Soybean Review* (*Iowa Soybean Association, Urbandale, Iowa*) 20(7):14-15. Spring.
• ***Summary:*** "China is the No. 1 customer for U.S. soybean growers' crop, and by far the largest importer of soybeans in the world. Since 2003, China has accounted for more than 45

© Copyright Soyinfo Center 2021

percent of the world's soybean imports... and it appears that China's demand for soybeans will only increase with time.

"Feed production [in China] has increased an average of 16 percent each year for the past 17 years."

"While the total population of China will continue to increase slightly, the urban population in China has increased dramatically from 17.9 percent of the total population in 1978 to 44.9 percent of the total population in 2007."

A bar chart gives the "World's largest soybean importers" (from the entire world) in million metric tons. They are: China 37.82, EU-27 5.10, Japan 4.01, Mexico 3.65, Argentina 2.95, Taiwan 2.15, Thailand 1.73, Republic of Korea 1.20, Turkey 1.20, Indonesia 1.10, Iran 1.05, Egypt 1.00, Israel 0.55, Malaysia 0.47, Syria 0.43, and Norway 0.42. China imports more soybeans than all the other nations on this list combined!

1828. Bernard, Richard L. 2009. Re: Update on work with Gardensoy varieties of edamame. Letter (e-mail) to William Shurtleff at Soyinfo Center, July 7. 3 p.

• ***Summary:*** "Six Gardensoy varieties were released in May 2000 (Gardensoy 11, 21, 22, 31, 41, and 42) and the seven more were released in May 2002 (Gardensoy 01, 02, 12, 23, 24, 32, and 43). These were open releases, available to anyone with no restrictions. I have sent out free trial seed packets each year since to any gardener wishing to plant them. These were small packets with about 50 seeds each, enough to plant a 8 to 10 foot trial row and were provided at no charge.

"I filled requests from about 200 gardeners in 2008 (With an average of 5 varieties to each gardener, this totaled about 1,000 packets.) I have already sent seeds to over 120 gardeners in 2009. A few years ago these varieties were sold by one seed company (Rupp Seeds, Wauseon, Ohio) but they dropped them after one year because of low demand.

"The 13 varieties have a good range in maturity (over 30 days) from Maturity Group 0 to 4 (the first digit of the variety number), and it is wise to plant several to spread out harvest time. The main difference between these varieties and the typical grain varieties grown in this country is the larger seed size with only slightly lower yields. Their advantage over Asian vegetable varieties is higher yield and better seed quality in our environment. They are generally more shatter-resistant, more lodging resistant, and more disease and insect resistant than typical Japanese and Korean vegetable varieties. They have Japanese or Korean vegetable varieties in their ancestry from which they get their larger seed size but also have American grain varieties in their parentage from which they get their better adaptability to our growing conditions."

With this e-mail, Dr. Bernard sends three attachments that he has written: (1) Garden-type vegetable soybean varieties (4 pages), which includes two tables giving details on each variety. (2) Growing, harvesting and cooking Gardensoys (1 p.), containing practical information for those receiving packets of the soybeans. (3) New garden-type soybean varieties (2 p.), with general information and a table giving details on the Gardensoy varieties and comparing them with two grain-type soybeans and 4 other large-seeded varieties.

Talk with Dr. Richard Bernard. 2009. July 4. Breeding and distributing Gardensoy varieties has been one of his main activities and hobby since his retirement from the University of Illinois as a soybean breeder; he pays the postage on the seeds (about $500 a year) out of his own pocket–so it is a work of love. He also dances three nights a week. From the year 2000 to 2007 he sent out about 500 packets a year of Gardensoy soybeans to roughly 100 gardeners who requested them. In 2008 he sent 1,000 packets; five packets to each of 200 gardeners, 50 soybeans per packet. People learn about these free soybeans from newspaper articles, a posting on the National Soybean Research Laboratory (NSRL) website at the university, etc. The university sent out a little news release article to the news media on the Gardensoy soybeans Occasionally a journalist will visit Dick at the farm and write a newspaper story about his work and the availability of Gardensoy. His concern recently has been too much publicity. About one-third of those who request free Gardensoy soybeans reply to Dick's request for comments. Almost all of these comments are very favorable; people generally like edamame.

Each Gardensoy variety has a Japanese or Korean vegetable-type in their ancestry. Gardensoy 41 is his favorite one to eat; it tastes best, has the largest seed size and it peels out of the pod better. He had never bred any large-seeded soybeans before he started breeding Gardensoy. His plan is to register each of the Gardensoy varieties that he sends out, but he hasn't done that yet. The Agronomy Society has a new periodical titled *Journal of Plant Registrations.* These varieties have improved agronomic characteristics compared with earlier Asian vegetable-type soybeans. In the 1960s, Iowa State Univ. did a lot of breeding of vegetable types, with C.R. Weber being the USDA soybean breeder there. When people request Gardensoy varieties, Dr. Bernard decides what varieties to send them based mainly on the latitude at which they will be growing them. He sends five varieties so as to spread out the harvest season over about 30 days. If all are planted at the same time in May, the earliest one is about 30 days earlier than the latest one. He thinks that most of the people who request Gardensoy varieties are non-farmers but gardeners, so he sends a sheet of growing instructions.

Dr. Bernard likes to take his Gardensoy soybeans (ready to eat, in the pods) to parties and local ballroom dances year-round. He has a sign that puts in front of the bowl of edamame that says, "Don't eat the shells." Some people just love to eat them; those that don't, don't say much. The one group that won't try them or doesn't like them are soybean

© Copyright Soyinfo Center 2021

farmers. They say, "I've eaten 'em off the wagon [uncooked] and I know what they taste like." He says, "If you ate corn off the wagon, what would that tell you about sweet corn." People in the Midwest already know that you don't eat soybeans. "When I tell city folks here that I work with soybeans, I know what they're gonna say next–I can almost put it to music. 'Oh, they *sure* make a lot of things out of soybeans.' Paint, plastic, automobiles. When I say something about eating them, they get a bad taste in their mouth. It's too bad, because its an excellent vegetable and good tasting. I enjoy them every day." He cooks then freezes extra edamame in the pods, then, during the rest of the year, thaws them and eats them either as edamame (in the pods, about half of the time) or shelled (as in salads). Dr. Bernard has had trouble at the University of Illinois getting his colleagues interested in eating whole soybeans, where you just cook 'em and eat 'em. They are more interested in extracted protein and processed foods.

Dr. Bernard has grown increasingly fond of edamame as a food; he sees it as a "food of the future." Address: Prof. of Plant Genetics (Retired), Dep. of Crop Sciences, AW-101 Turner Hall, Univ. of Illinois, Urbana, IL 61801-4798.

1829. Han, Andrew. 2009. Dry roasted soybeans in Korea (Interview). *SoyaScan Notes.* July 18. Conducted by William Shurtleff of Soyinfo Center.

• ***Summary:*** In Korea, dry roasted soybeans are called *kong* [also written *k'ong*]. However, they are midway between being dry roasted and oil roasted soybeans. Rather, whole dry soybeans are typically stir-fried in a wok with a little oil and salt, then eaten as a snack like peanuts.

Another variation on this basic theme is called *Kong Jang*–which Andrew's mother makes: Place whole dry soybeans in a small wok with soy sauce, sugar, and sesame oil. Stir-fry slowly over low heat, stirring constantly, for about 30-40 minutes–until the soybeans become softer and are well cooked. Address: Owner, Elmwood Stationers, 3643D Mt. Diablo Blvd., Lafayette, California 94549.

1830. Choi, Duk-Kyung. 2009. Daedueu kiwonkwa jang, shi, mit dubueu bokeube kwanhan jaekeomto [Reexamination of the origin of soybean and the distribution of soybean sauce, soybean paste, and dofu: From the documentary and excavated data from ancient China]. *Yoksa Minsokhak* (*History and Folklore*) 30(7):363-427. July. [69 ref. Kor; eng]

• ***Summary:*** The summary in English states: Soybean, which is being called the 'Food of the Future,' has had a close relationship with our dietary lives, and has been grown in the Korean peninsula. Apart from this importance of soybean, however, we have not been able to explain its origin, let alone the origins of its related processed foodstuffs.

Renshus (2 Chinese characters) in the era of Xizhou have the same origin with rongshus in the northeast region, and from the record that Jihuangong, having possessed rongshus after subjugating Shanrong, distributed them all over the world, we can verify that the soybeans in the Huabei region are derived from northeast region. The term Gaolidou, showing up in the beginning part of *Qiminyaoshu*, also tells us that northeast region is the main cultivation region of soybeans. The distribution scale of soybeans in the era of Han dynasty can be found from the excavation of Luoyang tombs. The buried earthenwares have on their sides the words like 'A ten thousand bags of soybeans,' 'meat sauce,' or 'soybean sauce.' This reveals the wish for a good soybeans harvest, and that soybeans as processed foodstuffs had already been widely used. In fact, according to Shiji, high-profit food in big cities of the time include vinegar, soybean sauce, malted wheat and soybean malt. This means that the demand for processed foodstuffs like soybeans, soybean sauce and soybean malt was expanded mainly in a certain class of people in cities. This expansion in the demand for soybeans was brought by the development of the processing tools which varied the uses of soybeans.

The origin of the fermented sauce made from soybeans can be witnessed in shujiang, appearing in Wushierbingfang (5 Cc), written in 3rd century B.C. It is supposed that it was originally used as a material for medicine, but gradually came to be used for food. Qinjian and Erniannuling (4 cc) are showing that government officials or ordinary people working in government offices are issued with soybean sauce when traveling on official business, giving a good evidence of the popularization of soybean sauce at the time. It is of high possibility that high officials are issued with the sauce made from fragrant and tasty soybeans, and the lower officials and ordinary people with the sauce made from barley or meat, which is much easier in making. But there is little probability that soybean sauce and soybean malt were widely distributed to ordinary people and the subordinates in the era of Han dynasty. Entering the Wei and Jin Era, however, we can find that soybean sauce has been widely distributed among the people in rapidity, from the fact of the large-scaled production of soybean malt and from Qiminyaoshu's attention to the cooking methods for soybean malt or soybean sauce, which is all made from soybeans.

Soybean curd, another processed foodstuff from soybeans, makes its first philological appearance in Wudai (2 Chinese characters). Recently, however, the origin of soybean curd became the subject of discussion again, by the excavation of a picture on a huaxiangshi in the 1st Dahuting (3 Cc) tomb, Mixian, Henan province, which seems to be describing the soybean curd-making process. Some support, arguing that this has the same making process with that of today, the theory of the invention of soybean curd in the era of Han dynasty by Liuan (3 Cc), and some others argue that that pertains to one of the liquor-making processes, all inviting a fierce controversy as to the truth. The problems, or the focuses of the discussion, are whether any subjective

© Copyright Soyinfo Center 2021

conjecture was added in the process of copying the picture carved on the stone, and whether the soybean curd.

Cherl-Ho Lee (2016, p. 5) states: Chinese history books and literature indicate that, since the Bronze Age, soybean cultivation had been concentrated in the region of Northeast Asia, in particular, Manchuria and the Korean Peninsula.

Note: The Bronze Age in Northeast Asia, which came after the Neolithic period, began around 1200 BC (Lee 2016, p. 4-5). Address: Prof., Dep. of History, Pusan National Univ. [Pusan, Korea].

1831. Malnutrition Matters. 2009. Food technology solutions (Website printout–part). www.malnutrition.org 1 p. Retrieved Aug. 30.

• ***Summary:*** This is one of the most interesting and innovative organizations working with soyfoods in the world today. Low-tech and appropriate technology systems, that operate with or without electricity, make soymilk, tofu, soy yogurt, soy coffee, peanut butter, and related foods at very low cost and high efficiency. Congratulations to Frank Daller, his team, and his overseas partners.

Contents: Home. Partners and sponsors. Background: Foods and malnutrition. Technology / expertise. Personnel / Associates. VitaGoat. SoyCow. SolarFlex Dryer. Projects: VitaGoat projects in Africa: KwaZula Natal, South Africa, Uganda, Zambia, Kenya, Tanzania, Namibia, Guinea, Chad, Mozambique; Also India, North Korea. Contact us. Address: 498 Rivershore Crescent, Ottawa, ON K1J 7Y7, Canada. Phone: 1-613-742-6888.

1832. Daller, Frank. 2009. Chronology of work with soy and Malnutrition Matters worldwide, especially soymilk and development of the VitaGoat (Interview). *SoyaScan Notes.* Aug. 31. Conducted by William Shurtleff of Soyinfo Center.

• ***Summary:*** 1951–Born in Bavaria, Germany.

1956–Emigrated to Toronto, Canada.

1989–Began occasional volunteer work with Child Haven International, a Canadian charity active in India.

1991–Introduced to Raj Gupta by Child Haven, which was considering doing a trial with SoyaCows at their children's homes in India.

1991–Saw first prototype of SoyaCow at Raj Gupta's house. He was then working as a research scientist with the Canadian government and moonlighting on soymilk processing with Grant Wood, a technologist also with the Canadian government.

1992–Moved to Ottawa, invested some money in ProSoya Inc., and began working as vice-president to complete technology development and begin commercial phase of operations.

1993–First beta models of SoyaCow–made in Canada sent for field trials at Child Haven homes in India.

1993-94–Began to develop technology transfers with Indian company SSP and Russian company ASSOY. Gives equipment design and know-how to foreign partner to make equipment for ProSoya and for the partner to sell (in their own country) after paying a royalty to a local NGO (Child Haven in India).

1993–ProSoya continued development of larger systems including continuous process soymilk plants.

1994–Became President of ProSoya Inc.

1997–Resigned and sold my shares in ProSoya Inc.

2000–Founded non-profit organization Malnutrition Matters (MM) with partner Brian Harrigan. Objective was to develop small-scale food processing systems including soy, for developing countries. By this time, ProSoya had almost stopped promoting the small SoyaCows, since the business was too small compared to larger commercial systems.

2001-03–MM developed VitaGoat system for non-electric production of soymilk and other foods.

2003–First three "beta" models of VitaGoat, built in Canada, were delivered to Africare projects in Guinea, Chad, and Mozambique.

2005–Transferred VitaGoat technology to G.D. Machines in India.

2007–Brian Harrigan left MM to work with Africare in Zambia for two years.

2007–MM won a Laureate Award from the Tech Museum of Innovation in San Jose [Silicon Valley], California. It was an honor without money.

2007–Alpro, N.V. of Belgium began sponsoring the VitaGoat. [Philippe Vandemoortele introduced Frank to Alpro after Philippe had ceased to be active in Alpro].

2008–MM Won World Bank Development Marketplace competition [project design with local partner] for VitaGoat school feeding project in Orisssa, India. With the funds from winning, MM developed the project in India.

2008–Developed new lower-cost version of SoyaCow (named SoyCow) with separate electric grinder and pressure cooker and lower-cost press, and with option of multi-fuel boiler used by all VitaGoat systems. [Note: Raj Gupta had not used the name SoyaCow for years].

2009 Aug.–Currently there are over 90 VitaGoats in operation worldwide. The greatest number [about 40] are in Africa, followed by South Asia and North Korea. Others in Thailand and Brazil, plus demo systems in–Europe, U.S. and Canada.

With each system that is installed, the cost of the equipment, shipping, installation and training fees are provided (as a commercial transaction) by a partner organization–typically a non-governmental organization (NGO) or a government sponsored organization–but rarely an individual businessperson.

For more details see the very interesting Malnutrition Matters website at www.malnutrition.org. Address: Founder, Malnutrition Matters, 498 Rivershore Crescent, Ottawa, ON K1J 7Y7, Canada. Phone: 613-742-6888.

1833. Ketzenberger, Jolene. 2009. On a Korean kick: diners are developing a taste for Asian cuisine. *Indianapolis Star* (*The*) (*Indianapolis, Indiana*). Sept. 16. p. C1, C3.
• ***Summary:*** Chris Choi, a native of Korea and graduate of Michigan State University, bought H2O Sushi and increased the Korean influence.

"Ingredients that define Korean cuisine" include: Bean sprouts (both mung and soybean). Coarse red pepper flakes. "Miso: Fermented soybean paste with an intense flavor; for a milder version look for 'doenjang' on the label."

"Red pepper paste [*gochujang*]*:* A key ingredient in sauces and kimchee; look for it in Asian markets." Address: Star reporter.

1834. Jeong, Woo Ju; Lee, A.R.; Chun, J.; Cha, J.; Song, Y.S.; Kim, J.H. 2009. [Properties of cheonggukjang fermented with *Bacillus strains* with high fibrinolytic activities]. *J. of Food Science and Nutrition* 14(3):252-59. Sept. [22 ref. Kor; eng]
• ***Summary:*** "We previously isolated *Bacillus strains* with high fibrinolytic activities (FAs) from cheonggukjang prepared by traditional ways. To test their potential as starters for cheonggukjang, soybean was fermented for 72 hr at 37ºC with each isolate and a control lab strain: B. subtilis CH3-25 (BS3-25), B. amyloliquefaciens CH51 (BA51), B. amyloliquefaciens CH86-1 (BA86-1), and B. subtilis 168 (BS168, control, lab strain). Viable cell numbers of all cheonggukjang samples rapidly increased... The highest increase in the TPCs (total phenolic counts) was observed in cheonggukjang fermented with BA86-1 while the least was that fermented with BS168." Address: Div. of Applied Life Science (BK21), Graduate School, Gyeongsang National Univ., Gyeongnam 660-701, Korea.

1835. Unterman, Patricia. 2009. To Hyang gives L.A. competition. *San Francisco Examiner* (*The*) (*California*). Oct. 2. p. A20.
• ***Summary:*** "Urban legend has it that the best Korean restaurants on the West Coast are in Los Angeles." But To Hyang in San Francisco is "one of the most remarkable restaurants I've come across in years."

"This almost invisible little store front [at 3815 Geary Blvd., at 2nd Ave.], open less than a year, is a family affair headed by a Korean-only speaking chef-mother Hwa Soon Im, and her four personable, hip, bilingual daughters. Chef Im makes everything for her 35-item menu from scratch including chile paste, bean paste [*daen chang*], soy sauce [*kanjang*] and fish sauce."

"Daen jang chige ($10.99), a hearty vegetable and tofu stew seasoned with Im's mellow bean paste is gently hot, sweet and sour, a favorite of Korean children."

1836. Nguyen, C. Thi. 2009. Heavy on Korean funk, soul and stew: Seongbukdong. *Los Angeles Times* (*The*) (*California*). Nov. 25. p. 100.
• ***Summary:*** This tiny, neat restaurant on the edge of Koreatown is the creation of Young-hee Shon. "She was a housewife in Seong Buk Dong, a neighborhood of Seoul, and the source of her restaurant's name. But her cooking is pure Gyeongsang–the province in South Korea where she was born and raised." She came to Los Angeles 22 years ago and started working in various Koreatown restaurants. But she found none that captured the tastes of Gyeongsang. So she started her own. "Her bean paste casserole is also a must-eat. This is a soup heavily dosed with doenjang–Korean fermented [soy] bean paste. Her doenjang is another fine example of the Gyeongsang affection for direct, chunky flavors." "The doenjang of Seoul is mild by comparison. Her doenjang has a good saltiness to it."

1837. Lee, Eun-Hee; Chun, Jong-Hee. 2009. [Effects of chongkukjang intake on lipid metabolism and liver function in alcoholic fatty liver rats]. *J. of the Korean Society of Food Science and Nutrition* 38(11):1506-15. Nov. [50 ref. Kor; eng]
• ***Summary:*** "Therefore, chongkukjang intake seems to give a beneficial effect on improving lipid metabolism and liver function by increasing HDL-cholesterol level, antioxidative enzyme activites, alcohol enzyme activiities and decreasing serum lipids, liver TBARS and conjugated diene." Address: Dep. of Food and Nutrition, Inha Univ., Incheon 402-751, Korea.

1838. Lyddon, Chris. 2009. Global grain trade review: Despite soaring demand, record grain production puts surplus at highest point ever. *World Grain* 27(11):28-32, 34-36. Nov.
• ***Summary:*** A table titled "Global grain trade activity: Marketing years as indicated (in 1,000 tonnes)" gives the following statistics for soybeans: 2008-09 Top exporters: 1. United States 34,836. 2. Brazil 29,350. 3. Argentina 5,965. 4. Paraguay 2,300. 5. Canada 1,975. World total 76,324 (-4% from last year).

Top soybean importers: 1. China 39,800. 2. E.U.-27 12,800. 3. Japan 3,450. 4. Mexico 3,100. 5. Taiwan 1,830.

Top soybean meal exporters: 1. Argentina 25,000. 2. Brazil 12,772. 3. United States 7,983. 4. India 3,150. 5. Paraguay 1,167. World total 52,988 (-5%). Top soybean meal importers: 1. E.U.-27 22,150. 2. Indonesia 2,450. 3. Vietnam 2,300. 4. Thailand 2,100. 5. South Korea 1,850.

A two-page color spread shows (for major importing countries or regions, for *all* grains) "Grain imports and exports by major seaports" (in tonnes, calendar year 2008) (plus the increase or decrease compared with last year). A world map shows where each port is located. The tables of exporting ports have a blue background whereas the tables of importing ports gave a green background.

The main exporting ports in the USA are (in descending

© Copyright Soyinfo Center 2021

order of volume, 1,000 tonnes): 1. South Louisiana 22,828,781. 2. Tacoma, Washington 6,785,247. 3. Corpus Christi, Texas 5,423,867. 4. Houston, Texas 5,194,172. 5. Portland, Oregon 4,410,476. 6. Brunswick, Georgia 819,790. 7. Duluth, Minnesota 612,149. No importing ports are shown for the USA.

The main exporting ports for Brazil are: 1. Santos 10,101,975. 2. Parana 4,172,447. The main importing port for Brazil is: Santos 1,339,593.

The main exporting ports for Argentina are: 1. San Martin / San Lorenzo 34,636,170. 2. Rosario 14,847,183. 3. Bahia Blanca 7,350,005. 4. Quequen 3,202,964. 5. Ramallo 1,172,462. 6. Lima (Argentina; just northwest of Buenos Aires) 814,746.

The main importing ports for Europe (E.U.-27, which does NOT include Norway, Switzerland, Russia; Candidate countries are Croatia, Macedonia, Turkey) are: 1. Rouen, France 6,349,742. 2. Hamburg, Germany 3,690,955. 3. Rotterdam, Netherlands 2,457,000. 4. Rostok, Germany 2,361,000. 5. Amsterdam, Netherlands 1,393,000. 6. Ghent, Belgium 671,929. 7. Antwerp, Belgium 506,185.

Note: The main importing port for Russia is Novorossiysk 6,317,000, located on the Black Sea in southern Russia in Krasnodar Krai. To get there a ship must pass through the Mediterranean Sea, the Bosporus, then the entire Black Sea. Address: European editor; chris.lyddon@ntlworld.com.

1839. *SoyaScan Notes.* 2009. Chronology of major soy-related events and trends during 2009 (Overview). Dec. 31. Compiled by William Shurtleff of Soyinfo Center.
• ***Summary:*** Jan. 7–The USDA calls for an audit of the soybean checkoff program. The American Soybean Association had filed a complaint on 10 Dec. 2008.

May–Monsanto files a lawsuit against DuPont for patent infringement; DuPont countersues, accusing Monsanto of being anti-competitive.

June 15–Vandemoortele N.V. (Belgium) and Dean Foods (Texas) announce an agreement whereby Dean Foods (owner of White Wave's Silk® soymilk) will acquire Vandemoortele's Alpro Division. The transaction's price is approximately 325 million euros [$400 million]. It is expected to be completed in the third quarter of 2009. With its Alpro® soya and Provamel® brands, Alpro is the European leader in branded soy-based beverage and food products and had net sales of approximately 260 million euros in 2008. Alpro has five manufacturing plants in Europe–in Belgium, the United Kingdom, France and the Netherlands, and employs approximately 750 people.

June–SunOpta opens a soymilk / soybase plant in Modesto, California, about 5 minutes drive from the plant owned by the WholeSoy Co.

July 13–Monsanto acquires WestBred, LLC, a Montana-based company that specializes in wheat germplasm. Worldwide, over the past 5 years, there is growing interest among farmers and farm organizations in genetic engineering of wheat.

Aug. 17–Monsanto and DuPont (via Pioneer Hi-Bred), the world's two biggest sellers of genetically engineered seeds, turn up the volume in their latest skirmish. DuPont accuses Monsanto of monopolistic practices. The two giants are battling for control of the seed business.

In 2009 Shurtleff & Aoyagi publish seven free digital history books on Google Books. They are histories of Soybeans and Soyfoods in Mexico and Central America (1877-2009); Miso, Soybean Jiang (China), Jang (Korea), and Tauco / Taotjo (Indonesia) (200 B.C. to 2009); History of Soybeans and Soyfoods in South America (1882-2009); Edamame, Green Vegetable Soybeans, and Vegetable-Type Soybeans; Soybeans and Soyfoods in Africa (1857-2009); Mildred Lager–History of Her Work with Soyfoods and Natural Foods in Los Angeles (1900-1960); Clive M. McCay and Jeanette B. McCay–History of Work with Soyfoods, the New York State Emergency Food Commission, Improved Bread, and Extension of Lifespan (1927-2009).

For a complete list of these books go to <www.soyinfocenter.com> and search in the upper right corner.

1840. Kuroda, Yosuke; Tomooka, N.; Kaga, A.; Wanigadeva, S.M.S.W.; Vaughan, D.A. 2009. Genetic diversity of wild soybean (*Glycine soja* Sieb. et Zucc.) and Japanese cultivated soybeans [*G. max* (L.) Merr.] based on microsatellite (SSR) analysis and the selection of a core collection. *Genetic Resources and Crop Evolution* 56(8):1045-55. Dec. doi:10.1007/s10722-009-9425-3 [34 ref]
• ***Summary:*** "Abstract: Wild soybeans, *Glycine soja,* are a source of genetic variation to improve soybeans. To improve the efficiency evaluation of conserved germplasm a core or mini-core collection approach that maximizes allelic diversity in a proportion of the whole collection has frequently been advocated. The genetic diversity of a wild soybean collection (1,305 accessions) plus Japanese cultivated soybeans (53 accessions) were analyzed at 20 SSR marker loci. Higher levels of allelic diversity were found in wild soybeans (28 alleles per locus) than Japanese cultivated soybean (five alleles per locus)..."

Figures: (1) "Distribution of wild soybean (*Glycine soja*) and locations from which accessions analyzed came from. In brackets above (a-c) is the number of accessions from the region in the selected main core collection, below is the number of accessions analyzed from that region. • ***Summary:*** "Soybean products have been suggested to have a chemo preventive effect against prostate cancer." This meta-analysis was based on five cohort studies and 8 case-control studies. Summary odds ratios (OR) comparing high versus low categories of soybean consumption were calculated. Among individual soy foods, only tofu yielded a significant value of 0.73. Intake of soybean milk, miso, or natto did not significantly reduce the risk of prostate cancer. "Genistein and daidzein were associated with a lower risk of prostate cancer." Address: 1. Graduate School of Public Health, Yonsei Univ., Seoul, Korea.

1846. Nguyen, Andrea Quynhgiao. 2009. Asian dumplings: Mastering gyôza, spring rolls, samosas, and more. Berkeley, California: Ten Speed Press. 234 p. Illust. (color photos by Penny De Los Santos). Index. 28 x 19 cm. [38 ref]
• ***Summary:*** Another very attractive book and well-written book by Andrea Nguyen. In the Introduction, the section titled "Ingredients" (p. 8+) discusses soy sauce (p. 16) and tofu (p. 16-17).

Soy related recipes include: Steamed vegetable dumplings [vegetarian] (Zhengjiao, Chinese, with 3 oz. brown pressed tofu filling, and light (regular) soy sauce, p. 35-36). Kimchi dumplings (Kimchi mandu, Korean, with 10 oz firm tofu, p. 44-45). Korean meat and vegetable dumplings (Gun mandu, with 6 oz firm tofu, p. 46-47). Steamed filled buns (Zheng bao, Chinese, with Vegetable and tofu bun filling {p. 101}, p. 95-96). Baked filled buns (Ju bao, or Guk bao in Cantonese, Chinese, with Vegetable and tofu bun filling {p. 101}, p. 97-99). Vegetable and tofu bun filling (Cai bao, Chinese, p. 101).

Chapter 9, "Sauces, Seasonings,..." contains several soy dipping sauces: Tangy soy dipping sauce (great with Chinese jiaozi or Japanese gyôza, p. 215). Korean dipping sauce (for Korean Mandu, p. 215). Sweet soy sauce (good with Cantonese steamed rice rolls {p. 156-60}, p. 217). Address: Food writer, Santa Cruz, California.

1847. Tamang, Jyoti Prakash. 2009. Food and identity: A study among the Nepalis of Sikkim and Darjeeling. In: Tanka B. Subba, A.C. Sinha, G.S. Nepal, and D.R. Nepal, eds. 2009. Indian Nepalis: Issues and Perspectives. New Delhi, India: Concept Publishing. xvii + 398 p. See p. 297-310. Papers presented at the Conference on Identity and Nationality of the Indian Nepalis: Issues and Perspectives, held at Gangtok, 20-22 April 2006. [Eng]
• ***Summary:*** Page 3 contains a basic description of kinema. On pages 3-4 is an interesting description of "Kwanti," which is a special food of the Newars [the indigenous people of Nepal's Kathmandu Valley]. It is "prepared by mixing

© Copyright Soyinfo Center 2021

nine varieties of sprouted pulses and beans, such as white grams, dry peas, soybeans, black-eyed beans, white kidney beans, green grams, black grams, lentils and moth beans. Soybeans are soaked for 4-9 days, and other beans are soaked for 1-2 days. Sprouted beans are cooked with butter and spices to make a thick soup which is served with boiled rice. It is eaten in the festival called *Kwanti Purnima*, which usually falls in August."

On pages 6-7 is a section titled "Antiquity of kinema" which states: "The word *kinema* has been derived from *kinamba* of the Limbu language in which *ki* means fermented and *namba* means flavour (Tamang, 2001). The kingdom of Limbuwan (presently the districts of eastern Nepal–Terathum, Taplejung, Panchthar, Dhankuta and Ilam) was established by the Limbus before the seventh century. They ruled that part of Nepal until the unification of Nepal in 1769. Though there is no historical document on the origin of kinema, it is widely believed that the Limbus started its production and consumption. The unification of Nepal and migration of people from one place to another might have popularized this food among the other Nepali groups like Rai, Tamang, Gurung, Magar and Sunuwar. Kinema is not traditionally eaten by the Nepali Brahmins. Although the reason is not documented, it is believed that the Brahmins usually regard kinema as basi meaning stale. Another reason may be its strong flavour. However, for many ethnic communities in the eastern Himalayas and Southeast Asian countries it is a delicacy. The Lepchas call it *satlyangser* and the Bhutias call it *bari* in Sikkim. In Meghalaya, the Khasis call it *tyrumbai* [*turangbai*]*;* in Manipur a similar product is known [by the Meities] as *hawaijar;* in Mizoram, the Mizos call it *bekang-um* [*bekang*]*;* and in Nagaland the Naga people call it *aakhuni.* It is called *natto* in Japan; *chungkok-jang* in Korea; *thua-nao* in Thailand; *pe-poke* in Myanmar and *douchi* [sic] in China."

Fermented foods are much more numerous in North East India than in the rest of India. Address: Food Microbiology Lab., Sikkim Government College, Gangtok, Sikkim 737 102, India.

1848. Nordquist, Ted. 2010. Re: Early work with health foods, sour dough bread, and tofu in Sweden. Letter (e-mail) to William Shurtleff at Soyinfo Center, Jan. 6. 1 p.
• ***Summary:*** "You may not know this, but while studying for my PhD I worked part time at the Mental Hospital and also at Sweden's largest and first Health Food Store in Uppsala, founded and run by Birgitta Åkerheden and her husband. I introduced to this store a sandwich / soup café section and introduced sour dough whole grain bread by bringing sour dough starter from San Francisco and working with the local Skuttunge Bagari to manufacture the sour dough bread for the sandwiches. I then introduced to the store 'alfalfa sprouts' showing them how to grow these and sell them in the store.

"When I then tried to introduce tofu at the store the owner asked me why I did not start my own tofu factory. It was a good question. You know the rest.

"I actually made about 12 different foods from tofu and invited the investment banks to this store to get start up money. Birgitta and I worked all day and had a huge demo ready for the bankers at closing time 6:00 PM. Of the 5 banks invited, none of them showed up!

"I was able to borrow $10,000 from my mother and $10,000 from my Korean neighbor, Professor Ki Yong Kim, head of Seoul University Computer Department. Eleven years later I paid Kim back at 18% interest (We continue to share Christmas cards). (Like most children, I never paid my Mother back, but I have 'loaned' a lot more than that amount to my children, so I think my Mom is OK with the final result)." Address: TAN Industries, Inc., 351 California St., Suite 1330, San Francisco, California 94104; 660 Vischer Ct., Sonoma, CA 95476.

1849. Cho, Geum Joon.; Park, H.T.; Shin, J.H.; et al. 2010. Age at menarche in a Korean population: secular trends and influencing factors. *European J. of Pediatrics* 169(1):89-94. Jan.
• ***Summary:*** "... using representative Korean data from the 2005 Korean National Health and Nutrition Survey. Three thousand five hundred sixty-two women born between 1920 and 1985 were enrolled to identify secular trends in the age at menarche and 620 girls born between 1986 and 1995 were recruited to evaluate the factors influencing the age at onset of menarche. Mean age at menarche decreased from 16.90 +/- 1.25 years for women born between 1920 and 1925 to 13.79 +/- 1.37 years for those born between 1980 and 1985, indicating a downward trend of 0.68 years per decade (95% CI, 0.64-0.71) in age at menarche. Mean age at menarche of girls born between 1986 and 1995 was 13.10 +/- 0.06 years as estimated by the Kaplan-Meier method..." Address: 1. Dep. of Obstetrics and Gynecology, Korea Univ. Anam Hospital, Korea Univ. College of Medicine, 126-1, 5-ga Anam-dong, Seongbuk-gu, 136-705, Seoul, South Korea.

1850. Kwon, Dae Young; Daily, J.W., III; Kim, H.J.; Park, S. 2010. Antidiabetic effects of fermented soybean products on type 2 diabetes (Review). *Nutritional Research* 30(1):1-13. Jan. *
• ***Summary:*** "Historically, the incidence of type 2 diabetes has been lower in Asian populations compared with those in Western countries. One possible reason for the lower incidence among Asians is that they consume fermented soybean products, which are unique to the traditional Asian diet. Some have hypothesized that dietary phytoestrogens and soy peptides in fermented soybean foods consumed in traditional Asian diets may help prevent and slow the progression of type 2 diabetes."

"Although the lack of human intervention trials does

© Copyright Soyinfo Center 2021

not permit definitive conclusions, the evidence does suggest that fermented soy products may be better for preventing or delaying the progression of type 2 diabetes compared with nonfermented soybeans." Address: Emerging Innovative Technology Research Division, Korean Food Research Institutes, Sungnam, Korea.

1851. *Atlanta Constitution* (*The*) (*Atlanta, Georgia*). 2010. Classified ad: Restaurant Korean cook. Feb. 7. p. G7.
• ***Summary:*** "A Korean restaurant is looking for a Korean cook who can cook Korean dishes such as Dwenjang jjigae,... galbi, soondubu, bulgogi and etc. 6 months work experience is required. Please send letter or resume to Bang Ga Nae LLC, at 3312 Peachtree Industrial Blvd. #5, Duluth, GA 30096."

1852. Barnes, Stephen. 2010. The biochemistry, chemistry and physiology of the isoflavones in soybeans and their food products. *Lymphatic Research and Biology* 8(1):89-98. March. [64 ref]
• ***Summary:*** "Abstract: In this review of the chemistry, absorption, metabolism, and mechanisms of action of plant isoflavones, emphasis is placed on the isoflavones in soy and the food products derived from them. Soybeans have been part of food history in Asia for several millennia but did not reach the Americas and Europe until the eighteenth century. In the twentieth century, there was a tremendous increase in the cultivation of soybeans in the United States and more recently in South America. Soy foods have entered the U.S. food supply in ever-increasing amounts both in the form of traditional products (soy milk, tofu) and in more subtle ways in dairy and bread/cake products. The isoflavones in non-fermented foods are for the most part in the form of glycoside conjugates. These undergo changes due to different processing procedures. Isoflavones and their metabolites are well absorbed and undergo an enterohepatic circulation. They are often termed phytoestrogens because they bind to the estrogen receptors although weakly compared to physiologic estrogens. This estrogenicity is not the only mechanism by which isoflavones may have bioactivity–they inhibit tyrosine kinases, have antioxidant activity, bind to and activate peroxisome proliferator regulators alpha and gamma, inhibit enzymes in steroid biosynthesis, strongly influence natural killer cell function and the activation of specific T-cell subsets, and inhibit metastasis. These various properties may explain the much lower incidence of hormonally-dependent breast cancer in Asian populations compared to Americans and Europeans.

"History: History The soybean is a member of the *leguminosae* family, plants that form root noodles that house nitrogen-fixing soil bacteria (Rhizobia) in a symbiotic relationship, an event that is essential for life on this planet. Legumes have been used in a crop rotation system to restore the nitrogen in the soil on ground used for agriculture. The soybean, now called *Glycine max,* has had a long history as a domesticated plant, with records of its use as far back as the eleventh century BC in China. Missionaries took it into Korea and Japan in the third and fourth centuries AD [1=Hymowitz 1990]. It did not reach Europe until 1739 in Paris and 1790 in Kew gardens in London [1]. The first recorded use in the United States was in 1765 in Savannah, Georgia [1]... In 1960, the annual world production of soybeans was 27 million tons, with 69% being grown in the United States. By 2007, annual world production had risen to 206.4 million tons with nearly 90 million tons grown in Brazil and Argentina.

"Isoflavone Biosynthesis: The signals released by the soybean that attract the rhizobial bacteria are the isoflavonoids [3=Rolfe 1988] These are a subclass of the much more common flavonoids. These in turn are members of the large family of polyphenols that are widely found in plants. Isoflavonoids are formed by the same biosynthetic pathway for flavonoids [4]. First, phenylalanine reacts with malonyl CoA to form 4-hydroxycinnamoyl CoA (Fig. 1). Chalcone synthase catalyzes the reaction of this intermediate with three more molecules of malonyl CoA to form isoliquiritigenin or naringenin chalcone. Chalcone isomerase catalyzes the ring closure of the heterocyclic ring. Isoflavone synthase introduces a 2-hydroxyl group, which in turn is removed by an isoflavone dehydratase to yield daidzein (7,4'-dihydroxyisoflavone) and genistein (5,7,4'-trihydroxyisoflavone) (Fig. 1). The biosynthesis of glycitein (7,4'-dihydroxy-6-methoxyisoflavone), a major isoflavone in the soy germ (hypocotyls) is not understood. The numbering scheme for isoflavones is shown in Figure 2.

"Isoflavones in the soybean are converted to 7-O-β-glucosides by a glucosyltransferase and then to their 6"-O-malonates by a malonyl transferase. This chemical form is stored in vacuoles until used by the plant and is the major form in harvested soybeans. Although the yellow or black soybeans are the most familiar forms, an early harvesting before ripening results in a green immature soybean. This is cooked by boiling still in the pod and is served as edamame. It has similar levels of isoflavones to the yellow and black soybeans [5, 6].

"Soy Foods in Asia: Although soybean-containing foods have become more popular in the United States over the past 50 years, they are in general quite different from the forms of soy consumed in Asia [7]. Unlike American soy foods, the latter are often fermented. Soybeans are converted using microorganisms to miso (added to soups and stews in Japan), soy paste (in Korea) and tempeh (with a texture like meat in Indonesia). Soy sauce is another familiar soy product and is made either by acid hydrolysis (no isoflavones) or by prolonged fermentation. The proteins and lipids in soybeans are extracted with boiling water to form soy milk, an important alternative to mother's milk in countries with a high incidence of lactase insufficiency. Soymilk is curdled to

© Copyright Soyinfo Center 2021

prepare tofu, which can be pressed to remove water. Tofu can be fried or added to numerous other dishes.

"Soy Foods in the United States: In the United States, soybeans are grown mostly as a source of edible oil using a hexane extraction approach (Fig. 3). The defatted soy flour is enriched in protein (50% by weight). This has been traditionally used as the protein source in domesticated and research animal diets [8]. The soy flour is heated to produce a variety of related products–this includes toasting at 250ºC. These are used in many bread and cake products, particularly in doughnuts. Soy flour is washed with water to remove soluble carbohydrates–this creates soy protein concentrate, which contains 70% protein by weight (Fig. 3). Alternatively, soy flour is extracted with hot, aqueous 65% alcohol to remove carbohydrates, lipids, and other small molecules, including the isoflavones (also color and taste). This is another form of soy protein concentrate. Both the soy protein concentrates can be extruded to form textured soy protein, another meat-like product. Soy protein isolate (SPI), >92% protein, is prepared by first solubilizing the proteins in soy flour with a mild alkaline extraction (leaving behind complex carbohydrates and lipids) and precipitating the proteins by lowering the pH to 4.5 (Fig. 3). The soluble sugars remain in solution. SPI is found in many canned food products. It's added to improve the appearance of the food. It is also widely used by serious athletes who are on low-fat, high-protein diets. It's also used to prepare low-fat forms of soymilk. As in Asia, these soymilks are converted to tofu. However, this is typically done aseptically producing shelf-stable products. In a recent development, soy products are being made where microorganisms that hydrolyze the isoflavones are added to soy protein preparations.

"Hidden Soy in Foods: Just as for those who suffer from peanut or milk allergies, there are those for whom avoiding soy is essential. And with the widespread presence of soy in food products, this can be a difficult task. Read the food labels carefully–a product having added 'hydrolyzed vegetable protein,' or just 'vegetable protein' contains soy. Besides the clearly labeled new 'soy' foods (soy cheese, soy ice cream, soy yoghurt), soy can turn up in strange, but often familiar places. For instance, a soy-based batter is used to coat doughnuts-it provides the needed mouth-feel. When roasting the Christmas turkey, the expectation is that cooking will produce profuse gravy-to ensure that will happen, producers pump a solution of SPI into the turkey before it is sold. In some brands of canned tuna, the tuna meat is soaked in a soy broth. Chili often has added soy protein. Energy bars that are low-fat and high in protein may contain SPI. Licorice and licorice teas and most meatless products contain significant amounts of isoflavones. Extensive lists of common foods and their isoflavone content have been published [9, 10]. There is also a compilation of the isoflavone content of foods provided by a study funded by the U.S. Departments of Agriculture and the Army that can be obtained from the following website:

< http://www.nal.usda.gov/fnic/foodcomp/Data/isoflav/isoflav.html >

The contents continues: Changing chemistry of the isoflavones in foods. Other foods or supplements containing isoflavones (especially the American groundnut, *Apios Americana*), and the root of kudzu (*Pueraria lobata*). Absorption, metabolism and excretion of isoflavones. Mechanisms of action of isoflavones ("A new chapter in estrogen action was opened in 1996 with the discovery of" estrogen receptor beta, by Kuiper et al. It was related to estrogen receptor alpha, which is located on chromosome 6, it was instead located on chromosome 14). Address: Dep. of Pharmacology & Toxicology, MCLM 452, Univ. of Alabama at Birmingham, Birmingham, AL 35294.

1853. American Soybean Association. 2010. History of the American Soybean Association, 1998-1999 (Website printout–part). www.soygrowers.com/history/default.htm Retrieved April 22.

• ***Summary:*** "1998: ASA opened a new chapter for soybean producers this year when Congress enacted legislation that allows vehicle fleets regulated under the Energy Policy Act of 1992 to earn credits toward meeting EPACT requirements by operating on B-20. This legislation is significant because it provides credits for the use of biodiesel fuel that can be made from soybean oil, and it provides biodiesel blends that offer consumers the economics necessary to make B-20 the "low cost leader" in the EPACT market. Biodiesel has been one of ASA's top priorities for several years.

"+ ASA issued Grower Advisories pertaining to import clearances for soybeans grown from genetically modified seedstock in major export markets.

"+ A $6 billion ag assistance package was enacted that included $2.575 billion in total funding to address crop disaster losses, and another $3.15 billion in market loss payments to producers eligible for Freedom to Farm contracts. Also, ASA successfully urged Congress to approve income averaging, increased deductibility of health insurance for farmers, and a 5-year carryback for operating losses. The approved tax cuts are estimated to save producers more than $1 billion over the next five years.

"+ ASA worked diligently to ensure that Ag appropriators approved funding for the Foreign Market Development Cooperator Program at the current operating level of $32 million and $90 million for the Market Access Program. ASA utilizes funding from the FMD and MAP, along with producer checkoff dollars, to promote U.S. soybean exports in more than 80 counties.

"+ Funding was secured for the International Monetary Fund at $17.9 billion. IMF funding is vital to ensuring stability in U.S. Soybean export markets in both the short and long-term. ASA also succeeded in convincing USDA to include half a million tons of soy in a Russian Food

© Copyright Soyinfo Center 2021

Aid Program and another $61 million of soybeans and soy products in other P.L. 480 Title 1 programs.

"+ Early this year, ASA participated in the White House Rose Garden ceremony, during which President Bill Clinton signed into law the Agricultural Research, Extension, and Education Reform Act. This legislation was one of ASA's top priorities because it approved funding for increased agricultural research funds, as well as crop insurance. Agricultural research is slated to receive $600 million over five years, and it authorized $485 million over five years to pay insurance agents and companies for expenses to write crop insurance policies.

"+ On Nov. 10, the Food and Drug Administration gave initial approval to allow health claim labels on products containing soybean protein based on data contained in a petition presented by Protein Technologies International, Inc., and a follow-up petition filed by ASA in October. Approval by FDA of evidence that including soy protein in a healthy diet reduces serum cholesterol and may reduce the chance of heart disease will have consumers around the world seeking foods labeled to contain soy protein. A final rule was expected in 1999.

"+ In November, ASA formally opened its 14th international marketing office in Istanbul, Turkey, to increase demand for U.S. soybeans and products in the Middle East.

"+ ASA took the lead in working with biotechnology and seed companies to ensure that U.S. growers didn't lose $9 billion of U.S. Soybean export markets due to the presence of unapproved biotechnology-derived soybean varieties.

"+ To help maintain U.S. soy exports despite Asia's economic crisis, ASA worked to obtain and increase credit guarantees from USDA for the purchase of soybeans and soy products. In part due to ASA's aggressive initiative, USDA approved additional GSM-102 export credit guarantees for Asia including increases from $250 million to $400 million for Indonesia, $100 million to $300 million for Thailand, and zero to $100 million for Malaysia. In addition, Korea received an estimated $1.1 billion, an increase from $154 million from the previous year.

"+ The Loan Deficiency Payment (LDP) rate was increased by 34 cents as result of ASA's policy efforts during the 1996 Farm Bill process. LDPs were based on a $5.26 per bushel loan rate.

"+ ASA increased its membership for the fourth consecutive year, ending the year at 31,737 members. Even more was added to the value of an ASA membership with the launch of the first issue of the Washington Insider Report [ashington, DC]. This new publication, distributed quarterly to all ASA members, focuses on key policy issues facing soybean farmers. To help ensure continuation of the national soybean checkoff, ASA created a special Vote YES committee to develop funding and prepare for the possibility of a producer referendum.

"+ There was a record attendance of producers and exhibitors at Commodity Classic in Long Beach [California], making the third annual event a huge success. Show attendance reached 3,676 and more than 500 trade show booths were sold. More than $23,000 was raised for safety education through the 1998 Stephen M. Yoder Foundation Auction and from associated raffles."

"1999: The American Soybean Association applauded approval by the U.S. Food and Drug Administration (FDA) of a new soy health claim based on a petition filed by ASA in 1998. FDA published its final rule on October 25, that soy protein included in a diet low in saturated fat and cholesterol may reduce the risk of coronary heart disease by lowering blood cholesterol levels. As a result, food labels may now contain messages, such as "25 grams of soy protein a day, as part of a diet low in saturated fat and cholesterol, may reduce the risk of heart disease." Research funded by the soybean checkoff shows that the use of soybeans in food products will increase at a rate of 10% a year for the next five years, up from about 37 million bushels to more than 60 million bushels.

"+ Biodiesel implementation moved a big step forward with the release of the Department of Energy's interim final rule to allow public vehicle fleets to earn EPACT credits. ASA also was pleased with USDA's August 13, announcement that the agency planned to purchase an unprecedented level of 20,000 gallons of biodiesel during the year, and with pro-biodiesel legislation that was introduced in the Senate on November 17. That legislation, entitled the "Biofuels Air Quality Act" would allow biodiesel to compete for funds in the Congestion Mitigation Air Quality Improvement (CMAQ) program. Similar legislation was introduced in the House on August 6. The Senate and House bills expand the CMAQ program's authority to allow funding of alternative fuel projects that include purchases of biodiesel, which is a proven cleaner-burning fuel made from natural, renewable sources, such as soybean oil. ASA also asked that the government introduce biodiesel-blended fuels in at least 50% of the government's diesel-powered vehicles by 2002.

"+ While drought and flood conditions in several areas of the country prevented another record-breaking U.S. soybean harvest, producers continued to face the lowest prices paid for their soybeans since the early 1970s. Three ideal growing seasons, one right after the other, in the majority of soybean production areas in both the United States and in South America, caused soybean stocks to grow, while at the same time, export growth stalled as a result of depressed economies in key Asian markets. These factors were primarily responsible for drifting soybean prices paid to farmer down from an average per bushel price of $7.35 in 1996, to $4.35 in 1999.

"+ Fortunately, ASA's soybean safety net policy work during the 1996 Farm Bill process helped see many

© Copyright Soyinfo Center 2021

producers through a tough year. ASA's success in raising the soybean loan rate $.34 would provide growers with nearly $1 billion of additional farm revenue from the loan deficiency payment program.

"+ Even with ASA's earlier policy efforts and successes, it was clear that stronger and more comprehensive efforts would be needed to improve the outlook for soybean producers. In February, ASA farmer leaders made public a comprehensive list of farm income and market demand policy initiatives for the Administration and Congress to act upon. ASA's proposal included economic loss assistance, farm income protection, food assistance and export initiatives, biodiesel, and trade policy initiatives. Also included were key domestic policy initiatives concerning the Food Quality Protection Act implementation, the environment and conservation, research, transportation and tax initiatives. ASA also outlined major issues for changes in Federal crop insurance programs.

"+ ASA urged Congress to provide economic loss payments to producers, similar to payments provided to farmers in 1998, and also advanced with congressional leaders inclusion of soybean-specific payments and provisions in any farm aid package. Subsequently, Congress did approve an $8.7 billion emergency farm spending plan that also included an authorization of $475 million in direct payments to oilseed producers to help partially offset low prices. It was estimated that this oilseed payment would provide producers with 15 additional cents per bushel of soybeans.

"+ In April, ASA and the National Oilseed Processors Association (NOPA) provided Secretary of Agriculture Dan Glickman with a comprehensive list of recipient countries, quantities, and products for a proposed $1 billion concessional sale and donation program for soybeans, soybean meal, soybean oil, and soy protein products. Secretary Glickman requested this list during a March 16 meeting with ASA leaders in Washington when ASA urged him to utilize Commodity Credit Corporation (CCC) funds for a purchase and donation program that could help alleviate a disastrous decline in prices and soybean producer income.

"+ ASA also initiated, for the first time, discussions with a group of international food aid groups who were interested in programming soy into their USDA requests. These private voluntary organizations (PVOs) provided concrete proposals to USDA for the implementation of food aid. This combination of ASA's "pushing" and the PVOs "pulling" helped convince USDA of the merits of assisting people in the most needy countries in the world while bolstering demand and improving prices paid to farmers.

"+ To urge further action on ASA's request for a $1 billion soy donation, 72 House members cosigned a letter to Secretary of Agriculture Dan Glickman in November, calling for USDA to move quickly to mitigate the downward pressure on soybean prices during harvest. ASA also met with several Senators and Representatives to urge them to place calls to the White House, Agriculture Department, and Office of Management and Budget to "dislodge" this and other food aid programs which have been held up pending reviews.

"+ At year's end, ASA was still waiting for a major food aid announcement, which was being delayed by bureaucratic red tape. Meanwhile, some significant amounts of soy were already being included in major food aid programs, such as the purchase by Russia of an additional 117,000 metric tons of soymeal under the P.L. 480, Title I program for shipment December 17, 1999 to January 7, 2000.

"+ On November 15, U.S. and Chinese negotiators completed bilateral talks on China's accession to the World Trade Organization (WTO). The agreement that U.S. trade negotiators reached with China included significant opportunities to expand market access that ASA has worked toward for years. According to U.S. government sources, the ongoing WTO accession negotiations include assurances that will formalize access to the Chinese market–the largest growth market for soy in the 21st century–and includes commitments to expand access over the next few years.

"+ Based on the announced WTO Accession Terms for Agriculture, there will be no tariff rate quota (TRQ) for soybeans, and the duty is bound at the current applied level of 3%. The agreement stated that soybean oil will be subject to a 9% duty and the TRQ quantity will be based on average 1995-97 calendar year imports calculated on the basis of data from Oil World. Soybean oil also will be designated a "most-favored-oil"–meaning that any permanent or temporary duty reduction provided to other oils also will be extended to soy oil. ASA also began an extension policy effort in 1999 to promote approval of Permanent Normal Trade Relations (PNTR) with China, which the U.S. Congress was scheduled to debate in 2000.

"+ ASA counted among its accomplishments the lifting of sanctions on the sale of U.S. food to Iran, Sudan and Libya. ASA continued to work to expand sanctions relief to Iraq, North Korea, and Cuba to help improve soybean producer profitability.

"+ Confusion about the marketability of biotech-derived crops was at the forefront of many producers' thoughts. During these challenging times, ASA called upon all of its resources to actively communicate with growers, customers and other stakeholders about the safety of biotech soybeans to minimize the negative effects of activities and efforts to undermine public confidence in agricultural biotechnology.

"+ In November and December, ASA implemented a series of "Planting Decision 2000" Town Hall meetings around the country to help producers make well-informed planting decisions for 2000. ASA also produced "Planting Decision Guide" that provided producers accurate information on the factors affecting the demand for both biotech and non-biotech soybeans. ASA distributed the

1857. Shike, Jennifer. 2010. Bernard breeding better edamame at 83 (News release). College of Agricultural, Consumer, and Environmental Sciences (ACES), Univ. of Illinois at Urbana-Champaign. 2 p. June 16.
• ***Summary:*** "At the age of 83, when many people have long since retired, University of Illinois researcher Richard Bernard unveiled his 14th variety of Gardensoy edamame.

"Bernard has been breeding soybeans and edamame, or vegetable soybeans, since 1954. And he has no intentions of stopping now.

"In fact, after the release of Gardensoy 51, he is looking ahead to his next projects: developing varieties that have higher protein content, higher concentration of omega-3 fatty acid, and creating varieties that do not have the genes that cause allergic reactions.

"Bernard's fascination with edamame began in the 1930s and 1940s when edible soybeans were a popular vegetable being pushed in the United States for their nutritive value.

"'As a boy, I was curious and tried them,' Bernard said. 'I've been enjoying them ever since. The first varieties I tried were Etum and Tastee, and they are still among my favorites.'

"A city kid from Detroit, Bernard grew up working in an auto factory before joining the army. After the war, he was hitchhiking through southwestern Illinois when a farmer stopped and picked him up.

"'The farmer mentioned soybeans, and I had to ask what they were,' Bernard said. 'He hit the brakes and made me go out in the field and take a look. That was my first experience with soybeans. Little did that farmer know what he was starting when he stopped the truck and took me out into that field.'

"Bernard went on to obtain his bachelor's and master's degrees from The Ohio State University, and his Ph.D. from North Carolina State University where he studied peanuts. At NC State, he worked next door to Herbert Johnson who was leading USDA soybean breeding efforts nationwide at the time.

"Johnson later hired Bernard as a USDA research agronomist at the U of I, where he coordinated northern regional testing for soybean varieties and became the curator of the U.S. Germplasm Collection.

"'I developed varieties of soybeans for Illinois farmers,' Bernard said. 'The majority of Midwest acres planted in the 1960s and 1970s were my varieties.'

"One accomplishment in particular stood out in Bernard's mind. 'Back then, a cultivar named 'Harosoy' was widely grown,' he said. 'It was probably the most susceptible to Phytophthora root rot–a devastating disease that had recently hit the area.'

"Bernard backcrossed in a gene for resistance to the disease, resulting in Harosoy 63. This variety saved farmers a lot of money.

"In the 1980s, he began breeding edamame as a hobby with a goal to develop 'especially good eating' large-seeded edamame with higher protein content. He also wanted to develop edamame that would grow well in Illinois.

"'Large-seeded edamame have a better mouth feel for eating,' Bernard explained. 'Those varieties mainly come from Japan and Korea, but they tend to be prone to shattering and susceptible to diseases. I wanted to create edamame varieties with improvement in those areas.'

"Bernard released the first six edamame varieties in 2000, followed by seven more in 2002. He named them Gardensoy with numbers following to reflect the soybean

© Copyright Soyinfo Center 2021

maturity group and release order. His latest release, classified in soybean maturity group V, adds a later-maturing variety to the mix and will be the last one to harvest before the frost hits.

"'For years, I mailed out free seed packets for people to grow Gardensoy in their home gardens,' he said. 'Most people have a hobby that costs them money. I consider that the price of mine.'

"Overcoming misconceptions about eating soybeans has been Bernard's greatest challenge in breeding edamame over the years. 'People are harder to change than soybeans,' Bernard said. 'In the Midwest, people have been slower to accept edamame, despite its great taste and nutritional value.'

"As more and more people learn about the great taste, convenience and nutritional benefits of this complete protein vegetable, demand for edamame has increased. However, most of the demand has been met through the import of product from China, said Theresa Herman, U of I research specialist.

"Gardensoy varieties are perfect for growing in gardens, Bernard said. Due to harvesting and storage challenges, only a few operations in the United States are currently producing edamame on a large scale. However, consumer interest is quickly increasing along with the number of farmers growing edamame to sell at farmer's markets.

"'The U.S. edamame industry has yet to take off in a big way, but with increasing demand, sustainability of local production is more and more likely,' Herman said. 'As more edamame are grown and consumed in the U.S., it remains to be seen whether the Gardensoy varieties will be chosen favorites. However, Dr. Bernard will always be in the group of pioneers who saw the potential of this crop in the U.S.– for human health and for grower profit.'" Address: Urbana, Illinois.

1858. Shanmugasundaram, S.; Yan, Miao-Rong. 2010. Vegetable soybean. In: Guriqbal Singh, ed. 2010. Soybean: Botany, Production and Uses. Wallingford, Oxfordshire, UK, and Cambridge, Massachusetts: CAB International (CABI). xii + 494 p. See p. 427-60. Chap. 19. [96 ref]
• ***Summary:*** One of the best documents seen to date on vegetable soybeans. The authors are the world's leading experts on the subject. Contents: Introduction (Vegetable soybean is called *edamame* in Japan, *mao dou* in China, *poot kong* in Korea and *tua rae* in Thailand): Definition, distinction from grain soybean, nutritional value. Production. Cultural practices: Location, season and cropping system, temperature, soil type, land preparation and sowing, fertilization and irrigation, insect pest and disease control, harvesting, seed production. Genetic improvement. Processing and utilization. International trade. Potential for developing countries. Conclusions. Address: 1. New Jersey, USA; 2. • ***Summary:*** The recipe includes:
"2 pounds Gorilla Ogo, or any other ogo
"Sauce:
"½ cup shoyu
"½ cup apple cider vinegar
"1 tablespoon kochujan (kim chee paste)"

1861. Kim, H.G.; Hong, J.H.; Song, C.K.; Shin, W.H.; Kim, K.O. 2010. Sensory characteristics and consumer acceptability of fermented soybean paste (Doenjang). *J. of Food Science* 75(7):S375-S383. Sept. [28 ref]
• ***Summary:*** "This study was conducted to examine the sensory profiles of fermented soybean paste (Doenjang), to understand consumers' acceptability of different types of Doenjang samples and to identify the sensory characteristics that drive consumer acceptability of Doenjang products."

"Introduction: Various fermented soybean products, such as soy sauce, Japanese miso, and tempeh, have been used in Asia for hundreds of years. Consumption of the fermented soybean products is gradually expanding around the world, due to its various health benefits, such as anticancer, antihypertension, immunity, and antioxidative activity." Address: 1-2. Dept. of Food Science and Engineering, Ewha Womans Univ., Seoul 120-750, South Korea.

1862. Kim, Jihye; Kim, H.J.; Joung, H.; et al. 2010. Overnight urinary excretion of isoflavones as an indicator for dietary isoflavone intake in Korean girls of pubertal age. *British J. of Nutrition* 104(5):709-15. Sept.
• ***Summary:*** "Little is known about the bioavailability of isoflavones in children. Previous studies have shown that children excrete more isoflavone in urine compared with adults. Thus we examined the relationship between usual dietary isoflavone intake and the urinary excretion of isoflavonoids in Korean girls of pubertal age. Twelve girls each were selected from the lowest and the highest

© Copyright Soyinfo Center 2021

quartiles of isoflavone intake among 252 Korean girls aged 8-11 years. Age, BMI and sexual maturation stage were matched between the two groups. Dietary intakes for 3 d by diet record and overnight urine samples were collected at baseline and at 6 and 12 months. Total and individual isoflavone (daidzein, genistein and glycitein) intakes were calculated from diet records. The parent isoflavone compounds (daidzein, genistein and glycitein) and their metabolites (equol, O-desmethylangolensin (O-DMA), dihydrodaidzein and dihydrogenistein) present in the urine samples were analysed using liquid chromatography-MS. Intake levels of total and individual isoflavone compounds were significantly higher in the high isoflavone (HI) group than the levels in the low isoflavone (LI) group ($P < 0.05$). Urinary excretion of all isoflavone parent compounds was significantly higher in the HI group than in the LI group ($P < 0.0001$). Among isoflavone metabolites, only O-DMA and total metabolites were significantly different ($P < 0.05$). Total isoflavone intake was highly correlated with the urinary excretion of total parent compounds (r 0.68; $P < 0.01$), parent compounds plus their metabolites (r 0.66-0.69; $P < 0.01$) and total isoflavonoids (r 0.72; $P < 0.0001$). In conclusion, overnight urinary excretion of total isoflavonoids is a reliable biomarker of usual isoflavone intake in Korean girls of pubertal age."

"Estimated adolescent soyfood and isoflavone intake: 12 girls 1st quartile intake. Age 10.3±0.5 years. 12 girls 4th quartile intake. Age 10.2±0.7 years. Soyfoods intake is not reported. Isoflavone intake 3.0±0.913 mg/day." Address: 1. Dep. of Food and Nutrition, Daegu Univ., Gyeongbuk 712-714, South Korea.

1863. Gupta, Rajendra ("Raj") P. 2010. Overview and current status of soymilk worldwide (Interview). *SoyaScan Notes.* Oct. 13. Conducted by William Shurtleff of Soyinfo Center.

• ***Summary:*** Raj finds it very difficult to say which part of the world has the brightest future for soymilk. All over the world, there is a slow but steady growth of interest in soymilk and in ProSoya's technology for making it. ProSoya's main large system is 2,000 liters per hour capacity, but the biggest system it has sold is 6,000 liters per hour. This capacity refers to a concentrated product (soya base), which approximately doubles in volume when reconstituted to regular strength. The protein level of the concentrate is about 5%. The solids content is 10-11%. Also, the okara is rewashed to extract more nutrients from the soybeans. It is these big machines that keep ProSoya afloat financially.

ProSoya sells large-scale equipment to countries all over the world. One year Korea looks promising, the next year Germany, or Ghana or Latin America. Those machines almost always become the center of a successful business that continues to do well. They are purchased by people who know how to run a food business. Some machines are creating new markets while others are adding capacity to existing companies or enabling co-packing.

In Russia more than 1,000 SoyaCows (called Soyushkas) have been sold. Initially, many were in government ministries but now the majority are owned by small entrepreneurs. People line up in the morning to buy fresh, hot soymilk directly from the manufacturers.

As for ProSoya's license to Russia, nothing has changed. The company that ProSoya licensed to make SoyaCows in Russia has never paid ProSoya the royalties that it agreed in the licensing agreement to pay. So Raj has accepted that situation as it is. "It is not worth it to chase people in countries like that. Our company works on the honor system. But we did profit a lot from Russia because they bought some of our very large machines. As a result we gained some credibility in Russia, which resulted in more sales." ProSoya continued to sell SoyaCows in both Russia and Eastern Europe.

"It is very difficult to make predictions. SoNice was launched in the United States at about the same time as Silk. It as selling much better than Silk at one point. But the company that was making SoNice at that point [Pacific ProSoya Foods] ran into financial difficulties, because they were expanding too rapidly, so Silk pulled way ahead.

Raj has known Ratan Sharma, PhD, for a long time and they still keep in touch on a regular basis, but Ratan has not received any money from ProSoya Inc. in Canada for many years. Years ago, ProSoya used to pay Child Haven royalties, and that money was used to pay Ratan's salary. Ratan has done a lot of good work, and he continues to devote a lot of time to it–even though he doesn't make a lot of money from it. He also works as a consultant for the American Soybean Association (ASA-IM) and that is probably his main source of income. He also gets paid by ASA to nurture these SoyaCows and to write brochures and give presentations. Address: President and CEO, ProSoya Inc., 2-5350 Canotek Road, Ottawa, ONT, K1J 9N5, Canada. Phone: 613-745-9115.

1864. Park, Min Kyung; Cho, I.H.; Lee, S.; Choi, H.K.; Kwon, D.-Y.; Kim, Y.-S. 2010. Metabolite profiling of *Cheonggukjang,* a fermented soybean paste, during fermentation by gas chromatography-mass spectrometry and principal component analysis. *Food Chemistry* 122(4):1313-19. Oct. 15. [23 ref]

• ***Summary:*** "Metabolite profiling by applying principal component analysis (PCA) to a GC-MS data set was performed to assess changes in a select number of pre-defined metabolites during the fermentation of Cheonggukjang. A total of 20 amino acids, 12 organic acids, and nine fatty acids were found as targeted metabolites in Cheonggukjang. As fermentation proceeded, the levels of most amino acids decreased during the early stage of fermentation, but increased in the later part of fermentation.

© Copyright Soyinfo Center 2021

On the other hand, amounts of fatty acids increased throughout the fermentation process, while those of most organic acids, except for tartaric acid [TA], decreased. A PCA score plot illustrated good separation of the Cheonggukjang samples according to fermentation period by combining principal component 1 (PC 1) (36.8%) with PC 2 (30.3%). Tryptophan, citric acid, beta-alanine, itaconic acid, 2-hydroxyglutaric acid, gamma-aminobutyric acid, leucine, malic acid, and tartaric acid were the major components that differentiated the various samples."

Note: Why is Korean natto described as "a fermented soybean paste"? Address: 1-2. Dep. of Food Science and Technology, Ewha Womans Univ., Seoul 120-750, Republic of Korea.

1865. Lee, J.H.; Kim, T.W.; Lee, H.; Chang, H.C.; Kim, H.Y. 2010. Determination of microbial diversity in meju, fermented cooked soya beans, using nested PCR-denaturing gradient gel electrophoresis. *Letters in Applied Microbiology* 51(4):388-94. Oct. [25 ref]

• ***Summary:*** "Significance and Impact of the Study: This is the first report showing the differences and similarities in the populations of micro-organisms in meju samples using nested PCR-DGGE, a culture-independent method. The results may be applicable to the development of improved meju, in which the indigenous micro-organisms required for fermentation can be standardized." Address: 1-3. Inst. of Life Sciences & Resources and Graduate School of Biotechnology, Kyung Hee Univ., Yongin, Korea.

1866. *SoyaScan Notes.* 2010. Did the Chinese or Japanese or Koreans traditionally feed soymilk to infants or to recently-weaned children? No! (Overview). Compiled by William Shurtleff of Soyinfo Center.

• ***Summary:*** A personal view by William Shurtleff:

I have lived in Japan with a Japanese family for 6½ years, spoke fluent Japanese, traveled all over China, and read huge amounts of literature about soy in China and Japan.

I would say that the Japanese and Chinese do NOT feed soymilk to infants or even to weaned infants. Rather they DO feed tofu as one of the earliest weaning foods. They mash it with rice gruel, so both are very soft. Remember that traditional Asian soymilk causes infants intestinal gas which tofu generally does not, or at least much, much less.

Of course it depends partly on what age you mean by "infants." At what age does an infant cease to be an infant? Wikipedia says of "infant": "It is typically applied to children between the ages of 1 month and 12 months; however, definitions vary between birth and 3 years of age."

However, I have seen one article which states: "Soy-based infant formula has been used for centuries in Korea." (Source: Lee et al. 2003. Korean J. of Nutrition. 36(8):841-50. Oct.) I assume this infant formula was started after the baby was weaned from breast milk.

Except for this one Korean document, I have never seen or heard of soymilk used as an infant food or a weaning food, except in a few early French-language articles such as: Labbé 1911, and Beltzer 1911–and maybe a few other articles.

The statements in these two articles that soymilk is fed to infants are rare exceptions. I imagine that Beltzer learned it from Labbé and that Labbe did not know much about the subject.

Read the writings of Dr. Harry Miller (M.D., on our website, www. soyinfocenter.com) who established the first soy dairy in China in 1936, who lived in China as a missionary in China for many decades, and who introduced soymilk for infants (Soyalac) to the United States. He wrote a great deal and a biography has been written about him, yet I do not recall that he ever said that Chinese feed soymilk to infants. Address: Soyinfo Center.

1867. Kim, Moon Young; Lee, Sunghoon; Van, Kyujung; et al. 2010. Whole-genome sequencing and intensive analysis of the undomesticated soybean (*Glycine soja* Sieb. and Zucc.) genome. *Proceedings of the National Academy of Sciences, USA* 107(51):22032-37. Dec. 21. [44 ref]

• ***Summary:*** The genome of the soybean (*Glycine max*) has recently been sequenced; it is one of six crop species that have been sequenced. This paper reports the genome sequence of *Glycine soja,* the undomesticated [wild] ancestor of *G. max* (in particular *G. soja* var. IT182932).

"The 48.8-Gb lllumina Genome Analyzer (lllumina-GA) short DNA reads were aligned to the *G. max* reference genome and a consensus was determined for *G. soja.* This consensus sequence spanned 915.4 Mb, representing a coverage of 97.65% of the *G. max* published genome sequence and an average mapping depth of 43-fold. The nucleotide sequence of the *G. soja* genome, which contains 2.5 Mb of substituted bases and 406 kb of small insertions / deletions relative to *G. max,* is approx. 0.31% different from that of *G. max."*

"Data presented in this study suggest that the *G. soja/G. max* complex may be at least 0.27 million y old, appearing before the relatively recent event of domestication (6,000-9,000 y ago). This suggests that soybean domestication is complicated and that more in-depth study of population genetics is needed. In any case, genome comparison of domesticated and undomesticated forms of soybean can facilitate its improvement." Address: 1. Dep. of Plant Science and Research Institute for Agriculture and Life Sciences, Seoul National Univ., Seoul 151-921, Korea.

© Copyright Soyinfo Center 2021

[26 ref. Kor; eng]
• ***Summary:*** "The objective of this study was to improve the flavor of Cheonggukjang prepared by the culture optimization of starter with the fibrinolytic activity. After 25 strains isolated from the commercial Cheonggukjang and Doenjang in different regions were compared, 7 Bacillus strains with proteolytic and slime-producing activities were selected... Therefore, Cheonggukjang fermented with CJJN-4 starter at 40ºC had the improved flavor, such as change of amino or ammonia type nitrogen production, and higher fibrinolytic activity." Address: Dep. of Food Science and Technology, Chungju National Univ., Chungbuk 368-701, Korea.

Effects of isoflavone aglycone-rich fermented soybean paste extracts on osteoblastic differentiation of MG-63 cells (Open Access). *J. of the Korean Society for Applied Biological Chemistry* 53(6):803-09. Dec. [23 ref. Eng]
• ***Summary:*** "Fermented soybean extracts containing large amount of isoflavone aglycones were prepared from Korean traditional fermented soybean paste (KFSP) to examine beneficial effect of isoflavone aglycones-rich KFSP on bone formation activities of osteoblastic cells. To determine positive effects of KFSP on osteoblastic differentiation, alkaline phosphatase activity was measured as phenotypic marker for early stage in osteoblastic differentiation and osteocalcin (OC), and type I collagens were measured as terminal stage markers of differentiation in MG-63 cells. Stimulatory effects of KFSP on bone morphogenic protein-2 (BMP-2), important inducer of differentiated factors for bone formation, remodeling, and mineralization, was examined. Soybean paste fermentation produced higher amount of isoflavone aglycones. KFSP more effectively stimulated production of BMP-2 and increase levels of alkaline phosphatase, OC, type I collagen, and bone mineralization during osteoblastic MG-63 cell differentiation than non-fermented soybean paste extracts."

Note: The name of this journal is confusing; it seems to have two names. One is given above. The other is simply *Applied Biological Chemistry*, published by Springer. Address: 1. • ***Summary:*** "Changes in characteristics of low-salted Kochujang added with mixed additives (licorice 0.8%, mustard 0.7%, chitosan 2%) were investigated during fermentation for 40 days. There was no significant difference in viable and yeast cell counts and color among all treatments, whereas lactic acid bacteria counts of 6.8% and 5.9% salted Kochujang added with the mixed additives ($p<0.05$) were significantly lower than that of control... In sensory evaluation, 5.9% salted Kochujang with the additives had the highest score in overall palatability. These results indicate that salt contents of Kochujang could be lowered up to 5.9% by addition of the mixture of licorice, mustard and chitosan, resulting in improvement of palatability and shortening of fermentation time." 1874. Baum, Richard. 2010. The fall and rise of China. Chantilly, Virginia: The Great Courses. 24 CDs; 48 lectures [75* ref]
• ***Summary:*** A superb course on the history of China from about 1700 to 1989, accompanied by a course guidebook, with a biography of the teacher, lecture guides, timeline (600 BCE to 1989), glossary, biographical notes on key Chinese figures, and bibliography.

The detailed timeline / chronology of China, especially since about 1700, is the best we have seen. Here is a sample of a few pages from the middle of that timeline:

1949 Oct.–Mao Zedong announces birth of People's Republic of China (PRC).

1949 Dec.–Chiang K'ai-shek retreats to Taiwan.

1950 Feb.–Mao Zedong signs treaty of friendship and alliance with Joseph Stalin.

1950-1952–Land reform conducted in rural China.

© Copyright Soyinfo Center 2021

1950-1953–Korean War brings China and U.S. into military conflict.

1951-1952–Suppress Counterrevolutionaries and Three Anti campaigns launched.

1953 March–Joseph Stalin dies; Nikita Khrushchev eventually succeeds him.

1953 July–Cease-fire in Korea.

1953-1957–PRC launches 5-year economic plan with Soviet advice and money.

1956–China completes economic transition to socialism; Nikita Khrushchev denounces Joseph Stalin; popular unrest erupts in Hungary and Poland.

1956-1957–Mao Zedong introduces Hundred Flowers campaign.

1957 May–Stung by criticism, Mao Zedong halts Hundred Flowers campaign, punishes intellectuals.

1958 spring–Great Leap Forward begins.

1959 Aug.–Mao Zedong lashes out at critics of the Great Leap Forward.

1959-1961–Three Hard Years bring widespread famine.

1959-1962–Mao Zedong denounces Soviet "revisionism."

1961-1962–Liu Shaoqi and Deng Xiaoping reverse Mao Zedong's radical policies.

1962 Sept.–Mao Zedong launches Socialist Education movement.

1964-1965–Lin Biao initiates Mao Study in People's Liberation Army and schools.

"1965 Nov.–Leftists criticize revisionist literary works.

"1966 Aug.–Mao Zedong unleashes Red Guards.

"1966-1967... Cultural Revolution spawns political violence.

"1967 spring–Liu Shaoqi denounced as "China's Khrushchev."

"1968 Aug.–Soviet troops invade Czechoslovakia.

"1969 March–Fighting erupts on Sino-Soviet border.

"1969 summer–USSR threatens attack on Chinese nuclear facilities.

"1969-1970–Richard Nixon and Mao Zedong begin to consider U.S.-China détente.

"1971 April–Zhou Enlai invites U.S. ping-pong team to Beijing.

"1971 July–Henry Kissinger makes secret trip to Beijing.

"1971 Sept.–Lin Biao dies in suspicious plane crash.

"1972 Feb.–Richard Nixon flies to China, signs Shanghai communique.

"1973-1976–Succession struggle heats up as Mao Zedong's health fades.

"1974 Aug.–Richard Nixon resigns in wake of Watergate scandal.

"1975 April–Chiang K'ai-shek dies, is succeeded by Chiang Ching-kuo.

"1976 Jan.–Zhou Enlai dies, is succeeded by Hua Guofeng.

"1976 April–Deng Xiaoping purged for inciting "counterrevolutionary incident."

1976 Sept.–Mao Zedong dies after naming Hua Guofeng his successor.

"1976 Oct.–Mao Zedong's widow, Jiang Qing, and three associates arrested for treason.

"1977 July to 1978 Nov.–Deng Xiaoping mounts political comeback.

"1987 Nov.–Deng Xiaoping supports free speech at Democracy Wall.

Prof. Baum tells the history of China as a narrative–a story. Address: Distinguished Prof. of Political Science, UCLA, Los Angeles, California.

1875. Kupfer, Helmut Karl Peter. 2010. Wine in Chinese culture: historical, literary, social and global. Berlin: LIT Verlag. iii + 303 p. See p. 43. 24 cm. *

Page 43: During the late Han dynasty, "the technology for making *li* from *nie* (as sprouted rice) was transmitted to Japan through Korea, where *nie* was known as *getsu* (1 Chinese character given) and *li* as *rai* (1 Cc). Getsu was also displaced in Japan in the medieval period, when the Japanese learned how to prepare rice koji and to use it to make saké (1 cc) wine."

Page 84: "Most fermented Chinese foods are made using *qu*. The Japanese transcription *koji* has come to be generally used in non-Chinese speaking countries."

Koji is also mentioned on pages 80 and 81.

1876. Nagai, Toushirou; Tamang, Jyoti Prakash. 2010. Fermented legumes: Soybean and non-soybean products. In: Jyoti P. Tamang and K. Kailasapathy, eds. 2010. Fermented Foods and Beverages of the World. Boca Raton, Florida: CRC Press / Taylor & Francis. xii + 448 p. See p. 191-224. [125 ref]

• ***Summary:*** An ethnic fermented food is one used by a certain ethnic group. Contents: Introduction. Fermented soybean foods: Bacilli-fermented, sticky and nonsalty soybean foods (natto, kinema, thua nao, chungkokjang, hawaijar, tungrymbai, aakhone, bekang, peruyaan, pepok, sieng), mold-fermented soybean foods (tempe, douchi, sufu, doenjang, miso, shoyu / soy sauce, tauco).

Fermented non-soybean legume foods: Dawadawa (preparation and culinary, microbiology), ugba (preparation and culinary, microbiology), maseura (preparation and culinary, microbiology), wari (preparation and culinary, microbiology), oncom (preparation and culinary, microbiology), dhokla and khaman (preparation and culinary,

© Copyright Soyinfo Center 2021

microbiology). Conclusion.

Among the Bacilli-fermented, sticky and nonsalty soybean foods, natto, for example, has the following contents (p. 194-96): Introduction, history, preparation and culinary, socioeconomy, microbiology and food safety, biochemistry, nutritional composition, and functional properties. Kinema and thua-nao similarly subdivided, however some lesser-known soyfoods and some non-soy foods are described in less detail.

The Introduction (p. 192-93) discusses Dr. Tamang's revised "KNT triangle" theory, with two maps. "Within the proposed triangle-bound countries, many fermented sticky nonsalty soybean foods are consumed by the different ethnic groups of people in Cambodia, Laos, Vietnam, Darjeeling hills and Northeast states of India, eastern part of Nepal, southern part of Bhutan, Myanmar, and southern parts of China (Figure 6.2). Beyond this hypothetical 'KNT triangle' there is no report of kinema-like products that are sticky and ammonia-flavored fermented soybean foods, and the proposed 'KNT triangle' does not include salted, nonsticky and non-bacilli fermented soybean products such as *tempe, miso, sufu, soy sauce,* etc. (Tamang 2010)."

Fermented soyfoods can be classified in various ways: (1) Those fermented by bacteria (primarily *Bacillus subtilis*), such as natto, thua nao, kinema, etc. (all have a characteristic stickiness), and those fermented by molds, such as soy sauce, miso, tempeh, etc. (2) Nonsalted (those to which no salt has been added, such as natto, kinema, tempeh), and salted (such as soy sauce, miso, douchi, etc.) (p. 194). Pepok (p. 207) is an ethnic fermented soyfood from northern Myanmar (formerly Burma). To make pepok: Soak soybeans in water overnight, drain, and bring to a boil. Then wrap in leaves and allow to ferment for 2-4 days. Mash the fermented beans with salt and hot chili pepper, roll out into disks, and dry in the sun. Use as a seasoning or consume after roasting.

Sieng (p. 207) is a traditional fermented soyfood from Cambodia. To make sieng: Soak soybeans in water overnight, drain, and bring to a boil. Spread in shallow bamboo baskets and allow to ferment naturally for 2 days by bacteria adhering to the baskets or suspended in the air. Then immediately transfer the fermented soybeans to salt water and soak for 5-7 days; occasionally tree sap or enzymes are added to the salt water. Use with salt and spices as a seasoning.

Tables: (1) Nutritional composition of boiled soybeans (as a control), natto, and tempe [incl. vitamins, minerals, and fatty acids]. (2) Nutritional composition of kinema and raw soybeans.

Figures (photos unless described otherwise): (1) Map of the natto triangle (based on Nakano 1972). (2) Stylized map of the KNT (kinema–natto–thua nao) triangle. (3) Chopsticks lifting up natto from a polystyrene paper package. *Bacillus subtilis* (natto) produces a polyglutamate, a viscous material, which is called *ito*, meaning "string," in Japanese. (4) Natto in a classical package made of rice straw. (5) A bowl of kinema–freshly fermented. (6) Kinema curry in a bowl and on a plate. (7) Thua nao in a plastic bag, with the label in Thai. (8a) The front of a package of chungkokjang, labeled in Korean, with a photo on the label of the product in a thick spicy stew (*chigae*). (8b-c) Top view and side view of a mound of chungkokjang. (9a) The front of a package of Rusto's Tempeh. (9b-c) Top view and side view of a cake of tempe. The spaces between soybean cotyledons are packed tightly with white mycelia of *Rhizopus oligosporus*. Address: 1. Genebank, National Inst. of Agrobiological Sciences, Tsukuba, Japan; 2. Food Microbiology Lab., Sikkim Government College, Sikkim Univ., Gangtok, Sikkim, India.

1877. Richmond, Simon. 2010. Lonely Planet Korea. 8th ed. Footscray, Victoria, Australia; Oakland, California: Lonely Planet. 440 p. See p. 188. Illust. (some color). Maps (some color). Index. 20 cm.

• ***Summary:*** This is a guidebook to Korea. including North Korea. 110 maps. Korean characters are given for the names of most places and foods–which we find very helpful. "In the year 2000 the Korean government adopted a new method of romaising the Korean language. Most of the old romanisation system was retained. The new system is used throughout this book (p. 411)

*Ganjang* (soy sauce) is mentioned on pages 68, 69, 70, 75, 178 and 188.

Page 188: In Gangwon-do, "Gangneung's prized specialty is *sundubu* (3 Kc = Korean characters given), soft or uncurdled tofu [soymilk curds] made with sea water in Chodang, the 'tofu village.' At its plainest, *sundubu* is served warm in a bowl, with *ganjang* (soy sauce) on the side. It can also be prepared in *jjigae* (5 Kc; stew) or *jeongol* (5 Kc; casserole)."

In Chodang, there are about 20 restaurants, one of the best-known of which is Chodang Halmeoni.

*Sundubu* (soymilk curds or soft uncurdled tofu) is mentioned on pages 72, 78, 186, 188 and 189.

*Doenjang* (fermented soybean paste) is mentioned on pages 56, 68, 70, 78, 134, 188, 246, 257 (spelled *twenjang*) and 346.

*Doenjang jjigae* (soybean paste stew) is mentioned on pages 78, 134, 188, and 246.

Tofu (*dubu*) is mentioned on pages 70-74, 78, 127, 134, 136, 179, 188, 294, and 388.

Soft tofu is mentioned on pages 204, 257, 299.

1878. Tamang, Jyoti Prakash. 2010. Himalayan fermented foods: Microbiology, nutrition, and ethnic values. Boca Raton, Florida: CRC Press. xix + 295 p. See p. 65-78. 230-31, 233. Illust. 25 cm. [584 ref]

• ***Summary:*** This is a very interesting, original, well researched and well written book. It is also the best source of detailed, well documented information on kinema and its

© Copyright Soyinfo Center 2021

close relatives seen to date.

The word Sanskrit word Himalayas means literally "abode of the snows." This region is the home of over 65 million people. Those in the eastern Himalayas are of Mongolian ethnicity and ancestry.

Chapter 3, titled "Fermented legumes," includes a section titled "3.1 Important fermented soybean foods" which states (p. 65): "Some of the common ethnic nonsalted sticky fermented soybean foods of the eastern Himalayas are *kinema* (Nepal, Darjeeling hills, Sikkim, and South Bhutan), *hawaijar* (Manipur), *tungrymbai* (Meghalaya; food of the Khasi and Garo peoples), *bekang* (Mizoram; food of the Mizo people), *aakhone* (also called *axone*, Nagaland; food of the Sema Naga), and *peruyyan* (Arunachal Pradesh). Manipur, Meghalaya, Mizoram, Nagaland, and Arunachal Pradesh are small states in northeastern India.

All of these foods are similar to *kinema.*

Note: As a guide to the Seven Sister states of North East India, we are including a color map of the area created for Soyinfo Center.

For all these six foods is given: The name of the food, a close-up photo of the food, indigenous knowledge of preparation, a flow chart showing the indigenous method of making the food, culinary practices (how the food is prepared / cooked and eaten), economy (its role in the local economy), microorganisms (dominant and secondary).

Section 3.3 is "Microbiology" (of fermented legumes): Kinema (microorganisms, source of inoculation in kinema production optimization of fermentation period, in situ fermentation of kinema, selection of starter culture, monoculture fermentation of kinema, development of pulverized starter for kinema production, phylogenetic similarity of *Bacillus* strains from Asian fermented soybeans), other fermented soybean foods of north east India.

Section 3.4 is "Nutritive value" (table 3.1 compares the nutritional composition of raw soybean and kinema). And section 3.5 is "Conclusion."

The long and very interesting section (9.1.1) on the "Antiquity of kinema" (p. 230-34) states that it is a food of the Kirat ethnic group (to which the Limboo belong) of eastern Nepal. The origin of the word "kinema" can be traced back to the word *kinaba* of the Limboo language (*ki* = fermented; *namba* = flavor). It is not clear whether *kinema* appeared first, then was disseminated and diversified, or vice versa. The Limboo believe that their discovery and domestication of the soybean (which they named *chembi*) is mentioned in one of their oral myths known as *mundhuns.* This myth, which is described here in detail, might have been written between 2500 and 100 BC (p. 231).

Kinema is made by fermenting whole soybeans, without inoculation, with strains of *Bacillus subtilis* bacteria. It is alkaline in nature / pH, has a sticky, stringy texture and a strong flavor.

Natto [salty natto, not itohiki natto] is believed to have been introduced to Japan from China during the Nara period around 710-714 AD (Ito et al. 1996; Kiuchi 2001). Kinema might have originated in east Nepal around 600 B.C. to 100 A.D. during the Kirat dynasty.

Products closely resembling kinema are popular foods in many non-Brahmin communities in the eastern Himalayas. "The Lepcha [the aboriginal inhabitants of today's Sikkim] call it *satlyangser;* the Tibetans and Bhutia [of Bhutan and Sikkim] call it *bari;* the Khasi [of Meghalaya] call it *tungrymbai;* the Meitei [of Manipur] call it *hawaijar;* the Mizo [of Mizoram] call it *bekang;* the Sema Naga [of Nagaland] call it *aakhone;* and the Apatani [of Arunachal Pradesh] call it *peruyyan."*

Soybean products closely resembling kinema outside of the Himalaya region are *natto* of Japan, *chungkokjang* of Korea, and *thua-nao* of Thailand [From Google Books Preview].

Dr. Sasuke Nakao (1972) coined the term "natto triangle," but Dr. Tamang proposes that the hypothetical triangle be renamed "Kinema–Natto–Thua-nao triangle" (or KNT triangle).

Note: Four facts support Dr. Tamang's elegant new triangle:

(1) Indonesia and its mold-fermented tempeh should not have been part of the original natto triangle.

(2) Nakano (1972) guessed that natto might have come to Japan from Java during the Muromachi period, however extensive research on natto and tempeh after 1972 offers no support to his guess.

(3) Many new relatives of natto have been discovered since 1988, many of them by Dr. Tamang and co-workers. All of these (except the relatives of dawadawa made from soybeans found in West Africa) fall within the KNT triangle.

(4) No mold-fermented soyfoods–such as tempeh, miso, soy sauce, jiang, or fermented tofu–fall within the new KNT triangle.

An illustration / map (Fig. 9.1) shows this improved triangle with Japan (natto), Nepal-India-Bhutan (kinema), and Thailand (thua nao) at its three vertices / corners; it also includes chungkokjang (Korea), pepok (Myanmar), sieng (Thailand), and [incorrectly, mold-fermented] *douche* [*douchi*] from south China. These mildly alkaline, sticky fermented foods are popular among the peoples of Mongolian origin. This may be due to their typical flavor called *umami* (Kawamura and Kara 1987). This flavor is developed during the hydrolysis of soy protein (by protease enzymes) into amino acids during fermentation. Have people of Mongolian origin evolved or developed particular senses which incline them to enjoy the umami flavor? In the eastern Himalayas green vegetable soybeans are also boiled and eaten.

Section 10.3, "Commercialization through ethnic food tourism," suggests that just as tourists visit the vineyards of

© Copyright Soyinfo Center 2021

France, tempeh shops in Indonesia, and artisans or factories that make shoyu or sake in Japan, there are potential tourist sites for experiencing how traditional foods are made in the Himalayan villages. For kinema, try visiting Aho village in Sikkim.

About the author (p. xix): A good biography and portrait photo are given. In the "Acknowledgments" (p. xvii) he writes: "I am thankful to my wife Dr. Namrata Thapa for constant support and technical assistance in the preparation of this book. Over the past 16 years the team of brilliant Ph.D. students that I have recruited from the Food Microbiology Laboratory, Sikkim Government College, Gangtok, has been the real driving force in researching and identifying the scientific mechanisms of ethnic Himalayan fermented foods." He then lists their names. Address: Food Microbiology Lab., Sikkim Government College, Gangtok, Sikkim 737 102, India.

1879. Tamang, Jyoti Prakash; Samuel, Delwen. 2010. Dietary cultures and antiquity of fermented foods and beverages. In: Jyoti P. Tamang and K. Kailasapathy, eds. 2010. Fermented Foods and Beverages of the World. Boca Raton, Florida: CRC Press / Taylor & Francis. xii + 448 p. See p. 1-40. [188 ref]

• ***Summary:*** Contents: Cultural foods: Hindu foods, Buddhist foods, Christian foods, Muslim foods. World dietary culture: Use of hands, use of chopsticks, use of cutlery, evolution of dietary culture. Antiquity and cultural aspects: Fermented vegetables, fermented soybeans and non-soybean legumes, fermented cereals, fermented milks, fermented fish, fermented meats, fermented beverages and alcoholic drinks. Conclusion.

Section 1.3.2 titled "Fermented soybeans and non-soybean legumes," begins with a concise and well documented paragraph on the origin of the domesticated soybean in the eastern half of north China around the 11th century BC around the end of the Shang dynasty (ca. 1700 to 1100 BC), then its dissemination / spread from this primary soybean gene pool to central and south China, and the Korean peninsula. The soybean then spread to Japan, and throughout Southeast Asia and into northern India during the following centuries.

The next paragraph discusses the two earliest Chinese fermented soyfoods: *chi* (*shi*) [fermented black soybeans] and *jiang* (*chiang*) [Chinese-style miso]. *Chi*, now known as *douchi* was "next to salt use in China."

Note: Actually, salt was rarely used directly to season food in China; in the early days jiang, and later soy sauce had that honor. Yet salt was a major ingredient in both jiang and soy sauce.

Recipes for making 3 different types of *chi* and 14 different types of *jiang* are given in the *Qimin Yaoshu* (6th century B.C.). Soy sauce is presently an essential seasoning in Chinese cooking, "but it was not an ancient and deliberate preparation. It developed as a by-product of some jiang relishes and did not become of culinary importance until the Song dynasty (960-1279) (Sabban 1988)."

There follows a discussion of the early development of fermented soyfoods in Japan, including the Taiho Laws (AD 701) and the *Engishiki* (AD 906). Salted fermented black soybeans, which originated in China, took root in central Japan, where they were known by various names such as *hama-natto* and *daitokuji-natto;* in Taiwan they were known as *in-shi* (Yokotsuka 1991).

The subsequent few paragraphs contain three statements which we believe are incorrect and are not found in the sources cited: (1) "*Natto,* a fermented sticky soybean, was introduced to Japan from China by Buddhist priests during the Nara period around AD 710-794 (Ito et al. 1996, Kiuchi 2001 [p. 9]). Note: This statement is based on a misinterpretation of the documents cited and on the confusion resulting from the fact that the Japanese word "natto" can be used to refer to two very different foods, natto and fermented black soybeans. Both documents are referring to the introduction to Japan (by a Buddhist priest) of salted, fermented black soybeans (*douchi*) and not of *itohiki* natto. For example, Kiuchi (2001, p. 9, written in English) states: "The two main varieties of *natto* [in Japanese] are *itohiki-natto* and *shiokara-natto,* which [referring only to the latter] was introduced to Japan from China during the Nara period (790-794) by a Buddhist priest."

(2) "The production of shoyu and miso in China was recorded around 1000 BC, with the transfer of the indigenous knowledge to Japan happening at around AD 600 (Yokotsuka 1985). Yokotsuka is perhaps the world's leading authority on this subject. However nowhere in this excellent chapter by Yokotsuka can we find anything that would justify the surprising statement (especially the date 1000 B.C. for shoyu) above.

(3) "Tempe made in present day Indonesia was originally introduced by ethnic Chinese centuries ago." No source is cited. Address: 1. • ***Summary:*** "The food of South Korea is a balance of cot, cold, spicy, sweet and mild. The chile pepper arrived via trade with China and Japan in the 16th century and Koreans have embraced it ever since. Many dishes here start with gochujang, fermented chile pepper paste, but none are overly hot. Others are seasoned with dwenjang, a misolike soybean paste."

1885. Kau, Andrew L.; Ahern, P.P.; Griffin, N.W.; Goodman, A.L.; Gordon, J.I. 2011. Human nutrition, the gut microbiome and the immune system. *Nature* 474(7351):327-36. June 15. [100* ref]
• ***Summary:*** Our gut health and our immune system are greatly influenced by the foods we eat, especially fermented foods.

Abstract: Dramatic changes in socio-economic status, cultural traditions, population growth and agriculture are affecting diets worldwide. Understanding how our diet and nutritional status influence the composition and dynamic operations of our gut microbial communities, and the innate and adaptive arms of our immune system, represents an area of scientific need, opportunity and challenge. The insights gleaned should help to address several pressing global health problems."

"The need: A number of reviews have appeared recently about efforts to decipher the interactions between the innate and adaptive immune system and the tens of trillions of microbes that live in our gastrointestinal tracts (`the gut microbiota'). Here we emphasize how the time is right and the need is great to better understand the interrelationships between diet, nutritional status, the immune system and microbial ecology in humans at different stages of life, living in distinct cultural and socioeconomic settings. Why now? The answer lies in a confluence of forces occurring at the present time that will affect the future.

Ten reasons are given. A schematic shows "envisioned interrelationships between the gut microbiota, the immune system and diet that underlies the development of malnutrition."

"Under-nutrition is associated with a variety of defects in the innate and adaptive immune system that, in turn, are associated with increased predisposition to diarrheal illnesses. Recurrent (enteric) infections predispose to macro- and micronutrient deficiencies, as well as impaired intestinal mucosal barrier function [77]. These factors lead to a cycle of further susceptibility to infection and worsening nutritional status. A confounding problem is that vaccines designed to protect children from certain pathogens

© Copyright Soyinfo Center 2021

(including enteropathogens) exhibit poor efficacy in areas of the world where poor nutrition is rampant [74]. A testable hypothesis is that the gut microbiota may contribute to disease risk and pathogenesis through effects on nutrient processing and absorption, and on immune function. These interrelationships are illustrated in the Figure. Diet shapes gut microbial community structure and function while the microbiota adapts in ways that promote nutrient processing; the ability of the microbiota to process a given diet affects the nutrient and energetic value of that diet. The microbiota and immune systems co-evolve: malnutrition affects the innate and adaptive immune system as well as the microbiota. The microbiota serves as a barrier to enteropathogen infection; this barrier function may be disrupted by malnutrition as well as by perturbations in immune system function. The microbiota affects nutrient processing and nutrient distribution to the host, including the expression of host genes involved in nutrient transport and metabolism." Address: Center for Genome Sciences and Systems Biology, Washington University School of Medicine, St. Louis, MO 63108.

1886. Kim, Yi-Seul; Kim, M.C.; Kwon, S.W.; Kim, S.J.; Park, I.C.; Ka, J.O.; Weon, H.Y. 2011. Analyses of bacterial communities in meju, a Korean traditional fermented soybean bricks, by cultivation-based and pyrosequencing methods. *J. of Microbiology* 49(3):340-48. June. [66 ref]
• ***Summary:*** "Despite the importance of meju as a raw material used to make Korean soy sauce (ganjang) and soybean paste (doenjang), little is known about the bacterial diversity of Korean meju. In this study, the bacterial communities in meju were examined using both culture-dependent and independent methods in order to evaluate the diversity of the bacterial population... In conclusion, this study indicated that the bacterial communities in meju were very diverse and a complex microbial consortium containing various microorganisms got [sic, not] involved in meju fermentation than we expected before."

Two types of meju are produced in Korea. Korean homemade meju is the traditional product, and Japanese refined meju is the commercial product. Address: 1. Agricultural Microbiology Team, National Academy of Agricultural Science, Rural Development Administration, Suwon 441-707, Republic of Korea.

1887. Hwang, In Guk; Hwang, Y.; Kim, H.Y.; Lee, J.S.; Jeong, H.S.; Yoo, S.M. 2011. [Quality characteristics of tofu (soybean curd) added with Cheongyang hot pepper (*Capsicum annuum* L.) juice]. *J. of the Korean Society of Food Science and Nutrition* 40(7):999-1005. July. [35 ref. Kor; eng]
• ***Summary:*** "Overall, Caps. pepper juice could be used as an effective ingredient to improve the sensory and antioxidant properties of tofu without affecting the quality properties." Address: 1. 1888. Morris, Danielle H.; Jones, M.E.; Schoemaker, M.J.; Ashworthy, A.; Swerdlow, A.J. 2011. Secular trends in age at menarche in women in the UK born 1908-93: results from the Breakthrough Generations Study. *Paediatric and Perinatal Epidemiology* 25(4):394-400. July. *
• ***Summary:*** "Menarcheal age decreased over time in Western countries until cohorts born in the mid-20th century. It then stabilised, but limited data are available for recent cohorts. Menarche data were collected retrospectively by questionnaire in 2003-10 from 94,170 women who were participating in the Breakthrough Generations Study, aged 16-98 years, born 1908-93 and resident in the UK. Average menarcheal age declined from women born in 1908-19 (mean=13.5 years) to those born in 1945-49 (mean=12.6 years). It was then stable for several birth cohorts, but resumed its downward trend in recent cohorts (mean=12.3 years in 1990-93 cohort). Trends differed between socio-economic groups, but the recent decline was present in each group. In conclusion, menarcheal age appears to have decreased again in recent cohorts after a period of stabilisation." Address: 1. Section of Epidemiology, Institute of Cancer Research, Sutton, Surrey, UK.

1889. Brown, Lester R. 2011. World on the edge by the numbers–Grain production falling as soil erosion continues. *www.earthpolicy.org*. Aug. 2. www.earth-policy.org/data_highlights/2011/highlights17. [1 ref]
• ***Summary:*** "The thin layer of topsoil that covers much of the earth's land surface is the foundation of civilization. As long as soil erosion on cropland does not exceed new soil formation, all is well. But once it does, it leads to falling soil fertility and eventually to land abandonment. As countries lose their topsoil through overgrazing, overplowing, or deforestation, they eventually lose the capacity to feed themselves. Among those facing this problem are Lesotho, Haiti, Mongolia, and North Korea.

"Lesotho, one of Africa's smallest countries with only 2 million people, is paying a heavy price for its soil losses. A U.N. team visiting in 2002 found that crop production there "is declining and could cease altogether over large tracts of country if steps are not taken to reverse soil erosion, degradation, and the decline in soil fertility." During the last 10 years, Lesotho's grain harvest dropped by half as its soil fertility fell. Its collapsing agriculture has left the country heavily dependent on food imports."

Graphs show grain production in each of these four countries from 1961 to 2010. All show a downward trend in recent years. Address: President, Earth Policy Inst., 1350 Connecticut Ave., N.W., Suite 403, Washington, DC 20036. Phone: 202-496-9290.

1890. Kumar, Vineet; Rani, A.; Goyal, L.; Pratap, D.; Billore, S.D.; Chauhan, G.S. 2011. Evaluation of vegetable-type soybean for sucrose, taste-related amino acids, and isoflavones contents. *International J. of Food Properties* 14(5):1142-51. Aug. 16. doi:10.1080/10942911003592761 [16 ref]

• ***Summary:*** "Vegetable soybean differs from the conventional soybean in its distinct taste. Genetic variability has been scarcely investigated in vegetable soybean for taste-related compounds viz. sucrose, aspartic acid, glutamic acid, glycine, alanine, and isoflavones. In the present study, analysis of green seeds of 12 vegetable-type genotypes, between reproductive stages of R6 and R7 (i.e., when the pods were completely filled but the seeds and pods shell not yet turned yellow), revealed ranges of 1.28-7.12, 0.37-1.51, 0.64-2.82, 0.17-0.72, 0.11-0.51 g/100 g for sucrose, aspartic acid, glutamic acid, glycine, alanine content, respectively, while a range of 8.64-33.19 mg/100 g was observed for total isoflavones content. Genotypes with high levels of sucrose, aspartic acid, glutamic acid and alanine scored high for taste. Results did not indicate any significant relationship between isoflavones content and the taste score.

"Introduction: Vegetable soybean can be a potential mode for harnessing health components of soybean in countries like India, United states, Brazil, and Argentina, where the traditional soy products viz. soy milk, tofu, miso, natto from the South-East Asian countries could not become popular due to the off-flavour associated with them and the time consuming process involved in their preparation."

In Korea, vegetable soybean is known as *poot kong.* Address: National Research Centre for Soybean, Khandwa Road, Indore, MP India.

1891. Shurtleff, William; Aoyagi, Akiko. comps. 2011. William J. Morse–History of his work with soybeans and soyfoods (1884-1959): Extensively annotated bibliography and sourcebook. • ***Summary:*** "In this study, we investigated the antioxidative activity (scavenging activity of 1,1-diphenyl-2-picrylhydrazyl (DPPH) free radical and superoxide anion radical) and anti-obesity effects of black bean chungkugjang extract (BBCE)... Based on these results, it can be concluded that BBCE may have beneficial effects on reducing fat mass and serum lipid content." Address: 1. Technology Research Center, Ben's Lab Co., Ltd., Gyeonggi 445-743, Korea.

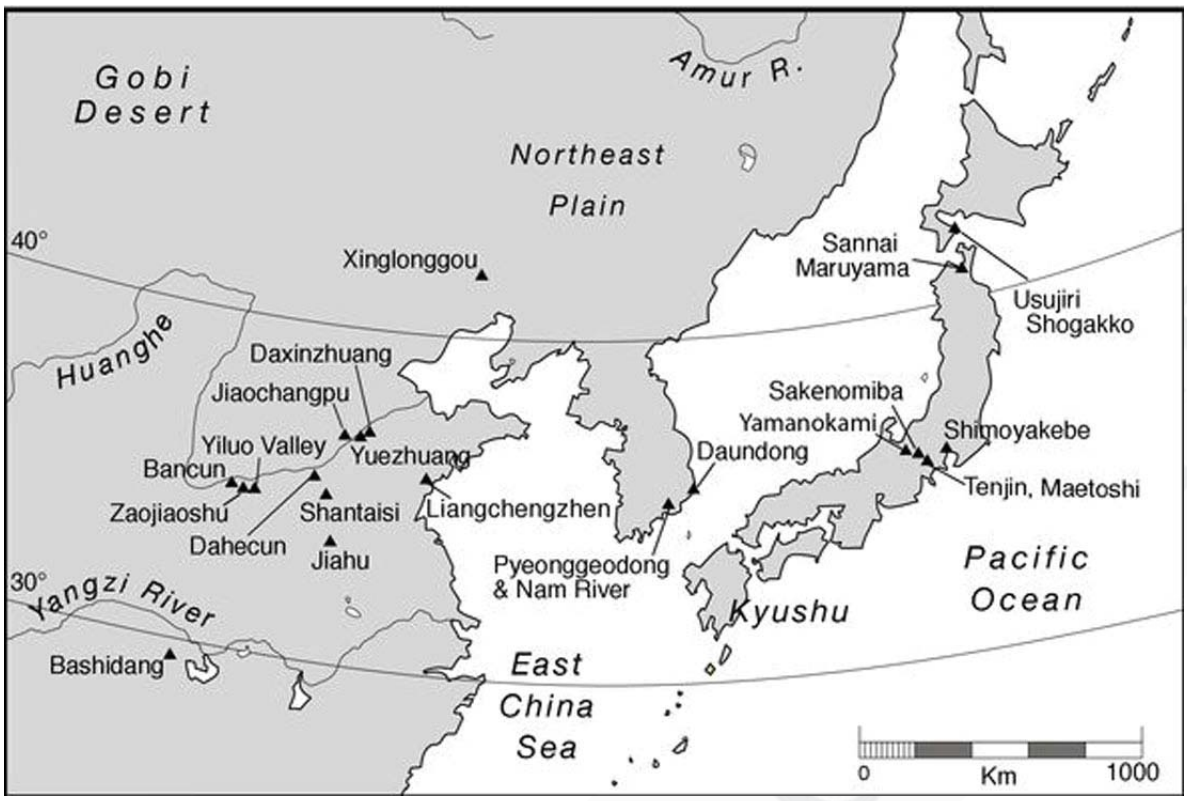
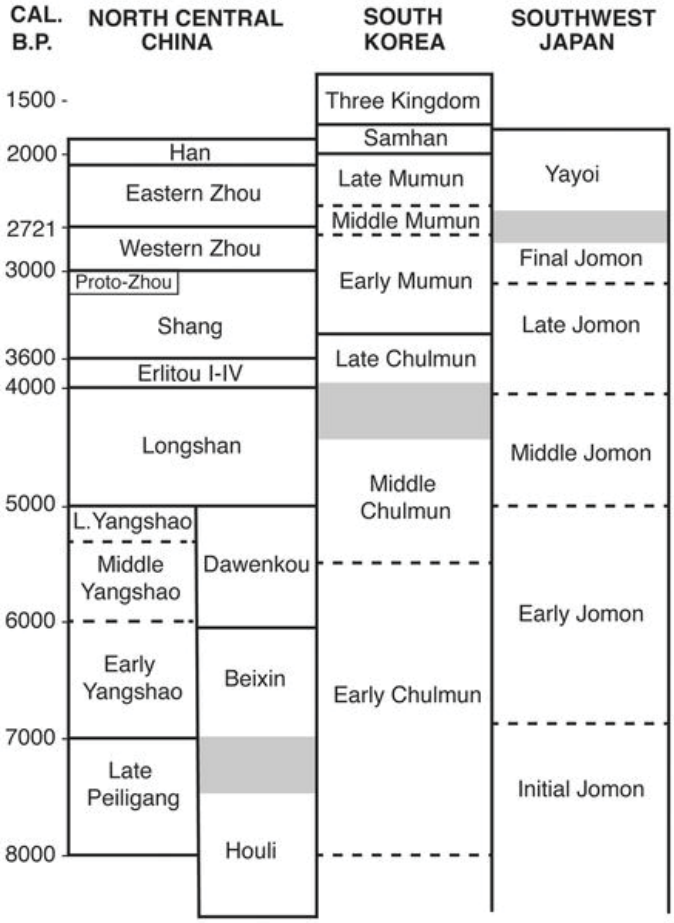
1893. Lee, Gyoung-Ah; Crawford, G.W.; Liu, L.; Sasaki, Y.; Chen, X. 2011. Archaeological soybean (*Glycine max*) in East Asia: Does size matter? *PloS ONE* 6(11): e26720. doi:10.1371/journal.pone.0026720. Published: Nov. 4. [69 ref]



• ***Summary:*** The authors, archaeologists, say that soybean adoption came earlier than previously thought. Moreover, domestication occurred outside of China, in countries such as South Korea and Japan.



"The recently acquired archaeological record for soybean from Japan, China and Korea is shedding light on the context in which this important economic plant became associated with people and was domesticated. This paper examines archaeological (charred) soybean seed size variation to determine what insight can be gained from a comprehensive comparison of 949 specimens from 22 sites. Seed length alone appears to represent seed size change through time, although the length x width x thickness product has the potential to provide better size change resolution.

"A widespread early association of small seeded soybean is as old as 9000-8600 cal [calculated] BP [Before the present] in northern China and 7000 cal BP in Japan. Direct AMS radiocarbon dates on charred soybean seeds indicate selection resulted in large seed sizes in Japan by 5000 cal BP (Middle Jomon) and in Korea by 3000 cal BP (Early Mumun). Soybean seeds recovered in China from the Shang through Han periods are similar in length to the large Korean and Japanese specimens, but the overall size of the large Middle and Late Jomon, Early Mumun through Three Kingdom seeds is significantly larger than any of the Chinese specimens. The archaeological record appears to disconfirm the hypothesis of a single domestication of soybean and supports the view informed by recent phyologenetic research that soybean was domesticated in several locations in East Asia."

Note: "BP" stands for "Before the present" where "the present" is taken as 1950. "cal" means calculated to adjust for historically uneven distributions of carbon 14 in the environment. "AMS" stands for "accelerator mass spectrometry." AMS radiocarbon dating is a form of radiocarbon dating that is more precise and requires less carbon than conventional radiocarbon methods. 1894. Park, H.G. 2011. [Government role for education of soybean breeders in Korea]. *Korea Soybean Digest* 28(1):59-63. Nov. [20 ref. Kor; eng]*
• ***Summary:*** "Current Status of cultivation and consumption of soybean in Korea: Korea must import annually about 1.2-15 million tons of soybean abroad since her self-sufficiency rate of soybean is only 7-9%. Soybean cultivated area in Korea was once 308,000 ha in 1960's, but now decrease to only 71,000 ha, Soybean yield is about 1.5-1.9 t/ha, much lower than that of US (=2.28t/ha). Wholesale price of locally produced soybean is surprisingly high 6.914 Won/kg (about $5.76/kg) compared 3,168 Won/kg for imported one. Main usages of soybean in Korea are for tofu, soy sauce, soy paste, soymilk, bean sprout and others. We, Koreans, have very highly negative attitude to GM soybean so far. We don't have single ha of GM soybean cultivated in the country, but have imported annually about 1 million tons of GM soybean mainly from US, Brazil and Argentina. We noticed that China's black-hole like import of soybean (52.5 million tons in 2010) would be a key factor for international stability of soybean supply and price." Address: Korea.

1895. *SoyaScan Notes.* 2011. Why seitan has not become as popular as tofu as a source of plant protein in the USA (Overview). Dec. 21. Compiled by William Shurtleff of Soyinfo Center.
• ***Summary:*** 1. Historical: Tofu has been a basic food in all countries of East Asia for at least 1,000 years. This includes China, Japan, Korea, Vietnam, and Indonesia. So wherever people with ancestry from these countries live, tofu is made. It has no class affiliation and is inexpensive, so it is eaten by people of all classes and income levels from these countries. And it appears in virtually all cookbooks for these cultures. So there has long been a large demand for tofu in the USA.

2. Tofu manufacturers in the USA: Since 1900 there have been plenty of tofu shops to supply the demand. Between 1905 and 1975 at least 528 different Japanese-owned tofu manufacturers were established in the USA. Probably at least that many Chinese-owned tofu makers also started.

3. Seitan historical: It was invented in about 1962 by George Ohsawa, the macrobiotic teacher, together with Mr. Kiyoshi Mokutani, the owner of a small soy sauce company (Marushima shoyu) in Japan. So it has a very short history. And originally (starting in 1969) it was all imported from Japan.

4. Macrobiotics: Seitan has been limited mostly to macrobiotic community. Wikipedia says incorrectly that seitan is another name for wheat gluten. Not true. Seitan is a product made from wheat gluten just like tofu burgers are made from tofu.

5. Evolution of the meaning of the word: Seitan was originally a salty seasoning, not a protein source. But over the years the meaning of the word gradually changed; it came to refer to any wheat gluten seasoned with soy sauce.

6. Not widely made in the USA since not much demand.

7. Very expensive compared with tofu, in part because not widely available so had to be sent by UPS or mail.

8. Wasteful process. It is made from wheat by discarding all but about 14% of the original wheat and using only the protein. Or, if you start with "vital wheat gluten" (a powder) the quality of the seitan is not nearly as good as if you start with whole wheat flour.

9. Process causes pollution: Dumping all of that starch into any sewage system pollutes the system and usually leads to either a fixed fee or a fine on the manufacturer.

10. Few books about seitan, and no much press coverage or information. Only 3 books about seitan (with "seitan" in the title) have ever been published in English: Jacobs 1987, Wingate 1988, and Bates 1993. Just the opposite with tofu.

1896. Kim, Jihye; Kim, Shin Hye; Huh, Kyoung; et al. 2011. High serum isoflavone concentrations are associated with the risk of precocious puberty in Korean girls. *Clinical Endocrinology* 75(6):831-35. Dec. [32 ref]
• ***Summary:*** "The gradual decrease in the age of onset of puberty raises concerns about the contribution of phytoestrogen intake on sexual maturation. However, no data are available on the association between serum isoflavone (genistein, daidzein) concentration and central precocious puberty (CPP). The aim of the study was to test the association between serum isoflavone concentrations and the risk of CPP in Korean girls."

The results suggest that elevated serum isoflavones may be associated with the risk of CPP in Korean girls.

Note: Puberty is the time during which sexual and physical characteristics mature. As a medical term, precocious puberty is when these body changes happen earlier than normal (ncbi.nlm.nih). Address: 1. PhD, Dep. of Food and Nutrition, Daegu Univ., Gyeongsan, Korea.

1903. Sung, Jung-Min; Kim, Ok-Sun; Ryu, Hye-Sook. 2011. [Changes in enzyme activity and sensory characteristics of kochujang with different ratios of added deoduk (*Codonopsis lanceolata*) root powder]. *J. of the Korean Society of Food Science and Nutrition* 40(8):1150-56. [34 ref. Kor; eng]
• ***Summary:*** "*Deoduk* (*Codonopsis lanceolata*) root powder was added to traditional kochujang to improve the quality of traditional kochujang. The microbial characteristics, enzyme activities, and sensory characteristics were investigated during fermentation. The aerobic bacterial count in kochujang was not remarkably different, and yeast and mold decreased during fermentation."

Note: Deoduk, also called deodeok or lance asiabell, is a flowering plant native to East Asia (China, Japan, Korea, and the Russian Far East). Address: 1. Korea Food Research Inst., Gyeonggi 463-746, Korea.

1904. Youn, Kumju; Kim, Jiyoung; Yeo, Hye-Reem; Jun, Mira. 2011. [Improving the functional quality of kochujang added with red ginseng and fermented wild herbal extract]. *J. of the Korean Society of Food Science and Nutrition* 40(12):1675-79. [23 ref. Kor; eng]
• ***Summary:*** "To improve the quality and palatability of Kochujang, the physicochemical properties, antioxidant capacity, and sensory evaluation of Kochujang were assessed when red ginseng and wild herbal extract were added during fermentation. This study investigated the antioxidant capacities of general Kochujang (GK) and Kochujang prepared with red ginseng and fermented wild herbal extract (RGK) by employing various in vitro antioxidant assays such as DPPH and FRAP assays... We concluded that RGK improves not only functional properties but also sensory properties as well." Address: 1. Dep. of Food Science and Nutrition, Dong-A Univ., Busan 604-714, Korea.

1905. Dajanta, K.; Chukeatirote, E.; Apichartsrangkoon, A. 2011. Analysis and characterisation of amino acid contents of thua nao, a traditionally fermented soybean food of Northern Thailand (Open Access). *International Food Research Journal* (*Selangor, Malaysia*) 18:595-99. [17 ref]
• ***Summary:*** "In this study, an analysis of free amino acid (FAA) profiles was determined using reversed-phase high performance liquid chromatography. For this, thua nao samples conventionally produced were collected from six local markets (Mae Wang, Mae Hia, Mae Taeng, Jom Thong, San Patong and San Sai) in Chiang Mai, Thailand and used for the analysis. Results indicate a variation in amino acid compositions and contents among these thua nao products. The quantities of total FAA were found between 11.03–61.23 g/kg, as dry basis. Predominant amino acids were Trp, followed by Glu, Cys, Lys and Leu. All essential amino acids (EAA) were present in considerable amounts in which the proportions of EAA7 and EAA10 values were 2.67–13.99 and 7.24–36.54 g/kg dry basis, respectively. The most abundant taste FAA class was the bitter FAA representing more than 50% of total FAA. This is the first paper to report thua nao amino acid profiles with an expectation to further shed light on its nutritive qualities.

"Introduction: Thua nao is a Thai traditional fermented soybean which is popular and widely consumed in the

© Copyright Soyinfo Center 2021

northern part of Thailand. It is protein-rich and thus has long been used as a meat substitute. Traditionally, thua nao has been prepared by naturally fermenting the boiled soybeans in a bamboo basket, covered with banana leaves for 2-3 days at ambient temperature. After fermentation, raw thua nao must be cooked by steaming or roasting in which spices and other ingredients may be added during cooking. Alternatively, raw thua nao is crushed and formed into a disc shape, exposed to sunlight resulting in a dried product, the so-called 'thua nao kab'. Other traditionally fermented soybeans similar to thua nao have also been found in Asian countries such as Japanese natto, Indian kinema, Chinese douche, and Korean chungkukjang." Address: 1, 3. 1906. Mangels, Reed; Messina, Virginia; Messina, Mark. 2011. The dietitian's guide to vegetarian diets: Issues and applications. 3rd ed. Sudbury, Massachusetts: Jones & Bartlett Learning. xi + 596 p. Illust. Index. 23 cm. 1st ed. 1996. 2nd ed. 2004. [342 soy ref]
• ***Summary:*** Chapter 9, "Soyfoods" (p. 249-89) is excellent. Its contents: Introduction. Isoflavones: Isoflavone content of soyfoods, isoflavone absorption and metabolism. physiologic properties of isoflavones. Asian soy intake. Nutritional composition of soybeans and soyfoods: Protein, fat, carbohydrate, vitamins, minerals (iron, zinc, calcium). Chronic disease prevention and treatment: Coronary heart disease (cholesterol reduction, lipid-independent effects), cancer (breast cancer, prostate cancer), osteoporosis, alleviation of menopausal symptoms, renal function. Controversies: Soy infant formula, cognitive function, thyroid function, fertility and feminization, breast cancer patients, allergy. Intake recommendations.

Table 9-1 (p. 251-52), "Chemical and common names and molecular weights (MW) of the 12 isoflavone isomers found in soybeans" includes the following foods and USDA IDN [identification number]: Tofu: Firm, firm #2, regular, silken firm, extra firm, extra firm #2. Natto. Soymilk, Miso, Tempeh. Soybeans, raw, US food grade. Soybeans, cooked. Soybeans, raw, Japan. Soybeans, raw, Korea. Soybeans, raw, Taiwan. Soybeans, green, cooked. Soybean curd, fermented. Soymilk skin (foo jook / yuba, cooked). Soymilk skin (foo jook / yuba, raw). Isolated soy protein. Soy protein concentrate: Water washed, alcohol washed. Soyflour: Full fat, defatted.

The Glossary of vegetarian foods (p. 447+) includes: Soyfoods: Edamame, soybeans, soy flour, soymilk, soy nuts, tempeh, textured vegetable protein (TVP, a brand name), tofu. Meat analogs: Commercial meat substitutes, seitan. Milks and dairy analogs: Nondairy cheese, nondairy frozen desserts, nondairy milks, sour cream substitute, yogurt. Address: 1. PhD, RD, LDN, The Vegetarian Resource Group, Maryland; Univ. of Massachusetts, Amherst, Mass.; 2-3. Nutrition Matters, Port Townsend, Washington; Loma Linda Univ., Loma Linda, California.

1907. Choi, Ben. 2012. Gochujang: Korean go-to, all-in-one magic chile sauce (Web article). *Awl* (*The*) https://www.theawl.com/2012/01/gochujang-korean-go-to-all-in-one-magic-chile-sauce/
• ***Summary:*** "Our relationships with condiments can become rote: ketchup/fries, mustard/hotdog, salsa/chips–even sriracha/pho. We robotically dip, drizzle and douse without a conscious thought. In this column, we'll be trying to shake up our collective condiment consciousness. Proust wrote, "The only real voyage of discovery consists in not seeking new landscapes but in having new eyes," and with that in mind, I thought I'd take you along in search of lost time–to my first condiment: Gochujang.

"As a Korean kid growing up in American Samoa, I was part of a subculture made up of the families of Korean fishermen and sailors that had sprung up around the tuna industry of the South Pacific. (I know, there's a musical in here, somewhere.) The heart of this community was Korea House, a blue-shingled, cantilever-roofed building, behind which were buried about a dozen earthenware vessels the size of Greek amphorae–it was in these we aged our gochujang.

"Gochujang is a fermented paste made of red chili powder, glutinous rice powder, pureed soy beans and salt, seasonings like garlic and onion, all sweetened with a little sugar syrup and aged for, like, eons in buried earthen vessels. It's about the consistency of hoisin sauce; perfectly uniform but slightly grainy. It brings to the table the perfect savory mix of flavors: spicy, salty and sweet, with an earthy finish and loads of umami. You may know it as the main finishing condiment for bibimbap, but it's truly versatile, good for anything that involves rice or noodles, stir-fries and any soups or stews that could use a peppery, reddish cast. Oh, and it's a main ingredient in spicy BBQ marinades, especially with pork.

"One of the coolest and most flexible uses of gochujang is as a mother-condiment, the basis for other sauces and pastes. It can be mixed with doenjang (Korean red miso) to form ssamjang, which is great for lettuce wraps (ssam) and dipping vegetables, both raw and lightly blanched. But perhaps the best kick-around variation is chogochujang, which goes excellently with fish, sauteed and blanched greens, and can pretty much be used as Korean ketchup. Keep chogochujang in your fridge in a squeeze bottle; it will definitely come in handy for omelets, fried rice, etc. Use it as a marinade for burgers. You can even mix in a little extra oil and use it as a salad dressing! Don't sweat orthodoxy with this condiment. (Interestingly, the peppers that go into gochujang were originally brought from America as part of the Columbian Exchange.)

"Condiments have a way of serving as passports

© Copyright Soyinfo Center 2021

between traditional cuisines. In American Samoa, gochujang served as a go-between for Asian, Polynesian and American taste stylings. I can remember enjoying gochujang and chogochujang with kalua pig, breadfruit, kimchi and spam or canned corned beef on a taro leaf for a Sunday afternoon meal.

"Later, when my family moved to L.A., and my parents were busy running a corner store, gochujang became a staple of the latchkey lifestyle for me and my brothers. Breakfast might be bokumbap, kimchi fried rice with Spam, tinged red with a healthy dose of gochujang and topped with an over-easy egg. For snacks we would make little maki rolls out of rice, canned tuna dressed with chokochujang and pickles. In a pinch, you can even make a meal of beef jerky or Slim Jims–remember, we were growing up in a convenience store–as long as you have some rice, some kind of vegetable and gochujang for dipping..." Address: Overlooking San Francisco Bay, California.

1908. Shurtleff, William; Aoyagi, Akiko. comps. 2012. History of natto and its relatives (1405-2012): Extensively annotated bibliography and sourcebook. Lafayette, California: Soyinfo Center. 657 p. Subject/geographical index. Printed 15 Feb. 2012. 28 cm. [1934 ref]
• ***Summary:*** Begins with an attempt to answer the question "What is natto?," followed by a brief chronology of natto and its relatives. Contains 136 historical photos (most in color), graphs, and illustrations http://www.soyinfocenter.com/books/151. Address: Soyinfo Center, P.O. Box 234, Lafayette, California 94549. Phone: 925-283-2991.

1909. Nguyen, Andrea Quynhgiao. 2012. Asian tofu: Discover the best, make your own, and cook it at home. Berkeley, California: Ten Speed Press. [viii] + 232 p. Illust. (color photos by Maren Caruso). Index. 24 x 24 cm. [21 ref]
• ***Summary:*** Another very attractive book and well-written book by Andrea Nguyen. In researching this book, Andrea traveled to many countries in East- and Southeast Asia. The color photos and the book design are both superb.

Contents: Introduction: East Asian stronghold (China, Japan, Korea), wavering Southeast Asia (Vietnam, Thailand, Cambodia, Laos, Singapore, Malaysia, Indonesia, Philippines, Myanmar / Burma), South Asian newcomer (India), tofu in America (Samuel Bowen, Benjamin Franklin, Commodore Matthew Perry, Civil War soldiers, Piper & Morse, George Washington Carver, Mildred Lager, World War II), alternative to mainstream (Boys Market in Los Angeles, *Diet for a Small Planet*, *The Book of Tofu*, Jeremiah Ridenour, Los Angeles Tofu Festival), tofu today (United Soybean Board Survey, Hodo Soy, Dong Phuong Tofu [Westminster, Orange County, California]).

Tofu buying guide: Tofu types (tofu blocks {silken, medium, medium firm, firm, extra firm, super firm}, pressed tofu, tofu noodles, tofu skin [yuba; an unfortunate term since yuba has nothing to do with tofu] {fresh tofu skin packets = dou fu bao, tofu skin rounds = dou fu pi or fu pi, dried tofu sticks [dried yuba sticks] = fu zhu or "tofu bamboo"}, fried tofu {fried tofu slices}, tofu pudding (like silken tofu but made by pouring rich soymilk into a tallish pot with a little calcium sulfate and tapioca starch dissolved in water in the bottom), fermented tofu {red or white}, soy milk).

Note: This is the earliest English-language document seen (Oct. 2012) that uses the term "fresh tofu skin packets" or the term *dou fu bao* in connection with yuba.

Tofu cooking tips: Cutting, draining, frying.

Homemade tofu tutorial (incl. homemade soy milk, soy milk lees, homemade silken tofu, homemade tofu pudding, block tofu, confetti tofu, oboro tofu, zaru tofu, seasoned pressed tofu, tea-smoked pressed tofu, white fermented tofu, frozen tofu, fresh tofu skin, soy-simmered fried tofu).

Recipes–Fresh and satisfying: Snacks and starters. Soothing and soft: Soups and hot pots. Homey and wholesome: Main dishes. Versatile and delicious: Salads and sides. Religion and artistry: Mock meats. Building on traditions: Buns, dumplings, crepes, noodles and rice. Amazing transformations: Sweets and desserts. Basics. Ingredients (glossary). Acknowledgments. Measurement conversion charts.

Note 1. This book contains many recipes that use meat, poultry, or fish as ingredients.

Note 2. The Vietnamese term for tofu is *dau phu.*

Note 3. The author (unfortunately) uses the term "tofu skin" to refer to yuba. Address: Food writer, Santa Cruz, California.

1910. Lee, Young Duck; Park, Jong-Hyun. 2012. [Rapid fermentation starter *Enterococcus faecium* of soybean for soy-sauce like product]. *Korean J. of Food and Nutrition* 25(1):188-95. [Kor; eng]
• ***Summary:*** The goal was to produce rapidly traditional kanjang, the Korean soy-sauce with rich flavors, lactic acid bacteria of *Enterococcus* species isolated from *Chungkukjang.*

Note: This journal was launched in 1988. Address: Dep. of Food Science and Biotechnology, Gachon Univ., Seongnam 461-701, Korea.

1911. Agranoff, Jonathan. 2012. Re: Details of making and selling tempeh in London starting Sept. 1985. Letter (e-mail) to William Shurtleff at Soyinfo Center, April 4. 1 p.
• ***Summary:*** "I started making tempe in London in 1985 when I was a second year Food Science undergraduate student at Kings College, London University. In fact that year I was in the nutrition research and development centre with a couple of other nutritionists and undertook a small project on tempe made from different water sources looking at bacterial contamination.

"I started making tempe in the microbiology lab when

© Copyright Soyinfo Center 2021

I got back to England but got evicted from there as no-one knew what it was and they thought my fungus was going to contaminate the rest of the lab so I moved it to my room and fermented the first batch under my bed in university accommodation. I subsequently improved hygiene standards and developed a dry dehulling method using a small hand operated 'maize mill' and used inoculum from Bogor market I brought back with me. I then modified an old refrigerator with a lamp and thermostat as a heating element and started making 10-15 kg a week, putting it on my bicycle and taking it up to the Indonesian Embassy in central London where the majority of Javanese diplomats had never had tempe in London before, only sometimes when someone came back from Amsterdam with a piece.

"My tempe was at that time the only fresh tempe available in that quantity in the UK and I began making it at home once a week and distributing it on weekends just after fermentation to the homes of the Indonesian community in NW London. I returned to Indonesia roughly every 1-2 years with a project or other program and also made a series of radio documentaries for the BBC's Indonesian section on tempe, specifically on tempe Bongkrek, unraveling the story of the 1988 mass poisoning incident in Ajibarang, Banyumas and even interviewing the man who had made the deadly batch. I can let you have a copy of that if you're interested too. I also did a trip recently to Tondano, North Sulawesi where I was intrigued to check on the theory of the origin of tempe and 'spontaneous generation' from wild *Rhizopus* and the story of the Kyai Mojo exodus from East Java to Tondano where it was said this community did not bring any ragi but managed to make tempe from naturally growing mold. They didn't, and this story was completely wrong and I discovered something very odd had evolved instead.

"Anyway, long story, let me know if you'd like any more."

Shurtleff replies with several questions, to which Jonathan gives excellent replies:

(1) Did you ever have a business with a business name? "I started making tempe as a 'home industry' in September 1985. This was on my return from a long summer vacation on a project in the nutrition research and development centre in Bogor where I did some fieldwork in microbiology and where I first learned how to make tempe. Back in London, I had no formal business name, I just made it for the Indonesian community after I told them I had been researching tempe in Indonesia and they were very interested if I could make tempe for them. In London I used to time the fermentation so it would mature on my afternoon off classes so I could take it to sell, making a maximum of 15 x 400g packs. The embassy always invited me to their cultural and diplomatic events as they knew I would turn up with a stack of fresh tempe. I found tempe was such an important diplomatic tool for Indonesians too, later I introduced it later to communities in Zimbabwe and Burma. In Harare, while working for a British Overseas Development programme in 1988, I made it for a project with the embassy and the Zimbabwean nutritionists and federation of women's groups headed by Mugabe's wife at the time was fascinated with it. It had become a social tool to show what was unique about Indonesia and everyone liked it. I did a similar exercise in Nairobi [Kenya].

"I was interested in this since in 1985 I had met with all the participants of the United Nations University's (Tokyo) sponsored tempe training for scientists from Nigeria / Benin?, South Africa, Ethiopia (?), Egypt, Thailand, Korea, etc. who were all in Bogor at the time.

"In 1991 I started medical school in Southampton University and moved to that city. My converted refrigerator incubator and giant cooking pans came down too and my parents were pleased to be able to clean their kitchen at last after 10 years of encrusted soybeans and calls at 4 am to check fermentation temperature for overheating tempe. There were about 40 Indonesian PhD students at Southampton and they soon learned where the tempe was made. I also supplied some Indonesian restaurants in Oxford and London at the time which helped subsidize medical school."

(2) What year and month did you first sell any tempeh to anyone? "September 1985 first started making tempe in London."

(3) Where–at what address–did you make the first tempeh you sold? "I made this tempe at home, 27 Oman Avenue, London NW2, UK."

(4) Did you create a label for your tempeh? If yes, do you have any left–and could you send me a scan? "I didn't have a label for that tempeh."

(5) Where did you get your soybeans and tempeh starter? "In the beginning I obtained my tempe starter from Pasar Bogor or sometimes from tempe factories on each trip to Indonesia. I did use the lab at university to make some starter but it was too laborious, and again at home grown on rice. Subsequently I have been using the LIPICO commercial ragi from Bandung. My soybeans come from a local oriental supermarket [in London], I used to buy 45 kg sacks that was usually Canadian soy."

(6) You mentioned in your 1st e-mail receiving our *Book of Tempeh* on your 21st birthday. Did you learn how to make tempeh from our book? "I was given you're 'The Book of Tempeh' I think in 1988, but actually I had learned how to make tempe before that in 1985 but tried out lots of recipes from your book and tried making ragi, and was fascinated to see a parallel world to mine 20 years earlier in California!" Address: M.D., London, England.

1912. Shurtleff, William; Aoyagi, Akiko. comps. 2012. History of soy sauce (160 CE to 2012): Extensively annotated bibliography and sourcebook. Lafayette, California: Soyinfo Center. 2527 p. Subject/geographical index. Printed 31 May 2012. 28 cm. [1934 ref]

• ***Summary:*** Begins with a detailed chronology of soy sauce based on published documents. Contains 228 historical illustrations and photos (most in color). http://www.soyinfocenter.com/books/153.

Soy sauce: Worldwide, soy sauce is the most widely used and best known product made from the soybean. It is the defining flavor for many of the cuisines of East and Southeast Asia. Soy sauce arrived in many Western countries before the soybean, and before it was generally understood that the soybean was one of its main ingredients. We believe that soy sauce has *the* most interesting history of the many different soyfood products. Etymology of soy sauce in English:

The words "soy," "soya" and "soja," and the term "soy sauce" came into English from the Japanese word shoyu via the Dutch. Thus, the name of the soybean was derived from the name of the sauce made from it.

The first European-language document in which the words for "soy" or "soy sauce" appeared was Dutch. Why?

After 1633 (when the Portuguese were expelled from Japan by the Tokugawa shogunate), the Dutch were the only Europeans allowed to trade with Japan. Their trading activities, conducted by the Dutch East India Company (VOC), were limited to a tiny artificial island named Deshima in Nagasaki harbor in the south of Japan, far from the capital at Edo (today's Tokyo). Among the goods the VOC exported from Japan were shoyu (soy sauce), miso, and saké.

At first they exported these goods to VOC trading posts in Asia, but in 1737 they began exporting small amounts (via Batavia, today's Jakarta, Indonesia) to Amsterdam, Netherlands, where they were auctioned to international merchants.

All of the early Dutch documents that mention shoyu are handwritten letters, the originals of which are located at the VOC archives at The Hague, Netherlands. Soyinfo Center hired a Dutch researcher (Herman Ketting, who could read handwritten Dutch documents from the 1600s) to find and copy as many of these early documents as possible. We helped him to get on the trail by sending him 6-8 early citations from books on the history of Kikkoman.

The Dutch merchants who exported shoyu in kegs from Japan did their best to spell it as it sounded–phonetically. Here is how that spelling evolved–based on documents now at Soyinfo Center; each appears in this book:

1647 Oct.–soije
1651 June–sooje
1652 July–soij
1652 Aug.–soije
1652 Oct.–soije
1652 Oct.–zoije
1654 July–soijo
1655 Aug.–soija
1656 March–soeije
1657 Aug.–soija
1659 Aug.–soija
1660 June–soije
1665 Feb.–soija
1669 Feb.–soija
1669 Feb.–soija
1674 Nov.–sooij
1675 Nov.–soija
1676 March–soija
1676 June–soija
1678 Nov.–soija
1680 June–soije

The link from Dutch to English and other European languages was probably forged on the docks and in the warehouses of Amsterdam, as British and other European merchants bid at auction for a liquid seasoning (shoyu) made in Japan with a variety of exotic but similar Dutch names.

These merchants gave their new sauce a name which they hoped would catch on in their own language and also help it to sell. Then they started to distribute it widely; by Dec. 1750 it had reached the North America–arriving first in New York Harbor bearing the name "India Soy."

Here are the earliest known names for soy sauce in various Western languages other than Dutch:

English:

1679–saio (John Locke, in his journal).

1688–Soy (William Dampier, in his log). This was the spelling that caught on in English. For the next 250 years, soy sauce was usually called "soy" in English.

1696–Souy (John Ovington).

1727–Soeju (Engelbert Kaempfer; he lived in Japan on Deshima from Sept. 1690 to Nov. 1692).

1744–Chinese Soy, Japan Soy (White's China and Flint-Glass Warehouse, London, ad).

1750–Indian Soy (Rochell & Sharp, ad, New York City).

1752–Japan Soy (Berto Valle, ad, London).

1754–India Soy (John Breues, merchant from Perth, probably Scotland).

1754–soy of Japan (Society of Gentlemen, London).

1756–Joppa soy (G. Pastorini, ad, London).

1769–Soye, East-India Soye (William Stork, North America).

1795–soy-sauce (C.P. Thunberg).

1803–soy sauce (Susannah Carter).

1804–Soy, Sooju (James Mease, Pennsylvania).

1810–Chinese Soy, Japanese Soy (James Mease, Pennsylvania).

1832–Canton Soy (John Remond, ad, Massachusetts).

1866–Shoyu, Sh'taji (James C. Hepburn, Japanese and English Dictionary).

French:

1753–la Sauce Sooju (Histoire générale des voyages. Vol. 11).

1765–le soui, le soi (Denis Diderot).

© Copyright Soyinfo Center 2021

1790–la sauce soja (Jean Baptiste de Lamarck).
1796–sauce de soya (Karl Peter Thunberg).
German:
1785–Sooju, Soy (Charles Bryant).
1801–Indianische Soya (Philipp A. Nemnich).
1822–Soya, indische Soya (Joseph Koenig).
Italian:
1907–Il shoyu (Ruata & Testoni).
1912–Shoyu (L. Settimj).
1919–shoyu (G.E. Mattei).
Latin:
1705–Soia (Samuel Dale).
1712–Sooju (Engelbert Kaempfer; he lived in Japan from Sept. 1690 to Nov. 1692)
1730–Soia (Joseph P. de Tournefort).
Portuguese:
1603–Xôyu (Compania de Iesus; earliest Jesuit dictionary of Japanese).
1882–soiia, soja, ketjap (Gustavo d'Utra, Brazil).
1938–Shoju, Soyu, Shiyu, tao-yu (Abreu Velho, Angola).
Spanish:
1910–Salsa de la haba soya (C.F. Langworthy; translation of his American USDA bulletin).
1912–choyou, salsa de soja (Adolfo C. Tonellier, in Argentina). Address: Soyinfo Center, P.O. Box 234, Lafayette, California 94549. Phone: 925-283-2991.

1913. Kim, Ah-Ra; Lee, J.J.; Cha, S.S.; Chang, H.C.; Lee, M.Y. 2012. [Effect of soybeans, Chungkukjang, and Doenjang on blood glucose and serum lipid profile in streptozotocin-induced diabetic rats]. *J. of the Korean Society of Food Science and Nutrition* 41(5):621-29. May. [Kor; eng]
• ***Summary:*** "These results indicate that dietary supplements of soybean, chungkukjang and doenjang may improve blood glucose and lipid metabolism and help prevent or attenuate the progression of diabetes in STZ-induced diabetic rats." Address: Dept. of Food and Nutrition, Chosun Univ., Gwangju 501-759, Korea.

1914. *Malnutrition Matters Newsletter* (*Ottawa, Canada*). 2012. Ten new SoyCow 'E' systems for North Korea. May. p. 1.
• ***Summary:*** "A container full of SoyCows has been shipped from the fabricator in Thailand to North Korea for the Canadian NGO, First Steps. The SoyCow and VitaGoat form the backbone of First Steps' nutritional aid program for the past nine years. With the addition of these new systems, First Steps will have over 80 systems operating at about 30 sites, providing a daily cup of protein-rich soymilk to more than 80,000 needy children in orphanages, daycares and kindergartens." A color photo shows the SoyCow 'E' system, with the blue electric boiler at center. Address: 498 Rivershore Crescent, Ottawa, ON K1J 7Y7, Canada. Phone: 1-613-742-6888.

1915. Zhang, Jianjun; Dhakal, I.B.; Zhao, Z.; Li, L. 2012. Trends in mortality from cancers of the breast, colon, prostate, esophagus, and stomach in East Asia: role of nutrition transition. *European J. of Cancer Prevention* 21(5):480-89. Sept. [45 ref]
• ***Summary:*** The "nutrition transition" in East Asia refers to the transition to a Western-style diet, characterized by an increased intake of energy, animal fat, and red meats, which has occurred during the last several decades. Data was gathered from China (1988-2000), Hong Kong (1960-2006), Japan (1950-2006), Korea (1985-2006) and Singapore (1963-2006).

"A remarkable increase in mortality rates of breast, colon, and prostate cancers and a precipitous decrease in those of esophageal and stomach cancers have been observed in selected countries (except breast cancer in Hong Kong) during the study periods."

These striking changes "may be at least in part attributable to the concurrent nutrition transition." Changes in cancer mortality lagged about 10 years behind the beginning of the nutrition transition. Address: Div. of Epidemiology, Dep. of Public Health, Indiana Univ. School of Medicine, Indianapolis, Indiana 46202.

1916. Brown, Lester R. 2012. Full planet, empty plates: The new geopolitics of food scarcity. New York: W.W. Norton & Co. xiii + 144 p. Illust. Index. 21 cm.
• ***Summary:*** Contents: 1. Food: The weak link. 2. The ecology of population growth. 3. Moving up the food chain. 4. Food or fuel? 5. Eroding soils darkening our future. 6. Peak water and food scarcity. 7. Grain yields starting to plateau. 8. Rising temperatures, rising food prices. 9. China and the soybean challenge. 10. The global land rush. 11. Can we prevent a food breakdown?

See especially Chapter 9, "China and the soybean challenge" which begins with an excellent overview of soybean history in the North America: "Some 3,000 years ago, farmers in eastern China domesticated the soybean. In 1765, the first soybeans arrived in North America, but they did not soon catch on as a crop. For 150 years or so the soybean languished as a curiosity in gardens.

"Then in the late 1920s, a market for soybean oil began to develop, moving the soybean from the garden to the field. During the 1930s, soybean production in the United States climbed from 400,000 tons to over 2 million tons. And as growth in the demand for the oil gained momentum, soybean production jumped to over 8 million tons in 1950.

"During the 1940s and early 1950s, the soybean crop was harvested and crushed primarily for the 20 percent of the bean that was oil. Then during the 1950s, the demand for meat, milk, and eggs climbed. With little new grassland

© Copyright Soyinfo Center 2021

to support expanding beef and dairy herds, farmers started feeding their animals more grain supplemented with soybean meal in order to produce more beef and milk. Farmers were already relying heavily on grain to produce pork, poultry, and eggs. By 1960 soybean meal had become the primary product of soybean crushing and oil the secondary one. For the first time, the value of the meal exceeded that of the oil, an early sign of things to come in the changing role of the soybean."

Chapter 10, "The global land rush," also contains extensive information about soybeans. For example: "Between 2007 and mid-2008, world grain and soybean prices more than doubled."

"What is new now is the scramble to secure land abroad for more basic food and feed crops-including wheat, rice, corn, and soybeans-and for biofuels. These land acquisitions of the last several years, or 'land grabs' as they are sometimes called, represent a new stage in the emerging geopolitics of food scarcity. They are occurring on a scale and at a pace not seen before."

"South Korea, which imports over 70 percent of its grain, is a major land investor in several countries. In an attempt to acquire 940,000 acres of farmland abroad by 2018 for corn, wheat, and soybean production, the Korean government will reportedly help domestic companies lease farmland or buy stakes in agribusiness firms in countries such as Cambodia, Indonesia, and Ukraine (4)."

"China, faced with aquifer depletion and the heavy loss of cropland to urbanization and industrial development, is also nervous about its future food supply. Although it was essentially self-sufficient in grain from 1995 onward, within the last few years China has become a leading grain importer. It is by far the top importer of soybeans, bringing in more than all other countries combined (5)."

"The state-owned Chinese firm Chongqing Grain Group, for example, has reportedly begun harvesting soybeans on some 500,000 acres in Brazil's Bahia state for export to China. The company announced in early 2011 that as part of a multibillion-dollar investment package in Bahia, it would develop a soybean industrial park with facilities capable of crushing 1.5 million tons of soybeans a year (12)."

"Hostility of local people to land grabs is the rule, not the exception. China, for example, signed an agreement with the Philippine government in 2007 to lease 2.5 million acres of land on which to produce crops that would be shipped home. Once word leaked out, the public outcry-much of it from Filipino farmers-forced the government to suspend the agreement (25)." "In 2009, South Korea's Hyundai Heavy Industries harvested some 4,500 tons of soybeans and 2,000 tons of corn on a 25,000-acre farm it took over from Russian owners, roughly 100 miles north of Vladivostok. Hyundai had planned to expand production rapidly to 100,000 tons of corn and soybeans by 2015. But in 2012 it anticipated producing only 9,000 tons of crops, putting it far behind schedule for reaching its 2015 goal. The advantage for Hyundai was that this was already a functioning farm. The supporting infrastructure was already in place. Yet even if Hyundai reaches its 100,000-ton goal, this will cover just 1 percent of South Korea's consumption of these commodities (32)." 1917. He, Shuilian; Wang, Yungsheng; Volis, S.; Li, D.Z.; Yi, T.S. 2012. Genetic diversity and population structure: implications for conservation of wild soybean (*Glycine soja* Sieb. et Zucc.) based on nuclear and chloroplast microsatellite variation (Open Access). *International J. of Molecular Sciences* 13(10):12608-28. Oct. Special issue. [80 ref]

• ***Summary:*** Abstract: Wild soybean (*Glycine soja* Sieb. et Zucc) is the most important germplasm resource for soybean breeding, and is currently subject to habitat loss, fragmentation and population decline. In order to develop successful conservation strategies, a total of 604 wild soybean accessions from 43 locations sampled across its range in China, Japan and Korea were analyzed using 20 nuclear (nSSRs) and five chloroplast microsatellite markers (cpSSRs) to reveal its genetic diversity and population structure. Relatively high nSSR diversity was found in wild soybean compared with other self-pollinated species, and the region of middle and lower reaches of Yangtze River (MDRY) was revealed to have the highest genetic diversity. However, cpSSRs suggested that Korea is a center of diversity. High genetic differentiation and low gene flow among populations were detected, which is consistent with the predominant self-pollination of wild soybean. Two main clusters were revealed by MCMC structure reconstruction and phylogenetic dendrogram, one formed by a group of populations from northwestern China (NWC) and north China (NC), and the other including northeastern China (NEC), Japan, Korea, MDRY, south China (SC) and southwestern China (SWC). Contrib [sic, a program] analyses showed that southwestern China makes the greatest contribution to the total diversity and allelic richness, and is worthy of being given conservation priority. Address: 1-2, 4-5. China Southwest Germplasm Bank of Wild Species, The Key Lab. of Biodiversity and Biogeography, Kunming Inst. of Botany, Chinese Academy of Sciences, Kunming 650201, China.

1918. Park, Kyoung-Hee. 2012. Re: Soy flour and roasted soy flour in Korea–past and present. Letter (e-mail) to William Shurtleff at Soyinfo Center, Nov. 20–in reply to inquiry. 1 p. [Eng]

• ***Summary:*** 1. What other ways, besides "konggaru" (McCune-Reischauer system of romanization), can the name of roasted soy flour be spelled in Korean? Ans: *Konggaru*

© Copyright Soyinfo Center 2021

literally means `bean flour,' but in general it means flour of soybean which is most commonly ground into powder. In Korean, soybean is also called *hûin kong* (white bean) or *paekt'ae*. But Korean people say just *k'onggaru* when they refer to soy flour. In Korean, *k'ong* means "bean" and *garu* and *gomul* (as in *K'onggomul*) mean "powder" or "flour."

2. Was this food first introduced by the Japanese when they colonized Korea? Ans: No. It has been eaten for a long time before Korea was colonized by Japan. For example, *Imwôn Simnyukchi* [Records of Sixteen Aspects Rural Economy] written by a Korean scholar Yu-gu Sô (1764-1845) and published around 1827. This book (which is also called *Imwon Kyongje Simnyukchi*) is a sort of encyclopedia composed of 16 parts including agricultural techniques and practical matters related to farm life. It includes more than 80 kinds of Korean dishes. *K'onggaru* is used in making *Sigobang*, one of rice cakes in the book.

3. How important is this food today in Korea? *Konggaru* is used for various dishes in Korea today. Roasted soy flour is an important ingredient of *misugaru*, a traditional Korean drink of grain powder which is usually served in the summer days. *Konggaru* (without roasting) is also added in many kinds of Korean soups, such as Chinese cabbage soup, radish soup, seaweed soup and mugwort soup. There are very few people who make soy flour at home today because it is easier to buy it at supermarkets or mills. Address: PhD candidate.

1919. Shurtleff, William; Aoyagi, Akiko. comps. 2012. History of roasted whole soy flour (kinako), soy coffee, coffee alternatives, problems with coffee, and soy chocolate (1540-2012): Extensively annotated bibliography and sourcebook. Lafayette, California: Soyinfo Center. 709 p. Subject/geographical index. Printed 25 Nov. 2012. 28 cm. [1420 ref]

• ***Summary:*** This is the most comprehensive book ever published about the history of roasted whole soy flour (kinako), soy coffee, coffee alternatives, problems with coffee, and soy chocolate. It has been compiled, one record at a time over a period of 35 years, in an attempt to document the history of these unique soyfoods. It is also the single most current and useful source of information on this subject.

1920. Shin, J.S. 2012. [Case on the business strategy of small and mid-scale soybean food processing company]. *Korea Soybean Digest* 29(1):49-52. Nov. [Kor; eng]*

• ***Summary:*** "The objectives of this report are to provide business strategy model for small and mid scale soy processing companies by sharing the successful business development strategies (material sourcing, production and marketing) of mid scale soymilk company." Address: Yanggu, Korea.

1921. Park, Kyoung-Hee. 2012. Re: Korea Soyfood Society and their periodical *Korea Soybean Digest.* Letter (e-mail) to William Shurtleff at Soyinfo Center, Dec. 12–in reply to inquiry. 1 p. [Eng]

• ***Summary:*** "Today, I found 'Korean Soyfood Society' (http://www.soysos.or.kr/index.htm), which has published an annual academic journal *Korea Soybean Digest* since 1984. I tried to read the journals (they're written in the Korean language), but was not allowed to because I don't have a membership to the society.

"I checked the table of contents and Index of *Kankoku shoku bunkashi: genshi kara gendai made*, the Japanese book about the history of Korean food culture I mentioned the other day. There is a very short chapter dealing with Korean bean paste, but not the soybean itself. I checked the Index of the book, but found neither 'mame' nor 'daizu'" [two Japanese words for "soybean"]. Address: PhD candidate.

1922. Park, Kyoung-Hee. 2012. Re: Roasted soybeans in Korea. Letter (e-mail) to William Shurtleff at Soyinfo Center, Dec. 14–in reply to inquiry. 1 p. [Eng]

• ***Summary:*** 1. In Korean, roasted soybeans are called *pokûn k'ong* (literally "roasted beans")–using the McCune-Reischauer system of romanization.

2. How are they prepared and eaten? For example, there is a side dish which was eaten by noble people during the Choson era (1392-1897) in Korea. After being washed with water, the soybeans are roasted and coated with glutinous rice powder / flour. Then they are deep-fried and cooked in soy sauce with other seasonings.

3. Are roasted soybeans used as part of a festival similar to *setsubun* in Japan or *tsui-na* in China? Or they used in other ways in Korean festivals? Korean people don't use roasted beans on such occasions

4. Are they presently made mostly at home or commercially? They are normally purchased at supermarkets–although it might be possible that some people roast soybeans at home. They are now even sold at one website in Korean on the Web. These roasted beans are washed, dried, roasted at low temperature and eaten as a snack.

5. She does not know (without doing lots of research) how many companies make and sell roasted soybeans or how many tons of roasted soybeans are made each year.

6. One key question: What is the earliest Korean-

© Copyright Soyinfo Center 2021

language document in which roasted soybeans are mentioned? Address: PhD candidate.

• ***Summary:*** "The separation conditions for the enhancement of isoflavone contents in soybean by soaking and germination were developed, and the fermentation conditions of Chungkukjang were optimized by using response surface methodology analysis. The high-yield of isoflavone production was obtained when the conditions of soaking and germination were at 25.6ºC, 7 hr and 29.1ºC, 42.4 hr, respectively... Isoflavone contents in Chungkugjang under the optimum fermentation conditions were 1.3 times higher than the control (1,960 ppm)." Address: Chonbuk National Univ., Jeonju, Republic of Korea.

1931. Ann, Yong-Geun. 2012. [Jang (fermented soybean) in official and royal documents in Chosun Dynasty period]. *Korean J. of Food and Nutrition* 25(2):368-82. [Kor; eng]
• ***Summary:*** "This paper investigated the system that is relevant to Jang (fermented soybean paste or solution), the

© Copyright Soyinfo Center 2021

relief of hunger-stricken people by Jang, 33 kinds of Jang, and its consumption in the documents, such as the annals of the Chosun Dynasty, Ihlseong-document, Seungjeongwon daily, Uigwe (record of national ceremony), official documents on the basis of Kyujanggak institute for the Korean studies and database of Korean classics. There are lots of Jang named after the place of particular soybean's production from the ancient times. Jang, soybean, salt and Meju (source of Jang), during the Dynasty, were collected as taxation or tribute. In the 5th year of Hyeonjong (1664), the storage amount of soybean in Hojo (ministry of finance) was 16,200 kl, and its consumption was 7,694 kl a year. In the 32nd year of Yongjo (1756), the 1,800 kl of soybean was distributed to the people at the time of disaster, and in his 36th year (1756), the 15,426 kl of soybean was reduced from the soybean taxation nationwide. The offices managing Jang are Naejashi, Saseonseo, Sadoshi, Yebinshi and Bongsangshi. Chongyoongcheong (Gyeonggi military headquarters) stored the 175.14 kl of Jang, and the 198 kl of Jang in Yebinshi."

Note: There are 7 references that have been romanized (from 1993 to 2011) and 83 references in old Korean characters (from 1309 to 1905). These latter appear to be a great historical importance. Address: Dep. of Food and Nutrition, Chungcheong Univ., Cheongwon 363-890, Korea.

1932. Shurtleff, William; Aoyagi, Akiko. comps. 2013. History of soy sprouts (100 CE to 2013): Extensively annotated bibliography and sourcebook. Lafayette, California: Soyinfo Center. 671 p. Subject/geographical index. Printed 22 Jan. 2013. 28 cm. [1524 ref]

• ***Summary:*** This is the most comprehensive book ever published about the history of soy sprouts. It has been compiled, one record at a time over a period of 35 years, in an attempt to document the history of this ancient and interesting soyfood. It is also the single most current and useful source of information on this subject.

Contents: Search engine keywords. Dedication and acknowledgments. Introduction: What are soy sprouts? Countries where soy sprouts are consumed in Asia. Names of soy sprouts in Asia. Brief chronology / timeline of soy sprouts (1068-2012). About this book. Abbreviations used in this book. How to make best use of this digital book–Search it. Six pages of color photos. Contains 45 photographs and illustrations. http://www.soyinfocenter.com/books/162.

What Are Soy Sprouts? Soy sprouts are whole soybeans that have been washed, soaked in water, then placed in a container with holes in the bottom and allowed to germinate or sprout for 5-7 days until the sprouts are 2-6 inches long. They should be rinsed several times a day while they are sprouting.

Inexpensive, tasty, and easy to grow at home, soy sprouts are a fresh vegetable that can be grown in your kitchen at any time of year. Sprouts require much shorter cooking times that dry seeds. In places where fuel (or water) are in short supply, this can be a major advantage. During the sprouting process, the flatulence-producing carbohydrates largely disappear. Sprouts are a rich source of protein and various vitamins, especially vitamins B and C. The large (usually yellow) seed attached to each sprout distinguishes soybean sprouts from all other sprouts. Both the bean (cotyledons) and the sprout (hypocotyl) should be eaten together. Like all soyfoods, they should not be eaten raw. Cooking (steaming, boiling, sautéing, baking, etc.) for at least 7 minutes is necessary to eliminate their raw, "beany" flavor and to inactivate the trypsin inhibitors they contain.

Countries Where Soy Sprouts are Consumed in Asia: Soy sprouts are used in most countries in East and Southeast Asia which have a large Chinese or Korean population. They are most widely consumed in Korea. In China, Indonesia, the Philippines, Cambodia and Thailand they are fairly widely consumed, but probably not as much as mung bean sprouts. In Japan they are consumed, but not widely.

Names of Soy Sprouts in Asia:

Chinese–Mandarin–pinyin: douya, dou ya, dou-ya, huangdouya; da dou ya or da dou-ya

Chinese–Mandarin–Wade-Giles: touya, huangtouya, huang tou ya or huang tou-ya

Chinese–Cantonese: dai dau nga choi, ngunn nga choi; wong dow ga or wong dow gna; dow ngaah, dow ngah, dow gna; hwang dow ya, hwang dow-ya; ngah choy

Chinese–Fukienese:–tau ke

Filipino: togue, utaw

Indonesian: taugé or tauge or taugeh (of Chinese origin)

Japanese: daizu no moyashi

Khmer / Cambodian: Sondek bondos

Korean: kongnamul or kong namul or k'ong namul

Thai: taun gawk

Vietnamese: gia. In southern Vietnam it is called: gia dau nanh. In northern Vietnam it is called gia do tuong.

A Brief History of Soy Sprouts:

100 CE–Soy sprouts are first grown and used in China during the Han dynasty–but only as a medicine. Soy sprouts are first mentioned in China in the Shennong Bencao Jing [Classical pharmacopoeia of Shennong (Wade-Giles: Shen Nung), the Heavenly Husbandman]. The text refers to dadou huangjuan [four Chinese characters; yellow + curls + big + bean] for use as a medicine, not as a food (Huang 2000, p. 295).

1200 CE (approx.)–The earliest known document that mentions the preparation and use soy sprouts as a food in China is the *Shanjia Qinggong* or *Shanjia gongqing* [Basic Needs for Rustic Living], by Lin Hong. It appeared during the Southern Song dynasty (1127-1279). Bean sprouts were apparently a common article of food during the Song dynasty (960-1279) (Huang 2000, p. 296).

1767–Soy sprouts (probably) are first mentioned in an English-language publication or in the American colonies by Henry Yonge of Savannah, Georgia. Yonge got his

© Copyright Soyinfo Center 2021

information from Samuel Bowen, for whom he grew the first soybeans [called Chinese vetches] ever cultivated in North America in 1765. Bowen got his soybeans while traveling in China. Yonge writes:

"They put about two quarts of the vetches into a coarse bag, or hair-cloth bag, that will hold about a peck [2 gallons], and after keeping them in it a little time in warm water, they lay the bag on [a] flat grating, or a wooden lattice, placed about half way down a tub; then every four hours they pour water on them, and in about 36 or 40 hours they will have sprouted about three inches in length; they are then taken out and dressed with oil and vinegar, or boiled as other vegetables... "Mr. Flint and Mr. Bowen having found them an excellent antiscorbutic prepared in this manner, was a principal reason for his introducing them into America, as it would be a most valuable remedy to prevent or cure the scurvy amongst the seamen on board his majesty's ships." Note that in America, as in China, soy sprouts are first recommended for use as a medicine; It is their vitamin C that prevents or cures scurvy.

1830–Soy sprouts are first mentioned in Europe by Philip Franz von Siebold, an early traveler in Japan, in his book on the economic plants of Japan. In a large fold-out table, he states that soybeans (Sooja Japonica, Sieb.) can be artificially germinated to make "Mogasi" [sic, Moyashi]. He includes the word moyashi written in both katakana and Chinese characters.

1871–Frederick Porter Smith, a medical missionary from England living in China, states in his book Contributions toward the Materia Medica and Natural History of China, that soy bean sprouts (Tau-ya) are "artificially raised in large quantities for food in the winter" when green vegetables are scarce in China. This is the second earliest English-language publication that mentions soy sprouts.

1888–Keimlinge von Soja hispida, the German term for soy sprouts, is first used.

1905–Soy sprouts are first produced commercially in the United States by Wing Chung Long (later named Wing Chong Lung), a Chinese food company in Los Angeles, California.

1910 Jan.–Les germes de soja, the French term for soy sprouts, is first used.

1910 Jan.–Soy sprouts (Germes de soja) are first produced commercially in Europe by Li Yu-ying, a Chinese scholar and soybean expert, at his plant Usine de la Caseo-Sojaine at Valles, Colombes, northwest of Paris.

1914 Feb.–D. Bois in France publishes the earliest known illustration of a soy bean sprout.

1915–The term "soy bean sprouts" is first used in English by the USDA Bureau of Plant Industry, Inventory No. 35.

1917-1918–During World War I, interest in soy sprouts in the United States grows. Yamei Kin, a Chinese-American woman with an M.D. degree from an American college, is sent to China in June 1917 to study and report back on soyfoods–including soy sprouts, which she says can be used in a nutritious salad with fermented tofu.

Writing in Country Gentleman (28 Sept. 1918), Sam Jordan of Missouri states: "Another dish which tastes as good as it looks or sounds is soy-bean sprouts. The smaller beans, of some yellow or green variety, are usually used." They are excellent because of "their use in the winter, acting as a green vegetable, and the fact that the vegetable can be had whenever wanted."

William Morse, the USDA's soybean expert, writes in the Yearbook of the U.S. Department of Agriculture (1918), in a special section titled "Soy-bean sprouts," that in China soy beans are widely used for sprouting. "Bean sprouts can be used as a home winter vegetable, for the dried beans are sprouted easily in a short time under proper conditions of heat and moisture. It is quite possible that sprouted soy beans utilized in various vegetable dishes would appeal to the American taste." A full-page photo shows a large basket of sprouted soy beans. Taken by Frank N. Meyer, it is the first photo of soy sprouts ever published.

1918–Chi Yien Shih, in a booklet "Beans and bean products" (p. 7) first describes how to grow soy sprouts on a commercial scale.

1921 May–The modern English term "soy sprouts" is first used by Embrey and Wang in the China Medical Journal.

1921–Dr. John Harvey Kellogg, in his book The New Dietetics, has a special section titled "Soy bean sprouts" in which he is the first to use the word "vitamins" is describing the nutritional benefits of soy sprouts, and the first to note that "Sprouted soy beans is one of the constituents of the famous chop suey."

1923–The term "soybean sprouts" (with "soybean" spelled as one word), is first used in English by Piper & Morse in their classic The Soybean (p. 278)–to introduce eight recipes for these sprouts.

1938 Oct.–Whiteman and Keyt, in USDA Leaflet No. 166, first describe how to grow soy sprouts at home.

1943-1945–During World War II, awareness of soy sprouts again increases. Their champion is Prof. Clive McCay of Cornell University. His first brochure on the subject (April 1943, titled "Sprouted soy beans: Some informal notes") begins: "Our daily paper would surprise us if it carried an ad: 'WANTED: a vegetable that will grow in any climate, rivals meat in nutritive value, matures in 3 to 5 days, may be planted any day in the year, requires neither soil nor sunshine, rivals in vitamin C, has no waste (in preparation), can be cooked with as little fuel and as quickly as park chop.' The Chinese discovered this vegetable centuries ago in sprouted soy beans."

Prof. McCay and his wife, Jeanette, worked closely with the New York State Emergency Food Commission, to publicize soy sprouts and other soyfoods during the war

© Copyright Soyinfo Center 2021

years. Governor Thomas E. Dewey hosted a famous "soy bean lunch" at the governor's mansion in Albany, New York, to demonstrate the value of meat substitutes. Soy sprouts were in two of the dishes served to the 67 reporters.

1943 Nov.–"Half a dozen firms in Chinatown [New York City] raise thousands of pounds of soy and mungo sprouts daily for the city's restaurants and markets. Mungo sprouts are preferred." (Trelease & Trelease, J. of the New York Botanical Garden, p. 259).

1952 Feb.–Soy sprouts are first produced in the United States by a Japanese company, Yuta Moyashi Seizo-sho (Utah Beans Sprout Co.) in Salt Lake City, Utah.

1960s-2013–Soy sprouts benefit from the rapid growth of interest in all kinds of sprouts in the USA and Europe, and from the growing number of Asian-American citizens.

1965–William Brandemuhl, in an in-depth study of bean sprouts in Japan, discovers that Black mappe (Vigna mungo) are much more widely consumed than soybean sprouts. He takes some interesting photos in a shop that sprouts soybeans in Kyoto.

1976–Jhason Koo, of Pyung Hwa Food Co. Inc. (Toronto, Ontario, Canada) now makes 4,000 pounds of soybean sprouts weekly and sells them in 50-pound sacks to Oriental restaurants and groceries.

1976–F.G. Winarno et al., in *The Present Status of Soybean in Indonesia*, discover that soybean sprouts are most widely consumed in Lampung, on the southernmost tip of the island of Sumatra–6.5 grams per person per day.

1978 April 30–Masao Mori publishes a good update of Japan's bean sprout industry. Address: Soyinfo Center, P.O. Box 234, Lafayette, California 94549. Phone: 925-283-2991.

Kochujang, fermented soybean-based red pepper paste, decreases visceral fat and improves blood lipid profiles in overweight adults (Open Access). *Nutrition and Metabolism* (*London*) 10(1):24. Feb. 26. [43 ref]

• ***Summary:*** "Conclusion: KCJ supplementation (32 g/day) for 12 weeks in overweight adults showed anti-atherosclerotic and anti-obesogenic effects."

Background:

"The increasing westernized Korean dietary lifestyle, including frequently eating away from home, has favored foods that have not been a part of the traditional Korean diet [1]. The changing consumers' demand for western food products and diminished traditional dietary lifestyle have overlapped with the prevalence of obesity and obesity-related chronic diseases in Korea." Address: 1-4. Dep. of Food Science and Human Nutrition, Chonbuk National Univ., Obesity Research Center, 664-14 Dukjin-Dong 1-Ga, Jeonju, Jeonbuk, 561-756, Republic of Korea.

1934. He, Gene. 2013. Re: Nature Soy, Inc.: Its history and products. Letter to William Shurtleff at Soyinfo Center, Feb. 27. 10 p. + 3 inserts. 28 cm.

• ***Summary:*** In 1990 Sunkee Tofu Food Company (*Xinji Doufu Shipin Gongsi* in pinyin) started in Pennsylvania, located at 448 North 12th St., Philadelphia, a few blocks from their present location. The founder was Wen Yatsun, who was born and raised in China but had been educated in the USA; he previously been an electrician and had owned and operated a restaurant in Philadelphia. Being in the restaurant business, he saw that there was a demand for tofu but no local manufacturers. His business thrived and grew very nicely. Sunkee mostly served customers in Philadelphia, especially restaurant customers.

The company's original products, sold under the Sunkee brand, were basic tofu products–the types popular in the Asian-American market: Soft tofu, firm tofu, silken tofu, extra firm tofu, and five-spice extra firm. Also: Soymilk (plain or sweetened, ½ gallon), soymilk (sweetened, 16 oz = 1 pint). In about 1992 the company introduced soy puffs (deep fried tofu puffs).

In 1998 Mr. Wen decided to establish a new company, Nature Soy, Inc. (*Datian Doupin Chang*, in pinyin) and two new brands: "Nature's Soy" and "Datian" (two Chinese characters meaning "Nature Soy"). Production of tofu was moved into the current location (713 North 10th Street in Philadelphia), with about ten times as much square footage and with a very modern, advanced tofu production line. A space in the new building was constructed for an R&D laboratory; it began operation in late 1998. That laboratory improved the sanitation of the entire production facility.

In 2002 the following specialty flavored products were introduced to the market: (1) Hot & spicy flavored tofu, 8 oz. (2) Curry flavored tofu, 10 oz. (3) Oriental sauce tofu, 10 oz.

In 2003 Gene joined the company as a partner with Mr. Wen. They both own the company and work there every day. Gene developed the company philosophy: "We take soy products seriously!" and "Healthier living, healthier life." At this time the company began to do a little bit of marketing to reach outside the Asian-American community. It was also for this reason that the company began to develop various pre-marinated types of tofu, sliced tofu, 5-minute tofu (a cake of tofu with a packet of seasoning that takes about 5 minutes to cook), etc. Gene joined the company in large part to make sure the company meets all sanitation and modern food processing regulations. Born and raised in China, his educational background is in dairy products in the USA. He was one of the few Chinese cheese makers. He earned his PhD degree from Utah State University, and was especially interested in fermented dairy products. After that, he went into the fermentation industry.

In about 2004 the R&D lab developed tofu that could be sliced as thin as 1/16 of an inch, and from this they developed a new product: organic deli-style pre-sliced tofu (see photo from 2005 company brochure). The product was

© Copyright Soyinfo Center 2021

pre-seasoned like a lunch meat. As far as we know, this was the world's first product of this type. They supplied it to Giant (a supermarket chain) and also to Walmart. Gene's original intention was to replace those lunch slices which contain a lot of low-grade materials–as well as cholesterol, saturated fat, etc. One big problem at the time was that the company did not have enough marketing money. Unfortunately, the demand for this product was not very great and it had to be discontinued

Maybe the product was ahead of its time. Gene has developed a related product that is even more interesting than the original thinly sliced tofu. It is like a block of cheese, where a deli or restaurant can put it on their own cheese slicer to make fresh tofu slices to any thinness they desire. The company did a focus group on that product with a group of vegetarians and the loved it, but it is not yet on the market.

Competitors: The biggest are House Tofu (which has a new plant in New Jersey), Vitasoy / Nasoya, and Pulmuone [which has a relatively new plant in Tappan, New York]. Nature Soy's product line is much bigger than that of House, which is various forms of water-packed tofu.

Nature Soy has been growing every year, without one year in which sales decreased, even during the Great Recession that started in 2008 and even during the anti-soy campaign on the Web. Of the latter Gene says simply, "They are crazy."

In about 2004 the wheat gluten based vegetarian meat substitutes were produced for commercial sales. Also in 2004 fried tofu (8 oz was introduced).

Mr. He knows and likes fermented tofu. He says that if you blend it with other ingredients (such as garlic) to make a fermented tofu spread, where it serves as the source of flavor, it makes a great spread–as for crackers. A lot of fermented tofu is sold in the USA at Asian food stores, but essentially all of it is imported. It is almost impossible for a domestic manufacturer to compete with the low imported prices.

Gene believes that Nature Soy has a bright future. Address: 713 North 10th St., Philadelphia, Pennsylvania.

1935. Bramblett, Billy. 2013. More history of Wildwood Natural Foods (Interview). *SoyaScan Notes.* March 16. Conducted by William Shurtleff of Soyinfo Center.

• ***Summary:*** Pulmuone Wildwood Inc. now has a plant on the East Coast at 30 Rockland Park Ave., Tappan, New York 10983. Phone: (845) 365-3300.

Pulmuone has purchased the Monterey Pasta plant. John Breen, who had been Wildwood's CFO, is now running the Monterey Pasta plant. Billy has just returned from Expo West, where he worked at the Hodo Soy Booth and where he had a nice talk with John Breen and with various Pulmuone people. They were very nice to him. Y.C. Kang was there; he and Billy play golf together and they are friends. Doug Porter still works for Pulmuone; he was Wildwood's first employee back in the days when they were making sandwiches at the Sleeping Lady. Then Pulmuone sent some beautiful women over to take the origin and early history of how Wildwood. Billy had already written that history and given it to them, but they said they wanted to hear it from him directly. So he told it to them. In the USA, Pulmuone at one time had a factory in the Los Angeles (LA) area (in South Gate). That plant was closed sometime in 2003 or early 2004. The main factory in the LA area is now in Fullerton; it was newly opened in late 2003 or early 2004. Pulmuone no longer owns plants in Watsonville (Tom Lacina and his brother owned the property) or Santa Cruz (California), or Grinnell, Iowa.

The company was first named "Wildwood" under Chris Smith's tutelage. So Paul Duchesne was making sandwiches. He gave the business to Chris Smith then went to Boston. Chris Smith ran into the health department who said "You need to have a name on your label." Chris came to Billy and said, "What do you think I should do? I'm thinking 'Wildwood.' They walked out the back door of the Sleeping Lady and from there they could see redwood trees all the way up to Mount Tamalpais." Billy said, "Wildwood." They looked it up in a dictionary and found: "A wooded area in its natural state." Billy said, "Perfect." So Chris started putting on these little paper labels that he put on his Brown Rice and Tofu Sandwiches–"Wildwood Natural Foods."

Wildwood started making its sandwiches from organic ingredients in 1978 in The Sleeping Lady.

Chris Smith went to Boston. Paul Duchesne returned to Fairfax and started making sandwiches again. One day after work we decided, "Let's make tofu." Before that time, Paul, Chris, and Billy had gotten all the tofu they used from Quong Hop. They found a place at 135 Bolinas Rd. (across from the town hall), about a block away and across the street; The Sleeping Lady was at 58 Bolinas Rd. 135 Bolinas Rd. was a little storefront with a big picture window in the front. They incorporated the company there in April or May 1980, started to make tofu in August 1980. It was a tiny tofu shop, about 15 by 15 feet, with a walled-off kitchen behind it. They made tofu there until about 1993–because by that time they had already built the Santa Cruz plant.

It started when Paul Duchesne was an employee of Good Earth Natural Foods (founded in 1969; Mark Squire is one of the heavy organic hitters, and one of the most gentle, beautiful people in the world) a very early natural food store near The Sleeping Lady (TSL). The Good Earth asked TSL if they could use TSL's kitchen to make sandwiches, squeeze carrot juice, beet juice, and orange juice. So Paul came into TSL to make sandwiches for the Good Earth, then he dreamed up this Fried Rice and Tofu Sandwich (FRTS). He started making them, as well, at The Sleeping Lady, and then going and selling them at other natural food stores–in addition to The Good Earth. That's when he started his enterprise, that later came to be named Wildwood Natural Foods. Address: Pulmuone Wildwood.

1936. Breen, John. 2013. Re: Some key dates in the history of Pulmuone. Letter (e-mail) to William Shurtleff at Soyinfo Center, March 20. 1 p.
• ***Summary:*** 2002 May–Pulmuone's tofu plant in Tappan, New York starts operations.

2003 Aug.–Pulmuone's tofu plant in Fullerton, California, starts operations. The plant in South Gate closes shortly after Fullerton starts operations. Address: Executive Vice President of Manufacturing, 2315 Moore Ave., Fullerton, California.

1937. Breen, John. 2013. Re: What does the word "Pulmuone" mean? Letter (e-mail) to William Shurtleff at Soyinfo Center, March 21. 1 p.
• ***Summary:*** "It is actually not a word in Korean, it is a combination of two words 'Pulmu' and 'one.' And 'Pulmu' is not actually a word either but is a kind of contraction of the word that means 'the bellows' as used in a forge. The name was constructed by Mr. Won the spiritual founder of Pulmuone. See below web site for more info on Mr. Won and a photograph of him,

http://www.csulb.edu/~jlee6/PMO/html/story.html

"The story is that after the Korean war Mr. Won saw that a lot of the destroyed war materials where being melted down and reforged to be used for reconstruction. He recognized that many of the human beings that had been effected by the war also needed to be 'reforged' into productive members of society. Hence the term 'Pulmu' or 'bellows' and paired with 'one' as in 'we are all one' or forged together as one. It is not easy to translate. As you can see from the website he started a cooperative organic farm to bring together people who had been damaged by the war and help them to become productive members of society once again." Address: Executive Vice President of Manufacturing, 2315 Moore Ave., Fullerton, California.

1938. *SoyaScan Notes.* 2013. Three early students of soyfoods in Japan after World War II: A.K. Smith, William Brandemuhl, and William Shurtleff (Overview). April 15. Compiled by William Shurtleff of Soyinfo Center.
• ***Summary:*** Dr. A.K. Smith, had a strong academic background, having earned MA and PhD degrees from Columbia University. His interest in East Asian soyfoods began in about April 1948 when he began to write questions about fermented soyfoods to Lewis B. Lockwood, PhD and microbiologist. By June 1948 he had departed from the United States on a 3-month study tour that would take him to China, Japan and Korea. He collected samples of 100 microorganisms used in fermenting soyfoods. His articles on "Oriental use of soybeans as food" began appearing in *Soybean Digest* in Feb. 1949. He was mainly interested in fermented soyfoods; his articles about each food were accurate but relatively short.

William Brandemuhl studied soyfoods only in Japan. After graduating from the University of Wisconsin, he arrived in Kyoto, Japan in Jan. 1963 and became a research fellow at the Department of Agricultural Economics, Kyoto University, Kyoto, Japan. Between Feb. 1963 and May 1964 (15 months) he conducted field research on soybean utilization in Japan. In June 1963 (after William had been in Japan for 4 months), Tomoko Arai (his close friend) completed her graduate studies, graduated from the University of Wisconsin, and (since her scholarship was finished), returned to Japan–to be with William and to help him with his research in Japanese, which he spoke only moderately well. She traveled with him throughout Japan and translated for him during the many interviews he conducted. William's monthly check from Honeymead paid for his room and board–but not for his travel and research, so he had to work part time doing English translation for a Japanese company. On trips, he took many photos using his expensive Nikon camera. Tomoko's family lived near Kobe, where she and William were married on 8 Aug. 1964–three months after he finished his field research.

William's primary interests were: (1) To describe in detail, with photos, how each of different Japanese soyfoods were made. He was extremely thorough. (2) The place of each food in Japanese culture. (3) The industry of which each food was a part and its trade associations (if any). (4) The future of that food in Japan. He was not particularly interested in transmitting these foods and their technology to the United States, and he took almost no interest in carefully selecting names for these foods (or the equipment used to make them) which would give them the best chance of catching on in the United States.

William Shurtleff first visited Japan for 3 months in the summer of 1967 while a student at Stanford University; he lived in a Zen temple in Kyoto, practiced meditation each evening, and studied Japanese language and culture. After graduating from Stanford and living for 2½ years at Tassajara Zen Mountain Center, he arrived in Japan on 16 Jan. 1971 with the intent of becoming fluent in Japanese so he could translate the writings of Dogen Zenji, an early Soto Zen master. For the first year he lived with a Japanese family in Kyoto and became a full-time student at the *Nihongo Gakko*, a Japanese language school in Kyoto. At the end of that year he moved to Kyoto, where he entered a university to continue his Japanese language studies. While in Tokyo, he became close friends with Akiko Aoyagi, a Japanese artist and cook. In Oct. 1972 he first visited and met Mr. Toshio Arai, a Japanese tofu master under whose guidance Shurtleff would later become an apprentice. In Dec. 1972 he started to write a booklet for Americans about tofu; he believed that tofu could be a very positive addition to the American diet and that young Americans would enjoy making tofu as a new occupation. On 13 Jan. 1973 he signed a contract with Autumn Press, a small publishing company in Japan owned

© Copyright Soyinfo Center 2021

by Americans Nahum and Beverly Stiskin. For the next 2½ Shurtleff and Aoyagi researched and wrote *The Book of Tofu*, which was published in Dec. 1975. Shurtleff made enough money to live in Japan by working as an interpreter, translator and researcher for his father's tool company. The story of this adventure is told in the Preface to *The Book of Tofu* (see 2001 or subsequent editions). Shurtleff's interests and work were different from those of William Brandemuhl in several important ways: (1) He spoke very good Japanese. (2) His initial focus was almost entirely on tofu, although he later wrote a book about miso. (3) He was just as interested as Brandemuhl in describing accurately how tofu (and other soyfoods) were made in Japan, but primarily with the intent of transferring this technology to the United States and other parts of the world. To this end he was deeply interested in choosing names for soyfoods and equipment that would help them take root in their hew homes. On 13 June 1978 Shurtleff and Aoyagi, after being married, moved from Japan to live in the United States. For the rest of his life Shurtleff did research on and wrote books about soyfoods, and simultaneously worked to introduce them to the United States. By late 1999 soyfoods had become important foods in the USA; soy sauce, soymilk and tofu had become mainstream foods.

1939. Hye, Jeong Kang; Yoo, J.A.; Park, J-M.; Kim, S.H.; et al. 2013. [Quality characteristics of black soybean paste (daemacjang) with mixture ratio of black soybean, barley and salt concentration]. *Korean J. of Food and Nutrition* 26(2):266-72. June. [29 ref. Kor; eng]
• ***Summary:*** "This study investigated the quality characteristics of black soybean paste (*daemacjang*) with black soybean content and salt concentration. The total acidity increased as the pH decreased during the fermentation period. The amino-type nitrogen content of all samples increased significantly during the fermentation time. Total cell counts were not significantly different during fermentation, and mold counts decreased at 3 log cycles. The cell counts of lactic acid bacteria decreased approximately 2 to 3 log cycles in 10% salt concentration (treatment B and C), and were not detected in treatment A and D. Total polyphenol contents of treatment A, B, and C were 42.77%, 52.99% and 52.95% during fermentation up to 70 days, respectively, which was higher than D (39.86%). In a sensory evaluation, treatment B showed the highest scores for overall acceptability." Address: 1. Chungcheongbukdo Agricultural Research and Extension Services, Cheongwan, 363-883, Korea.

1940. Yang, Ming; Kwak, Jung Soon; Jang, Seri; Jia, Yuan; Park, Inshik. 2013. [Antioxidant activity of soybean yogurt added tomato extract by *Bacillus subtilis* and *Lactobacillus plantarum*]. *Korean J. of Food and Nutrition* 26(2):280-86. June. [29 ref. Kor; eng]
• ***Summary:*** "This study was performed to investigate the effect of types of microorganisms on the antioxidant activity of soybean yogurt by a single or mixed culture of *Bacillus subtilis* and *Lactobacillus plantarum* isolated from chunggukjang and kimchi." Address: Dep. of Food Science and Nutrition, Dong-A Univ., Busan 604-714, Korea.

1941. Yang, Ming; Kwak, Jung Soon; Jang, Seri; Jia, Yuan; Park, Inshik. 2013. [Fermentation characteristics of soybean yogurt by mixed cultures of *Bacillus* sp. and lactic acid bacteria]. *Korean J. of Food and Nutrition* 26(2):273-79. June. [23 ref. Kor; eng]
• ***Summary:*** "The microorganisms producing high protease activity and acid producing ability were isolated from Chunggukjang and kimchi, which were identified as *Bacillus subtilis* and *Lactobacillus plantarum* by morphological, biochemical and nutrient requirement. The attempt was made to produce soybean milk yoghurt by using the isolated microorganisms. The mixed culture of *Bacillus subtilis* and *Lactobacillus plantarum* exhibited the lowest pH value of 4.23 and highest titratable acidity of 0.88% compared to those of single cultures at 37ºC for 32 hrs..." Address: Dep. of Food Science and Nutrition, Dong-A Univ., Busan 604-714, Korea.

1942. Koo, Sung Cheol; Seo, J.S.; Park, M.J.; Cho, H.M.; Park, M.S. 2013. Identification of molecular mechanism controlling P34 gene expression in soybean. *Plant Biotechnology Reports* 7(3):331-338. July. [21 ref]
• ***Summary:*** It was demonstrated that the insertion mutation in the P34 promoter region is causing a down-regulation of P34 translation while mRNA levels are similar in low-P34 and normal genotypes, and there is no sequence variation in the coding region of the P34 gene between mutant and normal genotypes. Address: Dep. of Functional Crop, National Inst. of Crop Science, Rural Development Administration, Miryang 627-803, Korea.

1943. Lee, Seog-Won; Han, Sung-Hee. 2013. [Quality properties of gelling product prepared from soybean curd residue with addition of gums]. *Korean J. of Food and Nutrition* 26(3):428-37. Oct. [22 ref. Kor; eng]
• ***Summary:*** "The physical properties of jellified soybean curd residue (*biji*) with the addition of various gums were investigated to optimize the direct availability of a by-product of the tofu production process. The lightness (L value) of the jellified Biji prepared with various gums was approximately 77 to 80, regardless of the concentration of gum used. Especially at the concentration of 0.1% and 0.3%, a pectin showed a significantly higher value compared with other gelling agents (carrageenan and agar). The strength of samples prepared on the basis of carrageenan showed the value of 335 to 569 g/cm2 and 234 to 335 g/cm2 according to the addition of locust bean gum and xanthan

© Copyright Soyinfo Center 2021

gum, respectively. On the other hand, the samples made with pectin and agar were 134 to 272 g/cm2 and 50 to 215 g/cm2, respectively. Where locust bean gum was used as a viscous agent, the adhesiveness of sample prepared by adding carrageenan was greater than those made with pectin or agar. The values were -6.0-11.0 g, -2.7-10.2 g and -3.7-7.0 g, respectively. Overall, the strength and adhesiveness of samples according to increase of the added amount of Biji showed constantly increasing trend regardless of the type of gelling agent used. In the sample containing carrageenan this trend was most noticeable." Address: 1. Dep. of Food & Nutrition, Yuhan Univ., Bucheon 422-749, Korea.

1944. Jeong, Kwang-Ho; Choi, M.-S.; Lee, S.-K.; Seo, M.-J.; Hwang, T.-Y.; Yun, H.-T.; Kim, H.-S.; Kim, J.-T.; Kwon, Y.-U.; Kim, Y.-H. 2013. Development of low Gly m Bd 30K (P34) allergen breeding lines using molecular marker in soybean [Glycine max (L.) Merr.]. *Plant Breeding and Biotechnology* 1(3):298-306. Sept. [24 ref]
• ***Summary:*** Genetic markers have been described for identification of low-P34 genotypes in breeding programs. The advantage of gene silencing is in the complete elimination of an allergen, whereas in "null"-alleles gene expression in frame shift mutations may be reduced beyond a threshold level, while small amounts of the respective protein or some peptides thereof can still be synthesized.

Although an increasing number of soyfoods are being produced, their consumption is limited for individuals allergic to soy. Address: 1-3. National Inst. of Crop Science, Rural Development Administration, Suwon 441-857, Korea.

1945. Kim, Y.J.; Lee, S-J.; Lee, H.M.; et al. 2013. Comparative proteomics analysis of seed coat from two black colored soybean cultivars during seed development. *Plant Omics Journal* 6(6):456-63. Sept. *
• ***Summary:*** "The seed coat plays an important role in the life cycle of soybean by controlling embryo development and determining seed dormancy and germination. In the present study, comparative proteomics analysis of the seed-coat from two black-colored soybean cultivars, Seonheuk and Geomjeong 2 which have different anthocyanin and isoflavone contents, was conducted."

Note: "The branches of science known informally as omics are various disciplines in biology whose names end in the suffix -omics, such as genomics, proteomics, metabolomics, metagenomics and transcriptomics. Omics aims at the collective characterization and quantification of pools of biological molecules that translate into the structure, function, and dynamics of an organism or organisms" (Source: Wikipedia May 2020).

1946. Lee, Haeng-Shin; Cho, Y.H.; Park, J.; Shin, H.R.; Sung, M.K. 2013. Dietary intake of phytonutrients in relation to fruit and vegetable consumption in Korea. *J. of the Academy of Nutrition and Dietetics* 113(9):1194-99. Sept.
• ***Summary:*** "Flavonoids were mainly obtained from persimmons, mandarins, apples, grapes, onions, soybeans, and chestnuts. However, one or two food items contributed to nearly all intake of each phytonutrient, suggesting a lack of variety." Estimated adolescent soyfood and isoflavone intake: 512 boys and girls ages 2-18. Intake of soyfoods not reported. Isoflavone intake 30.3±4.8 mg/day did meet fruit and vegetable recommendations. 1,716 boys and girls ages 2-18. Intake of soyfoods not reported. Isoflavone intake 4.90±0.6 mg/day did not meet fruit and vegetable recommendations. Address: 1..

1947. Chang, Youngeun; Choue, R. 2013. Plasma pharmacokinetics and urinary excretion of isoflavones after ingestion of soy products with different aglycone/glucoside ratios in South Korean women. *Nutrition Research and Practice* (*Korea*) 7(5):393-99. Oct. [37 ref]
• ***Summary:*** "Twenty-six healthy female volunteers (20-30 y old) consumed three different soy products (i.e., isogen, soymilk, and fermented soybeans) with different aglycone/glucoside ratios... The urinary recovery rates of daidzein and genistein were 42% and 17% for the isogen group, 46% and 23% for the fermented soybean group, and 33% and 22% for the soymilk group." The results indicate that soy products containing high levels of isoflavone aglycone are more effective for maintaining plasma isoflavone concentrations. Address: 1. Dep. of Agrofood Resources, National Academy of Agricultural Science, Rural Development Administration, Gyeonggi 441-853, Korea.

1948. Kim, Sounghun; Lee, Kyei-im; Choi, Ji-Hyeon. 2013. [The analysis on the production of bean curd industry in Korea]. *Korean J. of Agricultural Science* 40(4):411-16. Dec. 31. [Kor; eng]
• ***Summary:*** "In Korea, bean curd is one of most important foods and bean curd industry keeps growing. Korean bean curd industry has complicated structure with a few large-scale manufacturers and many small-size manufacturers, which causes difficulty in figuring the strategy for the promotion of bean curd industry. In order to solve this problem, more specific studies are required. The purpose of this paper is to analyze the production sector of Korean bean curd and to present the implications for the promotion of Korean bean curd industry. Survey analyses to producers was conducted for this research. The results of studies present a few findings: First, the solution for the easier purchase of raw material (soybean) should be prepared. Second, the support for marketing as well as R&D to small-size manufacturers is required. Third, the monitoring and controlling of unfair trading in bean curd market should be strengthened. Forth, the certification programs for the bean curd products should be managed." Address: Dep. of Agricultural Economics, Chungnam National Univ. [Korea].

• ***Summary:*** This novel makes bold predictions about world food security during the next few decades. Sikanyeon is the publishing house of Korea Food Security Research Foundation.

1951. Yum, Taewoo; Lee, S.; Kim, Y. 2013. Association between precocious puberty and some endocrine disruptors in human plasma. *J. of Environmental Science and Health, Part A: Toxic/Hazardous Substances and Environmental Engineering* 48(8):912-17. [21 ref]
• ***Summary:*** "Endocrine disruptors [EDCs] that mimic natural hormones and inhibit the action of hormones have recently attracted attention as one of the main cause of precocious puberty"–premature growth and the display of secondary sex characteristics.

"EDCs examined in this study were bisphenol-A (BPA), di(2-ethylhexyl) phthalate (DEHP), dibutyl phthalate (DBP), mono(2-ethylhexyl) phthalate (MEHP), monobutyl phthalate (MBP), n-nonyl phenol (n-NP), and t-octylphenol (t-OP), and whereas the isoflavones were equol, genistein, and daidzein." The latter three substances are found in soybeans.

The "levels of the daidzein, equol and genistein were 1.37, 1.3 and 2.67 times higher than those of the control group, and genistein showed a statistically meaningful result (P = 0.0008)." Therefore these three, and especially genistein, may have an effect on early onset of puberty. Address: 1. Korea Inst. of Science and Technology, Seongbuk-gu, Seoul, Republic of Korea [South Korea].

1952. Shurtleff, William; Aoyagi, Akiko. comps. 2014. History of soybeans and soyfoods in Korea, and in Korean cookbooks and restaurants outside Korea (544 CE to 2014): Extensively annotated bibliography and sourcebook. Lafayette, California: Soyinfo Center. 759 p. Subject/geographical index. Printed 17 March 2014. 28 cm. [1524 ref]
• ***Summary:*** This is the most comprehensive book ever published about the history of soy in Korea. It has been compiled, one record at a time over a period of 35 years, in an attempt to document the history of this ancient and interesting subject. It is also the single most current and useful source of information on this subject.

Contents: Search engine keywords. Dedication and acknowledgments. Introduction: Brief chronology / timeline of soy in Korea. About this book. Abbreviations used in this book. How to make best use of this digital book–Three keys. Contains 80 photographs and illustrations. http://www.soyinfocenter.com/pdf/174/Kore.pdf. Address: Soyinfo Center, P.O. 1953. Choi, Seon-Jeong; Ko, Hyeong-Min; Choi, Won-Seok; Lee, Nan-Hee; Choi, Ung-Kyu. 2014. [Changes in sensory characteristics of *cheonggukjang* made with smoked soybeans]. *Korean J. of Food and Nutrition* 27(2):280-86. April. [16 ref. Kor; eng]
• ***Summary:*** Cheonggukjang (also spelled cheongkukjang) is Korean-style natto.

"This study investigated the changes in the sensory characteristics of cheonggukjang made with smoked soybean. The total organic acid content of cheonggukjang made with smoked soybeans (CSS) increased to about two times in comparison with cheonggukjang made with non-smoked soybeans (CNS). Among the organic acids, the amount of succinic acid was highest for both CSS and CNS. The total free sugar content of CSS (228.6±8.8 mg%) was significantly reduced compared to that of CNS (350.1±13.7 mg%). Further, the total free amino acid content of CSS (10,123.3±301.4 mg%) was significantly increased compared to that of CNS (8,912.5±286.5 mg%). The contents of sweet, savory and bitter taste compounds were significantly elevated in CSS when compared to that of CNS. However, there were no significant differences in the total content of fatty acids in CNS and CSS. The sensory evaluation of aroma, taste and overall quality of CSS were significantly increased compared to that of CNS. Taken together, it was expected that a smoking process is useful for the development of new fermented foods." Address: 1. Dep. of Food Science & Technology, Korea National Univ. of Transportation, Jeungpyeong 368-701, Korea.

1954. Ko, Hyeong-Min; Choi, Seon-Jeong; Choi, Won-Seok; Lee, Nan-Hee; Choi, Ung-Kyu. 2014. [Quality characteristics of *cheonggukjang* made with smoked soybeans]. *Korean J. of Food and Nutrition* 27(2):274-79. April. [30 ref. Kor; eng]
• ***Summary:*** "The objective of this study was to investigate the fermentation characteristics of cheonggukjang [Korean-

© Copyright Soyinfo Center 2021

style natto] made with smoked soybeans. The study found that the amino nitrogen content and pH of cheonggukjang made with smoked soybean (CSS) were significantly elevated compared to that of cheonggukjang made with non-smoked soybeans (CNS). On the other hand, the moisture content of CSS was significantly lower when compared to that of CNS. Moreover, there were no significant differences in the viscous substance content between CNS (5.8±0.2%) and CSS (5.6±0.3%). In terms of colour, the L and b values of CSS were higher than that of CNS, whereas the a value of CNS was higher than that of CSS. Hence, it was confirmed that the total isoflavone contents in CSS (1,624.6±53.2 μg/g) were higher than that in CNS (1,590.6±59.3 μg/g). In both CSS and CNS, the content of genistin was highest followed by glacitin and daidzein. Also, the number of aerobic bacteria in CNS (8.1±0.4 log cfu/g) was higher than that in CSS (7.3±0.3 log cfu/g). Taken together, a smoking process can useful for the development of new cheonggukjang products." Address: 1. Dep. of Food Science & Technology, Korea National Univ. of Transportation, Jeungpyeong 368-701, Korea.

1955. Lee, Sun Mee; Hwang, Ja Young. 2014. [Physicochemical characteristics of soybeans grown in different origins and cultivation methods accompanying tofu properties]. *Korean J. of Food and Nutrition* 27(2):302-09. April. [16 ref. Kor; eng]

• ***Summary:*** "In this study, the characteristics of soybeans with different cultivation methods depending on their origins and the properties of tofu made from these soybeans were studied. The isoflavone content was higher in the general Korean soybeans compared to the organic American soybeans. There were no significant differences among the Chinese soybean samples, so the cultivar method was considered to have a greater effect on the isoflavone contents rather than the cultivation method. The protein contents were higher in the tofu made from the general Chinese soybeans and the organic Korean soybeans. Furthermore, the tofu made from the organic Chinese soybeans contained the least amount of proteins. Isoflavone contents were not significantly different among the samples. Texture profile analyses consisting of hardness, cohesiveness, adhesiveness, springiness, and gumminess were all shown to be higher in the organic tofu than in general tofu, with the exception of adhesiveness. In sensory evaluation, color and texture were significantly different according to the samples, and the differences were found to be affected more by the origin of soybeans rather than the cultivation methods. According to this study, the physicochemical properties of the soybeans and tofu seemed to be influenced by the cultivation region rather than the methods." Address: 1. Div. of Food Science, Kyungil Univ., Gyeonsan 712-701, Korea.

1956. Jeong, Do-Won; Kim, H.R.; Jung, G.; Han, S.; Kim, C.T.; Lee, J.H. 2014. Bacterial community migration in the ripening of Doenjang, a traditional Korean fermented soybean food. *J. of Microbiology and Biotechnology* 24(5):648-60. May 28. [43 ref]

• ***Summary:*** "*Doenjang*, a traditional Korean fermented soybean paste, is made by mixing and ripening *meju* with high salt brine (approximately 18%). Meju is a naturally fermented soybean block prepared by soaking, steaming, and molding soybean. To understand living bacterial community migration and the roles of bacteria in the manufacturing process of doenjang, the diversity of culturable bacteria in meju and doenjang was examined using media supplemented with NaCl, and some physiological activities of predominant isolates were determined." Address: 1-4. Dep. of Food Science and Biotechnlogy, Kyonggi Univ., Suwon 443-760, Republic of Korea.

1957. AVRDC–The World Vegetable Center (Website printout–part). 2014. www.avrdc.org Retrieved June 6.

• ***Summary:*** Under "About us" is a page of Quick Facts:

"Mission: The alleviation of poverty and malnutrition in the developing world through the increased production and consumption of nutritious and health-promoting vegetables.

"Founding: The Asian Vegetable Research and Development Center was founded on 22 May 1971 by the Asian Development Bank, Japan, Korea, Philippines, Thailand, USA, Vietnam, and the Republic of China (Taiwan) with a mandate to work in tropical Asia. The headquarters campus in Taiwan was dedicated on 17 October 1973."

"Our name: As the Center gained expertise and capacity, it expanded into sub-Saharan Africa, Central Asia, and South Asia. In 2008, the organization adopted a new name–AVRDC–The World Vegetable Center–to reflect its global scope."

"Annual budget: Approximately US$18 million, with the majority of funding from national governments and major private foundations. Donors include the Asia & Pacific Seed Association, Australian Centre for International Agricultural Research, Germany's GIZ/BMZ, Republic of China, United Kingdom's Department for International Development, United States Agency for International Development, UK Department for International Development.

"Management & Structure: Independent, non-governmental, not-for profit international agricultural research institute run by a management team that reports to an international Board of Directors. The organizational structure accommodates regional project management and efficient global coordination.

"Staff: Approximately 300 staff with around 50 internationally recruited scientists and professionals

"Headquarters: Shanhua, Taiwan. The Center is the only international agricultural research center headquartered in a Chinese-speaking country.

© Copyright Soyinfo Center 2021

"Regional offices: East and Southeast Asia–Bangkok, Thailand (1992). Eastern and Southern Africa–Arusha, Tanzania (1992). South Asia–Hyderabad, India (2006). West and Central Africa–Bamako, Mali (2007).

"Sub-regional offices: Central & West Asia and North Africa–Tashkent, Uzbekistan. National Horticultural Research Institute–Suwon, Korea.

"Liaison offices: Yaounde, Cameroon

"Training station: East and Southeast Asia Research and Training Station–Kamphaeng Saen, Thailand.

"Outreach project offices: Maroua, Cameroon. Sikasso, Mali. Java, Indonesia. Malang, Indonesia. Sigatoka, Fiji. Honiaria, Solomon Islands. Dhaka, Bangladesh. Islamabad, Pakistan. Ranchi, Ludhiana, Bhubabeswar, Chickmagalur, and Raichur, India.

"Principal partners: National agricultural research and extension systems and nongovernment organizations in developing countries; the private seed sector; research universities.

The headquarters in southern Taiwan is located on a 117-hectare campus. AVRDC also has regional offices in Arusha, Tanzania (192); Bamako, Mali (2007); Tashkent, Uzbekistan; Bangkok, Thailand (1992); Hyderabad, Andhra Pradesh, India (2006); and Fiji. Address: P.O. Box 42, Shanhua, Tainan 74199, Taiwan.

1958. Choi, Duk-Kyung. 2014. [On review of Renshu and Rongshu: with regard to the origin of the Chinese soybean]. *Dongyang Sahak Yougu* (*The Society for Asian Historical Studies: Seoul*) No. 128. p. 1-45. June. ISSN: 1226 1270. [36 ref. Kor; chi]

• ***Summary:*** This article has a Chinese summary but no English summary.

Concerning the words "Renshu" and "Ronshu" in the title; these are Chinese words that meant the same thing or almost the same thing as the word *Shu*, meaning soybean. These two words first appear in the *Erya* (Literary Compositor, compiled in about 150 BCE). In Chapter 13, "Explanation of Grass" (*Shicao*) the *Erya* states that *"rongshu* is the same as *renshu."* This means that the beans of the *rong* (Wade-Giles: Jung) tribe are the same as soybeans. (Translated by H.T. Huang, PhD, Aug. 2001).

A later example, in the *Qimin Yaoshu* (written in 544 CE by Jia Sixie) he states in Chapter 6, when talking about the *Erya*, "ronshu is the same as renshu." Sun Yan's commentary on the *Erya* explains that *rongshu* is the name for soybean (*dadou*).

Another later example: In the *Erya Xinyi* [New explanations of the *Erya* (ancient dictionary)], by Lu Tian: The section titled *Rongshu* and *renshu* discusses different words applied to *shu* (the soybean). *Rong* and *Ren* refer to two different tribes that live in different parts in northern China.

Concerning this Prof. Choi comments (23 Feb. 2021, email): The above is the primary point of view, but in the thesis, a more detailed and comprehensive analysis was conducted. The Chinese analysis is a rudimentary step. Of course, all raw materials were found and analyzed. Address: Prof., Dep. of History, Pusan National Univ. [Pusan, Korea].

1959. Lee, Ggot-Im; Lee, Cherl-Ho. 2014. Safety aspects of alkaline-fermented foods. In: Prabir K. Sarkar & M.J. Robert Nout, eds. 2014. Handbook of Indigenous Foods Involving Alkaline Fermentation. Boca Raton, Florida: CRC Press, Taylor & Francis Group. xxviii + 601 p. See p. 399-423. [69 ref]

• ***Summary:*** Contents: 6.1 Alkaline-fermented foods (AFFs) are generally safe (Korean chongkukjang and doenjang, Japanese natto, Chinese douchi, Thai thua nao, and Nepalese and Indian kinema, which are all made from soybean, belong to this class of fermented foods. *Bacillus subtilis* and related bacilli are the essential and main microorganisms responsible for making AFFs). 6.1.1 Initial thermal treatment.

6.1.2. Growth of *Bacillus subtilis* (It's optimal growth temperature is around 40ºC. Several researchers have reported that *Bacillus subtilis* and *Bacillus pumilus* can produce metabolites that inhibit the growth of pathogenic bacteria. The *Bacillus* species, especially *B. subtilis*, not only have an antibiotic effect, they also produce strong proteolytic enzymes that hydrolyze that protein in the beans and seeds into peptides and amino acids, and finally into ammonia. The combination of high pH and high concentration of free ammonia, along with rapid growth of *B. subtilis* at the high temperature of 40ºC makes it very difficult to grow).

6.1.3 pH change (The pH of AFFs typically rise from 6.0 to 7.0 at the start to 7.9 to 9.0 at the end. Many of the pathogenic and spoilage microorganisms are inhibited by a pH over 8.0). 6.1.4 Cooking process.

6.2 Hazards in alkaline-fermented foods (microbiological and chemical). 6.2.1 Microbiological hazards (*Bacillus cereus* is the main culprit). 6.2.1.2 Other potential pathogens. 6.2.1.3 Mycotoxins (incl. aflatoxins). 6.2.2 Chemical hazards: Biogenic amines (Biogenic amines have been reported in AFFs such as natto, chongkukjang, and doenjang. Miso is reported to have had high levels of histamine, putrescine, cadaverine, and tyramine).

6.3 Control of hazards (by applying good agricultural practices {GAP} and hazard analysis and critical control points (HACCP)). 6.3.1 GAP. 6.3.2 HACCP (The critical control points are placed in the flowchart of operational steps). 6.4 Conclusion.

Soy-related tables: 6.3 Approximate pH tolerance of some microorganisms (shows maximum and minimum for each).

6.6 Main biogenic amines and their precursors. This table has 4 columns: Compound name, precursor structure (2), and molecular weight. It also has 9 rows: Agmatine, Tryptamine, 2-Phenylethyl amine, Putrescine, Cadaverine,

© Copyright Soyinfo Center 2021

Histamine, Tyramine, Spermidine, and Spermine.

6.7 Contents of biogenic amines in different fermented soybean products (mg/kg). This table has 10 columns: Tyramine, Tryptamine, Histamine, Putrescine, Cadaverine, Phenylethylamine, Spermine, Spermidine and Reference. It also has 9 rows: Miso, Doenjang (Korean traditional type), Doenjang (Korean modern type), Miso Chongkukjang, Chongkukjang powder, natto (Japanese), natto (Taiwan), natto (Japanese). The foods with the highest Spermidine content are (1) natto (Japanese) 339.7. (2) chongkukjang powder 54.6 (3) chongkukjang 52.0.

Soy-related figures: 6.1 (graph) The pH change of several alkaline-fermented foods (Chongkukjang, Thua nao, and Ogiri), Address: Korea Food Security Research Foundation, Korea University, Seoul, South Korea.

1960. Lee, Jang-Eun; Lee, Ggot-Im; Lee, Cherl-Ho. 2014. Chongkukjang. In: Prabir K. Sarkar & M.J. Robert Nout, eds. 2014. Handbook of Indigenous Foods Involving Alkaline Fermentation. Boca Raton, Florida: CRC Press, Taylor & Francis Group. xxviii + 601 p. See p. 63-71. [11 ref]

• ***Summary:*** Chongkukjang is similar to Japan's natto.

Contents: Origin of chongkukjang (first written record is from 1765). Methods of preparation. Biochemical composition. usage and function. Safety aspects.

Figures: (2.26) Diagram. The position of chongkukjang in Korean fermented soybean products (Modified from Lee, C.H., *Fermentation Technology in Korea*, Korea University Press, Seoul, 2001). Shows that chongkukjang is related to Japan's natto.

(2.27) Photo. Chongkukjang with mucous strings–when lifted up with chopsticks.

1963. Sarkar, Prabir K.; Nout, M.J. Robert. eds. 2014. Handbook of indigenous foods involving alkaline fermentation. Boca Raton, Florida: CRC Press, Taylor & Francis Group. xxviii + 601 p. Illust. Index. 24 cm. [500+ ref]

• ***Summary:*** See next page. This is a unique and outstanding book. Contents (through Chapter 2): Series preface. Preface. Editors. Contributors. 1. Introduction. 2. Diversity of plant-based food products involving alkaline fermentation. Chapter 2 is divided into "2.1 Legume products" and "2.2 Non-legume products." "2.1 Legume products" is divided into "2.1.1 Soybean products" and "2.1.2 Non-soybean products." The soybean products are:

Natto, by Toshirou Nagai (p. 8-18).

Douchi, by Li-Te Li and Yan-Li Ma (p. 18-33).

Kinema and similar products, by Pabir K. Sarkar and M.J. Robert Nout (p. 33-53).

Doenjang, by Kun-Young Park Ji-Kang Jeong (p. 33-63).

Chongkukjang, by Jang-Eun Lee, Ggot-Im Lee, and Cherl-Ho Lee (p. 63-71).

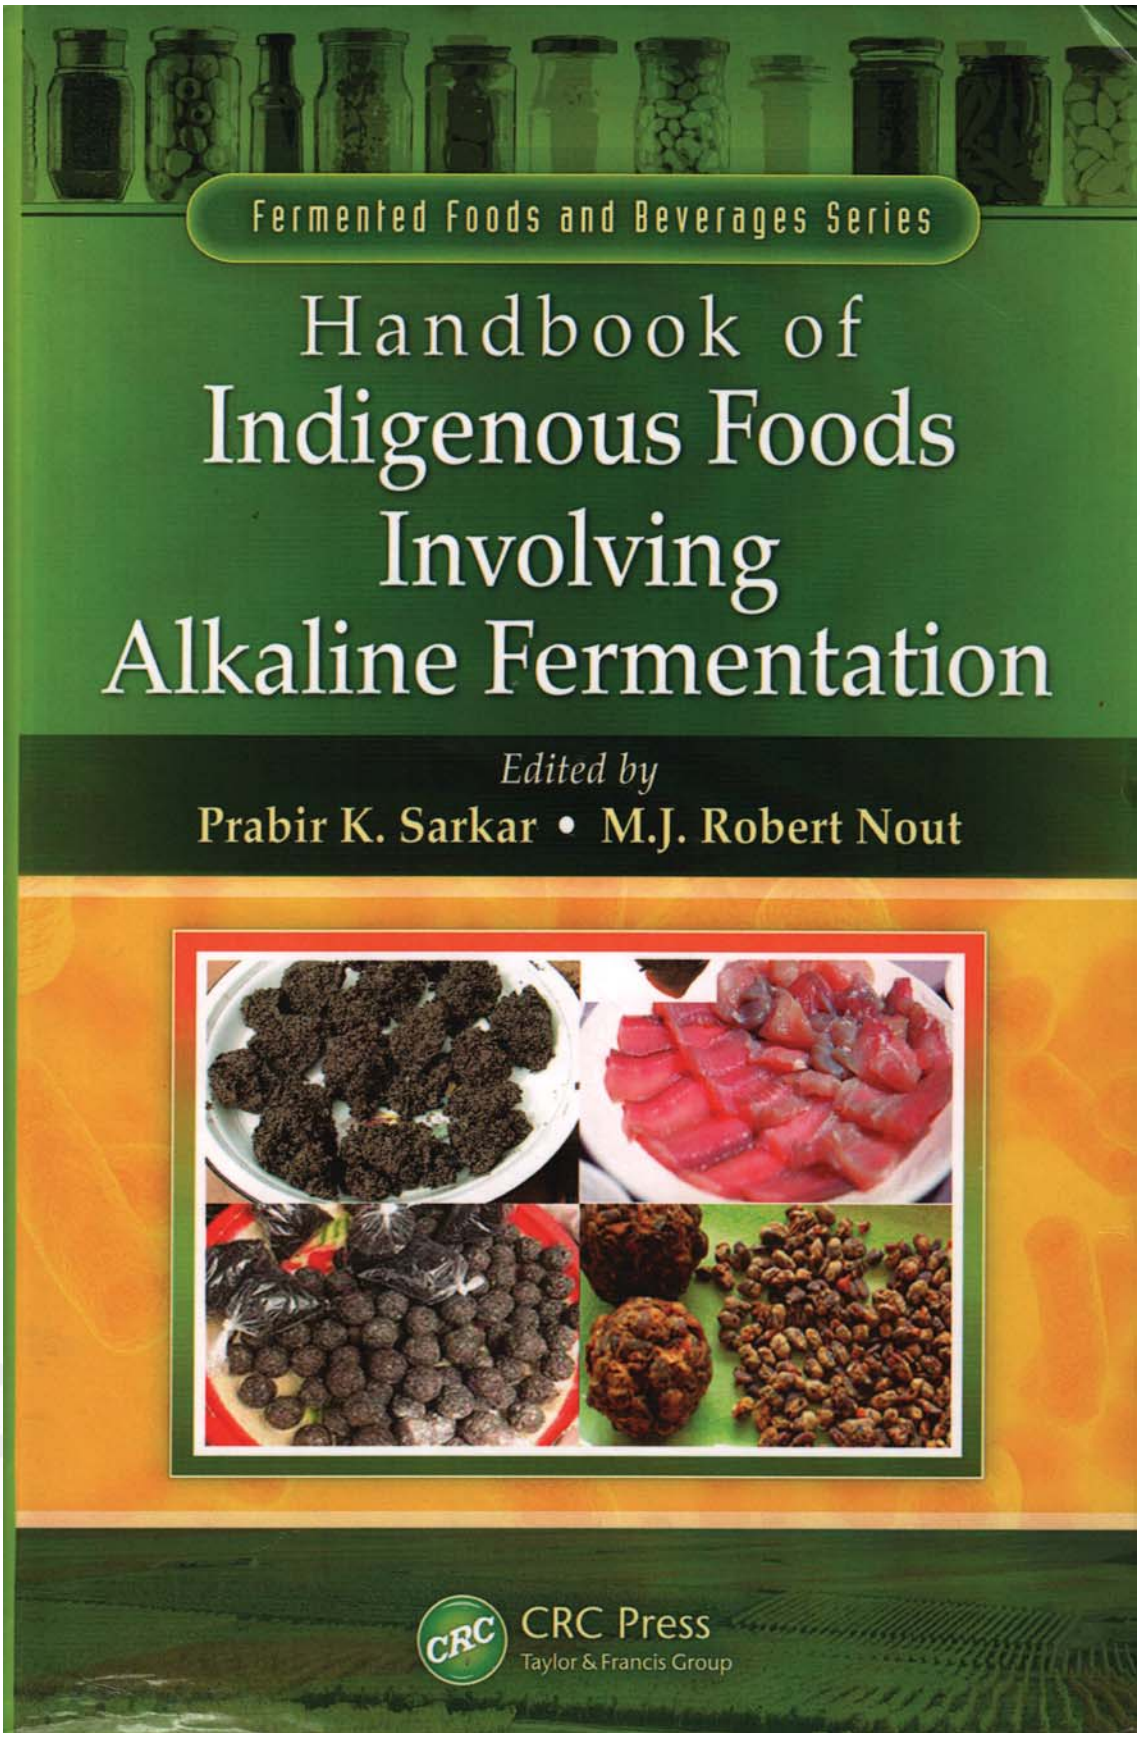
Douchi, by Li-Te Li and Yan-Li Ma (p. 18-33).

Thua Nao, by Ekachai and Chukeatirote (p. 71-76).

Meitauza, by Li-Te Li and Yan-Li Ma (p. 76-87).

Yandou, by Hongjiang Yang (p. 87-92).

For other soy-related material: Soybean, p. 4-5. Cultivation, p. 8. Protein, p. 8. Tempe bongkrek, p. 150. Yeasts, p. 282-89. Soy dawadawa, p. 285. Meju yeasts, p. 287-88. Nutritional value, p. 323-24. TI [trypsin inhibitor] reduction, p. 336 Antioxidative activity, p. 342-43. Okara; See also Meitauza. Okara, antioxidative activity, p. 343-44. Miso, biogenic amine levels in, p. 411, 413t. Spermidine, contents in different fermented soybean products, p. 413t, 414.



Note: Biogenic amines include (table 6.7, p. 413): tyramine, tryptamine, histamine, putrescine, cadaverine, phenylethylamine, spermine, and spermidine. Spermine, precursor of, p. 412t. Spermidine, precursor of, p. 412t Spermidine, contents in differented fermented soybean products, p. 413t, 414. Soybean meal, alkaline protease production, p. 480-81. Soy sauce, p. 490.

From the publisher (back cover): *"Handbook of Indigenous Foods Involving Alkaline Fermentation* details the basic approaches of alkaline fermentation, provides a brief history, and offers an overview of the subject. Devoted exclusively to alkaline-fermented foods (AFFs), this text includes contributions from experts from around the globe. It discusses the diversity of indigenous fermented foods involving an alkaline reaction, as well as the taxonomy, ecology, physiology, and genetics of predominant microorganisms occurring in AFFs.

"Presented in 10 chapters, the book explains how microorganisms or enzymes transform raw ingredients into AFFs. It discusses the quality and safety aspects of AFFs, and considers the challenges associated with the technological aspects in modernizing AFFs. It stresses the significance of the microbiological and biochemical processes in the fermentations, as well as the factors that influence the development of the characteristic microbiota, and the biochemical and organoleptic changes induced by them. It also proposes solutions, discusses the value of AFFs and related dominant microorganisms, and assesses the future of AFFs.

"The authors highlight commonly known foods

© Copyright Soyinfo Center 2021

© Copyright Soyinfo Center 2021

and beverages of plant and animal origin. They provide insight into the manufacture, chemical and microbiological composition, processing, and compositional and functional modifications taking place as a result of microbial and enzyme effects. The text examines safety, legislation, traditional and industrialized processes, as well as new product development, and opportunities for developing commodities from Africa, Asia, Europe, USA, and the Middle East. In addition, it also assesses the value of food processing by-products, biotechnology, and engineering of solid-state processes, modern chemical and biological analytical approaches to safety, and health and consumer perception."

This book contains a wealth of new and detailed information about several fermented foods, including Meitauza (by Li-Tee Li and Yan-Li Ma) which is made from okara (p. 76-87) and Yandou (by Hongjiang Yang), which is a fermented salted soybean food, widely consumed in eastern China, especially in Jiangsu province and surrounding areas (p. 87-92).

Note: Cherl-Ho Lee (PhD of Korea Univ., Seoul), wrote 2.1.1.5 Chongkukjang (p. 63-71), Hongeohoe (p. 224-28), and 6. Safety aspects of alkaline fermented foods (p. 399-423). Address: 1. Dep. of Botany, Univ. of North Bengal, Siliguri, India; 2. Lab. of Food Microbiology, Wageningen Univ., Wageningen, the Netherlands.

1964. Baek, Ji Eun; Choi, Y.H.; Song, J.; Yun, H.T.; Choi, H.S.; Park, S.Y. 2014. [Physicochemical properties of cheonggukjang with fermentation period for a variety of soybean cultivars]. *Korean J. of Food and Nutrition* 27(4):742-50. Aug. [28 ref. Kor; eng]

• ***Summary:*** Cheonggukjang (also spelled cheongkukjang) is Korean-style natto.

"This study was done in order to investigate the changes in quality of Cheonggukjang for soybean cultivars during fermentation. Cheonggukjang of 14 cultivars that were inoculated with *Bacillus subtilis* 15893 was produced, and, then, it was measured for hardness, proximate composition, amino nitrogen, enzyme activity, and total aerobic bacteria counts. In a raw bean, the highest hardness value was 16,975 g from Sunyu. In a steaming bean, Jangwon had the highest hardness value and the lowest aerobic bacteria counts of forty-eight hours fermented Cheonggukjang. Saedanbaek, whose protein content was highest in raw bean, was also highest in Cheonggukjang. The amino nitrogen content of twenty-four hours fermented Cheonggukjang was highest in Saeol and Sunyu while forty-eight hours fermented Cheonggukjang was highest in Singi, Daol, and Milyang 231. In the protease activity, Saedanbaek had the highest and total aerobic bacteria count that were either increased or held as time went on; twenty-four hours fermented Cheonggukjang was highest in Milyang 231 and Keunol while forty-eight hours fermented Cheonggukjang was highest in Chunsang." Address: 1. Dep. of Agrofood Resources, National Academy of Agricultural Science, RDA, Suwon 441-853, Korea.

1965. Choi, Jae-Ho; Chung, M.J.; Jeong, D.Y.; Oh, D.H. 2014. Immunostimulatory activity of isoflavone-glycosides and ethanol extract from a fermented soybean product in human primary immune cells. *J. of Medicinal Food* 17(10):1113-21. Oct. *

• ***Summary:*** "Sasang constitutional medicine is a major branch of Korean traditional oriental medicine. Constitutions of Sasang medicine are classified into Taeyangin, Taeumin, Soyangin, and Soumin."

"Daidzin, glycitin, and genistin were used to treat primary immune cells in the same condition, the cell proliferation; iNOS mRNA expression and nitrite concentration of daidzin, glycitin, or genistin-treated immune cells isolated from the blood of Soyangin volunteers was higher than that of Taeumin and Soeumin volunteers. The effect of DJ and isoflavone glycosides on immunostimulatory activities showed similar trends."

The fermented soybean product was probably Chongkukjang (Korean-style natto). Address: 1. Dep. of Food Science and Biotechnology, College of Agriculture and Life Sciences, Kangwon National Univ., Chuncheon, Korea.

1966. Kwon, Dae Young; Jang, Dai-Ja; Yang, Hye Jeong; Chung, Kyung Rhan. 2014. History of Korean *gochu*, *gochujang*, and kimchi (Open Access). *J. of Ethnic Foods* 1(1):3-7. Dec. [6 ref. Eng]

• ***Summary:*** "The gochu (Korean red pepper) that goes into Korean traditional fermented foods such as kimchi (fermented cabbage) and gochujang (spicy red pepper paste) should have a mild spiciness and its Scoville heat unit (the unit that measures spiciness) is <1,000."

Note: This is the first article in this open access journal. Address: 1-3. Korea Food Research Institute, Seongnam, South Korea.

1967. Hu, Xiao Juan; Song, W.R.; Gao, L.Y.; et al. 2014. Assessment of dietary phytoestrogen intake via plant-derived foods in China. *Food Additives & Contaminants. Part A, Chemistry, Analysis, Control, Exposure & Risk Assessment* 31:1325-35. *

• ***Summary:*** Based on the overall population sampled, the average total phytoestrogen intake was estimated at 232 mcg per kg per day. Genistein contributed to about 66%, secoisolariciresinol and glycitein to about 10% each, and daidzein to about 7% of the overall intake.

With 87 boys and 87 girls enrolled, ages 1-14, soyfoods intake per day was not reported. Isoflavones intake was 531.7±343.8 mcg/kg body weight in 75th percentile, and 726 mcg/kg body weight average. Address: 1. State Key Laboratory of Food Science and Technology , Nanchang

1971. Lee, Seul; Yoo, Seon Mi; Park, Bo Ram; Han, Hye Min; Kim, Ha Yun. 2014. [Analysis of quality state for gochujang produced by regional rural families]. *J. of the Korean Society of Food Science and Nutrition* 43(7):1088-94. [21 ref. Kor; eng]
• ***Summary:*** "This study investigated the quality properties of glutinous rice Gochujang produced by regional rural families in order to determine the present state of quality of traditional Gochujang. A total of 80 Gochujang samples were collected from nationwide rural families and their physicochemical characteristics were analyzed." Moisture, pH, acidity, crude protein, salinity, viscosity, color, amino nitrogen, reducing sugars, and capsaicinoids, were measured and varied widely, especially between the Gangwon-do and Gyeonggi-do regions.

Note: Capsaicin is the ingredient found in different types of peppers, such as cayenne peppers, that makes the peppers hot. Capsaicin is the main capsaicinoid in chili peppers. It is used to relieve a certain type of pain known as neuralgia. It is used as a fungicide in soy sauce and soybean paste in Korea. 1973. Uchida, Jun. 2014. Brokers of Empire: Japanese settler colonialism in Korea, 1876-1945. Cambridge, Massachusetts: Harvard University Press. xi + 481 p. See Chap. 7. Illust. Maps. 23 cm. Series: Harvard East Asian Monographs, No. 337 *
• ***Summary:*** From the publisher: "Between 1876 and 1945, thousands of Japanese civilians–merchants, traders, prostitutes, journalists, teachers, and adventurers–left their homeland for a new life on the Korean peninsula. Although most migrants were guided primarily by personal profit and only secondarily by national interest, their mundane lives and the states ambitions were inextricably entwined in the rise of imperial Japan. Despite having formed one of the largest colonial communities in the twentieth century, these settlers and their empire-building activities have all but vanished from the public memory of Japans presence in Korea. Drawing on previously unused materials in multi-language archives, Jun Uchida looks behind the official organs of state and military control to focus on the obscured history of these settlers, especially the first generation of pioneers between the 1910s and 1930s who actively mediated the colonial management of Korea as its grassroots movers and shakers. By uncovering the downplayed but dynamic role played by settler leaders who operated among multiple parties-between the settler community and the Government-General, between Japanese colonizer and Korean colonized, between colony and metropole-this study examines how these brokers of empire advanced their commercial and political interests while contributing to the expansionist project of imperial Japan."

Contents:
Emergence. The world of settlers.
Settlers and the state: uneasy partners.
In action. Building an empire of harmony.
The discourse on Korea and Koreans.
Industrializing the peninsula.
In search of a political voice.
Organs of the state. The Manchurian impact.
Citizens and subjects under total war.

1974. Lee, Cecilia Hae-Jin 2015. Wealth of *banchan* on the side: food & dining. *Los Angeles Times* (*California*). Jan. 10. p. E2.
• ***Summary:*** The restaurant Soban is "known among Koreans for its *ganjang gaejang* (soy-seasoned raw blue crab).

Mapo Kkak Doo Gee is known for its weekday lunch specials, which are such bargains. "The selection may also include soy-stewed potatoes, seasoned seaweed, steamed cabbage leaves with a side of seasoned *dwenjang* (fermented soybean sauce [paste])..."

At U2: "The giant vat of *dwenjang* (fermented soybean paste) is dwarfed only by the larger container of kimchi."

1975. Jang, Seri; Yang, Ming; Ahn, Su Mi; Park, Inshik. 2015. [Antioxidative activity and texture characteristics of

*wanja-jeon* with soybean powder]. *Korean J. of Food and Nutrition* 28(1):9-15. Feb. [27 ref. Kor; eng]
• ***Summary:*** "Wanja-jeon is pan-fried meat and tofu patties. It is served as a side dish. Combine ground beef, tofu, onion, garlic, green onion, carrot, 1 teaspoon salt, soy sauce, ground black pepper, sesame oil and 1 egg in a bowl. Mix well until the mixture gets a little sticky.

"Divide the mixture into 16 equal pieces. Roll each piece into a ball between your palms, then flatten into 2 inch disk and ¼ inch thick. Put the flour into a shallow bowl. Coat each patty with flour. Transfer to a platter. Repeat it with the rest of patties. Pan fry: Beat 1 egg, 1 egg yolk, and a pinch of salt in a bowl.

"2. Heat a large nonstick pan over medium heat. Add some oil and tilt the pan to spread it around.

"3. Working in batches, dip each patty in the beaten egg and place in the pan, one by one.

"4. Cook for about 1 minute until the bottom part turns light golden brown. Flip it over and cook for a few more minutes until the bottom part turns a little crunchy and light golden brown. Add more oil to the pan as needed.

"5. Turn and cook for another 30 seconds and transfer to a serving platter. Serve the patties hot or at room temperature.

"This study was conducted to improve the quality of Wanja-jeon, a Korean traditional food utilizing beef. Antioxidative evaluation of the ingredients in Wanja-jeon showed that soybean powder was highest in DPPH, ABTS radical scavenging activities and in reducing power among the food ingredients tested. Since soybean powder demonstrated high antioxidative activity, beef was replaced with soybean powder in Wanja-jeon to increase the antioxidative activity. All antioxidative activities such as DPPH and ABTS radical scavenging activities as well as reducing power increased with increases in the amount of soybean powder replacing beef. In texture analysis, the hardness, chewiness and brittleness of Wanja-jeon were highest when beef was replaced with 20% soybean powder, whereas the springiness and cohesiveness of the Wanja-jeon were highest with 50% of the beef replaced with soybean powder. The Hunter's color L and b values were highest in Wanja-jeon with 50% soybean powder replacing beef, while the a value of the color was highest in Wanja-jeon with 30% soybean replacing beef."

Note 1. What is "soybean powder"? Is it ground whole mature soybeans? Soy protein concentrate?

Note 2. DPPH free radical scavenging is an accepted mechanism for screening the antioxidant activity of plant extracts. In the DPPH assay, violet color DPPH solution is reduced to yellow colored product, diphenylpicryl hydrazine, by the addition of the extract in a concentration dependent manner. Note 3. "In biochemistry, ABTS (2,2'-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid)) is a chemical compound used to observe the reaction kinetics of specific enzymes and for radical scavenging." Address: Dep. of Food Science and Nutrition, Dong-A Univ., Busan 604-714, Korea.

1976. Kwon, Dae Young; Chung, Kyung Rhan; Yang, Hye-Jeong; Jang, Dai-Ja. 2015. Gochujang (Korean red pepper paste): a Korean ethnic sauce, its role and history (Open Access). *J. of Ethnic Foods* 2(1):29-35. March. [28 ref. Eng]
• ***Summary:*** "Gochujang (Korean fermented red pepper sauce, also written in Kochujang), along with kimchi, is an age-old ethnic food made with Korea's representative ingredient, red pepper. A typical Korean meal (Bapsang) is composed of rice (Bap), from which calories are derived, soup (Kuk), which helps in the chewing and digesting of the rice, and side dishes (Banchan), which provide additional nutrition and flavor. To add even more variety to the taste, seasoning (Jang, Yangnyum) is added. Gochujang has become the most fundamental of these kinds of food in Korea over thousands of years, functioning to make add flavor to rice taste better while aiding the digestive system. Gochujang also serves as a simple seasoning when making dishes such as braised spicy chicken, and provide additional nutrients. According to age-old documents, the development process used to manufacture Gochujang requires the basic ingredients of Meju (block made with cooked soy bean) powder, rice or glutinous rice flour, and red pepper powder. Sunchang Gochujang is one variety known for its great taste that was often consumed by kings during the Chosun dynasty." Address: 1&3. Korea Food Research Institute, Korea, Songnam, Kyongki-do, South Korea.

1977. Shin, Donghwa; Jeong, Doyoun. 2015. Korean traditional fermented soybean products: Jang (Open Access). *J. of Ethnic Foods* 2(1):2-7. March. [37 ref. Eng]
• ***Summary:*** "Fermented products are going beyond the boundaries of their use as mere side dishes, and are seeing significant increases in their use as a functional food. Kanjang (fermented soy sauce), Doenjang (fermented soybean paste), and Gochujang (fermented red pepper paste) are the most well-known fermented products in Korea... These products occupy an important place in people's daily lives as seasonings and are used in many side dishes. It has been proven through clinical studies that these products have many health benefits, such as their ability to fight cancer and diabetes, and to prevent obesity and constipation."

"Korea has a few other kinds of complex fermented dishes. A few of those that use soy sauce are listed below (7).

"Eoyukjang: The haunch of cow, chicken, gray mullet, and sea bream are dried and then put into Meju along with abalone, mussel, shrimp, egg, ginger, green onion, and tofu. Using these ingredients, the same steps for making Kanjang is followed.

"Fermented dried pollack: Hwangtae soybean is steamed, and the Meju is shaped like a hilt with bean leaves

© Copyright Soyinfo Center 2021

floating on the top. With this Meju, a fermented product is produced.

"Chongyukjang: Fried soybean is boiled and from this a solution is produced. Next, soybean is added to the solution it is boiled with beef, white radish, and red pepper for three to four days.

"Juebjang: Meju is made with wheat bran and fried soybeans. Is it then shaped into walnut-sized pieces and steamed with mulberry leaves that float. Cucumbers and eggplants may be added and then fermented together." Address: 1. Shindonghwa Food Research Institute, Jeonju, Jeollabuk-do, South Korea; 2. Inst. of Sunchang Fermented Soybean Products, Sunchang, Jeollabuk-do, South Korea.

1978. Xanthos, Julia. 2015. Slices of life: mother & daughter share secrets of family's bulgogi. *Daily News* (*New York, New York*). April 12. p. 16.
• ***Summary:*** The recipe ingredients for bulgogi include: 4 tablespoons soy sauce, Soybean paste, and Red chili paste.

"It is best to eat bulgogi by wrapping it in a lettuce leaf with Ssamjang (a combination of soybean paste (*dewnjang*) and red pepper paste (*gochujang*), and a spoonful of rice)." Address: New York Daily News.

1979. Choi, Won-Seok; Park, Hwa-Young; Choi, Ung-Kyu. 2015. [Quality characteristics of *cheonggukjang* prepared with germinated soybeans by the addition of smoking process]. *Korean J. of Food and Nutrition* 28(3):493-498. June. [27 ref. Kor; eng]
• ***Summary:*** "The aim of this study is to investigate the changes in the quality characteristics of *cheonggukjang* [Korean-style natto] made with germinated soybeans, which is produced by the addition of a smoking process. The L value of smoked cheonggukjang made with germinated soybeans (SCGS) was higher than that of non-smoked cheonggukjang made with non-germinated soybeans (NCNS) and non-smoked cheonggukjang made with germinated soybeans (NCGS). The a value of NCNS was the highest, followed by NCGS and SCGS. The b and delta T values had a similar tendency compared with the L value. The amino acids in NCGS were significantly decreased compared with NCNS, whereas no remarkable difference in amino acid content was observed between NCGS and SCGS. The moisture content of NCGS (61.9±0.9%) was increased by more than 8% compared with that of NCNS (53.3±0.7%). The moisture content of SCGS was significantly decreased compared with NCGS, whereas the moisture content of SCGS was higher than that of NCNS. The pH of SCGS was significantly the highest, followed by NCGS and NCNS. The viscous substance content of NCGS was significantly increased compared with that of NCNS. No remarkable difference in viscous substance content was observed between NCGS and SCGS. The number of aerobic bacteria in SCGS was significantly decreased compared with NCGS. The levels of total isoflavone in NCNS, NCGS, and SCGS were 1,573.9±62.5, 1,759.1±65.8, 1,738.0±68.1 mg%, respectively." Address: Dep. of Food Science & Technology, Korea National Univ. of Transportation, Jeungpyeong 368-701, Korea.

1980. Lim, J.H.; Jung, E.S.; Choi, E.K.; Jeong, D.Y.; Jo, S.W.; Jin, J.H.; Lee, J.M.; Park, B.H.; Chae, S.W. 2015. Supplementation with *Aspergillus oryzae*-fermented kochujang lowers serum cholesterol in subjects with hyperlipidemia. *Clinical Nutrition* 34(3):383-87. June.
• ***Summary:*** "Background & aims: Kochujang, a traditional fermented red pepper paste, is known for its hypocholesterolemic effect; however, these studies used non-commercial preparations of kochujang. In this study, we examined whether commercially-made kochujang in which Aspergillus oryzae (also known as koji) was used as a microorganism for fermentation has the same cholesterol-lowering effects."

"Conclusions: These results indicate that A. oryzae-fermented kochujang elicits a significant hypocholesterolemic effect and might be useful for improving blood cholesterol levels in subjects at high risk for cardiovascular disease."

1981. Nam, Y.R.; Won, S.B.; Chung, Y.S.; Kwak, C.S.; Kwon, Y.H. 2015. Inhibitory effects of Doenjang, Korean traditional fermented soybean paste, on oxidative stress and inflammation in adipose tissue of mice fed a high-fat diet. *Nutrition Research and Practice* 9(3):235-41. June.
• ***Summary:*** "Background/objectives: Doenjang, Korean traditional fermented soybean paste has been reported to have an anti-obesity effect. Because adipose tissue is considered a major source of inflammatory signals, we investigated the protective effects of Doenjang and steamed soybean on oxidative stress and inflammation in adipose tissue of diet-induced obese mice."

"Conclusions: Doenjang alleviated oxidative stress and restored the dysregulated expression of adipokine genes caused by excess adiposity. Therefore, Doenjang may ameliorate systemic inflammation and oxidative stress in obesity via inhibition of inflammatory signals of adipose tissue." Address: 1-2. Dep. of Food and Nutrition, Seoul National Univ., Seoul 151-742, Korea.

1982. Park, Hwa-Young; Choi, Won-Seok; Choi, Ung-Kyu. 2015. [Changes in taste component of cheonggukjang prepared with germinated soybeans by the addition of smoking process]. *Korean J. of Food and Nutrition* 28(3):499-508. June. [24 ref. Kor; eng]
• ***Summary:*** The aim of this study was to investigate the changes in the taste components of cheonggukjang [Korean-style natto] made with germinated soybeans, which is produced by the addition of a smoking process. The total

© Copyright Soyinfo Center 2021

organic acid content of smoked cheonggukjang made with germinated soybeans (SCGS) was four times higher than that of non-smoked cheonggukjang made with non-germinated soybeans (NCNS). The total organic acid content of SCGS was lower than that of non-smoked cheonggukjang made with germinated soybeans (NCGS). The total free sugar content of NCGS and SCGS was approximately three times higher than that of NCNS. The total free amino acid content of NCGS was significantly decreased compared with that of NCNS, whereas the total free amino acid content of SCGS was 1.2 times higher than that of NCGS. The essential amino acid content of SCGS was significantly increased compared with that of NCGS. The ratio of glutamic acid to the total free amino acid in NCNS and SCGS was 19.6%. Similarly, the ratio of glutamic acid to the total free amino acid in NCGS was 19.1%. There were no significant differences in the total fatty acid content of NCNS, NCGS, and SCGS. The sensory evaluation of appearance, aroma, taste, and overall quality of SCGS was significantly increased compared with that of NCNS and NCGS. These results suggest that smoked cheonggukjang made with germinated soybeans could be utilized for the development of a novel fermented food. Address: Dep. of Food Science & Technology, Korea National Univ. of Transportation, Jeungpyeong 368-701, Korea.

1983. Wei, B.; Cha, S.-Y.; Kang, M.; Kim, Y.J.; Cho, C.W.; Rhee, Y.K.; et al. 2015. Antiviral activity of Chongkukjang extracts against influenza A virus in vitro and in vivo (Open Access). *J. of Ethnic Foods* 2(2):47-51. June. [26 ref]
• ***Summary:*** "Results: All 10 compounds extracted from Chongkukjang showed neuraminidase inhibitory activity. Extracts A3 and A8, with high neuraminidase content, had the best inhibitory activities. The in vivo antiinfluenza virus activities of the ethyl acetate, A3, and A8 extracts as well as commercially available genistein were evaluated using H1N1 (A/NWS/33) to test mice survivability after virus challenge. The Chongkukjang extracts did not reduce mortality, but the A3 and A8 extracts delayed the median time to death after influenza A virus infection of mice.

"Conclusion: Our results suggest that the Chongkukjang extracts may have potential as a therapeutic agent to treat influenza virus infection." Address: 1-3. Departments of Infectious Diseases and Avian Diseases, College of Veterinary Medicine and Korea Zoonosis Research Institute, Chonbuk National University, Iksan, Jeollabuk-do, South Korea.

1984. Lipoid GmbH. 2015. Lipoid–History (Website printout–part). www.lipoid.com 1 p. Retrieved July 7. [Eng]
• ***Summary:*** "1977–Foundation of Lipoid based on the aim to manufacture dietetics for special nutritional requirements as well as lecithin and phospholipids for pharmaceutical products on an industrial scale.

"1981–Expansion and investment at the site in Ludwigshafen am Rhein [in Rhineland-Palatinate, Germany].

"1996–Establishment of Lipoid AG in Cham/ Switzerland.

"2001–Acquisition of A. Nattermann & Cie. GmbH's tincture and plant extract business and foundation of R&R Extrakte GmbH in Köln.

"2002 Expansion of Lipoid's natural lecithin and phospholipids business by acquiring Nattermann Phospholipid GmbH in Köln which is renamed Phospholipid GmbH.

"2004–Operational roll-out of a second cGMP-compliant production site for the manufacturing of natural lecithins and phospholipids. Incorporation of Lipoid LLC in Newark, New Jersey, USA.

"2013–Lipoid and Cosmetochem AG merge their cosmetic activities to form Lipoid Kosmetik AG." Address: Cham, Switzerland.

1985. Kayal, Michelle. 2015. Fueled by heat-seeking Americans, Korean cuisine is now hot. *St. Joseph News-Press* (*St. Joseph, Missouri*). July 26. p. E3.
• ***Summary:*** Korean food has many characteristics that recommend it to contemporary American diners. "The cuisine's foundation ingredients include doenjang, a fermented soybean paste, and gochujang, a fermented chili paste. These are often used in combination with other ingredients and aromatics to produce a unified experience of salt, sweet, sour, spice, and that elusive earthy, savory satisfaction called umami."

In the Atlanta area, menu items include "various tofu preparations, pork, chicken and ribs marinated in gochujang and rubbed with classic barbecue spices,..."

Skeptics are won over by the Korean way of preparing classic crispy tofu.

America, a "country that moons over Sriracha also is primed for the smoky, tangy heat of gochujang. The word gochujang gets only a few mentions on chain menus... But the spicy paste appears to be leading the migration of Korean ingredients from ethnic groceries to supermarket shelves. And some companies are determined to make it as familiar as ketchup." Address: Associated Press.

1986. Nordquist, Ted. 2015. Re: Summary of work with soyfoods in Sweden. Letter (e-mail) to William Shurtleff at Soyinfo Center, Aug. 20. 1 p.
• ***Summary:*** 1976–Ted Nordquist, soyfoods pioneer of Swedish ancestry now living in California, begins his work with soy by making and selling a tofu kit. By late Nov. 1979

© Copyright Soyinfo Center 2021

he is in Örsundsbro, Sweden, working with Tim Ohlund, a businessman named Gunnar, and a Korean Professor named Kim to start a new company to make soyfoods.

1980 Feb.–Aros Sojaprodukter KB in Örsundsbro, Sweden (near Uppsala), launches its first commercial soy product–tofu. This is the earliest known company in Scandinavia to make tofu. "Anne-Marie's dad and Ted took over a old soft drink factory in Örsundsbro, renovated it and installed Takai tofu equipment. Tim agreed to be plant manager and they started operations in Jan. 1980. The owner's mother lived in the flat upstairs but died in the spring. Again with the help of Anne-Marie's father, Tim's father (there visiting during the summer of 1980) and friends they renovated the upstairs apartment and moved from their student apartment to this flat in May 1980. They were making tofu all of this time. In the fall of 1980 they really started making tofu and delivering it to Stockholm and Uppsala twice a week.

1981–*Tofu-Boken* [The Tofu Book], by Ted Nordquist and Tim Ohlund is published in Örsundsbro, Sweden by Aros Sojaprodukter. It is Sweden's first book about tofu.

"1982–Alfa Laval, a Swedish food processing equipment company asks Ted to join their Soy Research & Development Team in Lund, Sweden. They install ultrafiltration equipment in Ted's tofu factory in Örsundsbro to experiment with a new type of tofu. Ted helps with the installation of a soybase line in Lund.

"1984–Alfa Laval Soy Research and Development is moved from Lund to Singapore (where it remains today). A co-worker drives Ted to Trensums Musteri in Tingsryd, Sweden, where the CEO Mark Ljungström and Ted agree to build a 'soybase' plant to produce Scandinavia's first 'soybase,' a water extract from whole soybeans. Nearby, at Winner ice cream factory in Karlshamn, Ted and Lola Skog begin developing what was later to be Tofu-Line Glass. Ted test markets this soy frozen desert (vanilla flavor) by taking samples of the product to the classrooms of his three children. By 1990 the children rush to get these samples and Ted knows that the flavor and consistency is good enough to sell to the public."

1984 Oct.–Aros Tempeh is first made and sold commercially by Tim Ohlund of Aros Sojaprodukter. This is the first commercial tempeh ever sold in Scandinavia.

"1987 March–Aros Sojaprodukter launches the first of its "Tofu Line" range of products, a series of 8 tofu entrees. They developed firm tofu, marinated tofu, tofu burgers, curry tofu burgers, tofu burgers with red beets, and a chili con tofu. In addition, they produced soft tofu in bulk for restaurants (Korean, Japanese and Chinese). Eventually they had five employees including Tim.

1990 May–Aros Sojaprodukter launches Tofu Line Glass (Vanilj, Choklad) [Tofu Line Soymilk Ice Cream (Vanilla, or Chocolate)]. This is Scandinavia's first commercial soy ice cream and the most delicious soy ice cream we have ever tasted. The key is the bland soybase Ted has developed. In the spring of 1990, when the Tofu Line Glass was launched, a Swedish national newspaper *Aftonbladet* published their yearly vanilla ice cream tests for the summer. Someone managed to get the Tofu Line Vanilla Glass entered into this contest and of the six major ice cream companies submitting their best vanilla premium ice creams, Tofu Line Glass came in second, behind Movenpick. It was a sensation for a soybean based frozen dessert and Aros' sales that summer took off!

"1990 Dec. 31–Ted Nordquist sells Aros Sojaprodukter KB (tofu manufacturing) to Blekinge Invest (owners of Trensums Musteri where Ted and co-workers built the soybase plant). Ted now owns 25% of a new corporation named Aros Sojaprodukter AB, of which he is also CEO. He can now work full time developing dairy alternatives made from the 'soybase' he and Mark Ljungström developed. He is trying to find companies to license his new technology and process for making soybase. Erik Kenhead, a businessman retired from Volvo Penta Marine Motors in England formed Aros Sojaprodukter AB with Ted. Soon after this, Blekinge Invest is included in the company resulting in 25% ownership for Ted, 25% for Erik and 50% for Blekinge Invest."

1991 July–Ted Nordquist establishes TAN Industries, Inc., in California. In Aug. 1994 his family joins him in Sonoma, California. In January of 1995, TAN Industries starts packaging and selling soymilk in extended shelf-life refrigerated packaging in the United States.

"1992 May–Ted Nordquist sells all of his shares in Aros Sojaprodukter AB, his second company in Sweden, since he now lives in the USA."

• ***Summary:*** "Thua nao is a traditionally fermented food in Thailand. It is manufactured by fermenting cooked soybeans with naturally occurring microbes. There are also similar products including natto in Japan, kinema in India, and chongkukjang in Korea. In Thailand, thua nao is widely consumed, especially by people in the northern part. The

© Copyright Soyinfo Center 2021

product is generally regarded as a protein supplement and widely used as a condiment. Two major types of thua nao can be distinguished; fresh and dried forms. To date, scientific information on thua nao is scarce and thus this article aims to document the updated knowledge of Thai thua nao." Address: School of Science, Mae Fah Luang Univ., Chiang Rai, Thailand.

1989. Young, Jackie M. 2015. The art of creating tofu: Mao-Chi Tzeng approaches tofu making as an art (Web article). *HawaiiBusiness.* Oct. 28.
• ***Summary:*** Mao-Chi Tzeng (age 66) and his wife Mei-Liang own Mrs. Cheng's Soybean Products, 233 Kalihi St., in Kalihi, Honolulu, Hawaii. A large color photo shows Mr. Tzeng standing in his tofu company. Originally from Taiwan, he and his wife immigrated to Hawaii in 1984 hoping to find "better health and educational opportunities for their two children. They had been pharmacists in Taiwan, and both came from families with medical and business backgrounds. So, a few months after arriving, Tzeng seized the opportunity when he heard Hui C. Cheng planned to retire and sell her tofu factory in Palolo.

He had big plans for the new company, but he noticed the market was too small to make a profit. So he upgraded her equipment because it was too small and outdated for the kind of company he envisioned. His new, state-of-the-art tofu-making equipment was custom made in Japan. That included a special cooker for the soybean slurry "that has three heating zones and four temperature monitors to make sure the soymilk slurry from crushed soybeans is heated gradually and evenly cooked, but not overcooked." And he raised the quality of the ingredients to pharmacy grade (from food grade) when possible and later started using non-GMO soybeans. Nevertheless, he lost money for the first three years.

"When Tzeng took over Mrs. Cheng's, the product line was plain soymilk, nigari tofu (firmer than hard tofu), hard tofu and soycheese, a brown-colored baked tofu that imitates cheese.

"Tzeng added soft tofu, or 'silken tofu,' after he found that upscale Japanese and Korean restaurants had no local supplier."

"He now also does custom orders [daily] of 'soong tofu' for Korean restaurants, similar in style to silken tofu."

In 1992, when a larger location became available, he moved the factory to its present location on Kalihi Street (Phone: 841-2571).

"About 40 percent of Mrs. Cheng's customers are high-end restaurants, and the rest are supermarkets, health food stores, wholesalers and individuals who buy direct from the factory." Address: Honolulu, Hawaii.

1990. Yoo, Taebum; Yoon, In-Jin. 2015. Becoming a vegetarian in Korea: the sociocultural implications of vegetarian diets in Korean society. *Korea Journal* 55(4):111-35. Dec. [50 ref]*
• ***Summary:*** "This essay is a social psychological analysis of the meaning of and social pressures against vegetarianism in a highly collective cultural context. It postulates potential difficulties in social relationships as the real challenge in becoming a vegetarian in Korea. The research is based on data collected from participant observations and in-depth interviews conducted with 38 vegetarians in the Seoul metropolitan area in 2010 2011. Given the social importance placed on ordering and sharing similar meals together in order to foster intimate relationships and emotional bonds in Korea, vegetarianism can be considered deviant social behavior discordant with the nonvegetarian norm. In highly collective Korean society, it is regarded as a bad practice that disturbs harmony within the group, and vegetarians/vegans, especially those who are younger and occupy lower social positions, face enormous social pressures to yield to a conventional omnivorous diet, especially on occasions, such as a family gathering and a company dinner. While some people fail to maintain their vegetarian diet, many vegetarians/vegans try to cope with such social pressures by using various bargaining strategies, such as avoiding meal time, hiding their identity, giving an excuse, and doing routine chores for everyone else at the dinner table." Address: 1. The New School, Dep. of Sociology; 2. Korea Univ., Dep. of Sociology.

1992. Kim, You Jin; Park, M.Y.; Chang, N.; Kwon, O. 2015. Intake and major sources of dietary flavonoid in Korean adults: Korean National Health and Nutrition Examination Survey 2010-2012. *Asia Pacific J. of Clinical Nutrition* 24(3):456-63. [21 ref. Eng; Kor; chi]
• ***Summary:*** "With an effort to investigate possible relationship between flavonoids and health, an accurate estimation of flavonoid intake is valuable. We estimated dietary flavonoid intake and identified the major food

© Copyright Soyinfo Center 2021

sources. Subjects were healthy adults aged >=19 y (n=11,474) who completed the 24-h dietary recall of the Korean National Health and Nutritional Examination Survey (2010-2012). The US Department of Agriculture and newly estimated or published values for typical Korean foods were combined into a Korean-targeted flavonoid database. The mean intake of total flavonoid was 107±1.47 mg/d, with a higher intake in women than in men after energy-adjustment. Quercetin, cyanidin, genistein, daidzein, epigallocatechin 3-gallate, epicatechin, hesperetin, and luteolin were identified as major flavonoid compounds. Across the age range studied, flavonols and flavones showed a reversed U-shape curve; flavan-3-ol and flavanones showed a decreasing pattern; and anthocyanidins and isoflavones showed an increasing pattern. Forty-five food items were identified as contributing >2% of at least one flavonoid compound's intake. Kimchi was the major food source of total flavonoids, followed by green tea, persimmons, and soybeans. Single food items accounting for more than 50% of the intake of a specific flavonoid included persimmons (cyanidin), green tea (epigallocatechin, epicatechin-3-gallate, and epigallocatechin 3-gallate), black tea (thearubigin), tangerines (hesperetin and naringenin), and onions (isorhamnetin). This study provides information on Korean flavonoid intake to enable international comparisons, along with insight into how the sources and intake of various flavonoids vary according to age and gender. This work should facilitate future investigations of the association between flavonoid intake and health." Address: Dep. of Nutritional Science and Food Management, Ewha Womans Univ., Republic of Korea.

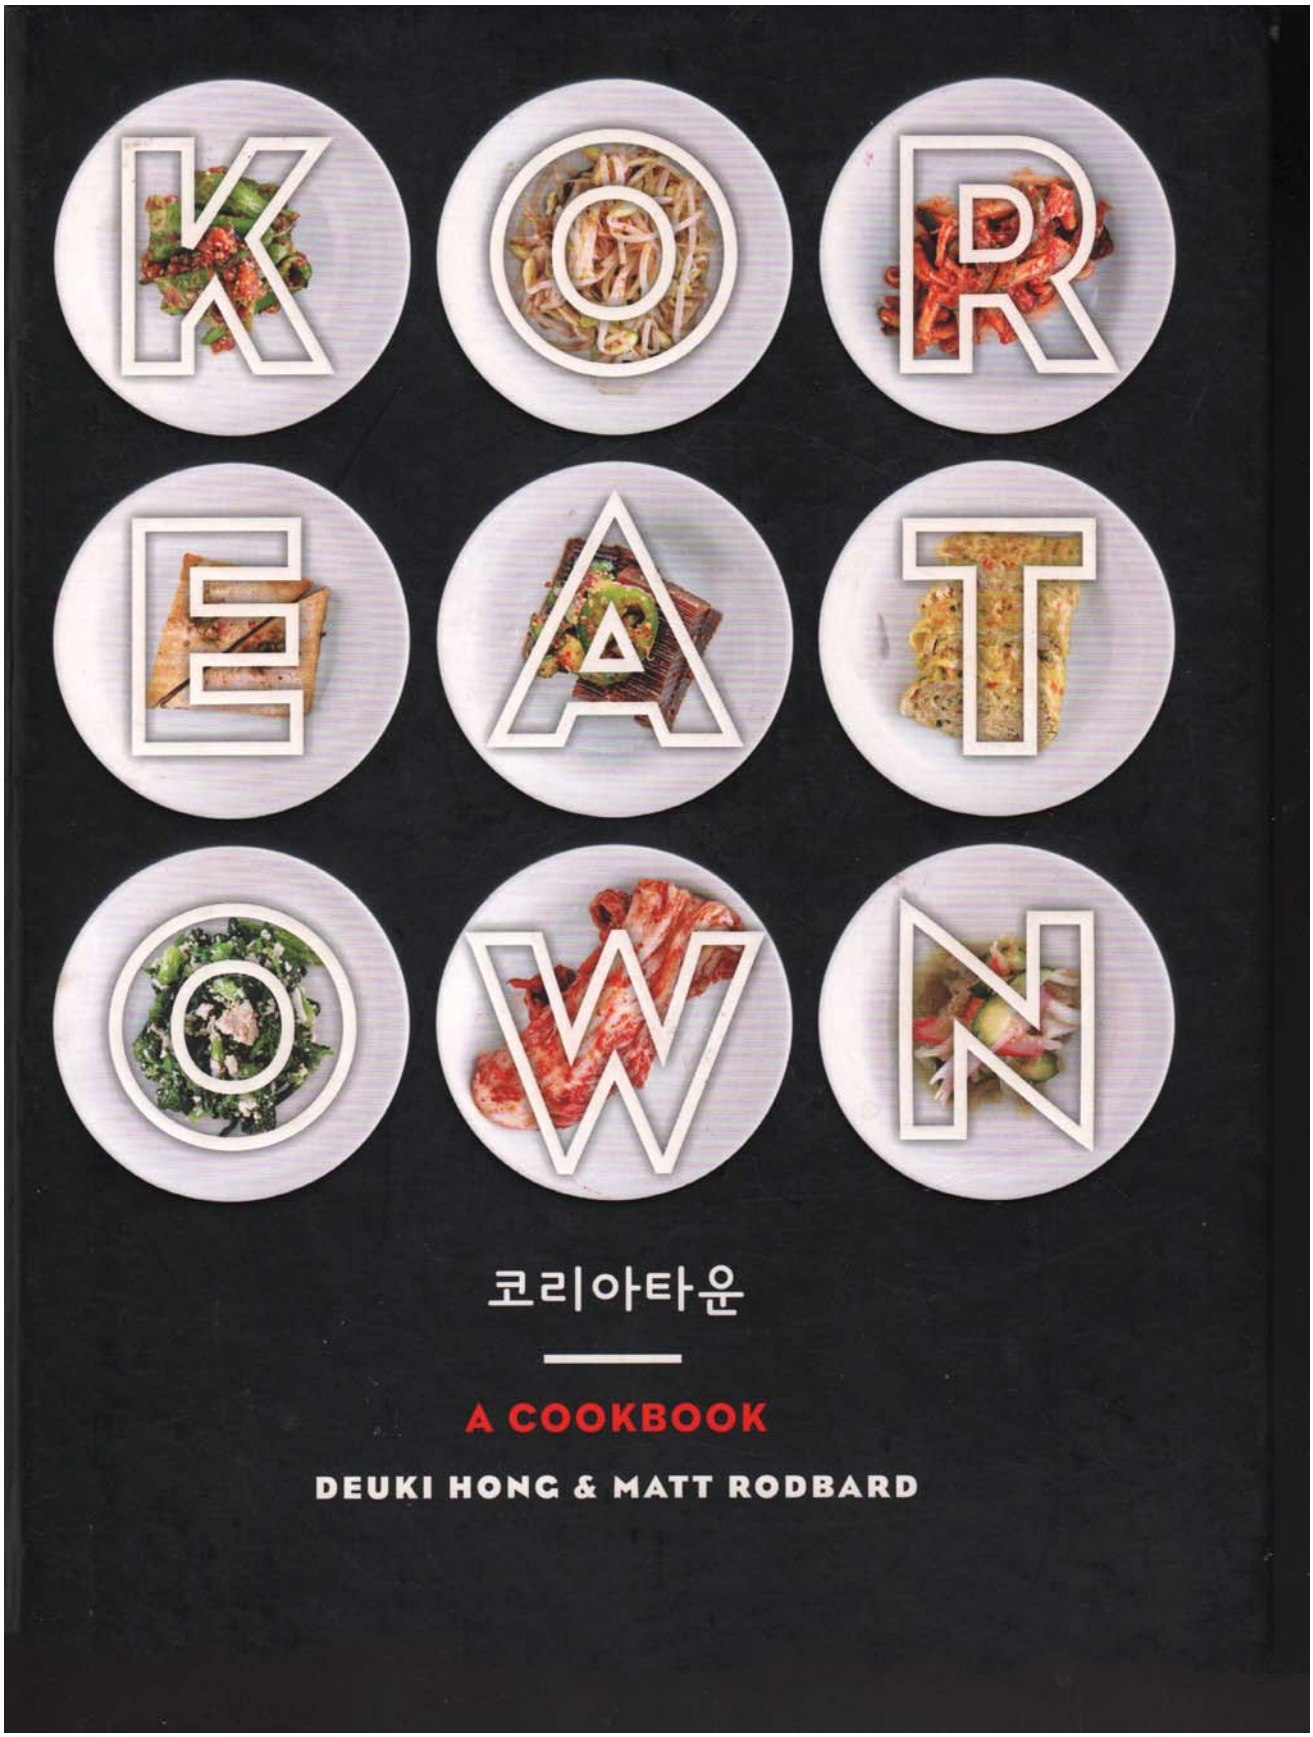
1993. Lee, Cherl-Ho. comp. 2015. Kong Se Kye Gwa Hak Gwan [Soyworld Science Museum]. Seoul, Korea: Sikanyeon Publishing. 212 p. Illust. (many color photos). 26 x 20 cm. [Kor]
• ***Summary:*** This beautiful book is a catalogue of the soybean museum at Yeongju City, Kyungsangbukdo. Korea. On the cover is a color photo of one end of the museum against a green background. On pages 2-3 is a color aerial illustration of the entire expansive site with 9 places numbered and named in both Korean and English: 1. Parking area. 2. Soyworld Science Museum. 3. Soyworld Activity Hall. 4. Farming experience center (large outdoor farm). 5. Picnic square. 6. Eaoullim Madang. 7. Farm products market. 8. Public restroom. 9. Yeongju apple exhibition hall.

1994. Tamang, Jyoti Prakash. 2015. Naturally fermented ethnic soybean foods of India (Open Access). *J. of Ethnic Foods* 2:8-17. [38 ref. Eng]
• ***Summary:*** Abstract: *"Kinema, hawaijar, tungrymbai, bekang, aakhone,* and *peruyaan* are naturally fermented ethnic soybean foods of India; they are popular among the Mongolian-origin races in the Eastern Himalayas. *Bacillus subtilis* is the dominant functional bacterium in all naturally fermented soybean foods of these regions. Although there is a good demand for ethnic fermented soybean foods among local consumers in north-east India, the production is limited to household level. A ready-to-use pulverized starter culture for kinema production can be introduced to kinema-makers or similar sticky fermented soybean foods of north-east India and adapted to local conditions for additional income generation. Ethnic fermented soybeans are one of the major food resources in the Eastern Himalayas; they supplement inexpensive, high-digested plant protein in the local diet with low fat/cholesterol content and high nutritive value as well as antioxidant and other health-promoting properties."

"Kinema is similar to other Asian Bacillus-fermented sticky soybean foods such as natto of Japan [28], chungkukjang of Korea [29], and thua nao of northern Thailand [30] (Fig. 11), pepok of northern Myanmar [31], and sieng of Cambodia and Laos [32]. The preparation of kinema is very similar to that of natto," Address: Dep. of Microbiology, School of Life Sciences, Sikkim Univ., 6th Mile, Tadong 737102, Sikkim, India.

1995. Ahn, Seonghee; Lee, S.; Lee, J.; Kim, B. 2016. Accurate determination of ochratoxin A in Korean fermented soybean paste by isotope dilution-liquid chromatography tandem mass spectrometry. *Food Chemistry* 190:368-73. * Address: Graduate School of Biotechnology, Korea Univ., Seoul 136-701, Korea.

1996. Hong, Deuki; Rodbard, Matt. 2016. Koreatown: a cookbook. New York, NY: Clarkson Potter. 272 p. Illust. (photos by Sam Horine). Index. 26 x 21 cm.
• ***Summary:*** This a very original and creative Korean cookbook.



The chapter titled "Ingredients and Equipment" (p. 22+) starts with "Korean Mother Sauces: Gochujang, Doenjang, and Ganjang," noting that "Much of Korean cooking is based around three essential, easy-to-find foundations called jangs."

(1) Gochujang (Spicy Fermented Pepper Paste), pronounced go-CHOO-jong, is sold in a bright red container with a number system, on the package, rating its hotness. The lower the number, the milder the taste.

To make gochujang, meju, a type of fermented soybean koji, is mixed with hot red pepper [chili] flakes, barley, sweet rice flour, salt and water. The mixture is placed into large earthenware crocks and left out in the sun to ferment for 30 to 90 days. The taste of gochujang is too intense to be used by itself, so it is always mixed with ingredients such as "sesame oil, rice vinegar, garlic, ginger and soy sauce."

(2) Doenjang (Fermented Soybean paste), pronounced DEN-jong, is much milder, less hot and intense, than gochujang. "Meju is rehydrated with salted water," placed into earthenware crocks, and left out in the sun to ferment for many months. When it has roughly the consistency of

© Copyright Soyinfo Center 2021

© Copyright Soyinfo Center 2021

applesauce, a basked is pushed down into it, and the soy sauce (ganjang) which accumulates in the basket is drawn off. The thick, salty paste left in the crock is ganjang. It is widely used in Korean cooking, and best known as the backbone of Ssamjang.

(3) Ganjang (Korean Soy Sauce [also spelled kanjang]), pronounced GAN-jong, is the liquefied co-product just discussed. In Korean cooking, two main types are available: regular and that used for soups. The regular is very similar to the soy sauce found in China. "The soup variety of soy sauce in unique to Korea. It is much lighter in color and has a lower sodium content. "It is also key when preparing namul (marinated vegetables)." Two photos (p. 23) show: (a) Making doenjang. (2) A courtyard filled with large earthenware containers of fermenting jang.

Page 25: Chunjang (black soybean paste) is similar to Chinese black soybean sauce. "It's made from roasted soybeans and thus is nuttier and less salty than the Chinese version. Chunjang is the main ingredient use in Jajangmyeon (p. 97), a popular Korean-Chinese noodle dish."

p. 31: Tofu (Dubu). Korea has regular and silken tofu types.

Soy sauce is used in a great many recipes in the book; we will mention only the most important–starting with:

p. 48: Soy sand sesame spinach.

p. 49. Quick soy sauce pickles.

p. 52. Soy-marinated eggplant.

p. 57. Soy-braised tofu (Dubu jorim).

Soy milk noodle soup (Kongguksu).

Black bean noodles (Jjajangmyeon, with chunjang {black bean paste}). Ssamjang (the great Korean barbecue condiment, with doenjang).

p. 118. Soy-marinated grilled rib eye (Bulgogi).

Spicy pork spare ribs (Daeji kalbi, with gochujang).

p. 142: Soy garlic glaze.

p. 151. Soy-braised pig's feet (Jokbal).

p. 153. Soy-marinated beef tartare (Yukhoe).

p. 170. Bean paste stew (Doenjang jjigae).

p. 173. Soft tofu stew (Soondubu jjigae).

p. 185. Sweet soy-braised chicken.

p. 193. Ground soybean soup (Dongbibi jjigae).

p. 208. Spicy kimchi yuba "noodles" with poached egg.

p. 216. Doenjang-braised pork belly with ddeokbokki.

p. 219. Crispy tofu sandwiches with munchim pickles and grape-jelly doenjang dressing.

p. 233. Doenjang and kimchi-braised kale.

For more see the excellent index. But don't look for "sprouts" or "soybean sprouts." Address: USA.

1997. Shin, H.W.; Jang, E.S.; Moon, B.S.; Lee, J.J.; Lee, D.E.; Lee, C.H.; Shin, C.S. 2016. Anti-obesity effects of gochujang products prepared using rice koji and soybean meju in rats. *J. of Food Science and Technology* 53(2):1004-13. Feb. [24 ref]

• ***Summary:*** "The Korean traditional hot sauce gochujang has been reported to have biological activities. Different kinds of gochujang products were prepared based on combinations of a fungal rice koji with two kinds of bacterial soybean mejus... High levels of capsaicin and genistein in gochujang products are considered to contribute to anti-obesity effects." Address: 1. Dep. of Biotechnology, Yonsei Univ., Seoul, 120-749 South Korea.

1998. Rodriguez, Robert. 2016. Clovis sets the table in good taste. *Fresno Bee* (*The*) (*Fresno, California*). April 13. p. C1-C2.

• ***Summary:*** Robert Schram is diversifying the school lunch offerings at Clovis East High School. One of these is "baby back ribs with a gochujang glaze.

"Haven't heard of gochujang? Don't be surprised, neither have most people. Gochujan [sic] is a savory and spicy Korean sauce that some in the food world believe will be the next sriracha."

1999. Pulmuone Foods Co. Ltd. 2016. Pulmuone closes asset purchase agreement with Vitasoy USA (Web article). www.prnewswire.com/news-release/ 1 p.

• ***Summary:*** Fullerton, California, May 12, 2016.–Pulmuone Foods Co., Ltd. announced on May 9th it has completed the acquisition of substantially all of the assets of Vitasoy USA Inc., which includes the Nasoya®, Azumaya® and San Sui® brands in North America. This acquisition solidifies Pulmuone's position as the world's leading tofu company while strengthening its operations in South Korea, U.S., Japan and China. Pulmuone had previously announced it had entered into an asset purchase agreement to acquire Vitasoy USA Inc. on March 24th.

"'This acquisition provides bi-coastal production and logistics capabilities as well as a national sales and distribution platform,' said Mr. H. Y. Lee, CEO of Pulmuone Foods Co., Ltd. 'We are especially excited about expanding the brand beyond the tofu category through our innovative product development and with our multi-channel business base. We look forward to bringing our customers and consumers more healthy and tasty products.'

"The acquired business, now known as Nasoya Food USA LLC., joins the Pulmuone family of healthy and nutritious brands and will be a part of our significant expansion in the U.S. M&A will continue to drive future growth for Pulmuone in North America and globally.

"Ross Gatta has been appointed to lead the Nasoya Food USA business as CEO. The acquired operations will remain in Ayer, Massachusetts with significant investments planned to grow the business." Address: Fullerton, California.

2001. Lee, Cherl Ho; Kim, Moonsil Lee. 2016. History of fermented foods in northeast Asia. In: Jyoti P. Tamang, ed. 2016. Ethnic Fermented Foods and Alcoholic Beverages in Asia. New Delhi, India: Springer Verlag. xiii + 409 p. See p. 1-16. [24 ref. Eng]
• ***Summary:*** Contents: 1.1 Introduction: where and who? 1.2 Pottery and dietary culture in northeast Asia. The *Hou Hanshu* [History of the Later Han dynasty (25 to 220 CE), written in the mid-5th century CE] mentions the "eastern archers" (*dongyi*). The word *dongyi* was originally written with two words meaning "big" + "bow." *The Hou Hanshu* also states that the dongyi were good at riding horses and archery, and that they had "established several proto-states in Manchuria, the Korean Peninsula, and the Japanese Archipelago such as Puyo, Dongye, Okcho, Koguryo Samhan and Wa." This suggests that as early as the 3rd century BCE the Dongyi has already established a unique culture that differed from the Chinese civilization to the north. Moreover, an oracle bone inscription from the Shang dynasty, dating to about 1200-1046 BCE, states "... the king orders to campaign against the Yi." This statement implies that, since around 1000 BCE the Dongyi had occupied part of northeast Asia and competed against the Chinese. And archaeological evidence indicates that they used fermented soybean products.

1.2 Pottery and dietary culture of Northeast Asia. Late Paleolithic (40,000 to 10,000 BP) sites have been found on the Korean Peninsula, South Manchuria, and the Japanese Archipelago. The meat-centered diet of the early hominin gradually changed to an omnivorous one. The Korean Peninsula served as a land bridge connecting the seasonal movements of Paleolithic hunters from the north of Manchuria to the south of the Japanese archipelago; the Korea strait is about 200 km (120 miles) wide, with Tsushima island in the middle. Evidence of this migration is the many pieces of primitive pottery found on both sides of the strait. A map (Fig. 1.2) shows where such pottery has been found. An earthen vessel excavated from Paldang in Korea has traces of soybeans on the surface; this supports the theory that these people used pottery for cooking soybeans in Central Korea beginning in the Bronze Age.

1.3 Origin and development of fermentation technology in Northeast Asia. 1.3.4 Origin of soybean fermentation. In the West, it is generally understood that soybeans were first domesticated, cultivated and consumed in China [Hymowitz 1970].

1.4 Fermented soybean products in Northeast Asia. 1.4.1 Korean Kanjang and Doenjang. The *meju* used as soybean koji for both these products is made from cooked soybeans. It is generally covered with *Aspergillus oryzae* mold and the inside is laden with bacteria, typically *Bacillus subtilis.* The result is liquid soy sauce (*kanjang*) and Korean-style soybean paste (*doenjang*). The flavor of soy sauce improves with increasing storage time, just as the flavor of wine becomes smoother as it ages. 1.4.2 Japanese shoyu and miso. The flavor of these two seasonings is mild and sweet compared to their Korean counterparts.

1.4.3. Korean *Chongkukjang* (like Japanese natto but salted). Cook soybeans and cover with a straw mat or cloth. Place on a warm stone floor, *ondol*, for 3-4 days until mucous strings (peptido-saccharides) formed. Then mix in chopped ginger, chopped garlic, and salt. Pound slightly until the soybeans are separated into halves. Store in an earthen jar. Natto is not generally liked by Koreans. In the so-called urbanized, apartment culture of today, Korean elders miss the stimulating savory smell of *chongkukjang* wafting from their kitchen; Korean young people generally dislike this smell.

1.4.4 Korean Kochujang uses meju (soybean koji) as a main ingredient, but mixed with strong, pungent red peppers. The most distinctive difference between Korean food that of neighboring Japan and China is the fiery taste of red peppers in most Korean dishes.

1.5 Role of fermented food in Northeast Asia. Fermented soybean products plays a major part. Korean koji is called *nuruk.*

1.6 Conclusion.

An excellent map (p. 2) shows the area described by the term "Northeast Asia."

2004. Kim, Soon-Hee; Chung, Kyung Rhan; Yang, Hye-Jeong; Kwon, Dae Young. 2016. Sunchang *gochujang* (Korean red chili paste): The unfolding of authenticity (Open Access). *J. of Ethnic Foods* 3(3):201-08. Sept. [54 ref]
• ***Summary:*** "Abstract: Background: Gochujang is one of the most frequently consumed foods by Koreans and can be used as a seasoning in *kuk, banchan,* or also used as a condiment itself. In this paper, we discuss the historical, literary, and geographical aspects of Sunchang gochujang, which has been acknowledged as the best quality.

"Methods: The history, origin, and tradition of gochujang and Sunchang gochujang were examined through literature review. Sunchang's climate and geographical characteristics were examined in order to determine their effects on the ingredients and its fermentation condition.

"Results: Sunchang is located in the southwest region of Korea. Its geography, with characteristic mountainous basins, provides high temperatures and humidity that is suitable for the fermentation of gochujang. In addition, distinctive seasons and temperature variance between day and night helps with growing high-quality red peppers with moderate levels of spiciness. The first reference to gochujang is found in the *Hyangyak-jipsongbang* (5 Cc = Chinese characters, 1433). Sunchang gochujang was enjoyed in the royal court, as described in the Ojuyeonmun-jangjeonsanko (8 Cc) and Somunsaseol (4 Cc). Sunchang gochujang was introduced as a medicinal food in the medicinal newspaper, and its recipes were recorded by royal physicians during the Chosun Dynasty. This demonstrates that Sunchang gochujang gained popularity not only for its flavor but also for its medicinal effects.

"Conclusion: The outstanding flavor and functional effects of Sunchang gochujang are due to the geographical characteristics that provide a congenial climate for fermentation and a great environment for growing high-quality red peppers."

"The majority of Korean foods are seasoned with jang rather than salt, as jang, being made from fermented beans, contains rich amino acids and volatile aromatic compounds that enhance the smell and flavors of food [2]. As jang is used in most kuk and banchan, many have stated that jang decides the flavor of a food. The Hurbaekjeongjip (4 Cc), a book written in the 15th century by Gwidal Hong (3 Cc, 1438-1504), stated that 'the quality of gochujang decides the farming success of that year.' This statement demonstrates the importance of jang in Korean food beyond its nutritional value [5].

"Gochujang is a fermented and aged bean product made from soybean powder, red pepper powder, and rice flour [2]. It has been indispensably used in dishes such as bibimbap [6], chicken, pheasant, and fish stews [7]. As with other types of jang, gochujang can be used as a seasoning in kuk, tang, and banchan, or as a condiment [4]. Chogochujang, a combination of vinegar and gochujang, is enjoyed with grilled meat or sashimi. According to the 2015 National Nutrition Survey conducted by the Korea Health Industry Development Institute, gochujang was ranked as the 14th most frequently consumed food in Korea [8]. The reported average daily intake of gochujang was 6.11 g and it was the second-most consumed seasoning after kanjang [8].

"Although many regions have traditionally made gochujang, the most famous region for gochujang is Sunchang. Generally, gochujang produced in Sunchang is the highest-selling product. In this paper, the historical, literary, and geographical aspects of Sunchang gochujang will be discussed."

"2. The history and tradition of gochujang: References to the cultivation of red peppers (*gochu*) in Korea can be found in the Chronicles of the Three States (4 Cc, 1145) and Mankiyoram (4 Cc) written by Busik Kim [9], [10] (Fig. 1). In addition, the Nonggawolryeongga (5 Cc, 1816) introduced red peppers as an important crop [11]. The Gijaejapgi (4 Cc, 16th century) mentioned bibimbap, a rice and vegetable dish, that was usually consumed with gochujang [12]. Taking these references and the long history of jang into consideration, it would be safe to presume that gochujang has been consumed by Koreans for thousands of years. The oldest written reference to gochujang is found in the Hyangyak-jipsongbang (5 Cc), published in 1433 during the 15th year of the reign of King Sejong in the Chosun Dynasty [Fig. 2; This book refers to gochujang or gochojang as chojang (2 Cc) and gochu as gocho or gochu (1 Cc)] [13]. However, the early references to gochujang are primarily focused on its medicinal properties rather than its role as a food additive. For example, gochujang was often used to promote digestive issues caused by weaknesses in the spleen and stomach [7], [14]."

"4. Gochujang production methods: One of the major ingredients of gochujang is gochujang meju. Meju is made from cooked soybeans and nonglutinous rice with a ratio of 6:4. This mixture is then woven with straw and then dried for 2-3 months. Gochujang is made from meju powder mixed with malt, salt, rice flour, and red pepper powder [2]. The typical recipe for gochujang is 25% red pepper powder, 22.2% glutinous rice, 5.5% meju powder, 12.8% salt, 5% malt, and 29% water. Once these ingredients are mixed and placed in a crock, it takes approximately 6 months to 1 year for fermentation to occur [2]. The two main groups of microorganisms in gochujang are *Bacillus licheniformis*

© Copyright Soyinfo Center 2021

(33%) and *Bacillus subtilis* (32%)." Address: Div. of Nutrition and Metabolism Research, Korea Food Research Inst., Songnam, South Korea.

2005. Patra, Jayanta Kumar; Das, Gitishree; Paramithiotis, Spiros; Shin, Han-Seung. 2016. Kimchi and other widely consumed traditional fermented foods of Korea: a review (Open Access). *Frontiers in Microbiology* 7:1493. Sept. [164 ref]

• ***Summary:*** "Different types of fermented foods such as chongkukjang, doenjang, ganjang, gochujang, and kimchi are plentifully available and widely consumed in north eastern Asian countries including Korea." However these are the Korean names for these foods.

"Chongkukjang [Korean-style natto paste] is a fermented product manufactured by short term fermentation of boiled soybean seeds using *Bacillus subtilis* in rice straw. It is one of the favorite traditional foods in Korea (Su et al., 2007; Kwon et al., 2011; Shin and Jeong, 2015). It contains a number of useful microorganisms and bioactive compounds that are absent from unfermented soybean products. Chongkukjang has the shortest fermentation period of 2-4 days and is fermented at a high temperature (40-43ºC). The soybean proteins are degraded during fermentation process by the protein degrading enzymes of *B. subtilis*, and flavonoid glycosides are converted into aglycones by hydrolysis during fermentation, resulting in production of free amino acids along with related peptides (Nakajima et al., 2005; Kim N. Y. et al., 2008; Wei et al., 2015). The Koreans have been consuming Chongkukjang for hundreds of years. Significant amount of data suggests that Chongkukjang contains a number of proteins and minerals that can stimulate the generation and growth of human cells and strengthen the immune system (Choi et al., 2014; Shin and Jeong, 2015). Moreover, there are several reports on the bioactive potential of Chongkukjang such as antidiabetic, antiinflammatory, antimicrobial, antioxidant, blood pressure lowering activities, and neuroprotective effects (Kang et al., 1998; Cho et al., 2000; Yang et al., 2003; Kim et al., 2004; Kim N. Y. et al., 2008; Wei et al., 2015). Compounds like isoflavones (daidzein and genistein) are found at high concentrations in Chongkukjang and they were reported to possess the protective effect against oxidative damage related with atherosclerosis and cancer (Barnes et al., 1996; Anthony et al., 1998).

"Doenjang is traditionally used in Korea as a basic seasoning (Kim et al., 2009; Nam et al., 2015). It is produced by the fermentation of cooked and crushed soybean seeds or blocks, Meju, by naturally occurring bacteria and fungi with brine in a container such as a porcelain pot and has been consumed for centuries as a source of protein and flavoring ingredient in Korea (Kim et al., 2009; Kwon et al., 2010). During recent times, the doenjang has been prepared commercially by various local firms around the Korean peninsula using a slightly modified procedure that varies in the quality as affected by the fermentation process, microbiota involved, and by the basic ingredients used, such as soybeans or a combination of soybeans and grains (Yoo et al., 2000; Park et al., 2002). Doenjang has attracted much attention due to its health-related beneficial properties such as anticancer, anti-mutagenicity, antioxidative, and fibrinolytic activity (Lim et al., 1999, 2004; Ra et al., 2004). Various types of microorganisms are involved in the fermentation of doenjang; the unique flavors and tastes are due to the decomposed products of soybean proteins from the soybean seed by the action of microorganisms during the fermentation process. A number of reports have stated that *B. subtilis* and *B. licheniformis* are the dominant microorganisms in doenjang along with *Aspergillus, Mucor,* and *Rhizopus* species (Kang et al., 2000; Nam et al., 2015). During the fermentation process, cleavage of β-glycosyl bond of isoflavone glucoside increases the content of isoflavone aglycones, including daidzein and genistein due to the rapid microbial growth (Nam et al., 2015). Daily intake of doenjang has been reported to suppress the body weight gain, cytokine levels, and serum oxidative stress in high-fat-fed mice (Nam et al., 2015). Similarly, the anti-inflammatory and anti-oxidative stress effects of doenjang have also been reported in the adipose tissue (Nam et al., 2015).

"Ganjang is a kind of Korean soybean sauce made from fermented soybeans (Hong-beum, 2004). It contains approximately 15-20% salt, 50-70% water, free sugars, isoflavones, peptides, and organic acids that are produced from the soybeans during the fermentation process (Jeon et al., 2002; Shim et al., 2008). The sauce has a characteristic black color due to the presence of melanoidins, which are formed when carbonyl compounds and amino compounds combine together (Kim et al., 2011). The melanoidins present in soybean sauce are responsible for its antioxidant potential (Choi et al., 1990). Ganjang is prepared from the soybeans blocks, meju, which is dried for about 1 week and then tied with straw and dried for another 40 days. After the meju have dried, they are then fermented in a specially made clay pot mixed with salt and water. When the fermentation is complete, dark liquid separates, which is called ganjang (soy sauce or soya sauce) (Hong-beum, 2004).

"Gochujang is a fermented paste made of red chili powder, glutinous rice powder, pureed soybeans and salt, seasonings like garlic and onion, sweetened with a little sugar syrup and fermented for long period in specially designed earthen vessels (Choi, 2012). It is an essential part of the Korean cuisine and is used in almost all the Korean foods like bibimbap, noodles etc. It is a basic ingredient for other sauces and pastes, it is mixed with the doenjang to make samjang, it is used to prepare the chogochujang, salad dressing etc. (Choi, 2012)" Address: 1. Research Inst. of Biotechnology and Medical Converged Science, Dongguk University-Seoul Goyang, South Korea.

2006. Ann, Yong-Geun. 2016. [A study on making *meju* (molded soybean) for traditional jang]. *Korean J. of Food and Nutrition* 29(5):670-76. Oct. [48 ref. Kor; eng]
• ***Summary:*** "In this study, we analyzed the utensils, covers and mats that were used for making meju, the shape of meju, and the heating method used for making meju from the 225 ways of preparing jang mentioned in the 32 volumes of the ancient cook books from 530 AD to 1950. The heating method of traditional meju bean and starch included 57 kinds of steaming, 59 of boiling, 21 of roasting + boiling, and 2 of cooking. The shape of meju included 41 kinds of egg, 27 of ball, 22 of lump, a kind of doughnut, 8 kinds of hilt, 6 of flat, 4 of chip, and a kind of square. Among the 72 gochoojang meju, the heating method of bean included 9 kinds of boiling, and 6 kinds of steaming; whereas the heating method of starch included 19 kinds of steaming of dough, 11 of rice cooking, and 5 of boiling of dough. The utensils for molding of bean meju were 49 kinds of straw sack, 14 of round straw container, 11 of heating bed, 7 of large straw bowl or Japanese snailseed, 5 of jar, 4 of ditch, 3 of straw bowls, 2 of pottery steamer of dough, 2 of gourd, and a kind of long round bamboo bowl and sack of straw. The cover and the mat used for molding of meju included 36 kinds of straw, 17 kinds of paper mulberry leaf, 15 of wide straw seat, 14 of mugwort, 11 of pine tree leaf, 10 of soybean leaf, 6 of cocklebur leaf, 6 of sumac leaf, 6 of barley straw, 6 of mulberry leaf, 5 of fallen leaf, 5 of cogon grass, 4 of reed seat, 3 of scrap of cloth, 2 of Indian bean tree leaf, a kind of reed. There were only 5 kinds of hanging." Address: Dep. of Food and Nutrition, Chungcheong Univ., Cheongju 28171, Korea.

2007. Ghani, Mirwais; Kulkarni, K.P.; Song, J.T.; Shannon, G.; Lee, J.-D. 2016. Soybean sprouts: a review of nutrient composition, health benefits and genetic variation (Open Access). *Plant Breeding and Biotechnology* 4:398-412. Epub Nov. 30. [121 ref]*
• ***Summary:*** "Soybean... sprouts [*kongnamul* in Korean] are highly digestible and a year around vegetable suitable for human consumption. Sprouting process causes a number of biochemical changes inside the seed, resulting in the accumulation of various primary and secondary metabolites. Due to such changes, sprouts contain high levels of health-promoting phytochemicals as compared to other vegetables. Sprouts are an excellent source of protein, amino acids, and vitamins, which provide numerous health benefits. Due to such advantages, soybean sprouts have been preferred as a part of daily diets in Korea and quality soybean sprouts are in high demand in the edible food market. To produce high quality soybean sprouts, several factors, including the choice of the variety, health benefits from sprout phytonutrients and inherent genetic variation for the sprout-related traits of the variety need to be considered. In this review, we have summarized literature on soybean sprout components, the health benefits, changes in nutritional factors during the sprouting process and the genetic variation among the cultivars developed for sprout usage. We have also reviewed procedures and factors like seed characteristics, temperature, chemical applications that influence the sprouting process. The information collectively presented here will be useful for understanding the progress of soybean cultivars developed for soybean sprout development and use." Address: 1. School of Applied Biosciences, Kyungpook National University, Daegu 41566, Korea.

2008. *Medical Magazine.* 2016. Traditional fermented food in Korea. Nov.
• ***Summary:*** "While kimchi is certainly known for its taste and quality around the world, many outside of Korea still lack knowledge of jang, or the traditional fermented pastes. This is unfortunate because jang forms the bedrock of traditional Korean cuisine. Doenjang, gochujang, ganjang, and cheonggukjang are used to make almost all delicious and nutritious Korean dishes." One paragraph plus a photo are devoted to each of the following:

Doenjang [Korean-style soybean paste]. "Doenjang is one of the most basic and essential ingredients in Korean cuisine, which is used to make jjigae (stew), dressings for namul (boiled leafy vegetables), and bibimbap (steamed rice mixed with vegetables)." "Jang... forms the fundamental basis of Korean cuisine, as it makes its way into a great number of Korean dishes loved around the world, including bulgogi and bibimbap."

Gochujang [Soybean + Red pepper paste].

Ganjang [Korean soy sauce]

Cheonggukjang [also spelled Chongkukjang; Korean-style natto paste] "Cheonggukjang is another type of fermented soybean paste. Unlike doenjang, however, cheonggukjang is fermented for only a couple of days. As such, it offers greater amounts of protein and other substances natural to soybeans. The diverse vitamins, calcium, potassium, and other minerals richly contained in cheonggukjang boost metabolism and prevent obesity.

"Lecithin, a chemical compound natural to cheonggukjang, has proven to help reduce the cholesterol level and purify the blood, thus preventing cardiovascular diseases, including arteriosclerosis and strokes. Cheonggukjang is also rich in vitamin K, known to prevent osteoporosis. Vitamins B2 and B6, as well as unsaturated fatty acids like linoleic acid, all found in abundance in this pungent bean paste are also great beauty agents, capable of significantly improving the skin's condition."

a historical marker commemorating the 250-year anniversary of the introduction of the soybean to North America by Samuel Bowen. A standing marker was place by the road on Skidaway Island near Savannah, near the spot where Samuel Bowen's first soybeans were first grown. Because Bowen's recently purchase property, Greenwich, was not yet ready for a crop, he asked his friend Henry Yonge to plant the first soybeans in the spring of 1765 at his Orangedale Plantation, located on Skidaway Island.

May 9. Pulmuone Foods Co., Ltd. (Fullerton, California) completes the acquisition of substantially all of the assets of Vitasoy USA Inc., which includes the Nasoya®, Azumaya® and San Sui® brands in North America. This acquisition solidifies Pulmuone's position as the world's leading tofu company while strengthening its operations in South Korea, USA, Japan and China.

Sept. 14–Bayer to buy Monsanto for $66 billion cash. Bayer had to sweeten its price several times during the long negotiations. But the deal still has to get regulatory approval in both Germany and the USA (*USA Today.* Sept. 14. *Organic and Non-GMO Report* (The) (Fairfield, Iowa). Oct. p. 8-9).

2016–The last *Soya & Oilseed Bluebook* is published by HighQuest Partners; it has been published once a year since 1947. They find they can make more money organizing and sponsoring conferences, so they lost interest in it.

2010. Choi, S.; Han, S.; Sung, M.; Chung, J.I. 2016. Breeding of black soybean line with *ti* and *le* allele. *Plant Breeding and Biotechnology* 4(2):170-75. *

• ***Summary:*** Doenjang is one of the Asian fermented soyfoods that have been studied using high-throughput sequencing analysis.

2012. **Product Name:** White Rose Miso.
**Manufacturer's Name:** Keepwell Vinegar.
**Manufacturer's Address:** Dover, Pennsylvania.
**Date of Introduction:** 2016.
**Ingredients:** Incl. koji, soybeans.
**How Stored:** Shelf stable.
**New Product–Documentation:** Letter from Sarah Conezio and Isaiah Billington. 2021. April 21. We began selling miso to chefs and restaurants in 2016, and only recently have made it available in retail format.

"2. We use rice koji to make our white miso, our rice wine vinegar, and our shio koji. For most of our misos, we use a koji of emmer farro grain. This is a grain that grows well in Pennsylvania and Maryland. Our gochujang is made with meju bricks that are composed of soy and rice.

"3. We made our initial batches of koji in 2015 using knowledge from The Book of Miso and instructions from Gem Cultures included with the spore they sell. Since then, we have rounded out our knowledge by watching a lot of videos on Youtube and we continue to pick up new information from the books that have come out in recent years, such as Koji Alchemy and the Noma Guide to Fermentation. We have never had the pleasure of receiving instruction directly from a primary source.

"4. Our misos are sold in 9 oz glass jars. We use organic emmer farro, organic wheat, organic soybeans, organic sweet potatoes, organic sunchokes. Some of the rice we use is organic and some is not. The benne seeds, runner peanuts, black walnuts, and malted barley that we use are not organic. In each case, the product is not available locally to us (or at all) as an organic crop. We don't bother to claim that the miso is organic, even when composed of only organic ingredients, because we don't know how to navigate the documentation and record-keeping that is (theoretically) required.

"5. We are indeed surviving financially as a small business. Demand for fermented foods is very high right now, and we've been fortunate to connect with many restaurants and retailers, in addition to selling our food directly through our website.

"Thank you again for considering us, it is an immense pleasure, and please let us know if we can send you any miso to try! We're sure you have a lot."

soybeans began in Korea, not in China. In 2001 Dr. Kwon Tai-wan, the founding director of the Korea Food Research Institute, formed the Committee for the establishment of a Korean Soybean Museum, which would inform visitors of the true history and use of soybeans.

The letter of intent to establish the museum states that "Koreans were the first to plant soybeans and to use them for food. Soybeans were used as food in Northeast Asia more than 2,000 years ago."

In 2014 the Soyworld Science Museum was established in the city of Yeongju, North Gyeongsang Province. "Soybean Storytelling" was vital to the exhibits and included in the museum catalogue.

Contents: 1. The Origin of Soybeans: When Did We Begin to Eat Soybeans? Where Did Soybeans Originate? The Image of Soybeans Over Time, The Story of Soybeans through Historical Figures.

2. The Culture of Soybeans and Sauce: The Origin of Soybean Food Products, Traditionally Processed Soybean Products, Korea's Culture of Sauces, Varieties of Soybean Foods,

3. The Growth and Ecology of Soybeans: Korean Soybean Varieties and Varietal Explanations, The Life Cycle of Soybeans, Variety Classification by Use, Farming and Cultivation Methods.

4. Processing & Utilization of Soybeans: Utilizing Soybeans, The Soybean's Great Transformation, Soybeans, Food for the Citizens of the World.

5. Nutrition and Functionality of Soybeans: Structure and Composition of Soybeans, Soybean Nutrition and Bioactive Substances, Functionality of Soybean Products, Efficacy of Soy Foods on Various Diseases.

6. The Future of Soybeans: Legumes and Nitrogen Fixation, Soybean Products Saving the Environment, Hope Seen in Afghanistan, Wild Soybeans vs. Genetically Modified (GM Soybeans, Production and Trade of Soybeans, The Future of Korean Soybeans.

Pages 16-17: "Charred remains of about 20 examples of rice grains and soybeans have been excavated from Neolithic lots in the village of Daecheon in Okcheon, North Chungcheong Province. Through radioactive carbon dating it has become clear that these date from the Late Neolithic, between about 3000-3500 BC, making them the oldest example of soybeans found on the Korean Peninsula." The Korean nation originated 5000 years ago.

Note: 2017 Sept. 24: Wm. Shurtleff asks Dr. Cheryl Ho Lee for the source of the information in the last paragraph above. Dr. Lee replies: "Concerning the Neolithic evidence of soybean cultivation in Korea, please see the book *Kong* (2005) page 46-48. There are two Neolithic remains metioned, (1) Okchoen Daejeonri, and (2) Jinju Sangchonri. The evidence for the carbonized beans found in Okchoen was not clear, but those in Jinju was more clear as shown in the photographs on page 48. From page 49 to 58, numerous Bronze Age soybean remains are described. This chapter (Chapter 2) was written by Dr. Cho Hyeon-jong of National Museum of Korea, as I mentioned earlier, and he must have the original paper bags on the excavations."

Page 18: "The opinion that soybeans originated on the Korean Peninsula and in Manchuria is founded on Japan's Dr. Fukuda's [1933] assertion that the division of wild soybeans led to many areas of origin.) The scholar most representative of the China origin theory is the United States' Dr. Hymowitz, and his assertions are based on the 11th century BC text *Yi Zhou Shu* (The Lost Book of Zhou). In this Zhou dynasty history, mention is made of a bean called yungsuk ('warrior plant,' or wild beans). In the 11th century BC China's northeastern region supported not just one tribe, but several Eastern Yi tribes. In the past the whole of Manchuria, China's northeast region and stage of the Korean people's activities, was known worldwide as the soybean's place of origin. However, Koreans now make their base on the Korean Peninsula and find that wild soybeans grow naturally there, and the cultivated genetic variation is so high that Korea is also considered one of the places of origin of the soybean."

Note: Dr. Hymowitz's assertions are based on the *Shijing* [The Book of Odes / The Classic of Poetry], not on the *Yi Zhou Shu* [The Lost Book of Zhou]. This key paper is: Hymowitz, T. 1970. "On the Domestication of the Soybean." *Economic Botany* 24(4):408-21. Oct/Dec. (131 refs). Unfortunately it is not even cited in this Korean *Soybean Storytelling* book.

Letter of 2 Aug. 2017 from Dr. Cheryl H. Lee:

"I would like to add following record to your soybean chronology, as stated in Soybean Storytelling page 19:

"623 BCE–Duke Huan of QI brought back the warrior beans (Yungsuk) from Sanyung when he defeated the Northeastern Yi tribes (The Lost Book of Zhou, 6th century BCE; Sima Qian's *Shiji*). Guanzi reads, "Duke Huan of the state of Qi pushed the warring nomads north and brought back winter onions and warrior beans (Yungsuk), which now cover the land."

"It implies that Yungsuk was a superior variety of cultivated soybean compared to the beans found in China at that time. We read Chinese letter Su as Suk in Korean.

"Several remains of soybean from the Late Neolithic Age (before 1500 BCE) and Early Bronze Age have been excavated in Korean peninsula (*Soybean Storytelling*, pages 24-26; Cho, H.-J. in Kong, 2005 (Korean))."

2019. dMakulbekova, Akbota; Iskakov, Ayup; Kulkarni, Krishnand P.; Dong, Jong Tae; Lee, Jeong-Dong. 2017. Current status and future prospects of soybean production in Kazakhstan (Open Access). *Plant Breeding and Biotechnology* 5(2):55-66. June 1. [56 ref]

• ***Summary:*** Abstract: "Demand for soybean as an oil crop and animal feed is steadily growing in Kazakhstan and

© Copyright Soyinfo Center 2021

hence soybeans can be a great attribute for food security in this region. Currently, over 90% of all soybean production is concentrated in one region (Almaty [in the southeast]) because the crop is highly sensitive to photoperiod and temperature."

"In Kazakhstan, farmers began to cultivate soybeans in the 1930s; however, because of the lack of varieties and proper cultivation practices, further cultivation was abandoned. In the mid-1960s, several soybean cultivars from other countries were introduced. Statistical data on soybean production registered since 1992 by FAO revealed a gross production of 11,800 [metric] tons (Shurtleff and Aoyagi 2008).

"The soybean cultivation area has been growing steadily in Kazakhstan in the recent years. In the 2000s, soybeans occupied 3,500 ha, in 2013 approximately 103,000 ha, and in 2014 around 116,000 ha of fields in Kazakhstan. Soybean production grew from 3,900 t [metric tons] in 2000 to 217,900 t in 2014 (Fig. 2). Its yield per hectare was 1.3 t/ha in 2000, which increased to 2.06 t/ha in 2014 (FAO 2014)."

Fig. 2 shows Soybean cultivation area and production in Kazakhstan from 2000 to 2014 (FAO).

"None of the soy food, such as tofu, natto, soymilk, or sprouts is widely used in Kazakhstan. Historically, domesticated animals have been the major source of food, clothing, and transportation for households in Kazakhstan. For Kazakh people, meat and milk are the first sources of protein in their diets. The superior animal domestication in Kazakhstan can be explained by the country's climatic properties. Animal proteins are necessary for areas with freezing temperatures, because they aid in warming the human body. Soybean is an alternative forage crop that can be utilized as animal feed and several soybean genotypes have been reported to potential to produce quality forage."

"Additionally, there are large soybean processing factories with a production of 150,000 tons per year. The factories produce soybean milk, tofu, soybean flour, soybean yogurt, and compound feeds. However, these production units still under-produce because of the shortage of soybeans to process (Dautkanov 2015)."

Table 2 shows "Twenty soybean varieties released by Kazakh Research Institute of Agriculture and Crop production, Almaty, Kazakhstan" (Didorenko and Kudaibergenov 2014b). Address: 1, 3-5: School of Applied Biosciences, Kyungpook National Univ., Daegu 41566, Korea; 2. North Kazakhstan Research Inst. of Livestock and Crop Production, Petropavlovsk 150700, Kazakhstan.

2020. Britannica.com. 2017. The Anglo-Japanese Alliance. Retrieved 16 Aug. 2017. [10 ref]
• ***Summary:*** "Anglo-Japanese Alliance, (1902-23), was an alliance that bound Britain and Japan to assist one another in safeguarding their respective interests in China and Korea. Directed against Russian expansionism in the Far East, it was a cornerstone of British and Japanese policy in Asia until after World War I.

"The alliance served Japan in the Russo-Japanese War (1904-05) by discouraging France, Russia's European ally, from entering the war on the Russian side. It was renewed in 1905 and again in 1911 after Japan's annexation of Korea. On the basis of its tie with Britain, Japan participated in World War I on the side of the Allies.

"After the war the British no longer feared Russian encroachment in China and wished to maintain close ties with the United States, which tended to view Japan as its rival in the Pacific. Following an unsuccessful attempt to bring the U.S. into the alliance at the Washington Conference of 1921-22, Britain allowed it to lapse. It was specifically terminated by the Four-Power Pacific Treaty (1921), a vaguely worded agreement that left the Japanese without allies until the conclusion of their Tripartite Pact with Germany and Italy in September 1940."

Note: This alliance also paved the way for the soybean's ascendance in the European market–starting with England.

2024. Woo, Koan Sik; Kim, M.J.; Sim, E-Y; et al. 2017. [Quality characteristics of commercially available soybean and mung-bean flours in Korea]. *Korean J. of Food and Nutrition* 30(5):1119-26. Oct. [23 ref. Kor; eng]
• ***Summary:*** "Quality characteristics of commercially available soybean and mung-bean flours in Korea were evaluated relative to product information such as bean content, price, chromaticity, proximate composition, water binding capacity, swelling power and solubility. Origin of raw materials was 23 in domestic products and 19 in imported products. The price of the product was 3.48 times more for raw soybean flour, 3.34 times more for fried soybean flour, and 3.47 times more for mung bean flour compared to imported soybean. In the domestic products, the lightness of raw soybean flour was higher than roasted soybean flour. The redness and yellowness of roasted soybean flour were higher than raw soybean flour. Moisture content of raw soybean flour was higher than roasted soybean flour, and crude fat, crude protein and carbohydrate content were higher in imported soybean flour. Ash and crude protein contents of mung bean were slightly higher than imported products. Water binding capacity of roasted soybean flour in domestic products was higher than raw soy flour, and there was no significant difference in solubility and swelling power. Correlation between quality characteristics of commercially available soybean and mung-bean flours products was found to be highly significant among measured items, except for solubility." Address: Dep. of Central Area Crop Science, National Inst. of Crop Science, Rural Development Administration, Suwon 16613, Korea.

Oct. [24 ref. Kor; eng]
• ***Summary:*** "Representative brands of the three types of soybean-based short-term-fermented foods were chosen and evaluated. Chungkukjang showed the highest amino and ammonia type nitrogen contents, although Natto exhibited lower levels, and Shuidouchi showed the lowest pH and high acidity... These results might be due to differences in duration of fermentation, processing method, and quality of raw materials, but further research on the basis of ethnic culture and administration method of each nation should follow." Address: 1. Chongqing Collaborative Innovation Center of Functional Food, Chongqing Univ. of Education, Korea.

2026. Lee, Jun Ho; Jung, Han San. 2017. Physicochemical and consumer acceptance of tofu supplemented with licorice powder. *Preventive Nutrition and Food Science* 22(4):359-64. Dec. [60 ref]*
• ***Summary:*** Licorice has been used in traditional herbal medicine for at least 4,000 years (12) due to its emollient, anti-inflammatory, antiviral, anti-allergic, antioxidant, and anti-cancerous properties (13). Adding more than 4% of licorice powder (LP) to tofu had an adverse effect on general consumer acceptance.

"On the basis of the overall observations, tofu samples supplemented with 0.2% (w/w) LP were found to benefit from the functional properties of LP, without compromising consumer acceptance." Address: 1. Dep. of Food Engineering, Daegu Univ., Gyeongbuk 38453, Korea.

2027. Lee, Cherl Ho. 2017. History and characteristics of Korean fermented foods (PowerPoint presentation). Korea. 36 slides. [Eng]
• ***Summary:*** Slides: (2) Map of Northeast Asia, with Korean Strait highlighted. (3) Prehistoric culture in Northeast Asia (Korea, China, Manchuria, Siberia). (4) Colored map showing "Bones excavated from the paleolithic remains in Korean peninsula." All are animal bones; no human bones are included. (5-7) Foodstuffs of the Paleolithic men in Korean peninsula and Northeast Asia. The foods are divided into Early Paleolithic, Middle Paleolithic and Late Paleolithic, and into animals and plants. Wild beans are first consumed in the Late Paleolithic. See also Lee 1998. (8) Prehistoric culture in Northeast. Homo sapiens sapiens, Primitive pottery. Appearance of tribal states. (9) Chronology of prehistoric era of Korean Peninsula and Northeast Asia. (10) Techno-historical consideration of primitive earthenware. (11) Average temperature and sea level of the globe during the alluvial epoch (Barnes 1993). (12) Geography of Northeast Asia in 16,000 B.P. (Barnes 1993). (13) The depth of sea around Korean peninsula. (14) Paleolithic remains found in Northeast Asia (Lee 2001). (15) Primitive pottery age remains excavated in Korea Strait Region. (16) 8,000 to 3,000 B.C. Primitive pottery age. Fermentation technology began during this period. (17-18) Table 1-1. The estimated ages of primitive pottery remains of the Paleolithic era in Korean Peninsula and Northeast Asia (Lee 1999). (19) Beautiful color photo of early Korea pottery, showing different shapes, sizes, colors, and wall thicknesses.

(20-21) Table 2-3. Chronology and manufacturing characteristics of potteries excavated from *Sangnodaedo* remains (Lee 1999). (22) Direction of technological progress of primitive pottery in Korea Strait Region. Harder, lower water absorbency, durable in fire, bigger. A color photo shows an early pottery bowl. (23) Classification according to usage: Cooking vessel. Fermentation crock (middle

## Origin of Fermented Soybean Foods

- Primitive Pottery and Fermentation Technology in Korea Strait Region (6000 BC)
- Arrival of Northern Nomads and the Need for Protein Source
- Invention of Soybean Use for Food by Boiling Technology (ca. 2000 BC)
- Invention of Soybean Fermentation by Adopting Cereal Alcoholic Fermentation Technology
- Fermented Soybean Paste and Soybean Sauce Making (Before 200 BC.)
- Marinating Meat with Soysauce – Bulgogi(Roasted Beef of Korea)

## Social developments during Primitive Pottery Age

- Improvement of food storage technology
  - Fermentation
- Improvement of nutrition and food hygiene
  - *Chigae* culture
- Population increase
- Formation of tribal states (BC. 3-4000)
- Megalithic culture, Eastern tribe (*Dong Yi*)

size jar, 4-17 liter). Storage jar (large size jar; 17-56 liter), high absorbency, round/flat bottom. (24) Dietary culture of littoral (related to the shore of the sea or a lake) foragers. Cooking vessel & Chigae culture. Storage jar & fermentation technology. (25) Origin of fermentation technology. Nuruk (alcoholic fermentation starter). Kimchi fermentation. Jeotkal fermentation. (26) Beginning of Nuruk making and alcoholic fermentation of cereals. (27) Kimchi fermentation. (28) Joetkal fermentation.

(29) Origin of soybean fermented foods: Primitive Pottery and Fermentation Technology in Korea Strait Region (6000 BC). Arrival of Northern Nomads and the Need for Protein Source. 2030. Lee, Cherl-Ho. 2018. Re: Financing of the Soyworld Science Museum, in Yeongju, Korea. Letter (e-mail) to William Shurtleff at Soyinfo Center, Jan. 15. 1 p. [Eng]
• ***Summary:*** "Dear Mr. Shurtleff,

"The construction cost, building and exhibition except for land and personnel, was 5 billion won (ca. 5 million USD.). The museum was built by Yeongju City. The Yeongju Agricultural Extension Center is managing the museum. The entrance fee has been planned, but for the time being no fee is collected. The number of visitors is 200-300 during weekend, and 50 during weekdays; children 50%, middle and high school students 20%, adults 30%, and a very few foreigners 1-2%. Yes, ASA is still operating in Seoul.

"With my best regards. Cherl-Ho Lee, Seoul, Korea." Address: Emeritus Prof., Korea Univ., Seoul, South Korea.

2031. Rizzo, Gianluca; Baroni, Luciana. 2018. Soy, soy foods and their role in vegetarian diets. *Nutrients* 10(1):43. Jan. [590 ref]
• ***Summary:*** This is a review of the literature based on a non-systematic search of the Medline database. The authors seem to lack in-depth knowledge of their subject.

Contents: Abstract. Introduction. Soy consumption. Soy nutrients and bioactive compounds: Protein content and protein quality, isoflavones, lipids and phytosterols, other bioactive compounds. Health effects: Possible beneficial effects (cardiovascular and metabolic protection, anticancer properties, menopause and osteoporosis, other beneficial effects), possible detrimental effects (thyroid gland disturbance, sex hormones perturbation, procancer activity). Soy foods [traditional East Asian]. New generation foods. Food safety (early stage of infant nutrition, soy allergy). Conclusions. Abbreviations. References.

Tables (references are given for the information in each table): (1) Vegetable protein sources from legumes. Gives the nutritional composition of many edible legumes including soybeans.

(2) Soy consumption per day of soy and soy foods, soy protein, and isoflavones in USA, Europe, Vegetarians and soy users, China, Japan, and Korea. Very vague and incomplete.

(3) Isoflavone content in soybean from different cultivation countries. It is highest in the USA (159.98) and Australia (120.84). Based on USDA database (ref. 64).

Analytical protein quality methods [from oldest to newest]. Net Protein Utilization (NPU), PER, Nitrogen Balance, Biological Value (BV), True Digestibility, Amino Acid Score, Protein Digestibility corrected for amino acid score (PDCAAS; since 1991), Digestible Indispensable Amino Acid Score (DIAAS).

(5) Protein quality of 5 foods evaluated by different methods. The foods are soy, wheat, beef, eggs, and milk (from cows).

(6) Isoflavone content in soy foods (mg per 100 g)–miso 41.45, edamame 17.92, natto 82.29, soy cheese 6.02 to 25.72, soy flour, textured 172.55, soy flour, defatted 150.64. soy lecithin 15.7, soy protein concentrate (by aqueous wash) 94.65, soy protein concentrate (by alcohol extraction) 11.49, soy protein isolate 91.05, shoyu (soy sauce) 1.18, soy beans, roasted 148.5, soy beans, raw 154.53, yuba / foo jook 44.67, soy milk (many types) 0.7 to 10.73, sufu [fermented tofu]

© Copyright Soyinfo Center 2021

13.75, tempeh 3.82, tofu 13.1 to 34.78, okara 9.39, fuyu (fermented tofu) 45.51, soybean oil 0.

Soy foods description: The foods are tofu, soy milk, tempeh, natto, sufu, edamame, miso, yuba, soy sauce, textured vegetable protein.

"Soy is a basic food ingredient of traditional Asian cuisine used for thousands of years. In Western countries, soybeans have been introduced about a hundred years ago and recently they are mainly used for surrogate foods production. Soy and soy foods are common nutritional solutions for vegetarians, due to their high protein content and versatility in the production of meat analogues and milk substitutes. However, there are some doubts about the potential effects on health, such as the effectiveness on cardiovascular risk reduction or, conversely, on the possible disruption of thyroid function and sexual hormones. The soy components that have stimulated the most research interest are isoflavones, which are polyphenols with estrogenic properties highly contained in soybeans. In this review, we discuss the characteristics of soy and soy foods, focusing on their nutrient content, including phytoestrogens and other bioactive substances that are noteworthy for vegetarians, the largest soy consumers in the Western countries. The safety of use will also be discussed, given the growing trend in adoption of vegetarian styles and the new soy-based foods availability."

"Soy foods: There are several soy foods, traditional Asian foods (fermented or not) and new generation products, such as soy milk, edamame, tofu, soy cheese, miso, soy sauce (tamari, shoyu), tempeh, natto, sufu, yuba, soy flour, soy protein isolates (SPI) and meat analogues also called Textured Vegetable Protein (TVP). Table 7 shows a description of selected soy foods." Address: 1. Via Venezuela 66, 98121 Messina, Italy.

2032. *Malnutrition Matters Newsletter* (*Ottawa, Canada*). 2018. North Korea / First Steps program grows. June. p. 1.
• ***Summary:*** On May 17th the Air Koryo flight from Beijing to Pyongyang had some very special people and cargo aboard. The Canadian-based charity "First Steps" had a team of 5 travelling to N. Korea to further their long-term program of soymilk and nutritional fortification for schools, daycares and orphanages. The flight's cargo included three more SoyCows, bringing their total number of systems (including VitaGoats) to 98. The team visited five cities and also brought two of the SoyCows with them to two new locations. More than 100,000 children currently receive a daily fresh serving of soymilk under this program, which is now in its 15th year.

"Many of the soymilk operations are in centralized facilities with several systems operating and delivering the milk daily to their region, often by bicycle. Protein malnutrition is chronic among many children in DPRK and the daily soymilk serving provides the critical amount of protein needed. First Steps also provides good quality soybeans for all the operations. More systems are planned to be provided for this successful program later this year. www.firststepscanada.org"

Color photos show: (1) Many kids seated around a long table at Samjion Potae Daycare. (2) Two people in a room with twiny SoyCow systems at Nampo Hangdu daycare and kindergarten supply center.

2033. Cox, John H. 2018. Re: Planning to write an article about SANA's 40th birthday on July 30. Letter (e-mail) to William Shurtleff at Soyinfo Center, July 27. 1 p.
• ***Summary:*** "Hi Bill,

"Thanks for your message. I'm writing an article about SANA's 40th for the SANA newsletter. I plan to make it about what the organization has accomplished along with an appeal for it to continue. I'd like to include some of the history, certainly a photo would be nice. This will be in the SANA newsletter, mostly for members, but hopefully shared. I would love a quote from you about how the industry has changed–the good changes. What was it like at that first meeting?

"SANA will do everything we can to protect the use of 'soymilk' to describe soymilk. The FDA seems to know that if they interfere with soymilk being labeled as soymilk then they will be sued. I'm not sure the members are ready for this, but I will lead them if this happens. I'm not sure I have the complete history about 'the outcome of this issue last time around.' Certainly, the 1997 SANA petition to FDA was a smart move.

"SANA has 20 members, only 12 are making soyfoods. There are only two big ingredient companies–DuPont and ADM. We also have DanoneWave and two tofu companies (House Foods America and Nasoya/Pulmuone.) We continue to lose members and I'm not sure how to turn it around. It is an exciting time for plant-based foods, but soy's brand still needs help, as you know.

"Thanks for any historical information you can share with us. Good luck with your big project–I would love to know more about it.

"Best wishes, John." Address: Executive Director, Soyfoods Assoc. of North America, 1101 17th Street, NW, Suite 700, Washington, DC 20036. Phone: 202-331-2451.

2034. Chukeatirote, E.; Phongtang, W.; Kim, J.; Jo, A.; Jung, L.S.; Ahn, J. 2018. Significance of bacteriophages in fermented soybeans: A review. *Biomolecular Concepts* 9(1):131-42. Nov. 23.
• ***Summary:*** "Bacteriophages are ubiquitous and have been reported to have been found in many food products. Their presence is important as they have the ability to interact with their bacterial host in food matrices. Fermented soybean products, one of the most widely consumed ethnic foods among Asian people, are prepared naturally and include

• ***Summary:*** "This study examined the quality characteristics of whole soybean meju doenjang prepared for addition times and with different contents of starter (*Bacillus amyloliquefaciens*) for 8 weeks. To accomplish this, the quality characteristics, such as pH, moisture contents, total microbial flora counts, amino-type nitrogen content, total polyphenol content, and antioxidant activity, were determined. The pH decreased from 6.36 to 6.55 to 4.95 to 5.44 and the total acidity generally increased from 0.23 to 0.31% to 0.89 to 1.11% in doenjang fermentation. The moisture content of the control (no starter) was 59.90 to 60.58% and there were no significant differences in the aging period." Address: 1. Nov. doi: 10.1007/s13197-018-3408-3 [71 ref]

• ***Summary:*** The focus of this research was to make cheese using a mixture of soymilk and animal milks, or a mixture of dairy cheeses and tofu. The price of soymilk is less than that of cow or buffalo milk. Soymilk can add health benefits. Address: 1. Dep. of Food Science and Biotechnology of Animal Resources, Konkuk Univ., Seoul, Korea.

2037. Ibrahim, Seifeldin Elrayah. 2018. Soybean research [in Sudan]: current status, achievements, challenges and future prospects. Paper presented on "The Symposium to Mark the 100th anniversary of the Gezira Research Station, Wad Medani, Sudan." 33 p. Held 25-26 December, 2018. [12 ref]

• ***Summary:*** Two versions of this paper exist. #1 is a PowerPoint presentation (33 p.). #2 is a Microsoft Word document (8 p.). The titles are slightly different, but the content is very different. We will cite and quote from the #1 first; its pages are unnumbered. Then we will quote from #2.

Outline: Introduction: Economic importance of soybean, soybean utilizations and products, why soybean in Sudan? History and current status. Achievements. Challenges. Future prospects.

"History and current status of soybean:

"In 1910: soybean was first introduced to Sudan by the colonial Garden

"In 1930: soybean research was started in Sudan

"In 1975: intensive research was began to develop improved varieties in collaboration with International Soybean (INTSOY) varietal testing program, USA

"During 1977-1984: International Soybean Variety Evaluation Experiment (ISVEX) trials were conducted at:

"Gezira Research Station

"Abu Naama Research Station

"Kadugli Research Station

"Since 2007, diverse soybean germplasm were introduced from:

"IITA, Nigeria

"USDA Soybean Germplasm Collection, USA

"Rural Development Administration (RDA), Korea

"World Vegetable Center (AVRDC), Taiwan

"Egypt, Brazil, Argentina, and Croatia"

Paper #2: "Soybean research in Sudan is conducted mainly by national soybean research program at Agricultural Research Corporation (ARC). Since 2012, four soybean varieties were released by ARC in Sudan. Soybean cultivation area and production has increased dramatically in Sudan, from about 800 ha in 2013 to and 3,000 ha in 2017, and from 1,200 t [metric tons] in 2013 to 5,000 t in 2017, respectively.

"Soybean was first introduced to Sudan in 1910 by the Colonial Garden (Shurtleff and Aoyagi 2009; Ibrahim 2012a). Further introductions in the country were made in 1912, and in 1949, soybean was planted in southwest Sudan to prevent severe malnutrition among infants, children, and pregnant and lactating women (Ibrahim 2012a; Khojely et al. 2018). Further soybean introductions were continued (Ibrahim et al. 2017) with special efforts to encourage soybean cultivation in Sudan. From 1973 to 1985, hundreds of soybean accessions, especially southern USA and Brazilian varieties, were introduced to the country through the International Soybean Variety Experiments (ISVEX) initiated by the INTSOY soybean varietal testing program at the University of Illinois, IL, USA. Field studies indicated that the introduced tropical soybeans were highly adapted to Sudan's agro-environmental conditions, whereas the temperate germplasm flowered too early under short-day conditions in Sudan, resulting in poor vegetative growth, short plant height, and low yield (Ibrahim 2012a)."

Note: Dr. Ibrahim writes that this is not a peer-reviewed paper. Address: PhD, soybean breeder, Oilseed Crops Research Center, Agricultural Research Corporation (ARC), Wad Medani, Sudan. Phone: +249-912155997.

7. Biological Functions and Traditional Therapeutic Uses of Kochujang (Red Pepper Paste) (Dae Young Kwon and Soon Hee Kim)...

From the publisher: "Koreans believe the adage of food as medicine."

2040. Kim, Sohui; Wharton, Rachel. 2018. Korean home cooking: Classic and modern recipes. New York, NY: Harry N. Abrams. 303 p. Illust. (photos by Zack & Buj). Index. 29 cm.

• ***Summary:*** See next page. This is a beautiful, elegant book. The first author is a woman. There is more emphasis on recipes than ingredients. Every recipe has a full-page facing color photo. Many of the recipes are seasoned with Korean soy sauce (*ganjang*) so we will mention just the first one.

Contents: The Korean kitchen–with photos and explanations of basic ingredients. Names of recipes and most ingredients are given in Romanized Korean followed by English. Soy-related ingredients include: Doenjang (fermented soybean paste). Gochujang. Dried soybeans are soaked and simmered, then mashed into a paste and formed into bricks named *meju* [Korean-style soybean koji]. These are hung up to dry and ferment. The dried meju is then soaked in salt water for months in a stone crock to break down even further. The result is a mixture of doenjang and ganjang (Korean soy sauce). The longer the mixture is aged, the darker its color. Miso makes a fairly good substitute for doenjang.

Gochujang, fermented red chili paste, is made from red chile flakes (*gocharu*), sugar, glutinous rice, doenjang, and salt, traditionally fermented together for years in earthenware pots. Roasted soybean powder (Korean name not given). Tofu (firm and silken). Dried soybeans. Black soybeans (*seoritae*). Soy sauce and white soy sauce.

Banchan: vegetables and sides. The word 'banchan' means "small dishes;" every Korean meal begins with banchan. Jang Jorim: soy-braised beef. Ganja Jorim: potato stewed in soy sauce. Dubu Jorim: soy-braised tofu. Dan Hobak Jorim: sweet soy-glazed kabocha. Kongjang: Soy-braised black soybeans. Kong Namul: soybean sprout salad. Gaji Namus: charred eggplant with white soy and chiles.

Korean Barbecue. Dweji Kalbi: gochujang-glazed baby back ribs. Kong-Garu: soybean powder (roasted). Ssam Jang: seasoned doenjang sauce.

Haesanmul & Gogi: seafood & meat. Bulgogi: grilled sirloin.

Guk, Jjigae, Jjim & Tang: soups and stews. Soondubu: silken tofu stewed with seafood. Kimchi Jjigae: kimchi stew with tofu & gochujang. Doenjang Jjigae: soybean paste stew.

Myeon, Bap & Mandu: noodles, rice & dumplings. Jjang Myeon: black bean noodles (with black bean paste). Juk: congee (with 1 teaspoon soy sauce). Hu-Shik: desserts. Ripe Summer Tomatoes with tofu cream. Samsaek Kyung-Dan: sweet rice dumplings in three colors (one is coated with roasted soy powder (*kong-garu*)*;* [kinako]).

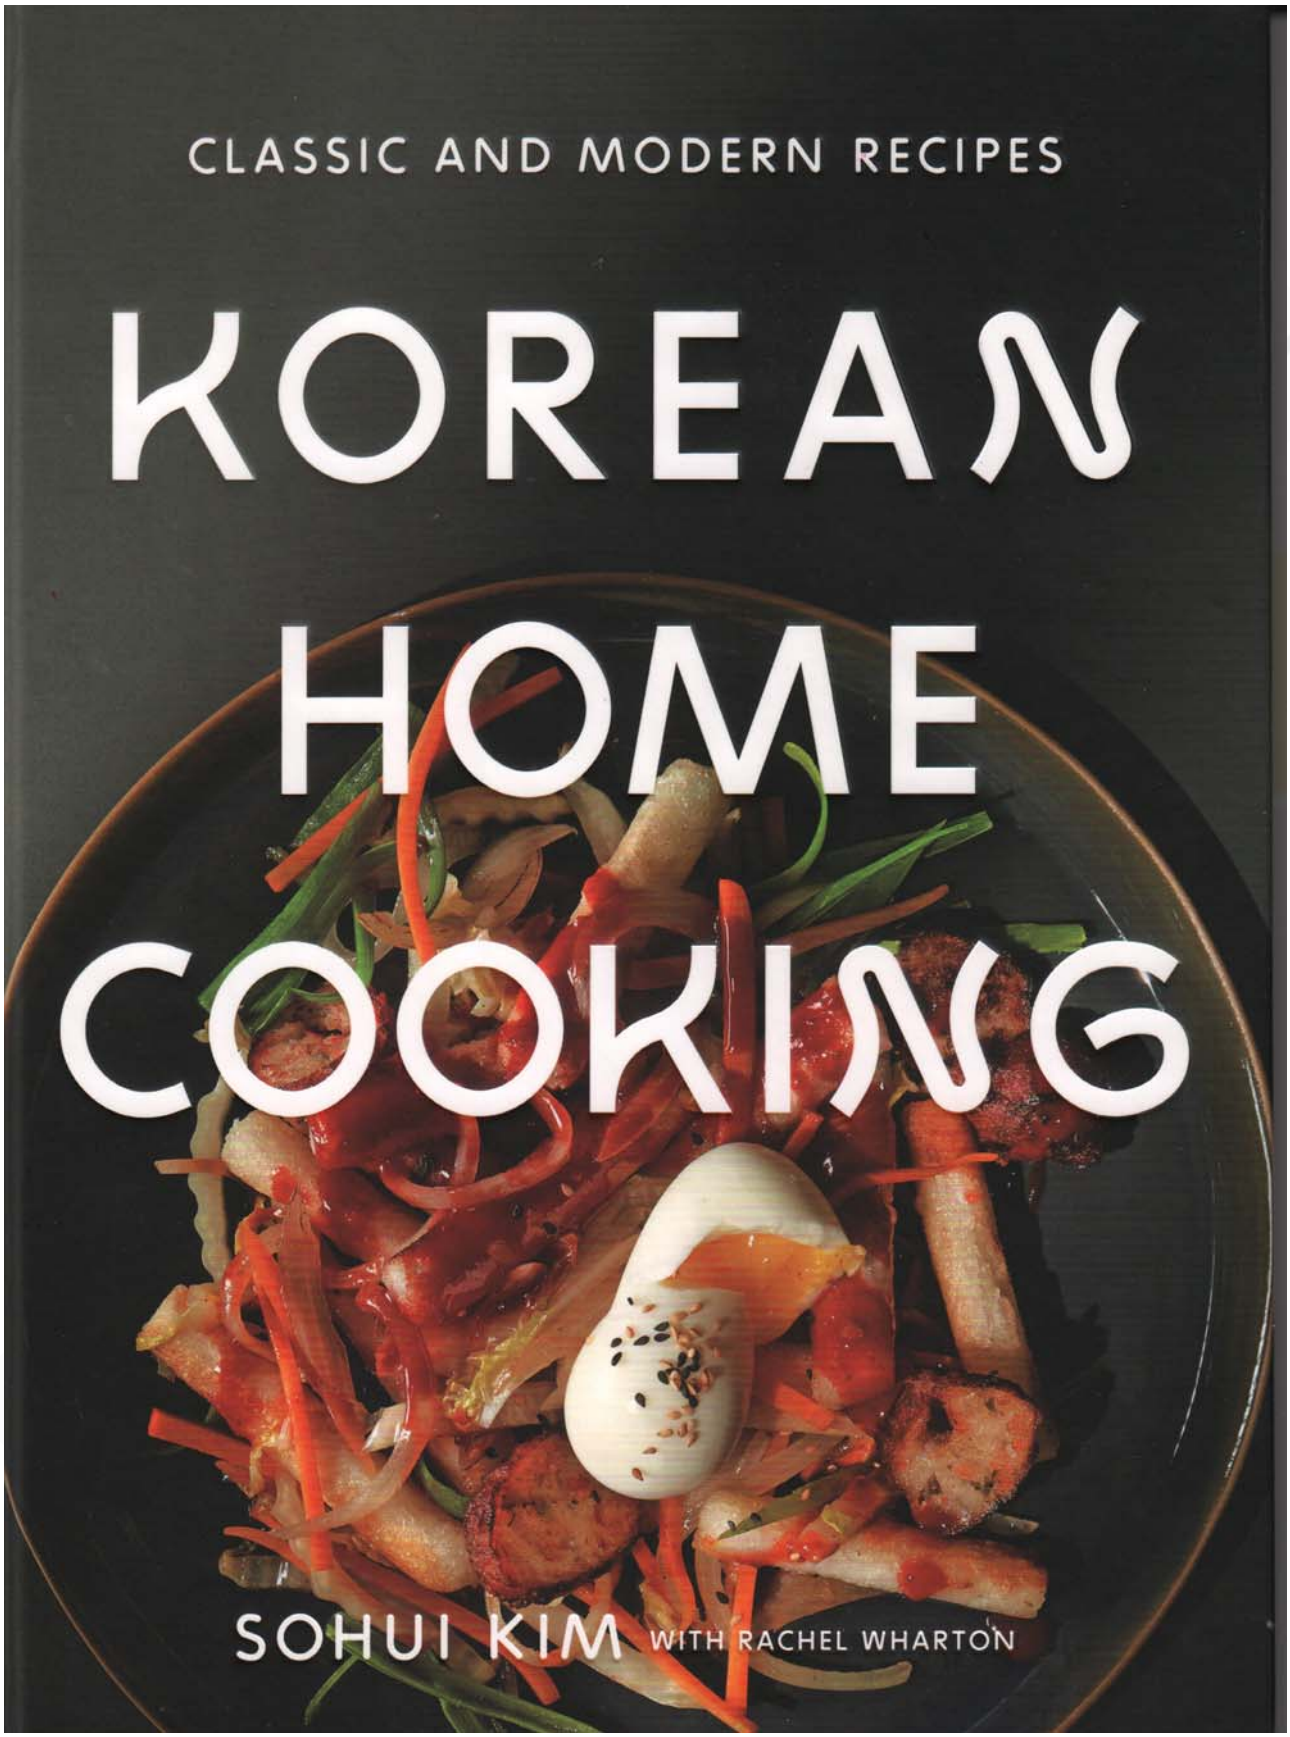
Note 1: "Sohui Kim is the chef and co-owner of Insa and the Good Fork in Brooklyn, She is the author of *The Good Fork Cookbook.*

"Rachel Wharton is a James Beard Award-winning journalist" and the co-author of three books. She lives in New York City.

Note 2. This book does not even mention the influence of the Japanese occupation of Korea–from 1910 to 1945–on Korea. Yet in this book we find mention of udon, sushi, kinako, adzuki / azuki beans, etc.–all Japanese foods. Address: Cook and author, Brooklyn, New York.

2041. **Product Name:** White Rose Gochujang, Benne Miso.
**Manufacturer's Name:** Keepwell Vinegar.
**Manufacturer's Address:** Dover, Pennsylvania.
**Date of Introduction:** 2019 January.
**Ingredients:** Incl. koji.
**Wt/Vol., Packaging, Price:** 9 oz. glass jars.
**How Stored:** Shelf stable.
**New Product–Documentation:** Letter from Sarah Conezio and Isaiah Billington. 2021. April 21. We began selling miso to chefs and restaurants in 2016, and only recently have made it available in retail format.

"Gochujang, Benne Miso–January 2019



"Farro Miso–February 2019."

2042. Kim, Dakota. 2019. You know gochujang. But do you know doenjang? https://www.myrecipes.com/world-cuisine/korean-recipes/what-is-doenjang 1 p.

• ***Summary:*** "It seems like everywhere you go these days, gochujang, the Korean fermented red chili paste, is on the menu. Gochujang aioli for your pommes frites. Gochujang-marinated steak in your lunch rice bowl. But what about doenjang? This lesser-known, equally popular cousin to gochujang is less known in the U.S., but packs its own uniquely pungent flavor and an even longer history.

"The history of doenjang dates back more than 2000 years, to the Three Kingdoms Period of Korea, from circa 57 BC to 668 AD, when fermented soybean products, including soy sauce and doenjang, defined Korean cuisine.

© Copyright Soyinfo Center 2021

© Copyright Soyinfo Center 2021

(Gochujang, meanwhile, doesn't find its first mention in Korean texts until 1433). In 1613, the Korean traditional medicine book, the *Dongui Bogam*, described doenjang's medicinal properties. By the time of the Joseon Dynasty (1392-1910), the royal court chefs were serving sophisticated varieties of tojangguk, a doenjang stew.

"To make traditional doenjang, humble soybeans go through a wondrous metamorphosis: they are soaked, boiled in salt water, pounded, ground, packaged into blocks that are dried and hung to ferment, washed and dried, soaked in brine in earthenware pots, and finally, mashed to become doenjang. (The remaining liquid becomes ganjang, or Korean soy sauce.) As you can imagine, most Korean food production companies no longer want to wait for natural fermentation, which can take around a year, so a speedier concoction of salt and a soybean, wheat, rice or barley starter is often used to flavor factory-made doenjang.

"While gochujang's primary flavor profile is dominated by red chile peppers, doenjang pushes fermented soybeans to center stage. Both pastes are thick and hearty, especially when gochujang also contains soybean paste, but doenjang is more forgiving. Diners can plop a big dollop of doenjang on ssam (lettuce wraps) without the spiciness from chile, and cooks can stir in doenjang to add a rich, earthy aroma to stews. Think of doenjang as the more introverted cousin at the party who you can handle larger doses of than limelight-loving gochujang."

2043. Park, Young Kyoung; Lee, Jae Hoan; Mah, Jae-Hyung. 2019. Occurrence and reduction of biogenic amines in traditional Asian fermented soybean foods: A review. *Food Chemistry* 278:1-9. April 25. [73 ref]
• ***Summary:*** An excellent, thorough review. Most fermented soybean foods studied contained potentially hazardous biogenic amine content, when compared with recommended limits. Yet regulation of biogenic amines in fermented soybean foods is presently insufficient. Thus, control of biogenic amines is necessary to produce safe fermented soybean foods.

Contents: Introduction. Regulation of biogenic amines: Korea ("Major fermented soybean products in Korea include Cheonggukjang, Doenjang, Gochujang and Korean soy sauce"), China ("The main fermented soybean products consumed in China include Chunjang, Doubanjiang, Douchi, Sufu, and Chinese soy sauce." Plus sweet soy sauce, known as Tianmianjiang in China and Chujang in Korea), Japan, Indonesia. Biogenic amine production by microorganisms isolated from fermented soybean products ("BA are mainly produced by microbial decarboxylation of free amino acids"). Reduction of biogenic amines in fermented soybean products ("Current research focuses on the development of starter cultures to reduce BA in fermented soybean foods"). Conclusion ("Improvements in the food manufacturing process are necessary to reduce BA content in fermented soybean foods. To implement appropriate BA control regulations, it is necessary to continuously monitor BA concentrations and establish BA content limits for fermented soybean products. Further research on practical measures to reduce BA content is necessary to ensure the safety of fermented soybean foods"). Acknowledgements. Declarations of interest. Tables: (1) Biogenic amine content of Korean fermented soybean products. (2) Biogenic amine content of Chinese fermented soybean products. (3) Biogenic amine content of Japanese fermented soybean products (miso, natto, soy sauce, tamari soy sauce). (4) Biogenic amine content of Indonesian fermented soybean products (tempeh). (5) Biogenic amine production by bacteria isolated from fermented soybean food products.

2046. Jansson, Hart. 2019. Re: Questions and answers about the history of Malnutrition Matters. Letter to William Shurtleff at Soyfoods Center, July 9–in reply to questions. 1 p.

• ***Summary:*** 1. When was Malnutrition Matters founded? Ans: "April 2000."

2. What was its initial address? Ans. "657 Eagle Street. Rockland, ON, Canada."

3. What was the first soy-related equipment you shipped? Ans: "First equipment shipped was an electric VitaCow to Romania."

4. How many units did you send to whom? Ans: "1 unit. Buyer Fito-Fitt."

5. Who paid for it? Ans: "Above."

6. When was your first order paid for by the World Bank? Ans: "We have had one project with the World Bank, in Orissa, India, 2007 to 2009. $150,000 to provide 18 VitaGoats, primarily for school feeding in NGO-run schools."

7. What equipment was it, how many units, and sent where?

Ans: "Most equipment in Orissa, 6 or 7 units in other parts of India."

8. How and when did Child Haven get involved in MM? Ans: "Child Haven was involved in the first pre-Malnutrition Matters project in 1989-1992, where the SoyCow concept was perfected. 15 units (fabricated in Canada) in total went to India, funded by the Canadian International Development Agency (CIDA)."

9. What were some of the first projects they sponsored? Ans: "Child Haven did not sponsor any projects per se; in 2005 and onward, they became customers of Malnutrition Matters–they have since bought 6 SoyCows from MM, for use at their children's homes in India, Bangladesh and Nepal."

10. How and when did Alpro get involved in MM? Ans: "2003. Due to a personal relationship between Frank Daller and Philippe Vandemoortele."

11. What were some of the first projects they sponsored? Ans: "There were no particular projects sponsored as it was

© Copyright Soyinfo Center 2021

generally for MM development and overall VitaGoat and SoyaKit system implementation etc. Formal sponsorship started in 2004."

12. 1. When did MM move to its present address? What is it? Ans: "Moved about 15 years ago to 498 Rivershore Crescent, Ottawa, Ontario K1J 7Y7 Canada."

13. How many people work there now, essentially 5 days a week? Ans: "2 headquarters staff."

14. When did you, Hart start working there from day to day? Ans: Started in 2002, day to day from 2006.

15. I know you want to keep your overhead as low as possible when you install a new unit. Which "animals" need a person from MM to install them? All? None? Some, but only on request. Ans: "SoyCow and VitaGoat need onsite installation services; SoyaKit training also needs onsite training, but local trainers can be trained remotely with the help of the Trainers Guide."

16. Do you have MM people pre-positioned in the field to keep air fares and travel time as low as possible. How many people? Where pre-positioned? How does this complex system work and who pays for these extra installation costs?

"Ans: We have contract staff in the field in Kenya, Ghana, South Africa, India, Thailand; as MM is a social business, clients or donors pay for the installation services.

17. Where is each of your soy "animals" now fabricated? Ans: "SoyCow and VitaGoat: Thailand and India; SoyaKit and SolarFlex/3HP dryers: China.

18. Please send me a few color graphics closely related to MM, such as a photo of the place where you work, etc. Ans: "We work in non-descript offices–would prefer that photos from the field are used: pictures attached: (1) Frank at a VitaGoat installation in North Korea in 2009 with Susan Ritchie (ED of First Steps Canada, which has commissioned the installation of over 100 SoyCows and VitaGoats in North Korea). (2) Hart at a SoyaKit training of women trainers in northern Ghana (West Africa), for the NGO MEDA (Mennonite Economic Development Association, May 2017)

"You are welcome to use any other photos from our website, most of the interesting ones are under the project tab." Address: Malnutrition Matters, Ontario, Canada.

• ***Summary:*** Here is a second look at one of the most

© Copyright Soyinfo Center 2021

interesting and innovative organizations working with soyfoods in the world today. Low-tech and appropriate technology "small is beautiful" systems, that operate with or without electricity, make soymilk, tofu, soy yogurt, soy coffee, peanut butter, and related foods at very low cost and high efficiency. Congratulations to Frank Daller, Hart Jansson, their team, and their donors worldwide. See also the videos in the upper left of the home page under New Development and Highlights.

The home page begins: "Malnutrition Matters is a Canadian-registered, non-profit organization, dedicated to providing sustainable low cost food technology solutions for malnutrition, primarily by using soya, but also cereals, grains, fruits and vegetables. These plant-based foods offer the greatest nutritional, environmental and economic benefits. Furthermore, soymilk and its derivative soyfoods are already well-known for their nutritional value, functionality and the sustainability of their agriculture and production."

This time we invite you to explore the Projects section of the website, which is divided into Africa, Americas, Asia, and South Asia.

Projects in Africa–each with a detailed description and dates–include projects in Malawi, Ghana, Mozambique, Liberia, IITA, Tanzania, Kenya, South Africa, Uganda, Zambia, Guinea, and Chad. "NB: Not all projects are shown."

One program is the "Rural Enterprises Program Phase III–2016 (ongoing)." The text states:

"The REP III program, funded by the African Development Bank, the International Foundation for Agricultural Development and the Government of Ghana, and implemented by the Ministry of Trade and Industry in Ghana, is dedicated to economic development of the rural areas of Ghana. Malnutrition Matters had been involved in planning the program before its official launch in December 2014. Malnutrition Matters (MM) is proud to be one of the few official partners in the program. MM began its REP activities in mid-2016. SolarFlex and SoyCow equipment (with PedalPro option) were delivered to 10 sites in Ghana, as shown, in January, 2017. Installation and demonstrations by MM personnel was completed in May of 2017 and full operational and business training is scheduled for July. The production and sale of affordable soymilk and derivative products such as soy yoghurt, soy porridge and tofu will improve nutrition and enable sustainable operations creating employment in these locations. Some sites may partner with local entrepreneurs. The SolarFlex systems will be used and promoted for economical solar drying of food to reduce post-harvest losses and improve food security. Some additional SoyCow and SolarFlex equipment is intended to be produced at various Rural Technology Facilities in Ghana, after transfer of technology to enable local fabrication." The map of Ghana showing 10 sites where MM equipment has been delivered is show. Address: 498 Rivershore Crescent, Ottawa, ON K1J 7Y7, Canada. Phone: 1-613-742-6888.

2048. Oger, Camille. 2019. Tofu, l'anthologie [Tofu: the anthology]. Paris, France: La Plague. 384 p. Aug. Illust. (color photos). Ingredients index. Index: Alphabetical list of recipe names23 cm. [33 ref. Fre]

• ***Summary:*** Contents: Is this a vegetarian book? What is tofu? The textures of tofu. Practical advice. Storing the tofu. Tofu derivatives and by-products. Other types of tofu. The basics of tofu.

Basic recipes: Soymik and okara, Firm tofu. Silken tofu, Silk tofu with citrus. Yuba (*peau de soja*). Tofu curds (2 methods).

China and Taiwan: The cradle of tofu. Tofu culture. One does not prevent the author. Types of tofu and their uses: Lists (in French) the names of 29 tofu recipes from China or Taiwan. In the book, each is accompanied by a full-page color photo.

Japan: The other tofu country. In praise of blandness. Not a product of chicks. Types of tofu and their uses: Lists (in French) 28 tofu recipes from Japan.

Korea: A particular method. Not marginal as in China and Japan. All flame tofu, Or tofu all soft. Types of tofu and their uses: Lists 16 Korean recipes.

Southeast Asia: A Chinese contribution. A firmer tofu. The particular case of Vietnam. The poor man's food. Types of tofu and their uses: Lists (in French) 25 Southeast Asian tofu recipes.

Burma: A special case. Bright yellow tofu. Types of tofu and their uses: Lists 9 Burmese tofu recipes.

India: So much peas but no soy. The soy paneer. Lists 8 Indian tofu recipes.

Elsewhere: An old encounter. A vegetarian product. Good tofus. Two parallel universes. Types of tofu and their uses: Lists (in French) 48 tofu recipes.

Bibliography.

From the publisher: 170 recipes from India, Japan, Burma, France or Italy. The blandness of fresh tofu is an advantage, a culinary "white page," like that of white rice or wheat flour, which can be exploited in many ways. By marinating it, cooking it with spices, herbs and various condiments–it is an inexhaustible source of culinary diversity.

2050. Messina, Mark J. 2019. Re: Are soyfoods / soy isoflavones endocrine disruptors. Letter (e-mail) to William Shurtleff at Soyinfo Center, Dec. 8-11.

• ***Summary:*** "I may have mentioned that the French and UK are in the process of determining whether soy/isoflavones are endocrine disruptors. Will be terrible if they reach that conclusion.

"I am writing a 30,000 word paper using the clinical data to refute this concern. Hope to have at least 10 coauthors but I will do the bulk of the writing. Hopefully, we can raise the cash to support my effort. Need about 43K (30K for me).

"If the industry doesn't come up with the money I will lose all hope. You have a company like Impossible Foods, which is worth $5 billion and whose only product is soy-based. They should fund the whole thing if need be. Same could be said for Soylent and House Foods (both members of the SNI).

"I am reducing my travel (just turned down a trip to Korea) to focus on what I consider to be most important. Time is short and most trips aren't very productive. Talking to 200 people pales in comparison to writing a paper that will be in the literature for years.

"Mark.

Wm. Shurtleff replies with a note of thanks.

Messina replies, Dec. 9

"The paper from the UK indicating their interest in isoflavones is attached. Also attached a slide deck on endocrine disruptors and the paper I plan to write. Will send some articles from France when I get them.

"Thanks for your offer to contribute financially to the writing of the paper. It is generous but I am confident it won't be needed. I think Dupont and Kellogg's among others will step up to the plate. The company I have no confidence in is Danone North America (WhiteWave). They seem not willing to spend on money on soy even when they claim they want to.

(6) Article titled "Worrying levels of phytoestrogens found in soy-based products, claims French consumer group" (The French Food Safety Authority)

(7). March 2005 Press release (translated from French) titled "Safety and benefits of phytoestrogens in foods," by AFSSA (*Agence Francaise de Securite Sanitaire des Aliments*) (French Food Safety Agency) and AFSSAPS (Agence Francaise de Securite Sanitaire des Produits de Sante) (French Health Product Safety Agency).

(8-14) Various questions and proposals.

Shurtleff replies (Dec. 10): "My basic perspective on the soy scare is this: If soyfoods are bad for people, why are the Japanese and Okinawans–as well as the Koreans and Chinese–so healthy. Their average per capita daily consumption of soy is much higher than those of people in all Western nations.

"Is this naive.

"Is it inadmissible evidence in a scientific paper?"

Messina replies: "Bill–Those observations are almost worthless. A more credible observation (question) is whether people in Okinawa who frequently eat soy are more or less healthy than people who infrequently eat soy.

"But even that question has rather limited value although it is certainly useful. Do people who eat soy frequently exercise more than those who infrequently eat soy? You can't control 100% for all potentially confounding variables. There is also the issue of Asian vs. non-Asian people–does one group respond differently than the other? And related to that, do people who have historically consumed soy respond differently to soy than people for whom soy is a relatively new food.

"The toxicologists like animal studies because you can completely control their diet and 'lifestyle.' Fortunately, in the case of soy there are literally hundreds of human intervention studies from which one can draw insight about health effects. But there are still limitations. For example, no one has conducted a trial to determine whether feeding soy to 10 year old girls for 20 years affects fertility. Impossible to do some clinical trials. So in the end, you look at the animal, clinical and observational studies and try to make the most sense of the data."

Dec. 11. Shurtleff replies: "Mark, I really appreciate your detailed reply.

"If the consensus is that soyfoods/isoflavones are endocrine disruptors, would I (and others) be wise to stop daily consumption of soyfoods–in my case tofu, soymilk and edamame–which are my main sources of protein?

"In science doesn't a consensus eventually emerge?

Dec. 11. Messina replies: "I consume soy 2-3 times per day. Second, there is rarely a consensus. In its evaluation of the cholesterol lowering effect of soy protein, the FDA concluded soy is safe at levels required for the health

© Copyright Soyinfo Center 2021

claim (25 g soy protein per day) (October 31, 2017). The claim deals with soy protein but the FDA evaluated 1300 comments that mostly dealt with isoflavones. So if ANSES concludes soy could be harmful, there won't be a consensus.

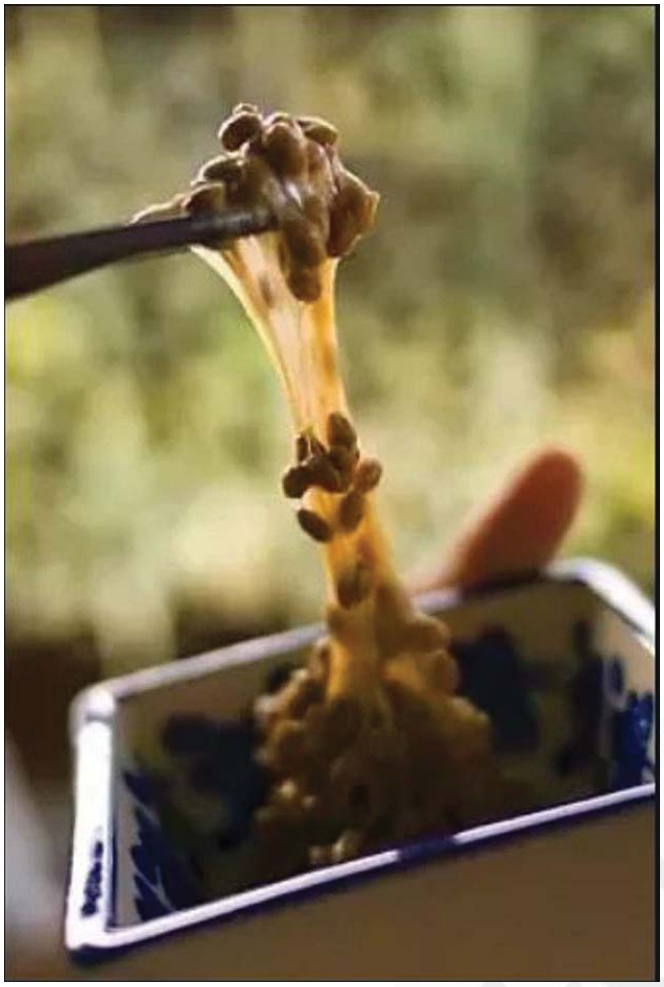
"Bear in mind, most concerns are mostly related to infants and children and in utero exposure, not old white guys like you and me. Finally, right now ANSES thinks 21 mg per day is the upper safe limit for isoflavone intake. That is 6-7 ounces of Silk soymilk. Do you really think consuming 2 cups of soymilk per day is harmful?" Address: PhD, Pittsfield, Massachusetts.

2051. Kim, Jae-Yoon Kim; Jeong, S.; Kim, H.K.; Lim, W.-J.; Lee, H.-Y.; Jeong, N.; Moon, J.K.; Kim, N. 2019. Dissection of soybean populations according to selection signatures based on whole-genome sequences (Open Access). *GigaScience* 8(12):1-19. Dec. [127 ref]

• ***Summary:*** "Background: Domestication and improvement processes, accompanied by selections and adaptations, have generated genome-wide divergence and stratification in soybean populations. Simultaneously, soybean populations, which comprise diverse subpopulations, have developed their own adaptive characteristics enhancing fitness, resistance, agronomic traits, and morphological features. The genetic traits underlying these characteristics play a fundamental role in improving other soybean populations.

"Results: This study focused on identifying the selection signatures and adaptive characteristics in soybean populations. A core set of 245 accessions (112 wild-type, 79 landrace, and 54 improvement soybeans) selected from 4,234 soybean accessions was re-sequenced. Their genomic architectures were examined according to the domestication and improvement, and accessions were then classified into 3 wild-type, 2 landrace, and 2 improvement subgroups based on various population analyses. Selection and gene set enrichment analyses revealed that the landrace subgroups have selection signals for soybean-cyst nematode HG type 0 and seed development with germination, and that the improvement subgroups have selection signals for plant development with viability and seed development with embryo development, respectively. The adaptive characteristic for soybean-cyst nematode was partially underpinned by multiple resistance accessions, and the characteristics related to seed development were supported by our phenotypic findings for seed weights. Furthermore, their adaptive characteristics were also confirmed as genome-based evidence, and unique genomic regions that exhibit distinct selection and selective sweep patterns were revealed for 13 candidate genes.

"Conclusions: Although our findings require further biological validation, they provide valuable information about soybean breeding strategies and present new options for breeders seeking donor lines to improve soybean populations." Address: 1-5. Genome Editing Research Center, Korea Research Institute of Bioscience and Biotechnology (KRIBB), Gwahak-ro 125, Yuseong-gu, Daejeon 34141, Republic of Korea.



2052. Scherer, Laura; Behrens, P.; Tukker, A. 2019. Opportunity for a dietary win-win-win in nutrition, environment, and animal welfare (Open Access). *One Earth* 1(3):349-60.

• ***Summary:*** "Summary: Sustainable food systems are essential for meeting nutritional requirements, limiting environmental impacts, and reducing animal welfare loss. Although current dietary trends in many regions rather go in the opposite direction, the adequacy of dietary guidelines is unknown, and the three sustainability dimensions are generally not assessed simultaneously. Here, we assessed nation-specific recommended diets for these impacts compared with the average diet. We assessed the trade-offs between nutritional quality, environmental sustainability (carbon, land, and water footprints), and animal welfare. Most countries reduce their animal product consumption in terms of food calories when switching to the nationally recommended diet. Recommended diets have the potential for 'win-win-wins' in all three categories when compared with the current average diet, such as that shown in Brazil. However, South Korea loses in all three regards, and many other countries face trade-offs. This highlights the scope for the optimization of dietary guidelines to minimize such trade-offs." Address: Inst. of Environmental Sciences (CML), Leiden University, 2333 CC Leiden, the Netherlands.

2053. Kwon, Dae Young; Chung, Kyung Rhan; Jang, Dai-Ja. 2019. The history and science of Chongkukjang, a Korean fermented soybean product: review article (Open Access). *J. of Ethnic Foods* 6(1):5 17 p. [77 ref]

• ***Summary:*** About Korean natto. "With several thousands of years of tradition, Chongkukjang is one of Korea's most well-known fermented soybean foods. Chongkukjang has existed in Korea since the first century BC and throughout the Koryo dynasty and kingdom of Silla, while si (shi [fermented black soybeans] 1 Cc [Chinese character], Chongkukjang) in Chaeksong was highly regarded according to the customs of Balhae. The fact that Koreans are good at creating fermented foods (3 Cc) is recorded in *Samkukjiwijidongijeon* (Records of the Three Kingdoms, 8 Cc), and Chongkukjang has been in Korea even longer than its 2000-year history in China. Chinese documents dating back to before 40 BC contain records of Chongkukjang or a similar fermented bean. Si does not originally come from China and was introduced to the country by an individual called Kang Baik (2 Cc) who is thought to have hailed from Korea, and there were many names for Chongkukjang in pure Korean such as jyeonkuk, cheongkuk, chyeonkuk, and chyeongkuk.

© Copyright Soyinfo Center 2021

"In short, Chongkukjang has existed as a fermented soybean food in Korea for more than 2000 years. However, some scholars have been distorting the truth and spreading false information about Chongkukjang. Some of these claims include "Chongkukjang was first created during wartime, as it could be prepared quickly," "Chongkukjang was introduced to Korea via the Qing dynasty," and "The first documented record of Chongkukjang in Korea is in *Junbosallimkyongje* (6 Cc), written by Yu Jung-im (3 Cc) in 1760." If these claims were true, the Chongkukjang would be less than 400 years old. However, these theories are mostly put forward by scholars who are familiar with Chinese characters but know nothing about natural science or food science. By examining Korean history purely through the analysis of Chinese characters, which is indicative of the toadyish attitude of such scholars, they have committed the error of misrepresenting Korean food culture and history. Instead of looking at the history of Chongkukjang through the character si (1 Cc), they claim that the only references to Chongkukjang in ancient texts are words written in Chinese characters (3 Cc, 3 Cc, 3 Cc, 3 Cc, or 3 Cc). How did this happen? Analysis of these documents can be used to demonstrate how these scholars came up with the baseless claim that Chinese characters, 3 Cc, 3 Cc, 3 Cc, 3 Cc, or 3 Cc, refer to Chongkukjang, instead of the names that were actually used (jyeonkuk, cheongkuk, chyeonkuk, and chyeongkuk), and how they inadvertently relegated Chongkukjang to the position of a food that has only existed in Korea for less than 400 years. Before Korean script (Hankeul [often spelled Hangul]; 2 Korean characters = 2 Kc) was developed, Chongkukjang was pronounced jyeonkuk, cheongkuk, chyeonkuk, or chyeongkuk and was referred to as si (1 Cc) in official records which were written in Chinese characters. After the advent of Korean script, Chongkukjang was recognized as a kind of jang alongside doenjang (soybean paste), kanjang (soy sauce), and kochujang (red pepper paste), which is why the character jang (1 Cc) was added as a suffix. Scholars then created the words 3 Cc, 3 Cc, 3 Cc, 3 Cc, and 3 Cc by selecting Chinese characters that represent the pronunciation of jyeonkuk, cheongkuk, chyeonkuk, and chyeongkuk and adding the character jang to the end of each. This kind of mistake is understandable. However, these scholars have taken it further to the point that their interpretation, based on a false understanding of the way in which Chinese characters were used to spell out Korean words phonetically, has distorted the history and origins of Chongkukjang."

"Recently, Chung published a paper in which he translated ancient documents about the history of Chongkukjang and used this as evidence to refute some high profile wrong theories about the food [endnote 4]. It was a very well-written paper based on written evidence [see: Chung, K.R. 2018. The history of Chongkukjang. J. Korea Contents Soc. 18:647-77. Note: "Chongkukjang: A type of Korean soybean paste made by placing soft boiled soybeans in a hot place to stimulate the production of *Bacillus subtilis*].

"After harvesting soybeans in autumn, they are washed, boiled, and left to cool. They are then placed in the warm part of a room on a basket or clay pot covered with straw, covered with a blanket to regulate the temperature, and left to ferment for 2-3 days [8, 9]. The fermenting agent is Bacillus, as most of the strains involved in the fermentation of Korean Chongkukjang come from straw. Chongkukjang is a classic example of a fermented soybean food that does not contain salt. Since Chongkukjang has been eaten in Korea for a long time, it makes sense that the food has several thousands of years of history. Japanese natto, a type of Chongkukjang that originated in Korea, has also been around for several thousands of years. Natto is an improved version of Chongkukjang that has become a global food, but its origins lie in Korea. Chongkukjang in Korea is usually eaten as a Kuk (like soup) and Chigae [6], while in Japan, natto was allowed to be eaten on its own after inoculating the strains."

Page 13: Meju, soybean koji, is made by fermenting soybeans for the purpose of making kanjang (soy sauce),

doenjang (Korean-style soybean paste or miso) and kochujang (fermented red chili paste).

2054. Intersimone, Jenna. 2020. Where to get the best ramen in Central NJ. *Central New Jersey Home News* (*New Brunswick, New Jersey*). Jan. 27. p. 7B, 8B.
• ***Summary:*** One type of ramen is miso ramen, which is a relative of miso soup. Spice miso ramen is also popular–costing about $15 a bowl.

"In New Jersey, no restaurant is perhaps better known for ramen than Ani Ramen, a modern, local restaurant chain with six New Jersey locations and one about two months away from opening in New Brunswick.

"To develop proprietary ramen variations, Ani Ramen partnered with Sun Noodle company based in Carlstadt. All broths are made from scratch and slow-cooked, and ramen is made using traditional methods. Currently Ani Ramen offers five ramen varieties."

Miso is also used in "miso tare," "spick miso tonkatsu ramen," "miso crab ramen."

Roosterspin, an Asian fusion restaurant, uses half Japanese miso and half Korean miso in their miso ramen. Owner Mihae Cho describes it as tasting like "chicken soup with a miso flavor." He adds that "the miso brings a lot of flavor."

2055. Tamang, Jyoti Prakash; Cotter, P.D.; Endo, A.; et al. 2020. Fermented foods in a global age: East meets West. *Comprehensive Reviews in Food Science and Food Safety* 19(1):184-217. Jan. *
• ***Summary:*** Table 1, under "D. Fermented Legume foods," contains four columns: 1. Country. 2. Substrate. 3. Food. 4. Organoleptic characters and culinary.

The following have "Soybean" as the substrate.

India. Bekang. Alkaline, sticky, paste, curry

Korea. Chungkokjang (or jeonkukjang, cheonggukjang). Alkaline, sticky, soup.

China, Taiwan. Douchi, Alkaline paste.

Korea, Doenjang. Alkaline, paste, soup.

China. Soybean curd. Furu. Mild acidic.

Korea, Soybean, red pepper. Gochujang. Hot-flavored seasoning.

India. Hawaijar. Alkaline, sticky.

Korea. Soybean, meju, salt water. Kanjang. Soya sauce.

Indonesia. Soybean, wheat. Kecap. Liquid.

Indonesia. Soybean (black). Kecap. Syrup.

India, Nepal, Bhutan. Kinema. Alkaline, sticky; curry.

China, Taiwan. Meitauza. Liquid.

Korea. Meju. Alkaline paste.

Japan. Miso. Alkaline paste.

Japan. Natto. Alkaline, sticky; breakfast.

Japan, Korea, China. Shoyu. Alkaline, liquid seasoning.

China, Taiwan. Soybean curd. Sufu. Mild-acidic, soft.

Indonesia. Tauco. Alkaline paste, use as a flavoring agent.

Indonesia (Origin), The Netherlands, Japan, USA. Tempe. Alkaline, solid, fried cake, breakfast.

Thailand. Thua nao. Alkaline, paste, dry, side dish.

India. Tungrymbai. Alkaline, sticky, curry, soup.

China. Yandou. Alkaline, sticky, salted, snack.

2056. Nawaz, Muhammad Amjad; Lin, X.; Chan, T.F.; et al. 2020. Korean wild soybeans (*Glycine soja* Sieb & Zucc.): geographic distribution and germplasm conservation: review (Open Access). *Agronomy* 10(2):214. Feb. 19 p. doi:10.3390/agronomy10020214 [117 ref]
• ***Summary:*** "Domesticated crops suffer from major genetic bottlenecks while wild relatives retain higher genomic diversity. Wild soybean (*Glycine soja* Sieb. & Zucc.) is the presumed ancestor of cultivated soybean (*Glycine max* [L.] Merr.), and is an important genetic resource for soybean improvement. Among the East Asian habitats of wild soybean (China, Japan, Korea, and Northeastern Russia), the Korean peninsula is of great importance based on archaeological records, domestication history, and higher diversity of wild soybeans in the region. The collection and conservation of these wild soybean germplasms should be put on high priority. Chung's Wild Legume Germplasm Collection maintains more than 10,000 legume accessions with an intensive and prioritized wild soybean germplasm collection (>6000 accessions) guided by the international code of conduct for plant germplasm collection and transfer. The center holds a library of unique wild soybean germplasms collected from East Asian wild habitats including the Korean mainland and nearby islands. The collection has revealed interesting and useful morphological, biochemical, and genetic diversity. This resource could be utilized efficiently in ongoing soybean improvement programs across the globe." Address: 1. Dep. of Biotechnology, Chonnam National University, 59626 Yeosu, Korea.

2057. Jo, Hyun; Kim, Minsu; Ali, Liakat; Tayad, Rupesh; et al. 2020. Environmental stability of elevated α-linolenic acid derived from a wild soybean in three Asian countries. *Agriculture* (*Open Access*) 10, 70. 12 p. [45 ref]
• ***Summary:*** "Soybean can be a source of essential fatty acids-linoleic (18:2, omega-6) and α-linolenic acid (18:3, omega-3)-for humans. Intake of fatty acids with high omega-3 concentration or low omega-6/omega-3 ratios is more desirable for human health. However, in soybean, the

© Copyright Soyinfo Center 2021

unsaturated fatty acids are less stable than the saturated fatty acids in different environments... Particularly, temperature influenced the accumulation of 18:3 concentration. The soybean genotype, UT-385-4-4, produced the highest 18:3 concentration and is more stable than all the other soybean genotypes, excluding PT-100-3. UT-385-4-4 is a potential genetic resource to develop novel cultivars with high 18:3 concentration, which could be dietary sources of plant-derived omega-3 fatty acids." Address: 1. School of Applied Biosciences, Kyungpook National Univ., Daegu 41566, Korea.

2058. Bhartiya, Anuradha; Aditya, J.P.; Pal, R.S.; Chandra, N.; Kant, L.; Pattanayak, A. 2020. Bhat (black soybean): A traditional legume with high nutritional and nutraceutical properties from NW Himalayan region of India. *Indian J. of Traditional Knowledge* (*New Delhi*) 19(2):307-19. April. [146 ref]
• ***Summary:*** *"Bhat* (black soybean) under the genus *Glycine*, is cultivated for food, fodder and medicinal uses by rural communities in Asia particularly, in China, Japan, Korea, Indonesia and India. In the Himalayan region of India, this legume is not only an integral part of a climate resilient farming system but also finds place in ethnodietary recipes and fondly consumed as a pulse. Black soybean ensures both food and nutritional security in hills where nutritional deficiencies are in abundance among rural, tribal and backward population engaged in subsistence farming in marginal rainfed terrains. Cultivation of black soybean is less capital intensive. Its ability to survive under harsh conditions particularly, in the event of failure of rain, makes it a better choice than other competitive crops grown during rainy season. Despite its enormous potentials, the legume has not gained the popularity in India and presently, area under this valuable legume is confined to North Himalayan hill region and scattered pockets of central India. Its high nutritive value, remedial and health promoting effects due to presence of various bioactive compounds make this legume an excellent functional food. Present review summarizes the potential role of black soybean for human nutrition and health benefits."

This black-seeded soybean is known by many names: *He-teou* (China), *Kokuzui* [sic] (Japan) and *Kongjaban* (Korea) and *Bhat, Bhatman, Bhatmas, Bhut, Teliakulth, Gerakalay, Kalitur* and *Kala Hulga* in India (refs. 12-14).

Contents: Introduction. History, origin and domestication: botanical description, nutritional composition, crude protein, fat, carbohydrate, dietary fibre, antinutritional factors, protease inhibitors, polyphenols, haemagglutinins (the sugar specific proteins sometimes referred to as phytoagglutinins or lectins), phytic acid, lipoxygenase, nutraceutucal properties ("still widely used as a key ingredient in Chinese herbal medicine" {108, 109}), anthocyanins (impart black color), isoflavones, other bioactive compounds imparting health benefits (flavonoids, saponins, sprout extract), potential of black soybeans as nutraceutical, functional food and feed (antioxidants, bioactive ingredients). Conclusion (Traditionally important, has played a "vital role in sustaining the traditional food production system of the Northwest Himalayan region." Yet it remains a "neglected legume"). Address: ICAR-Vivekananda Inst. of Hill Agriculture, Almora 263 601, Uttarakhand, India.

2059. Ismail, Ishamri; Hwang, Young-Hwa; Joo, Seon-Tea. 2020. Meat analog as future food: a review. *J. of Animal Science and Technology* 62(2):111-20. [59 ref]
• ***Summary:*** "Conclusion: It can be concluded that there is a high demand for meat analog in the current and future markets. The most significant interest in this product is not due to vegan consumer's number increase, but it was driven by the consumers concerned about healthy foods and a sustainable environment. Nevertheless, there is still limited meat analog in the current market and predominantly available only plant-based meat." Address: 1. Div. of Applied Life Science (BK21+), Gyeongsang National Univ., Jinju 52828, Korea.

2060. Kim, Jinyup. 2020. Tackling biopiracy in Southeast Asia: the need for a legally binding regional instrument. *Asia Pacific Journal of Environmental Law* p. 74-98. *

2061. Li, Man-Wah; Wang, Z.; Jiang, B.; Kaga, A.; Wong, F-L.; Zhang, G.; Han, T; Chung, G.; Nguyen, H.; Lam, H-M. 2020. Impacts of genomic research on soybean improvement in East Asia (Open Access). *Theoretical and Applied Genetics* (*TAG*) 133(5):1655-78. May. [133 ref. Eng]
• ***Summary:*** Soybean domestication originated in East Asia. However the USA has been the world's top soybean producer since the 1950s. Brazil became a major soybean producer in the 1970s, and Argentina in the 1990s. China was an exporter of soybeans to Japan before the 1990s, yet today, like Japan and Korea, China is a soybean importer [the world's largest]. Soybean yields in East Asia have stagnated during the past decade. To improve soybean production and enhance food security, these Asian countries have made major investments in breeding better-performing soybean germplasm. "As a result, China, Japan, and the Republic of Korea have become three important centers for soybean genomic research. With new technologies, the rate and precision of the identification of important genomic loci associated with desired traits from germplasm collections or mutants have increased significantly. Genome editing on soybean is also becoming more established. The year 2019 marked a new era for genome crop editing in the commercialization of the first genome-edited plant product, which is a high-oleic-acid soybean oil." In this review we summarize the latest developments in soybean breeding and the remarkable

© Copyright Soyinfo Center 2021

progress in this area in China, Japan and the Republic of Korea. Address: 1-2. Centre for Soybean Research, State Key Lab. of Agrobiotechnology and School of Life Sciences, The Chinese Univ. of Hong Kong, Shatin, China.

2062. Zimberoff, Larissa. 2020. Tofu goes mainstream in America thanks to Big Meat's Covid crisis (Web article). https://www.bloomberg.com/news/articles/2020-06-11/the-pandemic-opens-the-door-to-tofu-makers-who-race-to-meet-deman?utm_source=newsletter&utm_medium=email&utm_campaign=newsletter_axiosam&stream=top 4 p.
• ***Summary:*** The coronavirus made meatpacking plants more dangerous than usual. "Consumers suddenly found themselves in empty meat aisles, searching for protein.

"Enter tofu. In the U.S., it's historically been a niche product," even though popular throughout East Asia. "Now, more American shoppers are giving it a second look."

One major beneficiary of this new fame is "Pulmuone, a South Korea-based food maker boasting a 78% share of U.S. tofu sales with brands like Nasoya, Wildwood and Azumaya." With the new demand, three of its U.S. plants are operating six days a week and its has even been forced to import tofu from South Korea.

Sales of tofu last year in the U.S. were $363 million. Tofu is inexpensive; One pound of Beyond Meat ground "beef" sells for $8.99 versus 14 ounces of tofu retails for $2.99.

2063. Wikipedia, the free encyclopedia. 2020. Lysine price-fixing conspiracy (Web article). https://en.wikipedia.org/wiki/Lysine_price-fixing_conspiracy 2 p. Accessed July 30.
• ***Summary:*** The introduction begins: The lysine price-fixing conspiracy was an organized effort during the mid-1990s to raise the price of the animal feed additive lysine. It involved five companies that had commercialized high-tech fermentation technologies, including American company Archer Daniels Midland (ADM), Japanese companies Ajinomoto and Kyowa Hakko Kogyo, and Korean companies Sewon America Inc. and Cheil Jedang Ltd. A criminal investigation resulted in fines and three-year prison sentences for three executives of ADM who colluded with the other companies to fix prices. The foreign companies settled with the United States Department of Justice Antitrust Division in September through December 1996. Each firm and four executives from the Asian firms pleaded guilty as part of a plea bargain to aid in further investigation against ADM. The cartel had been able to raise lysine prices 70% within their first nine months of cooperation. [1] Also discusses: ADM's role.

Popular adaptations: The Informant is a nonfiction thriller book written by journalist Kurt Eichenwald and published in 2000 by Random House [18] that documents the case and the involvement of ADM executive Mark Whitacre. It has been adapted into the 2009 film The Informant! starring Matt Damon, which was released September 18, 2009.

2064. Kang, Gyung Young; Choi, Sang Woo; Chae, Won Gi; Chung, Jong Il. 2020. Accumulation of triple recessive alleles for three antinutritional proteins in soybean with black seed coat and green cotyledon. *J. of Plant Biotechnology* 47:118-23.
• ***Summary:*** "The black seed coat of soybeans contain anthocyanins which promote health. However, mature soybean seeds contain anti-nutritional factors like lipoxygenase, lectin and Kunitz Trypsin Inhibitor (KTI) proteins. Furthermore, these seeds can be used only after the genetic elimination of these proteins."

"This black soybean strain with *lx1lx1lx2lx2lx3lx3, titilele* genotype is a novel strain free of lipoxygenase, lectin, and KTI proteins." Address: Dep. of Agronomy, Gyeongsang National Univ., JinJu, Korea, 52828.

2065. Kim, So Yeon; Lee, Kyung Bok; Cho, Young Ho; et al. 2020. [Inhibitory effect of the extract of cheonggukjang fermented with *Bacillus amyloliquefaciens* SCGB 1 on LPS-induced inflammation and inflammatory diseases]. *J. of the Korean Society of Food Science and Nutrition* 49(7):659-67. July. [23 ref. Kor; eng]
• ***Summary:*** "Furthermore, mice given SCGB 1 showed significant inhibition of severe gastritis induced by HCl/EtOH in mice. Taken together, SCGB 1 is an excellent material to inhibit inflammation and inflammatory diseases." Address: 1. Dep. of Microbiology, College of Medicine.

2066. Lee, Hyun Jung; Yong, H.I.; Kim, M.; Choi, Y.S.; Jo, C. 2020. Current status of meat alternatives and their potential role in the future meat market (Open Access). *Asian-Australasian J. of Animal Science* https://doi.org/10.5713/ajas.20.0419 [80 ref]
• ***Summary:*** "Plant-based meat analogues, edible insects, and cultured meat are major meat alternatives that can be used as promising protein sources in the future. It is also believed that the importance of meat alternatives will continue to increase because of concerns on limited sustainability of the traditional meat production system. The meat alternatives are expected to have different roles based on their different benefits and limitations. Plant-based meat analogues and edible insects can replace traditional meat as a good protein source from the perspective of nutritional value. Furthermore, plant-based meat can be made available to a wide range of consumers (e.g., as vegetarian or halal food products). However, despite ongoing technical developments, their palatability, including appearance, flavor, and texture, is still different from the consumers' standard established from livestock-based traditional meat. Meanwhile, cultured meat

© Copyright Soyinfo Center 2021

is the only method to produce actual animal muscle-based meat; therefore, the final product is more meat-like compared to other meat analogues. However, technical difficulties, especially in mass production and cost, remain before it can be commercialized. Nevertheless, these meat alternatives can be a part of our future protein sources while maintaining a complementary relationship with traditional meat." Address: Dep. of Agricultural Biotechnology, Center for Food and Bioconvergence, and Research Inst. of Agriculture and Life Science, Seoul National University, Seoul 08826, Korea.

2068. Lum, Bob. 2020. Re: Phoenix Bean LLC and Jenny's Tofu in Chicago. Letter (e-mail) to William Shurtleff at Soyinfo Center, Nov. 17. 2 p. [Eng]

• ***Summary:*** Note: This email is in reply to one from Soyinfo Center based on an excellent article in the *South China Morning Post.*

"Thanks for contacting Jenny. She was thrilled to hear from you and honored to find out she was part of the *South China Morning Post* article that featured you and *The Book of Tofu.* She considers it the tofu bible and owns several copies!

"I help Jenny here at Phoenix Bean with various marketing and communications activities and hopefully can answer your questions. I'm not sure what detail you need for your dB, but I've prepared a short story below. Please let me know if you need more/less and any additional info.

Jenny is the 3rd owner of Phoenix Bean which has operated continuously in Chicago since 1981. The original owners only focused on selling tofu to the local Asian immigrant community. Since Jenny purchased the business in 2006, it operates as Phoenix Bean LLC and produces a variety of tofu, soy milk, and bean sprout products under the Phoenix Bean and Jenny's Tofu brands. Jenny's business mission has focused on educating a broader audience on the benefits of tofu, making quality improvements while retaining the authenticity and taste of traditional tofu products, increasing the appeal and accessibility of tofu, and improving sustainable practices. Our soymilk and tofu products are made fresh daily from organic or organically raised non-GMO Midwest grown soybeans. We now produce 30+ varieties of traditional tofu and ready-to-eat tofu salads for retailers, restaurants, wholesalers, and food producers. You can find our tofu in dishes at neighborhood eateries and Michelin starred restaurants, used as an ingredient in products such as Eli's Cheesecake vegan cheesecakes, and retailed in 10 states by Whole Foods, Mariano's and other grocers. We are currently in an expansion that includes a retail location and a new larger factory. Hopefully our new factory expansion will be up and running within the next few months. It is located just a few doors down on the same city block as the existing facility which will continue to serve as our main address.

"Thanks for all that you do at the SoyInfo Center and sharing about all the goodness of the soybean and its products. Feel free to contact either me or Jenny if you have any additional questions. Looking forward to being part of your project.

"Take care and hope you are also staying safe and well. Bob Lum.

Shurtleff asked a few more questions:

"Q1. What was the name of the business when Jenny bought it in 2006. Who owned it, how many employees, at what address? I know it existed since 25 Dec. 1986 at 5438 N. Broadway. Phone 312-784-2503.

"Ans. 1. Previous to Jenny–Phoenix Bean Products Inc. Sold as Phoenix Bean brand only. 6 employees "Currently–Phoenix Bean LLC. Sold as Phoenix Bean and Jenny's Tofu. 35 full time and 14 part time employees

"We are still at the same address on Broadway. The original owner started in 1981, but we do not have the original location before it was moved to Broadway.

"Q2. What coagulants do you you use?

"Ans. 2. "Calcium Sulfate

"Q3. What percent of your customers are Asian American? (estimate).

Ans 2. Over 60% overall.

"Q4. Where do you sell your tofu? Retail food stores (% Asian American vs Caucasian), % institutional, % restaurants, etc.

"Ans. 4. Retail 40% (60% Asian), 40% wholesalers and producers, 20% restaurants and institutions.

"Q5. What % of the Chicago tofu market do you control?

Ans. 5. Not known.

"Q6. Do you have any competition? Local vs. out of state?

"Ans. 6. Major competitors manufacture out of state–Pulmuone (Nasoya, Wildwood, etc), House Foods, Nature Soy, store brands.

Note: On Phoenix Bean's website (www.phoenixbean.com) under Products the following soyfood products are listed:

Tofu: Soft Tofu. Firm Tofu. Extra Soft Tofu. Extra Firm Tofu (white tofu).

Fried Tofu: Fried Tofu Puff. Fried Rectangle Tofu. Fried Triangle Tofu. Fried Extra Firm Tofu (fried white tofu).

© Copyright Soyinfo Center 2021

Baked Tofu: Baked Turmeric Tofu. Smoked Five Spice Tofu.

Noodles: Soybean Noodle. Sprouts Mung Bean Sprouts Soybean Sprouts

Soy Milk: Fresh Sweetened Soy Milk. Fresh Unsweetened Soy Milk.

Tofu Salads: Spicy Tofu Stir Fry. Teriyaki Tofu with Shiitake Mushroom. Asian Smoked Tofu with Chili. Chinese (Red) Peanut Tofu Salad. Thai Peanut (Green) Tofu Salad. Sweet & Spicy Tofu. Sweet & Spicy Tofu with Eggplant. Vegan Mapo Tofu. Teriyaki Shiitake Tofu. Tofu Skin (Yuba).

NEW! Jenny's Tofu Products:

Tofu: Organic Extra Firm Tofu.

Baked Tofu: Organic Baked Turmeric Tofu. Organic Smoked Five Spice Tofu.

Noodles: Organic Tofu Noodles.

Soy Milk: Organic Soy Milk (sweetened). Organic Soy Milk (unsweetened).

Tofu Salads: Szechuan Mapo Tofu. Chinese Red Peanut Tofu. Five Spice Chili Tofu. Address: Chicago, Illinois.

2069. Sim, Eun-Yeong; Kim, Hong-Sik; Park, Hye Young; Choi, Hye-Sun; Park, Jiyoung. 2020. [Studies on quality characteristics of commercial silken tofu products]. *Korean J. of Food and Nutrition* 33(5):576-83. [25 ref. Kor; eng]

• ***Summary:*** Seven types of commercial silken tofu were sampled and their physicochemical properties, including soluble solid contents, salinity, pH, total acidity, moisture contents (total solid contents), crude protein and fat contents were evaluated. The TPA results suggest that the texture of silken tofu was very different from one another according to the type of and the amount of coagulant. The commercial silken tofu showed a range of pH 5.53-6.48, total acidity of 0.12-0.32%, soluble solid contents of 2.62-5.07 ºBrix, salinity of 2.28-4.30%, and moisture contents of 87.10-92.24%, respectively. In terms of the coagulant of tofu, besides the GDL (glucono-delta-lactone), other coagulants such as MgCl2 for making silken tofu in the Korean tofu market. Address: 1-2. Researcher, Dept. of Central Area Crop Science, National Inst. of Crop Science, RDA, Suwon 16613, Korea.

2070. Choi, Duk-Kyung. 2020. [The rise of Chinese soybean jiang {*doujiang*} and the spread of soybean jiang culture on the Korean Peninsula]. *Yoksa Minsokhak* (*History and Folklore*) (*Journal of Korean Historical-Folklife*) (*The*) (*The Society for Korean Historical-Folklife Studies: Seoul*) 59:99-126. Dec. 31. [25 + 88 footnotes. Kor; eng]

• ***Summary:*** The summary in English states: Soy sauce is a fermented soybean food that leads the way in fermented foods in East Asia. It raises the possibility that the origin of soybeans was in northeastern China and the Korean Peninsula. From the perspective of the Chinese, the northeastern part of China was the production site of Long Shu [2 Chinese characters = 2 Cc] and Goguryeo beans [3 Cc] suitable for the manufacture of soy sauce. It was found that earthenware plasticization technology developed early on, and naturally towed stored fermented foods such as soy sauce without 'painting the inside of the jar' [2 cc]" such as the Zhongyuan [2 Cc] area.

"Unlike the Zhongyuan region, the records of Zengjiang [2 Cc], which means soy sauce, are handed down from various fis during the Goryeo and Joseon Periods. And the manufacturing method is well presented there. This suggests that Zhongyuan's soy sauce culture has advanced by communicating with the soy sauce class [2 Cc] on the Korean Peninsula and the salted fish [2 Cc] culture unique to the southern region.

"At the "Qiminyaoshu [4 Cc]" stage, soybeans are developed for the use of condiments that are corrosive rather than staple foods. In particular, after the Tang and Song dynasties, the milling industry developed, expanding the distribution of soy sauce, soybean oil, and tofu. In the Song Dynasty, soybeans were established as the main ingredient for the private necessities of "seven important items" [3 Cc], making them more important than the five staple grains [2 Cc]. In the Mingqing era, various kinds of soy sauce appeared, and soy sauce kimchi [2 Cc] was developed in the north and water kimchi [2 Cc] in the south, accounting for 60% of the use of soy sauce in today's Chinese diet."

Email from Prof. Choi (24 Feb. 2021): Korean jang has almost the same recipe as that for *doujang* in China. The only difference is how to make miso. As a liquid, it is used as a source for many foods.

The origin of soybean jiang [doujiang] has not been confirmed. China is said to have origins in China, but that is not clear either. My point of view is that Korea and Northeast China (in ancient times, Korean territory) were the origins of soybeans and bean paste.

The data sent (published in December 2020) is a thesis that revealed the possibility that Korea is the place of origin through archeology and literature studies.

As research continues, the origin will become clear. There are only possible hypotheses now. I will also publish a book about the origin and culture of beans this year or next year. Address: Prof., Dep. of History, Pusan National Univ. [Pusan, Korea].

• ***Summary:*** 277 bacterial and 80 fungal species were detected in Kinema. *Bacillus subtilis*, the core bacterium, showed the maximum predictive functional profiles. *Firmicutes* was the abundant phylum in kinema samples.

Note: Doenjang (fermented soybean pastes of Korea) is mentioned 6 times in this paper, and sufu (fermented tofu from China) is mentioned 3 times. Address: Dep. of Microbiology, School of Life Sciences, Sikkim University, Gangtok 737102, Sikkim, India.

2074. Choi, Sunchu. 2021. Oilseeds and products annual–Republic of Korea. Seoul, Korea: USDA Foreign Agricultural Service. 32 p. Report No. KS2021-0004.
• ***Summary:*** "Report Highlights:

"MY [Marketing Year] 2021/22: Korean soybean production and consumption is projected to remain mostly unchanged from the prior year, amid stagnant domestic production and flat consumer demand, following a small decline in 2020/21. 2021/22 soybean imports are also expected to hold steady, after a small in increase in 2020/21. Korea resumed the use of soybean oil in biodiesel production in 2019 and soybean oil imports are expected to rise moderately over the next few years, with expanding U.S. market share. COVID-19 has created greater demand of soybean oil to produce mayonnaise for both home consumption and home meal replacement (HMR).

"Executive Summary:

"Total domestic soybean consumption in MY 2021/22 is forecast to stay around 1.39 million MT (MMT). MY 2020/21 soybean consumption is expected to stay around 1.39 MMT, down 0.9 percent from the previous year.

"MY 2021/22 soybean imports are forecast to remain unchanged at 1.3 MMT. MY 2020/21 soybean imports are expected to increase slightly (0.7 percent) to 1.3 MMT.

"The 2021 autonomous food grade TRQ is expected for release in early March 2021.

"MY 2021/22 demand for crushing soybeans will remain flat at one MMT if crushing margins remain steady.

"MY 2021/22 soybean oil imports are forecast at 450,000 MT, up five percent from the current marketing year's estimate. In MY 2020/21, soybean oil imports are expected to increase seven percent to 430,000 MT."

Note: This 32-page USDA report is a combination of many large graphs with an explanation of the contents of each. For example, Table 1 shows soybean production in Korea from Crop Year 2013 to 2021. Area (ha), yield (kg/ha), and production (MT) are given. Production has decreased from 154,067 metric tons in 2013 to 80,926 metric tons in 2020–which is only 52% of the production in 2013.

microbial community analysis of doenjang and ganjang during fermentation..” Address: 1. Dep. of Bioscience and Biotechnology, Konkuk Univ. Seoul 05029, Korea.

2078. Kim, Il-Sup; Kim, Cheorl-Ho; Yang, Woong-Suk. 2021. Physiologically active molecules and functional properties of soybeans in human health–a current perspective (Open Access). *International J. of Molecular Sciences* 22(8):4054. April 14. 26 p. [205 ref]

• ***Summary:*** “Abstract: In addition to providing nutrients, food can help prevent and treat certain diseases. In particular, research on soy products has increased dramatically following their emergence as functional foods capable of improving blood circulation and intestinal regulation. In addition to their nutritional value, soybeans contain specific phytochemical substances that promote health and are a source of dietary fiber, phospholipids, isoflavones (e.g., genistein and daidzein), phenolic acids, saponins, and phytic acid, while serving as a trypsin inhibitor. These individual substances have demonstrated effectiveness in preventing chronic diseases, such as arteriosclerosis, cardiac diseases, diabetes, and senile dementia, as well as in treating cancer and suppressing osteoporosis. Furthermore, soybean can affect fibrinolytic activity, control blood pressure, and improve lipid metabolism, while eliciting antimutagenic, anticarcinogenic, and antibacterial effects. In this review, rather than to improve on the established studies on the reported nutritional qualities of soybeans, we intend to examine the physiological activities of soybeans that have recently been studied and confirm their potential as a high-functional, well-being food.” Address: 1. Advanced Bio-resource Research Center, Kyungpook National University, Daegu 41566, Korea.

Note: Keepwell is located in Dover, 8 miles southwest of York, Pennsylvania. The company started in early 2016. It was founded by Isaiah Billington and Sarah Conezio, who met as pastry chefs at a restaurant.

2080. Uyehara, Paul. 2021. Re: Another look at the tofu industry and market in Hawaii. Letter (e-mail) to William Shurtleff at Soyinfo Center, May 17.

• ***Summary:*** Q1. The biggest surprise for me in your last email was to learn that your main competition comes from brands of tofu made on the mainland. House Tofu (started by Mr. Shoan Yamauchi) is probably one of them.

Ans: House (Hinoichi) is our main competitor. When Mr. Yamauchi was running the company, he promised to never enter the Hawaii market (perhaps out of deference to his brother at A’ala Tofu). Once they were taken over by HouseFoods, they entered the Hawaii market immediately.

Q2. What are the main brands of tofu made on the mainland and sold in Hawaii, in descending order of importance?

Ans: I would say the following (loosely in descending order–the top two are the majority): Hinoichi (House Foods). Pulmone (A Korean brand). Azumaya. White Wave. Morinu (Morinaga) and Kikkoman (the aseptic pack tofus). Whole Foods and Don Quijote/Marukai have their own private label tofus, but probably made by the major tofu manufacturers.

Q3. What percentage of the tofu market in Hawaii would you guess these tofu brands made on the Mainland command?

Ans: Not sure, but I would guess around 70-80%. Address: President, Aloha Tofu Factory.

2081. Mao, Chi Tzeng. 2021. Re; His work with Mrs. Cheng’s Soybean Products and Toyohara Soybean Products, Inc. Letter (e-mail) to William Shurtleff at Soyinfo Center, May 19–in reply to questions.

• ***Summary:*** “First, thank you for those years you are promoting soybean products for the human consumption. It’s not only good for the global environment, but also helping the soybean related business.

“To answer your questions:

“1. We took over the business from Mr. Cheng on August 1, 1984. We moved to Hawaii from Taiwan in May, 1984.

“2. Our company’s name: Toyohara Soybean Products, Inc.

“dba Mrs. Cheng’s Soybean Products.

“3. Yes, our company is incorporated.

“4. Our products at present: Tofu (Regular Tofu, Soft Tofu and Nigari Tofu) all traditional hand-made style. Soymilk (Plain Soymilk, Maple Soymilk in a variety of sizes). Soycheese [savory baked tofu]. Special Order for: Traditional (Chinese) Tofu Pudding, Korean style Soon Tofu.

“5. About 75% of our sales go to restaurants (depends on the season).

“6. We are trying to use the highest grade ingredients as available. If the Pharmaceutical Grade in unavailable, we use Food Grade.

“7. I agree that the three largest makers of soyfoods in the Hawaiian Islands are Aloha Tofu Factory Inc., Mrs. Cheng’s Soybean Products, and A’ala Tofu Factory.

“8. The first thing I want our company to be is the most Unique, not the size or volume of sales. There were about 8 tofu manufactures in Oahu in 1984. We were the 7th or so smaller sales. The local consumption of tofu was small too. Both of us had a pharmaceutical background and working for a major medicine manufacturer for years. Food

© Copyright Soyinfo Center 2021

and medicine are related. So there is no problem for us to upgrade the equipment. For our equipment: they are special, custom design and made by the Japanese tofu machinery for us, it took more than a year from design, modify, redesign and modify so many times. We request the Tofu products keeps 'Hand Made' style, so the production isn't as fast as the mass production. That's why our products take more time and material to make. I would said we are small compared to the big guys." Address: President, Mrs. Cheng's Soybean Products.

2082. Choi, Sang Woo; Kang, Jae Eun; Lee, Seong Kyeong; Ly, Sarath; Chung, Jong Il. 2021. Breeding of black soybean with green cotyledon and four recessive alleles for lipoxygenase, Kunitz trypsin inhibitor, lectin, and stachyose (Open Access). *Agronomy* (*Basel*) 11(2):309. doi:10.3390/agronomy11020309

• ***Summary:*** "Anthocyanins from the black soybean seed coat are known to have many pharmaceutical effects. However, black soybean seed contains antinutritional factors such as lipoxygenase, Kunitz trypsin inhibitor (KTI), lectin, and stachyose. The genetic removal of these components will improve the nutritional value of black soybean seed... The soybean line with the black seed coat color, the green cotyledon color, a large seed size, and tetra recessive alleles has purple flowers, a determinate growth habit, and brown pods at maturity. The stem height of the breeding line was 52.3 cm. The 100-seed weight of the breeding line was 35.2 g and the yield (Ton/ha) was 2.50. The stachyose content of the breeding line was 3.30 g/kg. This is the first soybean strain with the black seed coat color, the green cotyledon color, a large seed size, and tetra null alleles (lox1lox2lox3/lox1lox2lox3-ti/ti-le/le-rs2/rs2, low content of stachyose, free of lipoxygenase, KTI, and lectin proteins)." Address: Dep. of Agronomy, Gyeongsang National Univ., JinJu 52828, Korea.

2083. Kim, See Hun; Kang, S.A. 2021. [Antioxidant and anti-diabetic activities of soybean fermented with *Monascus*]. *Korean J. of Food and Nutrition* 34(2):187-95. [39 ref. Kor; eng]

• ***Summary:*** "The DPPH radical scavenging activity of soybean fermented with Monascus was significantly increased compared to that of soybean... These results suggest that soybean fermented with *Monascus* has the potential to be used as a beneficial ingredient with antidiabetic and antioxidant effects."

Note: "DPPH free radical scavenging is an accepted mechanism for screening the antioxidant activity of plant extracts. In the DPPH assay, violet color DPPH solution is reduced to yellow colored product, diphenylpicryl hydrazine, by the addition of the extract in a concentration dependent manner." Address: Ph.D. Student, Dep. of Convergence Technology, Graduate School of Venture, Hoseo Univ., Seoul 06724, Korea.

2084. Spots at front of book: History of soybeans and soyfoods in Japan. 2021.

• ***Summary:*** (a) Graph of soybean production in Japan, 1878-1984. Soybean production in Japan was first recorded in 1878. From that date until its all-time peak in 1920, it climbed steadily.

In 1905, after the Russo-Japanese War (1904-05), victorious Japan, through the Treaty of Portsmouth, became the lessee of the Kwantung Leased Territory (1,337 square miles), the southernmost point of Manchuria. It contained the greater part of the southern branch of the Chinese Eastern Railway, which is now known as the South Manchuria Railway. This was Japan's first foothold on Manchuria.

In 1910 (Aug. 22) Japan annexed Korea as Chosen, a colony; this harsh domination lasted until 1945–the end of World War II.

After about 1910, Japan started to import small but steadily increasing amounts from Korea and Manchuria. These imports finally became so large that they led to a decrease in soybean production in Japan.

1931–"Manchurian Incident," also called the "Mukden Incident" took place on the night of 18 September 1931. A bomb exploded on the tracks of the Japanese railway north of Mukden. Japanese Colonel ordered a full-scale attack against the Chinese troops in Mukden, and General Honjô, hearing of the crisis, called out the whole Kwantung Army–which proceeding to take over Manchuria.

By early 1932 the conquest of all Manchuria had been completed. In March 1932 Manchuria was proclaimed an independent state named Manchukuo or Manchoukuo under the last Ch'ing ruler (P'u-yi).

The Lytton Commission of the League of Nations visited Manchuria in the spring of 1932 and condemned Japan as an aggressor. The report was adopted by the League of Nations, from which Japan withdrew in protest the following year. Japan was now in control of Manchuria, the world's greatest producer of soybeans.

1941–Japan attacks Pearl Harbor; soybean production plummets during the war. But it quickly climbed after Japan surrendered in 1945 and imports from the USA began.

2085. Spots at front of book: History of soybeans and soyfoods in Korea. 2021.

• ***Summary:*** Various maps of Korea. (a-b) Photos of kongnamul (Korean-style soybean sprouts) and kongnamul bap (soybean sprouts on rice dish). (d) Traditional Korean meju (soybean koji). (e) In Korean *k'ongaru, k'ong karu, konggaru* ("roasted soybean powder") is widely used to cover rice cakes (mochi). (f-g) It can be found at most Korean grocery stores. (h) In Indonesian *Bubuk kedele* means roasted soy flour. (i-j) Sari Bubuk Kedelai (from Indonesia). (k-l) *Bubuk kedele* as a coating for mochi (pounded rice cakes) in Indonesia. (m-n) Two views of Japanese kinako. (o) Sifting kinako. (p-q) Two bags of Shirakiku kinako from Japan. (r) Korean konggaru. (s) A Korean woman coating a food with *konggomul* (roasted whole soy flour). (t) Indonesian lontong (rice steamed in banana leaves, sliced and served topped with *bubuk kedelai*). (u-w) Kinako in Japanese hiragana. (x) Three ways of writing kinako in Japanese. (y) Kinako Latte written on a restaurant blackboard. (z) Kinako on a red tray.

2087. Spots: Soy sprouts. 2021.
• ***Summary:*** (a) Mature soy sprouts in a bamboo basket. (b) Cooked soy sprouts served with chopsticks. (c) Vigorous soy sprouts growing. (d) A bag of Korean soy sprouts. (e) Soybeans sprouting in a sprouter. (e-f) A background of soybean sprouts. (g-i) Kongnamul Korean soybean sprout dish. (k-l) More background of soy sprouts.

2088. *SoyaScan Notes.* 2021. Soyfoods historical research and writing wish list; we would strongly prefer that each of these be written in English (Overview). Compiled by William Shurtleff of Soyinfo Center.
• ***Summary:*** 1. Early history of Chinese soyfoods companies and products in America and Europe. Especially Chinese tofu manufacturers in San Francisco and Los Angeles from 1850 to 1910.

2. Statistics on soyfoods in China during the 1980s.

3. The Swedish trading mission in Canton during the 1700s and 1800s and its work with soy sauce.

4. A lengthy, scholarly history (with an extensive bibliography) of soybeans and soyfoods in China written by a Chinese.

5. A lengthy, scholarly history (with an extensive bibliography) of soybeans and soyfoods in Japan written by a Japanese.

6. A lengthy, scholarly history (with an extensive bibliography) of soybeans and soyfoods in Korea written by a Korean.

7. A history of the health foods industry in America, 1930-1980.

8. A book on mochi or how mochi came to the West, with a clear chronology of commercial mochi manufacturers in the western world.

9. A scholarly history (with an extensive bibliography) of each of the following soyfoods in Japan, written by a Japanese with a long-term involvement in the field: natto, miso, shoyu, tofu.

10. Explain why Linnaeus stated in *Hortus Cliffortianus* (1737, p. 499) that the soy bean was grown in the colony of Virginia in North America.

11. A lengthy, scholarly history (with a good bibliography) of Chinese growing and processing soybeans in California. They must have grown them between 1849 and 1899! (13 Sept. 1991)

12. Visit the best libraries and centers in Germany for doing research on soybeans and soyfoods (See #37465) and try to get missing old documents.

13. Try to document the statement that the soybean was used as a coffee substitute during the Civil War in the USA (1861-1865).

14. Use the Coker family archives in South Carolina to write a history of the company's pioneering work with the soybean.

15. A history of early experimental gardens such as those that the Portuguese developed on the Cape Verde Islands, the British at Kew, Nairobi, Singapore, and the colony of Georgia (the Trustees' Garden of Georgia, a government experimental farm at Savannah, laid out in 1733), the Spanish (under Cortez / Cortés) in today's Mexico, etc. Did soybeans appear in any of them? When did they first appear in each?

16. Learn much more about Korean natto. Did it exist in Korea before Korea became a Japanese colony? Try to find some references, as in early studies of food in Korea. How widely was it made and used? Try to find some estimates of annual production. How was it served? What was its distribution in Korea in 1900? 1950? 2000?

17. A scholarly biography of Clifford E. Clinton of Los Angeles.

18. A lengthy, scholarly history (with an extensive bibliography) of soybeans and soyfoods in the Soviet Union (USSR) written by a Russian speaker with a long and deep familiarity of the subject.

19. When and where were soybeans first grown in Iceland. Did they mature? Produce seeds. Did the first soybeans in Iceland come from Sven A. Holmberg of Sweden? Who was in charge of the soybean trials in Iceland?

2089. *SoyaScan Notes.* 2021. The languages and writing

© Copyright Soyinfo Center 2021

systems of East Asia, including Korea, China, and Japan (Overview). Compiled by William Shurtleff of Soyinfo Center.

• ***Summary:*** According to *East Asia: The Great Tradition*, by Reischauer and Fairbank (1960, p. 15-18), the two main language groups of East Asia are the Sinitic (or Sino-Tibetan, the largest group) and the Altaic. Within the Sinitic group, Chinese is by far the largest and historically the most important subdivision. The main Sinitic languages inside China are Mandarin, Wu (near Shanghai), Kan, Min (near Fukien / Fujian), Hsiang, Cantonese, Miao-Yao (southwest China), and Tibetan. Note that these are different enough from Mandarin to be considered virtually independent languages rather than dialects. Sinitic languages outside China include Burmese, Thai, Vietnamese.

The three major Altaic languages (named after the Altai Mountains in Mongolia) are Mongolian, Turkish (in the west), and Tungusic (in the far northeast). Peoples speaking Altaic languages, unlike the agriculturist Chinese, were nomads. "Korean and Japanese show close structural resemblances to the definitely Altaic languages, and the Koreans and Japanese may, therefore, be two eastern extensions of Altaic-speaking people into predominantly agricultural areas."

Concerning the Korean writing system, in the late 600s (7th century), a system called idu, using Chinese characters for phonetic purposes was developed as an aid to rendering Chinese texts into Korean. Though never extensively used, it was the beginning of Korea's native writing system. In the mid-1400s an excellent phonetic system for writing the Korean language was developed by the ruler named Sejong. Originally known as onmun ("vernacular writing") but known today as han'gul ("Korean letters") it was officially adopted by royal decree in 1446. "Han'gul is perhaps the most scientific system of writing in any country... Finally, the advantages of an alphabetic script and a syllabary (in which each symbol represents a whole syllable) are combined by bunching the individual letters into syllabic groups" (p. 435-36). [Note: the bunching makes use of a word processor more difficult than the linear alphabetic Indo-European languages]. Although han'gul was simple, it was little used during the next 5 centuries; scholars emphasized the Chinese written language. "It was not until after the liberation of Korea from Japanese rule in 1945 that han'gul came into its own as the primary method of writing in Korea."

In Japan, the development of purely phonetic scripts (called the Kana Syllabaries, hiragana and katakana) arrived in the early 800s and were attributed to Kôbô Daishi (Kûkai), Japan's most beloved and best known Buddhist saint, who founded the Shingon sect in Japan in about 806 and built his monastic headquarters atop Mt. Koya in 816. "The development of the kana was no doubt influenced by the Sanskrit studies of Buddhist monks and their knowledge of the alphabets of India. The kana, however, did not constitute alphabets but were syllabaries, in which the symbols represented whole Japanese syllables, which at that time invariably consisted of one of the five vowels (a, i, u, e, o) usually preceded but never followed by a consonant. Thus they required a minimum of 47 different symbols, instead of the 14 that would have sufficed to write 10th century Japanese with an alphabet... Thus hiragana and katakana constituted a less simple and flexible system than an alphabet would have provided."

2090. *SoyaScan Notes*. 2021. The best libraries for Asian-American studies in California (Overview). Compiled by William Shurtleff of Soyinfo Center.

• ***Summary:*** Mr. Seizo Oka of San Francisco, whose life work is writing a history of Japanese in America, has built an excellent library of documents on this subject. These archives have many early documents including America's best collection of early Japanese-American City Directories. Mr. Oka used to work for Bank of Tokyo, renamed Bank of California, and his project was part of the California First Bank History Project. The bank provided him with financial support. But they withdrew their support in late 1989, and on 15 Dec. 1989 the library had to be closed. But, with community support, it was reopened in Dec. 1990 in a new room at the same location: History Archives of the Japanese Cultural & Community Center, 1840 Sutter St., #206, San Francisco, CA 94115.

The second library is the Japanese-American Library, located at 1619 Sutter St, on Octavia & Sutter on the entire ground floor (1,500 square feet) of Hinode Towers (P.O. Box 590598, San Francisco, CA 94159. Phone: 415-567-5006). The director, Karl Matsushita, a graduate of UCLA in his mid- to late-40s, has collected for 20 years. Founded in 1969 (at the time of student demands for Ethnic Studies Programs) by Karl and a group named Center for Japanese-American Studies from Ethnic Studies Program, it became independent from the group in 1985. The library has at least 10,000 documents, lots in boxes, mostly post-war. They have no early city directories. The pre-war material is mostly in English. They have little or no information on soyfoods. They are planning to computerize the library to make it compatible with the University of California at Berkeley, Stanford, and Harvard-Yenching libraries. In the meantime they are typing 3x5 catalog cards for their documents.

Two libraries at the University of California have excellent, large collection of documents, many very early and many archival, on Chinese and Japanese in America. The Bancroft Library focuses on the far western USA. The Asian American Studies Library is more nationwide in scope. Its holdings include monographs, serials, theses and dissertations, conference papers, student research papers, and non-print media. It is the best source of Chinese-American documents in California. Many documents came from the Chinese Historical Society in San Francisco. Unfortunately

© Copyright Soyinfo Center 2021

no one on the staff can read or speak Japanese none of their Japanese-language documents can be cataloged.

A major library is found at the Asian-American Studies Center at UCLA; it is complemented by the East Asian Library at UCLA, which has mostly Asian-language materials. Hosokawa (1969) notes that "the Japanese American Citizens League, a nationwide organization of fewer than 25,000 members, launched in 1962 what was called the Japanese American Research Project. Funds were contributed by members and other interested persons and $100,000 presented to the University of California at Los Angeles. UCLA in turn undertook to seek out and preserve documentary materials and gather and analyze information relating to the Japanese Americans. Despite its modest scale this research project proved to be of sufficient academic and sociological interest that the Carnegie Corporation and the National Institute of Mental Health, a federal agency, provided grants for detailed studies into specific contributions by Japanese Americans to the American way of life." A number of independent papers, both popular and scholarly, have resulted from this project.

Another interesting group, which has no library, is the Center for Japanese-American Studies.

2091. *SoyaScan Notes.* 2021. Chronology of Korea. Compiled by William Shurtleff of Soyinfo Center.

• ***Summary:*** 1st century B.C.–Recorded history began.

688 A.D.–The country was united in a kingdom under the Silla dynasty. It was at times associated with the Chinese empire.

1592-98–Invaded by Japanese under Hideyoshi.

About 1637 shut out foreign contacts.

1876–Forced to grant treaty ports to Japan, which recognized Korean independence. 1894-95–Sino-Japanese war caused by Korea uniting with Japan in a time of internal disorder in order to resist Chinese interference (Korea was considered a Chinese vassal). The treaty that concluded this war recognized Korea's complete independence.

1904-04–Russo-Japanese War caused in part by rivalry between Russia and Japan over Korea.

1907–Became a Japanese protectorate.

1910–Japan forcibly annexed Korea as a province called Chôsen.

1945 July–At the Potsdam conference, the 38th parallel was designated as the line dividing the country into two zones of occupation: Russian in the north and American in the south.

1945 Aug. 10–Russian troops enter Korea. Aug. 15–Korea celebrates Victory over Japan Day, which liberated Korea from colonial rule. 1945 Sept. 8–U.S. Troops enter Korea. The Soviet military organizes socialists and communists and blocks efforts to let the Koreans unite their country.

1948 May 1–North Korea declares independence. The Democratic People's Republic of Korea founded in north Korea; its capital is P'yongyang. 1948 May–The South Koreans declare independence and form the Republic of Korea with Seoul as the capital. Dr. Syngman Rhee is chosen president. 1948 Aug. 15. South Korea gains independence. Freed from Japanese control upon defeat of Japan at the end of World War II.

1950 June 25–Over 60,000 North Korean troops invade South Korea in a surprise attack, starting the Korean War. The North is the stronger state, both industrially because of its mineral and hydro-power resources, and militarily because of Soviet armament for offensive warfare. The attack is immediately condemned by the United Nations Security Council. June 27–The U.S. under president Truman, backed by the United Nations Security Council, sends in Air Force and Naval troops under the unified command of General Douglas MacArthur. Troops from many countries in the United Nations join the fight. June 30–Truman approves air and ground strikes against the north.

1950 Sept. 15–General Douglas MacArthur launches a surprise amphibious invasion of Korea at Inchon, South Korea, behind the North Korean Army's lines. The battle of Inchon resulted in a decisive victory and strategic reversal in favor of the United Nations (UN). The operation involved some 75,000 troops and 261 naval vessels, and led to the recapture of the South Korean capital, Seoul, two weeks later.

1951 April 11–General MacArthur's increasingly public disagreement with the fixed American policy of no more than a limited war led to his dismissal by President Truman. 1951 July–Truce talks begin at Panmunjom, but drag on for 2 years (due to Stalin's stalling tactics) while sporadic fighting continues.

1953 July 27–After 3 years of fighting, an armistice is signed. A closed border at about the 38th parallel is established. U.S. troops remain in the south, and U.S. economic and military aid are continued. War casualties were: Chinese about 900,000, North Korean 520,000, South Korean 300,000, American 142,000 (the 4th largest in U.S. history).

1960 April 26–A movement spearheaded by college students forces the resignation of president Syngman Rhee in South Korea.

1961 May 16–In an army coup, General Park Chung Hee becomes chairman of the ruling junta. In 1963 he is elected president. A 1972 referendum allows him to be reelected for 6-year terms unlimited times. 1979 Oct. 26–Park is assassinated by the chief of the Korean CIA.

2092. *SoyaScan Notes.* 2021. Definition of soy sprouts (Overview). Compiled by William Shurtleff of Soyinfo Center.

• ***Summary:*** Soy sprouts (also called soybean sprouts) are whole soybeans that have been soaked in water and allowed

© Copyright Soyinfo Center 2021

to sprout or germinate for 4 to 7 days, at which point a 3-to-5-inch-long sprout (hypocotyl) will be attached to each bright yellow soybean. Soy sprouts are easily grown at home at any time of year. Though not as popular or widely available in the United States as mung bean sprouts or alfalfa sprouts (except at Korean-American grocery stores), soy sprouts are nevertheless an excellent source of nutrition, packed with protein, vitamin C, and isoflavones. They are also one of the world's best diet foods, containing less calories per gram of protein than any other known vegetable food. Soy sprouts must be cooked before serving. Try using them as a green vegetable year-round, parboiled in fresh salads or soups, or in stir-fried, sauteed, or baked dishes. Address: Soyinfo Center.

An asterisk (*) at the end of the record means that SOYINFO CENTER does not own that document. A plus after eng (eng+) means that SOYINFO CENTER has done a partial or complete translation into English of that document. An asterisk in a listing of number of references [23* ref] means that most of these references are not about soybeans or soyfoods.

544, 558, 683, 684, 709, 755, 844, 947, 1029, 1107, 1182, 1209, 1260, 1273, 1282, 1338, 1501, 1535, 1567, 1598, 1600, 1627, 1628, 1707, 1709, 1744, 1747, 1755, 1768, 1811, 1926, 1945, 1969, 2010, 2058, 2064, 2082

Soybean Seeds–Black in Color. Used as Food (Including in Fermented Black Soybeans and Inyu), Beverage, Feed, or Medicine, or Their Nutritional Value 77, 114, 141, 170, 210, 211, 216, 453, 531, 539, 636, 784, 786, 833, 1066, 1071, 1119, 1155, 1192, 1359, 1402, 1445, 1546, 1608, 1779, 1939, 2038

Soybean Seeds–Brown in Color. Especially Early Records 38, 46, 77, 83, 109, 114, 130, 149, 167, 168, 222, 231, 264, 397, 412, 431, 461, 531, 1209, 1260

Soybean Seeds–Green in Color. Food Use is Not Mentioned. Early Named Varieties Include Aoda, Columbia, Giant Green, Guelph or Medium Green, Medium Early Green, Medium Green, Samarow, Sonoma, and Tashing 1, 28, 45, 46, 53, 77, 83, 96, 97, 109, 110, 111, 114, 149, 167, 168, 184, 215, 216, 222, 230, 231, 234, 264, 266, 431, 450, 461, 531, 844, 1209, 1260

Soybean Seeds–Green in Color. Used as Food, Beverage, Feed, or Medicine, or Their Nutritional Value 77, 755

Soybean Seeds–Mottled, Speckled, Spotted, Striped, Banded, Flecked, Variegated, or Bicolored 77, 109, 130, 149, 167, 211, 531

Soybean Seeds–White in Color 1, 45, 53, 68, 77, 110, 111, 184, 189, 234

Soybean Seeds–Yellow in Color. Including Yellowish White, Cream Colored, and Pale (*Pallida*). Especially Early Records. See also: Soybean Seeds–White 1, 26, 45, 46, 55, 68, 77, 83, 85, 93, 96, 97, 109, 110, 111, 112, 114, 127, 130, 147, 149, 154, 167, 168, 210, 211, 215, 216, 222, 230, 231, 234, 264, 266, 359, 394, 395, 396, 397, 410, 412, 428, 431, 438, 452, 453, 461, 462, 468, 470, 531, 844, 947, 1209, 1338, 1768

Soybean–Taxonomy / Classification 22, 24, 95, 109, 116, 229, 305, 608, 888, 945, 1358

Soybean Varieties Canada–Harosoy 755, 1278, 1817, 1857

Soybean Varieties Canada–Harovinton–Large-Seeded and / or Vegetable-Type 1312, 1535

Soybean Varieties Canada–O.A.C. 211–Early Development 456, 1209, 1501

Soybean Varieties Canada–Quebec No. 92–Early Development 175, 456

Soybean Varieties Europe–Gelbe Riesen (“Yellow Giant” / Giant Yellow)–Early Introduction 83, 1260

Soybean Varieties USA–Acme–Early Introduction 109, 755, 1260

Soybean Varieties USA–Agate–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 531, 534, 686, 1107, 1209

Soybean Varieties USA–A.K.–Early Introduction 359, 360, 508, 686, 741, 844, 1031, 1252, 1338

Soybean Varieties USA–Aksarben–Early Introduction 264, 412, 431, 461, 462, 1209

Soybean Varieties USA–Amherst–Early Introduction 1260

Soybean Varieties USA–Aoda–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 531, 534, 686, 1107, 1209, 1535

Soybean Varieties USA–Arlington–Early Introduction 231, 264, 397, 844, 1209

Soybean Varieties USA–Auburn–Early Selection (1907) 109, 123, 1260

Soybean Varieties USA–Austin–Early Introduction 85, 109, 123, 222, 264, 412, 844, 1209

Soybean Varieties USA–Baird–Early Introduction 83, 1260

Soybean Varieties USA–Bakaziro / Bakajiro–Early Introduction. Renamed Amherst by May 1907 53

Soybean Varieties USA–Bansei–Large-Seeded and / or Vegetable-Type 418, 423, 431, 453, 456, 461, 462, 531, 534, 1107, 1209

Soybean Varieties USA–Barchet–Early Introduction 109, 154, 215, 216, 222, 231, 264, 431, 461, 462, 844, 1209

Soybean Varieties USA–Best Green–Early Introduction. Renamed Hope by 1910 53

Soybean Varieties USA–Biloxi–Early Introduction 154, 222, 230, 231, 264, 270, 373, 397, 431, 456, 461, 462, 544, 844, 947, 1209, 1260, 1338, 1501

Soybean Varieties USA–Black–Early Introduction. Renamed Buckshot by May 1907 211

Soybean Varieties USA–Black Eyebrow–Early Introduction 154, 204, 215, 216, 231, 264, 270, 359, 360, 431, 461, 462, 844, 1209

Soybean Varieties USA–Black Round–Early Introduction 53

Soybean Varieties USA–Brindle–Early Introduction 109, 1260

Soybean Varieties USA–Brooks–Early Introduction 109, 1260

Soybean Varieties USA–Brown–Early Introduction 264

Soybean Varieties USA–Brownie–Early Introduction 83, 1260

Soybean Varieties USA–Buckshot–Early Introduction 83, 109, 229, 270, 1260

Soybean Varieties USA–Butterball–Early Introduction 83, 109, 229, 270, 1260

Soybean Varieties USA–Chame–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 1260, 1535

Soybean Varieties USA–Chernie–Early Introduction 109, 264, 431, 461, 462, 1260

Soybean Varieties USA–Cherokee–Large-Seeded and / or Vegetable-Type 1107, 1209, 1535

Soybean Varieties USA–Chestnut–Early Selection (1907) 109, 123, 164, 172, 264, 270, 431, 461, 462, 536, 844, 1209, 1501

Soybean Varieties USA–Chiquita–Early Introduction 154, 222, 230, 231, 264, 270, 397, 431, 461, 462, 1260

Soybean Varieties USA–Chusei–Large-Seeded and / or Vegetable-Type 418, 423, 431, 453, 461, 462, 1107, 1209

Soybean Varieties USA–Cloud–Early Introduction 109, 844, 1209

Soybean Varieties USA–Columbia / Columbian–Early Introduction 264, 270, 397, 431, 461, 462, 844, 1209

Soybean Varieties USA–Delsoy–Large-Seeded and / or Vegetable-Type 470, 1107, 1209, 1535

Soybean Varieties USA–Disoy–Large-Seeded and / or Vegetable-Type 755, 1107, 1353, 1535

Soybean Varieties USA–Duggar–Early Introduction 123, 1260, 1501

Soybean Varieties USA–Dunfield–Early Introduction 264, 359, 360, 397, 412, 418, 427, 431, 461, 462, 474, 534, 683, 684, 741, 844, 1031, 1209, 1338

Soybean Varieties USA–Early Brown–Early Introduction 109, 222, 231, 264, 397, 1260

Soybean Varieties USA–Early Green–Early Introduction 264, 431

Soybean Varieties USA–Early Yellow–Early Introduction. Renamed Ito San by about 1902 167, 264, 431

Soybean Varieties USA–Easycook / Easy Cook–Early Introduction. Large-Seeded and/or Vegetable-Type 222, 264, 397, 418, 423, 431, 453, 461, 462, 544, 558, 844, 1209, 1535

Soybean Varieties USA–Ebony–Early Introduction 67, 109, 231, 264, 270, 359, 360, 418, 431, 461, 462, 844, 1209

Soybean Varieties USA–Eda–Early Introduction 109, 229, 270, 1260

Soybean Varieties USA–Eda Mame–Early Introduction. Renamed Ito San by 1910 427

Soybean Varieties USA–Edna–Early Introduction 1260

Soybean Varieties USA–Edward–Early Introduction 109, 1260

Soybean Varieties USA–Elton–Early Introduction 109, 222, 264, 431, 461, 462, 844, 1209

Soybean Varieties USA–Emerald–Large-Seeded and / or Vegetable-Type 1353, 1535

Soybean Varieties USA–Emperor–Large-Seeded and / or Vegetable-Type 428, 453, 461, 544, 1107, 1209

Soybean Varieties USA–Etum or Eatum–Large-Seeded and / or Vegetable-Type 453, 461, 462, 1107, 1209, 1857

Soybean Varieties USA–Fairchild–Early Introduction 1260

Soybean Varieties USA–Farnham–Early Introduction 109, 1260

Soybean Varieties USA–Flat King–Early Introduction 109, 1260

Soybean Varieties USA–Flava–Early Selection (1907) 109, 1260

Soybean Varieties USA–Fuji–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 1107, 1209

Soybean Varieties USA–Funk Delicious–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 531, 534, 1209, 1535

Soybean Varieties USA–Gardensoy–Large-Seeded and / or Vegetable-Type 1694, 1828, 1857

Soybean Varieties USA–German Coffee Berry–Early Introduction. Renamed Ito-San by about 1902 50

Soybean Varieties USA–Giant Green–Large-Seeded and / or Vegetable-Type 453, 462, 468, 686, 1209, 1535

Soybean Varieties USA–Goku–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 686, 1107

Soybean Varieties USA–Gosha–Early Introduction. Renamed Manhattan by May 1907 53

Soybean Varieties USA–Grande–Large-Seeded and / or Vegetable-Type 1353, 1535

Soybean Varieties USA–Green and Black–Large-Seeded and / or Vegetable-Type 450, 453, 1107, 1209

Soybean Varieties USA–Green–Early Introduction 264

Soybean Varieties USA–Green Medium–Early Introduction. Renamed Guelph by May 1907 53

Soybean Varieties USA–Guelph–Early Introduction 109, 154, 215, 216, 222, 229, 230, 231, 264, 270, 412, 431, 844, 1209

Soybean Varieties USA–Habaro–Early Introduction. Also spelled “Habara” in Canada 123, 264, 412, 431, 461, 462, 534, 683, 684, 844, 1209, 1501

© Copyright Soyinfo Center 2021

Soybean Varieties USA–Haberlandt–Early Introduction 68, 77, 109, 154, 215, 222, 231, 264, 270, 359, 360, 397, 412, 423, 431, 461, 462, 534, 544, 558, 755, 844, 947, 1031, 1209, 1338

Soybean Varieties USA–Hahto–Early Introduction. Large-Seeded and / or Vegetable-Type 215, 216, 222, 230, 231, 264, 270, 397, 418, 423, 431, 453, 461, 462, 544, 844, 1209

Soybean Varieties USA–Hakote–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 1107, 1209

Soybean Varieties USA–Hamilton–Early Introduction 264, 270, 359, 1260

Soybean Varieties USA–Hankow–Early Introduction 1260

Soybean Varieties USA–Hansen–Early Introduction 1260

Soybean Varieties USA–Higan–Large-Seeded and / or Vegetable-Type 418, 423, 431, 453, 461, 462, 1107, 1209, 1338

Soybean Varieties USA–Hiro–Large-Seeded and / or Vegetable-Type 350, 423, 431, 453, 461, 462, 1260, 1535

Soybean Varieties USA–Hokkaido–Large-Seeded and / or Vegetable-Type 350, 395, 418, 423, 431, 453, 461, 462, 531, 534, 641, 642, 1107, 1209

Soybean Varieties USA–Hollybrook–Early Introduction 83, 109, 154, 215, 216, 222, 231, 264, 397, 431, 461, 462, 544, 844, 1209

Soybean Varieties USA–Hongkong / Hong Kong–Early Introduction 264, 431, 461, 462, 534, 844, 1209

Soybean Varieties USA–Hoosier–Early Introduction 264, 270, 431, 461, 462, 844, 1209

Soybean Varieties USA–Hope–Early Selection (1905) 109, 1260

Soybean Varieties USA–Hurrelbrink–Early Introduction 359, 431, 461, 462, 1209

Soybean Varieties USA–Illington–Large-Seeded and / or Vegetable-Type 453, 1209

Soybean Varieties USA–Imperial–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 544, 558, 1107, 1209, 1535

Soybean Varieties USA–Indiana Hollybrook–Early Development 264, 431

Soybean Varieties USA–Ito San–Early Introduction. Synonyms–Medium Early Yellow, Early White, Early Yellow, Kaiyuski Daizu, Kiyusuki Daidzu, Kysuki, Yellow Eda Mame, Dwarf Early Yellow, Early, Eda Mame, Coffee Berry 83, 109, 123, 154, 204, 215, 216, 222, 229, 230, 231, 238, 264, 266, 270, 359, 360, 397, 412, 431, 461, 462, 1260

Soybean Varieties USA–Jackson–Large-Seeded and / or Vegetable-Type 453, 755, 1107, 1535

Soybean Varieties USA–Jefferson–Large-Seeded and / or Vegetable-Type 451, 453, 1107, 1209

Soybean Varieties USA–Jet–Early Introduction 231, 264, 1260

Soybean Varieties USA–Jogun–Large-Seeded and / or Vegetable-Type 394, 418, 423, 431, 453, 461, 531, 534, 544, 558, 686, 1107, 1209

Soybean Varieties USA–Kahala–Large-Seeded and / or Vegetable-Type 1535

Soybean Varieties USA–Kaikoo–Large-Seeded and / or Vegetable-Type 1535

Soybean Varieties USA–Kailua–Large-Seeded and / or Vegetable-Type 1535

Soybean Varieties USA–Kanrich–Large-Seeded and / or Vegetable-Type 755, 1098, 1107, 1353

Soybean Varieties USA–Kanro–Large-Seeded and / or Vegetable-Type 395, 418, 423, 431, 453, 456, 461, 462, 531, 534, 1107, 1209, 1338

Soybean Varieties USA–Kanum–Large-Seeded and / or Vegetable-Type 452, 453, 461, 462, 1107, 1209

Soybean Varieties USA–Kentucky A–Early Selection 1260

Soybean Varieties USA–Kim–Large-Seeded and / or Vegetable-Type 755, 1353

Soybean Varieties USA–Kingston–Early Introduction 109, 229, 270, 412, 844, 1209

Soybean Varieties USA–Kura–Large-Seeded and / or Vegetable-Type 418, 423, 431, 453, 461, 462, 1107, 1209

Soybean Varieties USA–Laredo–Early Introduction 222, 264, 270, 272, 359, 373, 397, 418, 431, 461, 462, 534, 947, 1209, 1338, 1501

Soybean Varieties USA–Large Black–Early Introduction 536

Soybean Varieties USA–Lexington–Early Introduction 154, 231, 264, 270, 397, 431, 461, 462, 1209, 1501

Soybean Varieties USA–Lowrie–Early Selection (1908) 109, 1260

Soybean Varieties USA–Magna–Large-Seeded and / or Vegetable-Type 755, 1107, 1353

Soybean Varieties USA–Mammoth Brown–Early Introduction 264, 412, 431, 461, 462, 1260

Soybean Varieties USA–Mammoth–Early Introduction 109, 147, 154, 215, 216, 222, 229, 230, 231, 264, 412, 558

Soybean Varieties USA–Mammoth Yellow–Early Introduction 147, 154, 156, 159, 160, 161, 264, 266, 270, 359, 397, 412, 431, 461, 462, 534, 844, 947, 1209, 1338

Soybean Varieties USA–Manchu–Early Introduction 154, 204, 215, 216, 222, 231, 264, 270, 272, 359, 360, 373, 397, 418, 427, 431, 456, 461, 462, 534, 683, 684, 741, 844, 1031, 1209, 1338

Soybean Varieties USA–Manchuria–Early Introduction 264, 844, 1209

Soybean Varieties USA–Mandarin–Early Introduction 204, 222, 264, 270, 412, 418, 431, 456, 461, 462, 508, 534, 683, 684, 741, 844, 1031, 1209, 1338

Soybean Varieties USA–Manhattan–Early Introduction 1260

Soybean Varieties USA–Medium Green–Early Introduction 109, 229, 230, 264, 266, 270, 431, 461, 462, 844, 1209

Soybean Varieties USA–Medium Yellow–Early Selection (1905). Renamed Midwest by 1923 109, 154, 215, 216, 222, 231, 264, 412, 431

Soybean Varieties USA–Mendota–Large-Seeded and / or Vegetable-Type 468, 531, 534, 1107, 1209, 1535

Soybean Varieties USA–Merko–Early Introduction 109, 264, 1260

Soybean Varieties USA–Merrimax–Large-Seeded and / or Vegetable-Type 1353

Soybean Varieties USA–Meyer–Early Introduction 109, 123, 130, 272, 1260

Soybean Varieties USA–Midwest–Early Introduction 231, 264, 270, 359, 360, 397, 431, 461, 462, 844, 1209

Soybean Varieties USA–Mikado–Early Development 222, 231, 264, 270, 1260

Soybean Varieties USA–Minsoy–Early Introduction 264, 270, 412, 431, 461, 462, 534, 844, 1209

Soybean Varieties USA–Mokapu Summer–Large-Seeded and / or Vegetable-Type 1535

Soybean Varieties USA–Mongol–Early Introduction 164, 172, 264, 397

Soybean Varieties USA–Morgan–Early Introduction 1260

Soybean Varieties USA–Morse–Early Introduction 222, 264, 270, 431, 461, 844, 1209, 1501

Soybean Varieties USA–Nanda–Large-Seeded and / or Vegetable-Type 396, 423, 431, 453, 461, 462, 544, 558, 1107, 1209

Soybean Varieties USA–Natsu–Early Introduction 1260

Soybean Varieties USA–Nemo–Early Introduction 1260

Soybean Varieties USA–Nielsen–Early Selection 1260

Soybean Varieties USA–Nigra–Early Introduction 222, 1260

Soybean Varieties USA–Nuttall–Early Introduction 1260

Soybean Varieties USA–Ogemaw / Ogema–Early Development. Synonym–Dwarf Brown (Morse 1948) 83, 109, 229, 264, 266, 270, 431, 461, 462, 1209

Soybean Varieties USA–Ohio 9035–Early Development. Renamed Hamilton by 1923 264, 359

Soybean Varieties USA–Okute / O'kute / O'Kute–Early Introduction 1260

Soybean Varieties USA–Osaya–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 1107, 1209

Soybean Varieties USA–Otootan / O-too-tan–Early Introduction 264, 270, 397, 418, 431, 461, 462, 534, 539, 544, 558, 844, 947, 1209, 1260, 1338

Soybean Varieties USA–Peking / Pekin–Early Selection (1907) 109, 123, 154, 215, 216, 222, 230, 231, 264, 270, 359, 360, 397, 412, 418, 431, 461, 462, 539, 844, 1209, 1501

Soybean Varieties USA–Perley's Mongol–Early Selection (1912) 264

Soybean Varieties USA–Pingsu–Early Introduction 109, 1260

Soybean Varieties USA–Pinpu–Early Introduction 264, 431, 461, 462

Soybean Varieties USA–Prize–Large-Seeded and / or Vegetable-Type 755, 1107, 1353

Soybean Varieties USA–Protana–Specialty, High Protein 1535

Soybean Varieties USA–Proto–Specialty, High Protein 1353, 1535

Soybean Varieties USA–Provar–Specialty, High Protein 1353, 1535

Soybean Varieties USA–Riceland–Early Introduction 109, 1260

Soybean Varieties USA–Rokugatsu–Early Introduction 53

Soybean Varieties USA–Rokusun–Large-Seeded and / or Vegetable-Type 418, 423, 431, 453, 461, 462, 686, 755, 1107, 1209, 1535

Soybean Varieties USA–Sac–Large-Seeded and / or Vegetable-Type 453, 531, 534, 556, 686, 1107, 1209

Soybean Varieties USA–Samarow–Early Introduction 83, 109, 229, 412, 1260

Soybean Varieties USA–Sanga–Large-Seeded and / or Vegetable-

Type 1209, 1535

Soybean Varieties USA–Saskatoon–Early Introduction 1260

Soybean Varieties USA–Sato–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 686, 1107, 1209

Soybean Varieties USA–Sedo–Early Introduction 109, 1260

Soybean Varieties USA–Seminole–Large-Seeded and / or Vegetable-Type 453, 461, 462, 531, 534, 1107, 1209, 1535

Soybean Varieties USA–Shanghai–Early Introduction 154, 264

Soybean Varieties USA–Sherwood–Early Introduction 1260

Soybean Varieties USA–Shingto–Early Introduction 109, 123, 844, 1209

Soybean Varieties USA–Shiro–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 1107, 1209

Soybean Varieties USA–Sioux–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 1107, 1209, 1535

Soybean Varieties USA–Sooty–Early Selection 264, 270, 431, 461, 462, 1209

Soybean Varieties USA–Sousei–Large-Seeded and / or Vegetable-Type 418, 423, 431, 453, 461, 462, 686, 1107, 1209

Soybean Varieties USA–Southern Prolific–Early Introduction 55, 264, 270, 431, 461, 462, 1260

Soybean Varieties USA–Soysota–Early Introduction 264, 270, 431, 461, 462, 844, 1209

Soybean Varieties USA–Stuart–Early Introduction 1260

Soybean Varieties USA–Suru–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 1260, 1535

Soybean Varieties USA–Swan–Early Introduction 109, 1260

Soybean Varieties USA–Taha–Early Introduction 109, 1260

Soybean Varieties USA–Tarheel Black / Tar-Heel Black / Tar Heel Black–Early Introduction 222, 264, 270, 397, 431, 461, 462, 844, 1209

Soybean Varieties USA–Tarheel / Tar Heel / Tar-Heel–Early Introduction. Renamed Tarheel Black by May 1915 231, 264, 270

Soybean Varieties USA–Tashing–Early Introduction 109, 1260

Soybean Varieties USA–Tastee–Large-Seeded and / or Vegetable-Type 453, 461, 462, 1107, 1209, 1857

Soybean Varieties USA–Toku–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 1107, 1209

Soybean Varieties USA–Tokyo / Tokio–Early Introduction 109, 154, 215, 216, 222, 231, 264, 270, 397, 423, 431, 461, 462, 534, 741, 844, 947, 1031, 1209, 1338

Soybean Varieties USA–Tortoise Egg–Large-Seeded and / or Vegetable-Type 686, 1209

Soybean Varieties USA–Trenton–Early Introduction 1260

Soybean Varieties USA–Verde–Large-Seeded and / or Vegetable-Type 755, 1107, 1353, 1535

Soybean Varieties USA–Vinton 81–Large-Seeded and / or Vegetable-Type 1353, 1445, 1449, 1535

Soybean Varieties USA–Vinton–Large-Seeded and / or Vegetable-Type 1085, 1308, 1353, 1415, 1535

Soybean Varieties USA–Vireo–Early Introduction 109, 1260

Soybean Varieties USA–Virginia–Early Selection (1907) 123, 154, 215, 216, 222, 230, 231, 264, 270, 272, 313, 321, 333, 359, 360, 373, 397, 412, 418, 427, 431, 461, 534, 1209, 1501

Soybean Varieties USA–Waseda–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 1107, 1209

Soybean Varieties USA–Wea–Early Introduction 264, 270, 431, 461, 462, 844, 1209

Soybean Varieties USA–White Eyebrow–Early Introduction 264, 534, 1260

Soybean Varieties USA–Willomi–Large-Seeded and / or Vegetable-Type 423, 431, 453, 461, 462, 1107, 1209, 1535

Soybean Varieties USA–Wilson–Early Introduction 109, 154, 156, 157, 158, 170, 215, 216, 264, 270, 333, 359, 360, 427, 431, 461, 462, 534, 539, 844, 1209, 1501

Soybean Varieties USA–Wilson-Five / Wilson Five / Wilson 5 / Wilson-5 / Wilson V–Early Selection (1912) 215, 216, 222, 231, 264, 270, 359, 397, 412, 418, 431, 461, 462, 1209

Soybean Varieties USA–Wisconsin Black–Early Introduction 222, 264, 270, 418, 431, 461, 462, 844, 1209

Soybean Varieties USA–Wolverine–Large-Seeded and / or Vegetable-Type 453, 686, 1107, 1209

Soybean Varieties USA–Yellow–Early Introduction 211, 264

Soybean Varieties USA–Yellow Marvel–Large-Seeded and / or Vegetable-Type 453, 1209

Soybean Varieties USA–Yokoten / Yokotenn–Early Introduction 264, 270, 431, 461, 462
