The subsection titled "Seed treatment" (p. 193) states: "Seed treatment with a fungicide is not recommended as a general practice when seed with high germination is planted. Stands may be increased by seed treatment when seed having a germination of 85 per cent is planted. Although seed treatment seldom results in increased seed yields,... the improved stands resulting from seed treatment aid in giving soybeans a competitive advantage with weeds. Studies by Howard W. Johnson *et al.* (1954) show that seed may be treated at any time between harvest and planting with equal effectiveness. The most satisfactory time for treating seed would be as it is cleaned. The materials Arasan, Captan, and Spergon have proved to be most satisfactory for treatment of soybean seed. Before any lot of seed is treated, it may be a good practice to check the germination with and without the fungicide to determine the beneficial effect of seed treatment on each seed lot."

The section titled "Harvesting methods: Historical" (p. 219) states: "The earliest harvester designed specifically for soybeans was a two-wheeled, horse-drawn machine which straddled the bean row (Piper & Morse, 1923, p. 94). This special harvester was common in Virginia and North Carolina, but was never commonly used in the North Central States. Harvesting losses ranged from 20 per cent under favorable conditions to as high as 60 per cent under unfavorable (Sjogren, 1939). In small-grain growing areas, the binder and thresher were adapted for soybean harvest. Harvest losses for using the binder or mower for cutting and then threshing ranged from 16 to 35 per cent of the total yield, with an average loss of 24 per cent (Sjogren, 1939).

"The combine harvester was first used for soybeans in the mid-twenties. The combine harvester has been a major factor in the expansion of soybean production. This machine required less labor than earlier methods and was more efficient."

Note: This book chapter is quite similar to an article with the same title by the same authors published in *Advances in Agronomy* 14:359-412 (1962). Address: 1. Agronomist-in-charge, U.S. Regional Soybean Lab., Crops Research Div., ARS USDA, Urbana, Illinois; 2. Research Agronomist, U.S. Regional Soybean Lab., ARS USDA, Stoneville, Mississippi.

625. Sim, K.S. 1964. [Studies on the antifungal activity of capsaicin for Ganjang soy sauce]. *Yakhakhoe Chi* (*J. of the Pharmaceutical Society of Korea*) 8(3):69-73. Sept. [Kor]*
• ***Summary:*** Cayenne pepper has been used traditionally as a hot seasoning and an antifungal agent in Ganjang soysauce in Korea. However the correlation between its components and antifungal activity has been unknown. Capsaicin is known as a hot component of cayenne pepper. Antifungal activity of capsaicin in Ganjang soy sauce was studied and the results are as follows: (1) In Ganjang soy sauce, antifungal activity of capsaicin is as strong as butyl-p-hydroxybenzoate.

(2) Antifungal activity of capsaicin was intensified by the addition of sodium chloride.

(3) The antifungal activity of capsaicin was increased by the lower pH (pH 5.5-4.5) of Ganjang soy sauce.

Note: This is the earliest English-language document seen (May 2021) that contains the word "Ganjang." It appears in the English-language summary of the article. Address: College of Pharmacy, Seoul National Univ., Seoul, Korea.

626. *Foreign Agriculture* (*USDA Foreign Agricultural Service*). 1964. USDA promotes soy beverage, defatted grits in test project. 2(48):10. Nov. 30.
• ***Summary:*** A pilot project to test the consumer acceptance of U.S. defatted soy grits and soy beverage products will get underway within the next 3 months with the distribution of 7,500 tons to consumers in six foreign countries. Main participants will be Brazil, Hong Kong, India, Korea, the Philippines, and Taiwan.

629. Aykroyd, Wallace R.; Doughty, Joyce. 1964. Legumes in human nutrition. *FAO Nutritional Studies* No. 19. xi + 138 p. Reissued by FAO in 1982 (152 p.). [119 ref]
• ***Summary:*** Contents: Preface. Introduction. History of legumes. Production and consumption. Composition and nutritive value. Methods of processing and cooking: Soybean preparations in East Asia (p. 48-52)–Germination (sprouted soybeans), soybean curd (tofu, incl. *chou tofu* or "stinking soybean curd"), soy sauce (shoyu), soybean paste (miso), tempeh, natto, hamanatto, soybean "milk," fermented preparations from groundnuts. Groundnut flour.

Effects of processing on nutritive value: Soaking, decortication, heating, germination, fermentation (mentions tempeh), effects of storage.

Toxic substances. Legume proteins. Observations on the value of legumes in human feeding. The place of legumes in human diets. Appendixes: (1) Legumes eaten by man. (2) Nutritive value of important legumes. (3) Amino acid content of legumes. (4) Account of lathyrism in central India by General Sleeman. (5) Bibliography of soybean (11 references). Some legume recipes. References.

Soybeans are also mentioned on: Page 15: Table 1, "Important legumes." Page 23: Indonesia, soybean curd, soy sauce, tempeh. Pages 23-24: Japan, miso, shoyu, natto, tofu, Korea, Taiwan. Pages 39-40: Carbohydrates in soybeans include "galactans, pentoses, and hemicelluloses which are poorly utilized." Fats: only the groundnut and soybean are important sources of it.

Page 55: Heating and trypsin inhibitor, methionine and cystine, raw unheated soybean meal, saridele. Page 58: fermentation, tempeh, PER. Pages 75-76: Protein values.

Page 81: Dean used soybeans to treat a protein deficiency. Page 84: Soybeans in India. Page 97: Soybean curd.

Appendix 1, titled "Legumes eaten by man" (p. 101-14), lists the various legumes by their Latin names. The entry for *Psophocarpus tetragonolobus* gives its vernacular names as "Goa bean, asparagus pea, winged pea, winged bean, sesquidillas."

Note: This is the earliest English-language document seen (Aug. 2007) that uses the word "sesquidillas" to refer to the winged bean. Address: 1. Dep. of Human Nutrition, London School of Hygiene and Tropical Medicine; Former Director, Nutrition Div., FAO, Rome, Italy.

630. Choy, Jung Suck (Mrs.). 1964. The art of Oriental cooking. Los Angeles, California: The Ward Ritchie Press. xi + 156 p. Introduction by Dr. Lee Wok Chang. Illust. Index. 18 x 18 cm.
• ***Summary:*** Contents: Introduction. Korean food. Chinese food. Japanese food. Shopping guide for Oriental ingredients (1 p., with emphasis on the names and address of stores selling Oriental foods). For each category of food (such as Soup) and for each recipe, the name in English is given first, followed by the Asian name in parentheses. ½ to 1 teaspoon "monosodium glutamate" is called for in many recipes. Likewise "soy sauce" is used in many recipes.

Note 1. The index to this book is not a typical index. For example, although "bean curd" is called for in many recipes,

© Copyright Soyinfo Center 2021

it does not appear in the index. So one must read the entire book and all the ingredients in each recipe to find which recipes call for bean curd.

Note 2. The book has an unusually heavy emphasis on animal foods–meat, chicken, fish, shellfish, and eggs. Did people in Korea, China, and Japan really eat like this in 1964?

In Korean, bean curd is called dubu or do-bu (p. 13); bean curd is also called for on pages 45, 50, 54, 125, 136, 137, 138 Other ingredients used: Miso, p. 125. Red beans [azuki], p. 63.

Recipes include: Fish teriyaki, p. 134. Sukiyaki, p. 136. Mizu-taki, p. 137-38. Beef teriyaki, p. 140-41. Pork teriyaki, p. 141.

The shopping guide mentions: Bean curds. Chinese black beans [fermented black soybeans]. Miso. Monosodium glutamate. Sesame seeds. Sesame oil. Soy sauce.

Note: The author was born and raised in Korea. She and her husband joined the faculty of Seoul National University in 1947; she taught home economics. Since 1950 in the United States, she has been giving courses on Oriental cooking to various social and church groups. Address: Berkeley, California.

Address: Seoul, South Korea.

632. Kim, Ze-Uook. 1965. [Studies on peptides during soybean koji preparation. III. Amino acid sequence of oligopeptides formed during soybean-koji preparation]. *J. of the Korean Agricultural Chemical Society* 6:107-17. April 20. [23 ref. Kor; eng]

• ***Summary:*** "(1) In order to study the specificity of *Aspergillus soya* protease to soybean protein, as well as the types of peptides formed during soybean-koji preparation the amino acid sequence for the di & tripeptide and N-terminal amino acid residue and C-terminal amino acid residue were identified. As the results of the study, the following were obtained. Gly, Glu. Ala. Ser. Glu. Ser. Ala. Val (Cys, Glu, Ser, Ala, Arg, Try, Leu or Ileu) Asp. Phe (His, Arg, Cys, Asp, Ser, Ala, Leu or Ileu) Glu. Ala (Cys, Gly, Met) Glu. Ala (Asp, Glu,) Gly. Met (Asp, Glu, Ala, Tyr, Leu or Ileu, Lys,) Gly. Leu or Ileu (His, Asp, Glu, Gly, Ser, Lys, Thr, Phe,) Cys. Gly (Asp, Tyr,) Glu. Pro (Asp, Glu, Ser, Gly, Thr, Ala, Val, Leu or Ileu) Try. Ser (Gly, Glu, Arg, Ala, Met, Leu or Ileu,) Asp. Met (Asp, Glu, Ala, Try, Pro, Leu or Ileu,) His Thr (Ser, Gly, Tyr, Pro, Leu or Ileu,) Glu. Gly (Asp, Ala, Ser, Glu,) Leu or Ileu (2) It has revealed that Aspergillus soya protease has considerably wider range of specificity than that of chymotrypsin, pepsin and trypsin but not mold protease and Aspergillus saitoi protease. It can be said that Asp. soya protease split the bond adjacent to glutamic acid, aspartic acid, glycine, serine, alanine, cystine, tryptophan, histidine preferably acidic amino acid as C-terminal amino acid residue." Address: Dep. of Agrochemistry, College of Agriculture, Seoul National Univ., Suweon, Korea.

633. Kim, Ze-Uook. 1965. [Studies on peptides during soybean koji preparation. II. Amino acid sequence of oligopeptides formed during soybean koji preparation]. *J. of the Korean Agricultural Chemical Society* 6:107-17. April 30. [21 ref. Kor; eng]

• ***Summary:*** (1) In order to study the types of peptides formed during soybean koji preparation, the amino acid sequences for the di- and tripeptide and N-terminal amino acid residues and C-terminal amino acid residue were identified. The following results were obtained:

Each of 15 amino acid groups is listed, e.g., Gly, Glu.

(2) It was found that *Aspergillus soya* protease has a considerably wider range of specificity than those of chymotrypsin, pepsin, and trypsin. However, its range of specificity is not wider than those of mold protease and *Aspergillus saitoi* protease. *Asp. Soya* protease split the bond adjacent to glutamic acid, aspartic acid, glycine, serine, alanine, cystine, tryptophan, histidine preferably acidic amino acid as C-terminal amino acid residue.

Note: It's hard to imagine what is meant by the previous sentence. Address: Dep. of Agrichemistry, College of Agriculture, Seoul National Univ., Suweon, Korea.

634. Abbott, J.C. 1965. Protein rich foods from oilseeds: Economic aspects. *P.A.G. News Bulletin* (*Protein Advisory Group, WHO / FAO / UNICEF*) No. 5. p. 19-38. April. [15 ref]

• ***Summary:*** Table 1 lists annual consumption (in metric tons) of oilseed protein foods in some main consuming areas. Column 1: Miso, tofu, tempeh and other fermented or cooked soybean products: Mainland China 3,736,000. Japan 2,536,000. Indonesia 200,000. South Korea 160,000. Taiwan 153,000. Hong Kong 15,000. Malaya 15,000. Singapore 15,000.

Column 2: Soy milks: Singapore and Malaya 1,300 metric tons, Hong Kong 1,000.

Note: This is the earliest document seen (March 2020) that contains industry or market statistics for soymilk by geographical region. Address: Chief, Marketing Branch, FAO Headquarters, Rome, Italy.

635. Chang, C.H. 1965. [Chemical changes during the fermentation of Korean soy sauce, in connection with its fermentative period]. *J. of the Korean Agricultural Chemical Society* 6:8-13. April. [12 ref. Kor; eng]*

• ***Summary:*** Korean Mejues

Mejus were prepared by means of ordinary, improved, and compromised methods, and analysis of the changes in various chemical compositions of the soy sauces throughout

© Copyright Soyinfo Center 2021

the fermentation period of 10 weeks Now, their results are as follows:

(1) In all of the soy sauces under study, the content of organic acids showed a slight increase for several weeks, followed by a marked increase after this period.

(2) In all of the soy sauces the total nitrogenous content indicated a rapid increase for the first four weeks, followed by a slower increase.

(4) In all of the soy sauces the content of reducing sugars indicated a slight increase for the first four weeks, followed by a rapid decrease until 8 weeks in the improved soy sauce. Then, it maintained an almost flat curve. In the ordinary and compromised soy sauces, there was a rapid decrease in reducing sugars for the first six weeks, followed by an almost flat curve.

(5) In the ordinary soy sauces, the *Samwol-zang-bub* (soy sauce prepared in March) is considered to be based on a comparatively scientific ground during the fermentative period.

(6) In order to improve the taste in ordinary soy sauce it is favorable to delay the period of preparation. The adequate period of waiting appears to be at least 8 weeks. It is recommended to mix the materials with carbohydrate sources.

(7) According to the *Samwol-zang-bub,* in the improved soy sauce it is thought that 8 weeks were adequate for fermentation.

(8) The compromised method may be recommended for the improvement of homemade soy sauce, and it may also be superior in quality to the ordinary soy sauce. Address: Seoul Municipal College of Agriculture.

636. Hesseltine, C.W. 1965. A millennium of fungi, food, and fermentation. *Mycologia* 57(2):149-97. March/April. [38 ref]

• ***Summary:*** A landmark, widely cited work on indigenous fermented foods. Interestingly, it makes no mention of amazake, or kanjang (Korean soy sauce). Contents: Tempeh. Ragi. Sufu (describes process, mentions pehtzes and the mold *Actinomucor elegans* NRRL 3104).

Color photos (sent by Dr. Clifford Hesseltine) show: (1) Luxuriant growth of *Actinomucor elegans* mold on some skewered cubes of tofu in an incubator; on the top row are uninoculated cubes. (2) Cubes of sufu (fermented tofu) in their final form after removal from brine.

Thamnidium (meat tenderizer and flavor enhancer from the mold *Thamnidium elegans*). Miso. Shoyu (incl. tamari. "In China, shoyu is more of the tamari type, that is, more soybeans are used and less wheat,..."). Tea fungus. Ang-kak (red fermented rice [red rice koji], p. 179-81). Advantages of fermenting foods. The future of food fermentations.

The glossary gives brief descriptions of aga-koji, akakoji, amylo process, anchu, angkak, angkhak, ang-quac, anka, ankak, arack, arak, arrack, atsumandie, awamori, bagoong, bakhar, beni-koji, benikoji, braga, brem, busa, chao, ch'au yau (Chinese name for shoyu), chee-fan (a type of Chinese cheese or sufu), chiang (Chinese equivalent of miso), chicha, Chinese cheese (sufu), Chinese red rice (ang-kak), chiu-chu (Chinese yeast), chiu-niang (Chinese term for koji), chou [*ch'ü; qu*] (Chinese equivalent of koji), dahi, dawadawa (made from African locust bean–*Parkia filicoidea;* soy is not mentioned), dhokla, dosai, fermentation of citron, fermented fish, fermentation of maize, fermented minchin (wheat gluten), fermented soybeans ("a Chinese food prepared from small black soybeans." See A.K. Smith 1961 [fermented black soybeans]), fish paste, fish sauce, fish soy, fu-yu, fu-yue, fuyu (see sufu [fermented tofu] for all 3), ginger beer plant, grib, hamanatto, hon-fan [fermented tofu], hongo, hung-chu, idli, injera, jamin-bang, java yeast, jotkal, kaffir beer, kanji, katsuobushi, katyk, kefir, ketjap, kimchi, kishk, kisselo mleko, koji, kombucha (tea fungus fermentation), kome-miso, kuban, kumiss, kumys, kushik, kushuk, kvass, kwass, kyoku-shi, lao-chao, leben, lebeny, levain of khasia, levain of sikkin, lontjom (ontjom), magou, mahewu, maize fermentation of the maoris, mazun, medusen tee, meen, meitauza, meju (fermented soybeans of Korea), mén, mien (Chinese yeast), mirin, mish, miso, moromi, mugi miso, murcha, nappi, nata, natto, ngapi, nuoc-mam, nukamiso, ontjom, patis, paw tsay, peh-khak, pehtze, peujeum, peyem, poi, prahoc, pulque, raggi, ragi, ranu, red pepper sauce, red rice, red sufu, sajur asin, saraimandie, sekihan [rice cooked with azuki beans; not fermented], shiro koji, shottsuru, shoyou, sho-yu, shoyu, soja japonais (shoyu), sonti (a rice beer wine of India), South African fermented corn, soy, soybean cheese [fermented tofu], soy sauce, sufu, su fu [both fermented tofu], sweet flour paste, taette, tahuli, tahuri [both "Philippine fermented soybean curd"], takuwan, tamari, tane koji, tao-cho [taotjo], taokoan [pressed or firm tofu, not fermented], tao dji (see taotjo {sic}), tao-si ([fermented black soybeans]; see Handbook of Philippine Agriculture. 1939. p. 132-43), tao-tjung, tao-yu, taotjo, tapej, tape ketan, tape ketella, tarhana, tea beer, tea cider, tea fungus, teekwass, teeschwamm, tempe, tempeh, tempeh bongkrek, tempeh kedelee, thamnidium, thumba, tibi, tien mien chang [chiang], tojo ("Philippine name for soybean curd"), tokua ("Philippine name for soybean curd"), torani, tosufu, toyo, trassi, tsue fan, tuwak, uri, u-t-iat, wunder pilz, yen-tsai.

Note 1. This is the earliest document seen (Oct. 2011) that mentions *Actinomucor elegans* in connection with sufu [fermented tofu]. In 1966 Hesseltine describes it as the best mold for use in making this fermented food.

Note 2. This is the earliest English-language document seen (Oct. 2011) that uses the terms "fuyu" or "fu-yue" or "chao" to refer to fermented tofu.

Note 3. By the mid- to late-1960s, macrobiotic companies in the USA were importing barley miso from Japan and labeling it "Mugi Miso."

637. *Jackson Sun* (*The*) (*Jackson, Tennessee*). 1965. Kipling was wrong, at least on Burkett in Jackson. Nov. 21. p. 34.
• ***Summary:*** East Asian and American students are rooming together with an advisor at 540 Burket St. in Jackson.

"The boys enjoy cooking in their house too. Lee makes a relish called 'Gochujan,' which is a dish from Korea. Jimmy Taylor said, 'the only way to describe it is hot!'"

Note: In April 2021, when we searched www.newspapers.com, the huge digitized newspaper database, for "gochujan," we got only 15 matches from 1965 to 2018. But when we searched for "gochu jang" (or "gochu-jang") we got 433 matches from 1983 to 2021. And when we searched for "gochujang" we got 3,351 matches from 1983 to 2021. Address: Sun staff writer.

638. Han, P.J.; Min, B.Y.; Kim, K.S. 1965. [Studies on the manufacturing of fermented soybean paste and soy sauce using defatted soybeans]. *Research Reports of the Office of Rural Development* 8:333-46. [Kor]*
• ***Summary:*** To ensure better utilization of soybean, comparative trials were conducted pertaining to the manufacturing of Korean condiments, bean paste, and soy sauce using the defatted soybean and whole soybean.

As a starter of fermentation, some elite microbes were cultured in carbohydrate resources such as barley, wheat, and sweet potato flour, which may be an important subsidiary material for well-flavored final products.

(1) From wild strains of microbes, 2 strains were preliminarily pure cultured to select an excellent strain, which is referred to as *Aspergillus oryzae* A.

(2) Through the comparative test among four strains already identified (*Aspergillus* original, *Aspergillus oryzae* #612, *Aspergillus sojae*, *Aspergillus oryzae* E209 E2 and *Aspergillus oryzae* A) the *Aspergillus oryzae* A was selected as an available strain for this purpose, and this strain has revealed conspicuously high activities of enzyme, amylase, and protease 2.5-3 days after culture.

(3) With the progress of bean paste fermentation, the sugars were decreased, while the total acid and amino-nitrogen were decreased by the relatively higher degree of defatted soybean plot. There was a possibility of manufacturing fairly good bean paste utilizing the defatted soybean within the shorter time requested, though the product has shown slightly inferior quality compared to bean paste made from whole bean.

(4) In the soy fermentation there was no marked difference between whole bean and defatted plot with regards to progressive sugar decrease and total acid and amino-nitrogen increase. However, total nitrogen value was higher in the defatted plot. It was found that within the relatively shorter time requested to reach full maturity of soy sauce, quality of soy could be as good when made from defatted soy beans as when it was made from whole beans.

(5) The paper chromatographic analysis of soy sauce gave no difference between the whole bean and defatted plot in the features of amino acid pattern, of which more than 12 kinds of amino acids were identified. This data implies the precise relevance of the availability of the defatted soybean.

(6) Costs of defatted soybean are calculated to 10.90 won to produce 1 kilogram of bean paste and 18.25 won to produce 1 liter of soy sauce. These are comparatively reduced costs compared to 14.60 won and 25.75 won for the cost of the soybean required. Address: Inst. of Agriculture & Engineering Utilization, Ministry of Agriculture & Forestry, Suweon, Korea.

639. Kim, Ze-Uook. 1965. [Studies on peptides during soybean koji preparation. I. Formation of peptides during soybean koji preparation]. *J. of the Korean Agricultural Chemical Society* 6:79-87. [Kor]*
• ***Summary:*** The contents of insoluble protein nitrogen, water soluble protein nitrogen, and peptides' nitrogen were determined from samples which were taken in 7½ hour intervals during soybean koji preparation to study changes in soybean protein. The contents of total nitrogen and amino nitrogen were measured for the fractions resulting from molecular sieving by using Dowex 50 having various cross linkages for peptides from soybean-koji extracts. The following results were obtained:

(1) The contents of the insoluble protein nitrogen and peptides' nitrogen are fairly constant at the earlier stage. The insoluble protein decreased and peptides' nitrogen increased markedly as mycelia grew. The rates of decrease and increase, respectively, lowered at later stages after sporulation. The contents of water soluble protein are also constant at the earlier stage, until the covering of mycelia over the koji, after which they are increased until the stage of sporulation, then decreased at the later stage.

(2) The amount of peptides' nitrogen in each fraction obtained by the molecular sieving was almost constant at the earlier stage. The values in fractions of X-16, X-12, X-8, X-4 and X-2 increased considerably together as mycelia grew. Then the values in the fractions almost plateaued after sporulation, when the effluent fraction showed markedly increased values throughout mycelia growth. Address: College of Agriculture, Seoul National Univ., Suweon, Korea.

640. Lee, K.H.; Chang, K.H. 1965. [Studies on koji for soy sauce brewing. III. On the abilities of UV-induced mutants of *Aspergillus oryzae* to produce protease, amylase, and vitamins]. *Misaengmul Hakhoe Chi* (*Korean J. of Microbiology*) 3:9-14. [Kor]*

• ***Summary:*** The enzyme producing potential of industrially important strains of *Aspergillus* was studied. Irradiation of three original isolates of *Aspergillus oryzae* to ultra-violet rays resulted in the production of mutants that differed from the parent riboflavin and vitamin B-12 in culture media.

(1) Irradiation of three strains of *Aspergillus oryzae* to ultra-violet light produced mutants. Two of these strains were selected for soy sauce brewing.

(2) The two strains are the physiological mutants of *Aspergillus oryzae*. Both were found to have superior enzyme activity to their relatives.

(3) *Aspergillus oryzae* UV-induced mutants 172-722 and 569-713 were more powerful than others in the production of riboflavin and vitamin B-12. The enzyme activity of these strains was high and decreased only slightly even in a 20 percent solution of NaCl.

(4) *Aspergillus oryzae* UV-induced mutant 172-722 had more powerful protease producibility in wheat bran media than in modified Czapek's solution. On the contrary, *Aspergilluz oryzae* UV-induced mutant 569-713 had more powerful producibility for saccharogenic and dextrinogenic amylase in modified Czapek's solution than in mold bran.

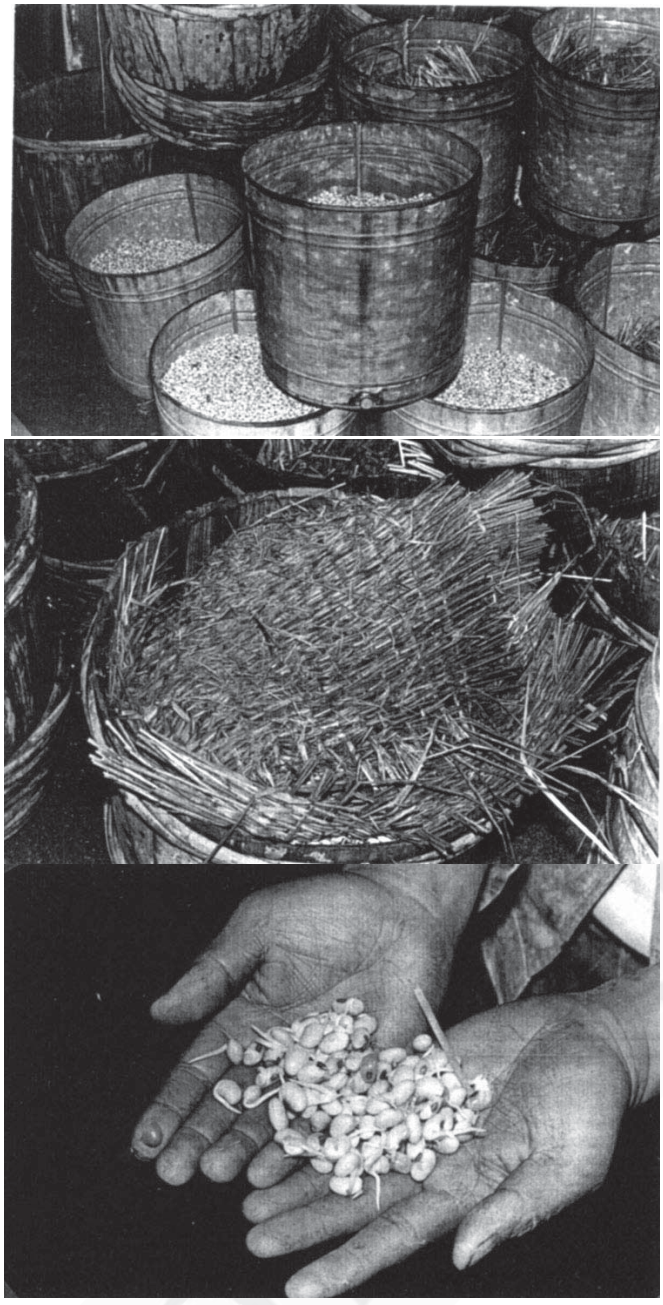
(5) *Aspergillus oryzae* UV-induced mutant 172-722 formed the spore rapidly and *Aspergillus oryzae* UV-induced mutant 569-713 did so ordinarily.

(6) *Aspergillus oryzae* UV-induced mutant 172-722 is valuable material for the manufacture of soy sauce because of its high protease activity in 20 percent solutions of NaCl. *Aspergillus oryzae* UV-induced mutant 569-713 is suitable for soybean mash and for fermented red pepper sauce because of its high saccharogenic and dextrinogenic amylase activity in 20 percent solutions of NaCl. Address: Army Research and Testing Laboratory, Seoul, Korea.

641. Brandemuhl, William. 1965. Moyashi [bean sprouts] (Document part). In: William Brandemuhl. 1965. Soybean Utilization in Japan. San Francisco, California. xxii + 478 p. See p. 413-23, Unpublished manuscript. 28 cm. [1 ref]

• ***Summary:*** See next page. "Manufacture: Japan has two basic types of Moyashi (bean sprouts), one made from Burmese mappe beans and the other from soybeans. The mappe bean is imported duty free by trade companies and contracted for by the National and Local Moyashi Associations. Soybean Moyashi [soybean sprouts] can be made only from Hokkaido soybeans which cost $194.45 (70,000 yen) per ton as other soybeans are too hard or contain too many splits. The type of soybean that is suitable for soybean Moyashi is also suitable for Natto."

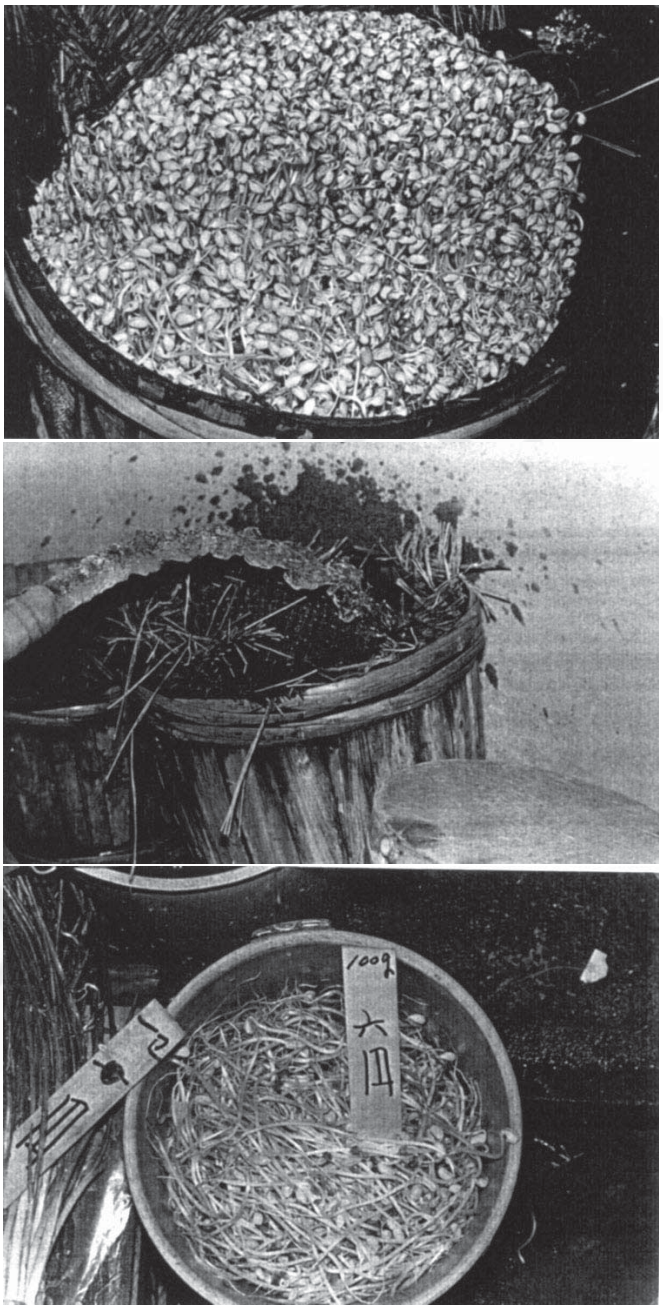
Note: Black mappe (*Vigna mungo*) also known as black gram, black lentil [not to be confused with the much smaller true black lentil (*Lens culinaris*)], white lentil, black matpe bean, is a bean that originated in India and is now grown in southern Asia (Thailand, Burma. India). The mung bean (*Vigna radiata*), a close relative of the black mappe, is also widely used for sprouting in many countries–but apparently not at this time in Japan.



"The Moyashi maker in Japan, unlike the small scale operators of other Asian countries, can be very large, at least with respect to his mappe facilities. Temperature and humidity control are common as well as automatic soaking machines. As will be apparent soybean Moyashi is not produced on this scale in Japan because demand is not high.

"The process of making soybeans Moyashi is accomplished under the same condition as for mappe Moyashi, that is, the sprouting room at 22-23ºC and water used to soak the growing sprout at 18ºC although since soybean sprouts are less sensitive, these conditions are not required but exist because they are required for mappe Moyashi.

"First 15-20 pounds of soybeans are placed in a container (see Figure 180) and washed with water. The container has outlets at the bottom so at no time is there water standing in the container but rather the soybeans are washed down. From that time the soybeans must be washed with water every four hours night and day the entire seven days it takes to finish the sprouting process. While the environmental conditions of sprouting soybean Moyashi do not need to be delicate, the inherent nature of the soybean cause it to be difficult to sprout so it is important that new soybeans be used. The first day the container need not be covered but is just allowed to stand in the dark room. The next day the soybeans in the container mentioned above are put in four containers and covered with a straw mat (see Figure 181).



"In addition to protecting the sprouting soybeans from light so they do not turn green, the container is covered so the heads of sprouts grow straight up. The head of the mappe bean is removed after sprouting but the head of the soybean is eaten. After one or two days in the second container the soybeans have sprouted as shown in Figure 182. While near the end of the seven day sprouting period they look as shown in Figure 183. After the container is covered with straw, washing is accomplished by running water into the container (see Figure 184) until it fills. As the water flows out the outlet at the bottom of the container, the straw mat as well as the sprouting soybean absorbs an adequate quantity of water. After seven days the sprout becomes about five inches long. The growth of the sprout can be regulated by raising and lowering temperature which quickens or slows growth respectively. With average facilities the Moyashi maker claims that soybean Moyashi is extremely simple to make. After the seven days sprouting period the sprout is ready to be marketed at $.014 (5 yen) per 100 grams, the same price

© Copyright Soyinfo Center 2021

as mappe Moyashi.

"Use: The consumption of mappe Moyashi is greatly dependent upon the supply of fresh vegetables. At certain times fresh vegetables because extremely high priced even during a particular vegetable's season. At this time mappe Moyashi's demand greatly increases. The production of mappe Moyashi is therefore considered highly profitable but economically dangerous for the maker while the production of soybean Moyashi has an element of scarcity but profit is low. The scarcity stems from the fact that the demand of soybean Moyashi is constant over a short term because the only people that eat it are the Korean residents of Japan (except in case of extreme food shortage).

"The concept of Moyashi originated in China, became popular in Korea then passed to Japan's southernmost island, Kyushu, where inhabitants eat more mappe Moyashi than other areas of Japan even today. Soybean Moyashi is a popular Korean food so it might be expected that the 500,000 Koreans that reside in Japan might demand same instead of consuming the mappe Moyashi which they consider tasteless. As the Korean people do not substitute soybean Moyashi for vegetables but eat it regularly, demand is constant. Demand level is indicated by the fact that for the 50,000 Koreans who live in Kyoto four of seven Moyashi makers produce 240 kilograms of soybean Moyashi in addition to mappe Moyashi. Although soybean Moyashi

© Copyright Soyinfo Center 2021

are required for Korean ceremonial occasions, the Korean population in Japan is decreasing and becoming more Japanized so consumption of soybean Moyashi is decreasing. Even though decreasing the present number of Koreans is rather conspicuous as they tend to group together. The prejudice that the Japanese have toward the Koreans is well illustrated by the following: when a Japanese family desires to rent or construct a home, their visits to the area prior to moving there may well include an examination of the market place. If a pan of soybean Moyashi (see Figure 185) is displayed with mappe Moyashi (see Figure 186) the family seriously considers whether or not to move into the neighborhood because they then know that Koreans live nearby. Whatever the social implication might be, soybean Moyashi is sold wherever Korean people live, with such food usually consumed by the Korean people in large quantities either boiled or fried by itself or with vegetables and meat."

• ***Summary:*** "History: Tofu, the coagulated protein and fat of ground cooked soybeans (see Figure 38) according to an ancient Chinese book was invented by a philosopher, prince *Hamintze* of the Han dynasty, while another source attributes the invention of Tofu to another Chinese philosopher *Whai Nain Tze.* Manufacture was supposedly begun in China in 164 B.C. during Emperor *Hwai Wen's* reign by *Liu an,* duke of *Hwai an. Liu an* was a good friend of the Buddhists monks so it is believed he started manufacturing Tofu, so as to give them a somewhat more varying diet. Tofu come to Japan (probably through Korea) for the first time during the Toyotomi period (880 years ago). Although not completely documented, Buddhist priests probably were the transmitting agents as the priests used Tofu long before it was in general use.

"Use of soybeans: Throughout Japanese history domestic soybeans were used to make Tofu, however Chinese soybeans began to be used after trade began between Japan and China. During and at the end of World War II all soybeans were in short supply, however in the early fifties U.S. soybeans began to be used for Tofu. This use developed so that now Tofu accounts for the largest Japanese food use of U.S. soybeans. The Tofu makers would use domestic soybeans if they were not too expensive however. Some makers still use a certain percentage of domestic beans although such practice is becoming less popular. More often used are U.S. specialty beans such as Illinois, Indiana, Ohio, Hawkeye, or select No. 2 ordinary even though such soybeans are higher priced then regular soybeans. Chinese soybeans are again starting to be used for Aburaage although because of custom U.S. soybeans are not likely be replaced in the foreseeable future. The existence of over 60,000 Tofu makers consuming over 200,000 MT of soybean per year with each maker consuming between 15-300 kilograms per day presents somewhat of a problem regarding soybean purchasing. Each particular maker is too small to purchase directly from anyone but the smallest wholesaler where the price of soybeans is too high for efficient operation. The Japanese people are association minded with the Tofu makers being no exception. The Tofu makers authorize their local association to purchase soybeans in large lots for future distribution to individual makers. The Tofu makers do not especially like to purchase through the association as the association charges for handling, however the makers have a desire to support the association so accept purchasing through it. The association deals with the importer, crusher, and large wholesaler, selecting whichever seller will give the best terms.

"The numerous Tofu makers that do not belong to the association (about 1/6) as well as members whose association does not purchase usually work out an arrangement with the smaller wholesalers. Soybeans are delivered to the maker by truck with the maker receiving material for a number of weeks each time he receives. The shipment is kept in bag form until the day before use.

"Manufacture–Regular Tofu (white Tofu): The manufacturing procedure described below is for the most used type of Tofu, 'Shirodofu' (white Tofu) as is seen in Figure 38. Other related products such as Yakidofu, Kinugoshi dofu, Aburaage, Hirosu, and others are processed in much the same way. Additional or different methods of processing these latter products are described in respective sections.

"The process of making Tofu consists of ten steps, that is, soaking, cooking, filtering, coagulating or precipitating, shaping, pressing, submerging [in water], cutting, and again submerging.

"Soaking: Depending upon season of year, 5-15 hours before processing, clean whole soybeans are put in containers of any size but most used are metal drums, wooden barrels or 20 liter tins. Water is added to the container until the soybeans in the container are completely submerged. Although length of soaking is not such a strict factor, generally soybeans are soaked 10-14 hours in winter and 5-10 hours in summer. Soybeans soaking in any one container should be of uniform size as soaking would not be

© Copyright Soyinfo Center 2021

even. Because of their small size, U.S. soybean are soaked for less time than Hokkaido soybeans. In winter Hokkaido soybeans may require as much as five additional hours of soaking. There seems to be to guides besides experience that indicate when soaking is sufficient, that is, the appearance of bubbles rising to the surface of the water and the whiteness of they inside of the soybeans.

"Grinding: Tofu processing usually begins at 3:00-5:00 in the morning so that the final product may be ready for use during that day. Processing is initiated by the removing of unabsorbed water from the containers. After that between five and eight kilograms of the soaked soybeans are put into an electric powered grinder of the types shown in Figures 39, 40, and 4l. The type of grinder pictured in Figure 39 is the most popular. Water is run into the grinder's intake container and the grinder is started. After ground as small as possible the soybeans in the form of thick white cream (see bottom of Figure 41) enter a container positioned at the outlet of the grinder. The cream could be called more paste-like than a liquid although it flows If it cannot water is added. If the cream is too thin, the residue after filtering will contain too much of the protein. For a batch of approximately seven kilograms of soaked soybeans the volume of creamy substance should be around 54 liters.

"Cooking: The type of cooker used depends upon the economic situation of the maker. Two of three types of cookers commonly used are shown in Figure 42 and 43. Although, wood (Figure 43) or oil stoked cookers are used, use of a steam boiler is slowly replacing all other methods. Either a small steam pressure cooker or a live steam open pit steam cooker (Figure 42) might be used if the factory has a steam boiler. To indicate that making Tofu is a cottage type industry very often makers with steam boilers will use same for heating their bath. The ground soybeans and water are usually drawn into the cookers by negative pressure but this procedure may also be done manually. Such is necessary if the maker does not have a steam boiler. After the cream is pulled into the cooker, water is added to the container to collect the residue remaining on the container's surface. This thin solution is also drawn into the cooker, Cooking lasts about four or five minutes or until pressure reaches approximately 10-12 pounds per square inch or the equivalent of it if another type of cooker is used. Cooking is very important for removing distasteful flavor, protein, causing good or bad cohesiveness and water holding capacity, although it is done without gauges, meters, or time control by the experienced Tofu maker. As an indication of the time of operation the cooking of 35-40 different batches may be completed by 6:00 a.m.

"Filtering: After cooking, a valve is opened. This valve is connected to a 1½ inch diameter pipe which bends upward so that it is positioned over a container usually around 24 inches square and made of metal although wood and tile are also used. A tile tank is shown in Figure 44. At the end of the pipe a course nylon bag is attached. The opening of the outlet value with pressure still fed to the cooker causes the cooked material to be forced through the looped pipe and into the nylon bag filter. Steam flow is then terminated then started again to force out what remains in the cooker.

"At some factories gravity may be used to remove the material from the cooker and such also might be accomplished by hand. The tank which the bag rests in also has an outlet at its bottom so the liquid (called Tonyu [soymilk]) which can readily pass through the coarse filter makes it way by pipe to a container. The temperature of this material is 100ºC when it leaves the cooker, however it drops to 80ºC by the time it reaches the container. The material that does not flow through the nylon filter is called Okara. As soon as all the material is forced out of the cooker and what liquid there is flows to the precipitating container a quantity of cold water (15-20 liters) stored in a tank above the container is dumped upon the nylon filter dropping the temperature of the Okara to 60ºC so that as much protein as possible can be removed. At some places this water may run directly into the cooker after the initial liquid was forced out.

Note 1. The author and his wife, Tomoko, did most of their tofu research in Kyoto. Companies they visited and observed in the spring of 1963 (listed alphabetically) were: Hamano Tofu Co., Hamamoto Tofu Co., Namikawa Tofu Co., Ryo Tofu Co., Shimamoto Tofu, and Uno Tofu. They also learned much from the Tofu-Aburaage Association (Kyoto). And they visited and observed Sasanoyuki Tofu Restaurant (Tokyo, 11 June 1963).

Note 2. The word *Shirodofu* is occasionally (but rarely) used to distinguish "white tofu" from non-white tofu (such deep-fried tofu, grilled tofu, dried-frozen tofu, etc.). This is the earliest English-language document seen (April 2013) that contains the word *Shirodofu.* (Continued). Address: San Francisco, California.

643. Ch'oe Pu's dairy: A record of drifting across the sea, translated with introduction and notes by John Meskill. 1965. Tucson, Arizona: University of Arizona Press. 177 p. See p. 73. Index. 24 cm. Series: The Association for Asian Studies: Monographs and Papers, No. XVII. [ soy ref]

• ***Summary:*** The *P'yohae-rok* (A record of drifting across the sea), is the diary of a Korean official–Ch'oe Pu. In Feb. 1488, during the Ming dynasty, he and his crew were caught in a storm off the coast of Cheju, at the southernmost tip of Korea; they drifted for 16 days in an open boat, a terrible ordeal, to the southeast coast of China, landing near Ning-po. After being taken captive, he and his crew suffered many more ordeals, but were gradually sent to Peking, following the route of the Grand Canal. On the way, in Shao-hsing prefecture (south of the Huang [Yellow] River), the Regional Commander and the other two high officials served him tea and fruit, and wrote a list of twelve foods and drinks to be presented to him. The last item on the list was "One plate of

© Copyright Soyinfo Center 2021

bean-curd."

In Peking, his adventure attracted the attention of the highest authorities, who provided the means to return him to the border of his homeland at the Yalu River. In 1488 Ch'oe presented his travel diary to the Korean King, "who was pleased and ordered that it be put into the archives."

Also discusses: When Koreans are in mourning for their parents, they do not drink wine or eat meat, garlic, oniony plants, or sweet things for fully three years (p. 50). Korea no longer revered the Buddhist law, but honored only the Confucian system. All its families made filial piety, fraternal duty, loyalty, and sincerity their concern (p. 51). Many Chinese officials had both a wife and concubines (p. 64). Public examinations were given great importance in both China and Korea. Those who placed high in the exams were honored by the government with public stipends, banners displayed on their gates, and their rank written on their name cards. In China, high ranking people we often carried in a sedan-chair, borne on poles by two men (p. 66). Address: Meskill: Barnard College, Columbia Univ., New York City, New York.

645. **Product Name:** La Choy Teriyaki Sauce.
**Manufacturer's Name:** La Choy Food Products.
**Manufacturer's Address:** 901 Stryker St., Archbold, OH 43502.
**Date of Introduction:** 1966.
**New Product–Documentation:** Fred Marken's brochure. Talk with Milan Drake. 1988. Jan. 4. He thinks this was launched in about 1966. Chun King may have had an earlier Teriyaki Sauce. He thinks Kikkoman came later. For details, contact Karen Johnston in Fullerton: 714-680-1430. A packaged teriyaki dinner was launched in about 1970. Note that La Choy was part of Beatrice Foods before Hunt-Wesson bought it.

646. Food and Agricultural Organization of the United Nations. 1966. Soybeans: Area harvested, yield, and production. *FAO Production Yearbook* (*Rome, Italy*) 20:207-09.
• ***Summary:*** The following nations are listed for the first time as soybean producers in the *FAO Production Yearbook.* F = FAO estimate. North Korea: Harvested 348,000F ha in 1948-1952, 375,000F ha in 1952-1956, 385,000F ha in 1961 through 1965. South Rhodesia: Harvested 1,000 ha in 1961-1963, 1,000F ha in 1965. The yield was 640 kg/ha in 1961, 660 kg/ha in 1962, 470 kg/ha in 1963, 410 kg/ha in 1964, and 510F kg/ha in 1965. Ruanda-Urundi: Harvested 2,000 ha in 1948-1952, and 6,000 ha in 1952-56. No figures are given for soybean area for 1961-65, however yield figures (500-530 kg/ha) are given for each of those 5 years.

The Philippines reappeared in 1966. The country harvested 1,000 ha in 1952-56, 2,000 ha each year from 1961 to 1965. The yield increased from 670 kg/ha in 1948-52, to a peak of 940 kg/ha in 1961, decreasing to 880F kg/ha in 1965.

Ethiopia harvested 13,000 ha in 1948-52, 10,000 ha in 1952-56, and 10,000F ha each year from 1961 to 1965, during which years the yield was 600F kg/ha.

Under Asia, there is a listing for "China Taiwan." After Asia, there is separate listing for "China Mainland."

Name change: Tanganyika (1963) is changed to Tanzania, United Rep. of Tanganyika (1964), then Tanzania / Tanganyika (1965).

647. American Soybean Association. 1967. Soybean Digest Blue Book Issue. Hudson, Iowa: American Soybean Assoc. 170 p. Index. Advertisers' index. 22 cm.
• ***Summary:*** The title page of this year's *Blue Book* states: "Blue Book issue. Vol. 27. March, 1967. No. 6."

A table (p. 26) gives world soybean production by continent and country, from 1955-59 to 1966 (preliminary) as follows: North America: Canada, United States, Mexico. South America: Argentina, Brazil, Colombia, Paraguay. Europe: Italy, Romania, Yugoslavia, Other Europe (excluding U.S.S.R.). USSR (Europe and Asia). Africa: Nigeria, Rhodesia, Tanzania. Asia: Turkey (Europe and Asia), China–Mainland, Cambodia, China–Taiwan, Indonesia, Japan, Korea–South, Thailand. Total #1. Total #2.

Soybean production in Mexico increased from about 39,000 bu in 1955-59, to 1,315,000 in 1964, to 2,205,000 in 1965 to 4,410,000 (preliminary) in 1966.

Soybean production in "China, Mainland" [including Manchuria] decreased from about 344,000,000 bu in 1955-59, to 255,000,000 in 1964, to 250,000,000 in 1965, and 250,000,000 in 1966 (preliminary).

Soybean production in "China, Taiwan" increased from about 1,248,000 bu in 1955-59, to 2,117,000 in 1964, to 2,414,000 in 1965.

A table (p. 29) gives U.S. exports of soybeans, oil and meal from 1962 to 1965 (preliminary) to the following regions and countries (for marketing years beginning Sept. 1; in bushels): North America: Canada, Mexico, other, total. South America: total. Western Europe: Belgium & Luxembourg, Czechoslovakia, Denmark, Finland, France, Germany–West, Italy, Netherlands, Norway, Spain, Sweden, Switzerland, United Kingdom, other, total. Eastern Europe: Czechoslovakia, Hungary, USSR (Europe and Asia), Poland, other, total. Africa, total. Asia and Oceania: Hong Kong, Israel, Japan, Korea–South, Philippines, Taiwan, other, total. Grand total.

Exports of U.S. soybeans to Mexico increased from 33,000 bu in 1962 to 177,00 in 1964.

Note: This is the 2nd earliest document seen (Feb. 2009) that gives statistics for trade (imports or exports) of

© Copyright Soyinfo Center 2021

Soybean acceptability and consumer adoptability in relation to food habits in different parts of the world. *USDA Agricultural Research Service.* ARS-71-35. p. 20-27. May. Proceedings of International Conference on Soybean Protein Foods. Held 17-19 Oct. 1966 at Peoria, Illinois. [1 ref]

• ***Summary:*** Contents: Traditional soy products in the Far East: Soysauce, soy milk, bean curd, tempeh, natto and miso, roasted soy flour, kochu chang [Korean soybean miso], sprouted beans. Introduction [of soybeans] in other countries: Brazil, USSR, Africa, Latin America, Turkey. New types of products: Defatted soy flour, full-fat soy flour and beverages made from it developed by the Soybean Council of America. Justification: Cost of a pound of protein from different foods. Beef $4.60. Pork $4.30. Poultry $1.50. Nonfat dry milk solids $0.41. Dry beans $0.35. Soybeans $0.14. Attempted introductions: India. Factors involved in adoptability.

Soybean varieties can be divided into three basic groups: commercial, forage, and garden or vegetable varieties. The commercial and forage varieties do not cook easily and have a raw, beany flavor, whereas the garden varieties can be characterized as having a milk or nutty flavor.

"Kochu chang is produced in every household in Korea from mashed boiled [soy] beans which are hung in bags for 2 to 3 months. The product is broken up, dried, and ground. It is then mixed with ground red pepper [plus salt and water] and kept for some time before use."

This paper was presented by Leon Marie Andrè.

Note 1. This is the earliest English-language document seen (Jan. 2007) that contains the term "roasted soy flour." We read (p. 22): "This product is produced in small amounts and consumed with rice cake [mochi]. There is hardly any information on the nutritive value of the product."

Note 2. This is the earliest English-language document seen (March 2009) that uses the word "kochu chang" (or "kochu-chang") to refer to Korean-style red pepper and soybean paste (miso). Address: 1-2. Food and Agriculture Organization of the United Nations, Rome, Italy; 3. FAO Liaison Officer and adviser to UNICEF.

649. *Los Angeles Times.* 1967. Pilot plant and training center opened by Meals for Millions. July 9. p. WS12.

• ***Summary:*** Meals for Millions has opened a demonstration pilot plant at 1800 Olympic Blvd., Santa Monica, California. Mark Sterner is foreman of the demonstration plant. It contains $40,000 worth of machinery and has the capacity to produce 3-4 tons of high-protein food supplement (or protein beverage) per day from oil seeds such as soy bean, sunflower, safflower, sesame, or cotton.

© Copyright Soyinfo Center 2021

Also in the building is a "multitrax classroom, where foreign technical trainees can select verbal instruction from one of five different languages all of which are electronically synchronized with a rear projection visual presentation.

Starting later this month, students from the following countries will arrive at Meals for Millions to attend training classes: Bolivia, Brazil, Chile, Ecuador, Japan, Korea, Philippines, and Taiwan.

They will learn how to make the high protein food supplement or beverage from seeds indigenous to their home countries. They will also learn processing sanitation, packaging, marketing, and distribution, so they may start a self-help program when they arrive home.

650. Chong, Y.H.; Ponnampalam, J.T. 1967. The effect on duckling of a diet containing moulded-soybeans. *Medical J. of Malaya* 22(2):104-09. Dec. [16 ref]

• ***Summary:*** Recent discoveries have shown that several common species of mold (such as *Aspergillus flavus, Aspergillus parasiticus,* and *Penicillium puberulum*) which cause spoilage in food, "produce a group of toxic metabolites known collectively as aflatoxins. Aflatoxins are the most potent liver poisons yet discovered." Aflatoxins are also extremely carcinogenic, and can cause liver cancer.

Ducklings are particularly sensitive to aflatoxins. In this experiment day-old ducklings were fed a "diet containing moulded soybeans which had previously been shown by physico-chemical means to be free of aflatoxins. No significant difference was observed in the general appearance, growth rate, mortality and liver histology between ducklings fed the experimental diet and those fed the control diet. This not only confirmed our previous finding of the absence of aflatoxins but also appeared to rule out the possibility of other hepatotoxic principles of fungal origin in moulded-soybeans."

"Our present results taken in conjunction with those of our previous study (Chong *et al.* 1966) seem to rule out firmly the possibility of aflatoxin contamination in moulded-soybeans and their product–soy sauce." Address: Inst. for Medical Research, Kuala Lumpur, Malaysia.

651. Chang, C.H. 1967. [Organic acid in Korean soy sauce]. *J. of the Korean Agricultural Chemical Society* 8:1-9. [Kor]*

• ***Summary:*** Korean soy sauces were prepared by the ordinary and improved methods and the organic acid content of each was analysed–with the following results.

(1) In analysing the general components of prepared soy sauce, larger quantities of total acid, volatile acid, and non-volatile acid were found in improved soy sauce than in ordinary soy sauce.

(2) Volatile organic acids were analysed using gas chromatography. The following results were obtained:

(a) In the ordinary soy sauce, formic acid, acetic acid, propionic acid, and butyric acid were detected. Acetic acid was in the highest amount, followed by propionic acid, butyric acid, and formic acid, respectively.

(b) In the improved soy sauce, formic acid, acetic acid, propionic acid, and butyric acid were detected. Acetic acid was in the highest amount, followed by propionic aid, butyric acid, and formic acid, respectively.

(3) Non-volatile organic acid was analysed with the paper partition chromatography method. The following results were obtained:

(a) Lactic, glutaric, fumaric, malonic, malic, glycolic, oxalic, tartaric, and succinic acids, in addition to two unknown spots were detected in ordinary soy sauce. Lactic acid was in the highest amount, followed by succinic, glycolic, oxalic, tartaric, glutaric, malik, fumark, and malonic acids, respectively.

(b) Lactic, glutaric, malonic, malic, glycolic, tartaric, succinic, and galacturonic acid, in addition to two unknown spots were detected in the improved soy sauce. Lactic acid was in the highest amount, followed by succinic, glycolic, malic, glutaric, tartaric, galacturonic, and malonic acids, respectively.

(4) Alpha-keto acid was analysed with paper partition chromatography. The following results were obtained: Pyruvic acid, alpha-keto glutaric acid and an unknown spots were detected in the ordinary and improved soy sauce. Pyruvic acid was in the highest amount, followed by alpha-keto glutaric acid.

(5) Stale flavor in the ordinary soy sauces seemed to be partly affected by butyric acid and propionic acid.

(6) Substances influencing taste, such as lactic acid and succinic acid, were found more in improved soy sauce than in ordinary soy sauce. Address: Seoul Agricultural College, Seoul, Korea.

652. Kim, S.Y.; Kim, Z.U. 1967. [Studies on the changes of protein, peptides and amino acids during natto preparation]. *J. of the Korean Agricultural Chemical Society* 8:11-20. [Kor]*

• ***Summary:*** In order to study the change of nitrogenous compounds during the Natto preparation, the contents of insoluble protein, water soluble protein, and amino nitrogen were determined, and the pattern of peptides and amino acids was investigated by paper chromatography for the fractions resulting from molecular sieving. The results are as follows:

(1) Insoluble protein nitrogen, which was increased to 84% by autoclaving the native soybean, decreased to 44%. The trichloroacetic acid soluble nitrogen increased from 8% to 45% during Natto preparation. The soluble protein nitrogen showed a slight increase.

(2) Fractionation of the peptides using Dowex-50 resins showed that they consisted mostly of lower molecular weight peptides, which increased in accordance with the progress of fermentation, especially after a 30-hour period.

(3) Sixteen known and two unknown amino acids,

© Copyright Soyinfo Center 2021

and three peptides with different Rf values, were identified during the Natto preparation. Their appearance showed some difference in that phenylalanine appeared after 10 hours, methionine after 20 hours, and proline after 30 hours. The three peptides appeared at different stages of fermentation. Address: Seoul Agricultural College, Seoul, Korea.

655. *Soybean Digest.* 1968. ASA [American Soybean Assoc.] expands to Taiwan, Korea, West Germany. July. p. 38.
• ***Summary:*** "The American Soybean Association is expanding its market development activities to Taiwan, Korea and West Germany.

"ASA has directed the promotion efforts in Japan for 11 years. In July, ASA's country director, Scott Sawyers, based in Tokyo, will conduct a preliminary market survey in bustling Taiwan in answer to a formal request from the Taiwanese Vegetable Oil Manufacturers Association. Sawyers flew to Korea June 19 to meet with industry leaders in Korea and investigate the possibility of participating in a trade fair in Seoul this fall.

"In West Germany a pilot program of promoting identified soybean oil will be tried for the first time in cooperation with the Soybean Council of America. Soybean oil is not identified but sold as a blend around the world. The identified soybean oil will be sold through thousands of retail outlets of the EDEKA food chain, the largest in Germany.

"The rapidly expanding Taiwanese pig and poultry industry is creating an increased market for soybean meal. U.S. soybean sales have passed the 10-million-bushel-per-year mark–all in dollar sales. In addition to meal for feed, opportunity exists to increase human per capita consumption of vegetable oil in Taiwan.

"In contrast to the Orient, Western Europe has a high edible oil consumption–higher than the U.S.–that is not expected to increase. Soybean oil promotion in West Germany aims for a larger share of the present market. Competition is toe-to-toe against other identified vegetable oils such as sunflowerseed oil from Russia.

"ASA's entry into Taiwan and Germany is made possible by funds contributed by market promotion agencies in Iowa, Louisiana, Mississippi, Missouri and Ohio. A recent amendment to the contract with Foreign Agricultural Service, USDA, provides funds for program activities in Taiwan and extends financing of the Japanese project through June 1971.

"The soy oil promotion is a cooperative effort of the Soybean Council of America and ASA. Joint financing comes from FAS, EDEKA, and ASA with administration by the Council. SBC president Glenn Pogeler notes that West Germany is currently the No. 2 buyer of U.S. soybeans after Japan. A successful soy oil promotion could significantly increase U.S. soybean sales."

656. *Foreign Agriculture* (*USDA Foreign Agricultural Service*). 1968. Soybeans to Asia. Sept. 16. p. 12.
• ***Summary:*** "Two Asian buyers of American soybeans have emerged in recent years–the Republic of China (Taiwan) and South Korea–both of which import beans to supplement local supplies.

"Taiwan's purchases of U.S. soybeans doubled to 312,000 metric tons after its 1967 import liberalization. In 1968 this import figure could reach 320,000. Most of the increase in soybean imports would be for consumer products, but purchase of soybean meal for feed are likely to show some increases as well. The country is on a campaign to double the output of its swine industry in the next 2 or 3 years.

"South Korea, although not now a large buyer of U.S. soybeans (21,000 tons in 1967), also shows some indications of future growth. The South Korean Government has moved away from efforts for self-sufficiency and has become more dependent on imports. The country could be in the market

© Copyright Soyinfo Center 2021

for some 70,000 tons of soybeans this year depending on weather conditions and its continued ability to improve its foreign exchange situation."

657. Sawyers, Scott. 1968. The soybean market in Japan, Taiwan, and Korea. *Soybean Digest.* Sept. p. 68, 70-72.
• ***Summary:*** "Soybean inspections for export to Japan this marketing year, from September 1967 through July 1968, have totaled 65,816,000 bu [bushels]. Shipments to Japan for the same 11 months the previous year amounted to 56,311,000 bu., or about 10 million bu. ahead of last year. This is good news to all of us in the soybean industry, particularly those of us involved in market development in Japan. Let's examine what has accounted for these increased sales.

"1–The Japanese economy has continued to grow. Their population continues to show preference for more and better foods.

"2–The swine industry has recovered and resumed growth after undergoing a period of market adjustment in 1966 and early 1967.

"3–The poultry industry has recovered from severe disease problems in 1966 and 1967 and has now resumed a normal growth pattern.

"Regarding the market situation in Taiwan and Korea, as a result of a recent visit to Taiwan, it appears purchases of U.S. soybeans will also again increase considerably. Before liberalization Taiwan purchased between 5½ and 6 million bushels per year. During 1967, after liberalization, volume doubled to over 11 million bu. per year.

"The Taiwan Market: The Taiwan market could grow to 12½ or 13 million bu. for 1968 based on a desire to process greater quantities of soybeans for oil for human consumption.

"Over the last 2 years Taiwan has imported about 1.1 million bu. each year, to supplement the domestic production, particularly as a result of dry weather conditions, but also in recognition of their increased foreign exchange capabilities and the growth in demand for more and better food items. The Taiwanese want to expand the swine industry, double it if possible, in the next 2 or 3 years. This will require more soybean meal.

"Korea, although not a large market now, shows indications of future growth. The government has departed from an effort to be self-sufficient in soybeans. Import allocations have been permitted through private channels as of 1967.

"During a recent survey trip I learned that the expected Korean purchases this year could jump to 2.4 to 2.6 million bu. This is highly dependent on weather conditions and their continued ability to improve a very tight foreign exchange situation."

The American Soybean Assoc. office in Japan, known as the Japanese American Soybean Institute, has concentrated on mass media and consumer promotions to increase the utilization of soybean oil, meal, and traditional foods prepared from soybeans. In Japan, this means liquid cooking oil, tempura oil, salad oil, vegetable oil margarine, miso, tofu, and soy sauce. Also, the growing preference for more meat, milk, and eggs in the Japanese diet requires the use of more soybean meal to support an expanding livestock and poultry industry. Efforts were made to popularize two slogans: "Take Oil Once a Day for Foods Cooked with Vegetable oil." And: "Take Oil for Health, Stamina, and Vitality." The key focus is to encourage the Japanese to consume more soy oil in their diet.

A small portrait photo shows Scott Sawyers. Address: Country Director, Japanese American Soybean Institute-American Soybean Assoc., Tokyo.

658. *Soybean Digest.* 1968. Worldwide oils and fats. Sept. p. 81.
• ***Summary:*** Discusses the situation in Eastern Europe, Korea, Australia, and Iran.

"Poultry farming is one of the most advanced areas of agricultural industry in Iran, but product prices tend to be relatively high in comparison with other countries. Iranians pay an equivalent of ten times as much as U.S. citizens do for a pound of poultry."

The Soybean Council of America has suggested improving the feed formulation used as well as overall operating efficiency. A photo shows Council Vice President Ferenc Molnar visiting a poultry farm near Tehran.

659. Marton, Larry B. 1968. Korean trade fair. *Soybean Digest.* Nov. p. 42.
• ***Summary:*** "Star attraction of the First Korea Trade Fair at Seoul Sept. 9 to Oct. 20 was the American agricultural exhibit sponsored by the U.S. Department of Agriculture in cooperation with the American Soybean Association, Wheat Associates, National Renderers Association, and U.S. Feed Grains Council.

"More than 25,000 visitors poured through the 3,000-square-foot American exhibit on opening day. By the end of the week, attendance had rocketed past the 125,000 mark–far exceeding totals chalked up by any other of the 10 nations sponsoring exhibits.

"Although the major drawing card was a generous distribution of wheat products including cake and yeast-raised doughnuts, waffles, pancakes, hot-dog-on-a-stick, and pig-in-a-blanket, widespread interest was centered around the ASA booth where soybean commodities generally unknown to Koreans were on display.

"Soybean products: Housewives and husbands alike kept booth attendants busy answering queries about margarine, quality cooking oil, salad dressings and mayonnaise. For the most part, home consumption of soybeans is in the form of traditional foods such as soy sauce, bean paste, bean curd,

© Copyright Soyinfo Center 2021

whole beans, and bean sprouts.

"The major stimulus for increased soybean consumption will most likely come in the area of new uses. With the Korean economy expanding at an annual rate that is one of the highest of any developing country in the world, and with per-capita incomes on the rise, the public is becoming more receptive to new and improved foods and upgraded diets.

"Both American and Korean officials believe, however, that the extent to which the soybean market expands will depend on a number of factors including the implementation of a nationwide educational program.

"Another factor is the force with which Korea moves through the transitional Aid-to-Trade stage which it has now entered. A recipient of about $4 billion in U.S. aid during the past 20 years, Korea is beginning to flex its economic muscles in the world commercial market.

"Cash imports: As a case in point, until 1966 virtually all soybean imports were under the P.L. 480 program. In 1966, the ROK approved an import license for 30,000 metric tons [m.t.] of whole soybeans and some meal and oil, representing the first significant cash purchase in that country's history. In 1967, another 30,000 m.t. were imported from the United States for cash and about one-half was permitted for the first time to move into commercial channels (previously the government used the entire import for its armed forces).

"Reaction of fairgoers to the doughnuts they sampled and their measurable interest in the soybean story, particularly the uses of margarine, went considerably beyond anything expected by the Foreign Agricultural Service, USDA's market development agency. If that interest is translated into demand at the market level, Korea may well become America's second largest cash customer in the Far East where Japan holds the No. 1 spot, and Taiwan now ranks second.

"ASA eyes potential: An increase of no more than 10% in Korea's soybean consumption would mean approximately an additional, $2.5 million in America's export cash register. The average per-capita consumption of soybeans is now roughly 15 pounds. Assuming the introduction of an educational program, which is even now under consideration by ASA officials, and the availability of credit, it is not unrealistic to project as much as a 50% consumption increase.

"Scott Sawyers, American Soybean Association's representative in Japan, who presided over the ASA booth at the Korea Fair in cooperation with USDA, believes all the elements for expanded commercial trade with Korea are present. 'If we can put them together at the right time and in the right place,' claims Sawyers, 'I have very high hopes for the future.'"

Several photos show the booth and visitors. Address: USDA Office of Information.

660. Chang, C.H. 1968. Biochemical studies on stored soy sauce. *J. of the Korean Agricultural Chemical Society* 9:9-27. [Eng; Kor]*

• ***Summary:*** Studies were conducted in order to elucidate chemical components and microflora in three types of soy sauce: 12 year old aged soy sauce prepared by the improved method, and 7 year aged and 20 year aged soy sauces prepared by the ordinary method. The results are as follows:

(1) The following are found to be the most important factors affecting the quality of soy sauce.

(a) Organic acids, reducing sugars and free amino acids were increased over the course of storage.

(b) In the aged soy sauces under study, non-volatile organic acid increased while volatile organic acid decreased, with the total acidity dependent on the latter.

(c) It was found that salt concentration decreased during storage.

(2) The results of investigation of microflora in the stored soy sauce are as follows. A table (a) shows the type and number of bacteria and yeasts in improved and ordinary soy sauce. The three columns show: (1) Name of microorganism, such as aerobic bacteria colony. (2) Improved soy sauce. (3) Ordinary soy sauce.

(b) In the stored soy sauces, aerobic bacteria are incapable of growth due to a drop in pH value and the influence of salt concentration.

(c) Halophilic lactic acid bacteria are incapable of growth due to a drop in pH value. Even the salt concentrations decreased during the storage.

(d) Osmophilic yeast continue growth in a low pH value and in decreasing salt concentration during this stage.

(3) The results of amino acid analysis by paper partition chromatographic and colorimetric methods are as follows:

(a) Fourteen different types of amino acids were detected in the 12 year aged improved soy sauce. Thirteen types of amino acids were detected in the 7 year aged and 20 year aged soy sauces.

(b) The contents of aspartic acid, glutamic acid, serine, valine, leucine, lysine, histidine, and methionine increased in the 20 year aged ordinary soy sauce compared to the 7 year aged soy sauce. Contents of alanine, tyrosine, phenylalanine, and cystine decreased.

(4) The results of sugar analysis by paper chromatography are as follows.

(a) In the 12 year aged improved soy sauce, galactose, glucose, arabinose, xylose, rhamnose, maltose, and an unknown were detected. Their amounts were in the above order, except maltose and an unknown. Address: Seoul Agricultural College, Seoul, Korea.

661. Who was who in America, historical volume: P.H. Dorsett. 1968. Chicago, Illinois. See p. 259.

• ***Summary:*** Palemon Howard Dorsett is known for his work of introducing foreign plants to the USA. Birth: Carlinville, Illinois, on 21 April 1862, the son of William Newman

© Copyright Soyinfo Center 2021

Dorsett and Laura Oceola. Earned B.A. degree from the Univ. of Missouri, 1884. Married Mary Virginia Payne, of Columbia, Missouri, on 12 Sept. 1892; she died on 13 August 1905. They had 1 son, James H. Dorsett (deceased). He was with the U.S. Department of Agriculture (USDA) since 1891; field office worker, and has assisted in building up 6 plant introduction gardens under the USDA; leader of an agricultural exploring expedition to Brazil, 1913-14; to China, 1924-26; Dorsett and Morse Agricultural Expedition to Japan, Chosen [Korea], Manchuria and Northern China, 1929-31. Member American Genetic Association (life), American Red Cross (life), Botanical Society of Washington, Episcopalian. Mason. Home: Bell, Maryland (P.O. Glendale, MD, R.F.D. 1). Address: U.S. Dept. of Agriculture, Washington, DC.

Note: An entry in the card catalog at the National Agricultural Library states that P.H. Dorsett died in 1943. His obituary appeared in the *Washington Post* on April 2. (p. 9B, col. 4).

662. Spilsbury, Calvin C. 1969. Three stages in Far East soybean markets. *Foreign Agriculture* (*USDA Foreign Agricultural Service*). April 14. p. 6-8.

• ***Summary:*** "Today soybean markets in the Far East, the original home of the soybean, have emerged from time-honored Eastern patterns and have differentiated into what may be called three types–traditional, transitional, and industrial.

"In traditional markets soybeans continue to be sold and used chiefly for human protein foods, and volumes traded are comparatively small. Also, volumes processed by modern methods are small. Transitional markets are characterized by larger volume, the modern processing of considerable quantities of soybeans for oil for human consumption, and the developing use of soybean meal for human food products and for high-protein animal feeds for emerging livestock and poultry industries. In industrial markets very large quantities of soybeans are efficiently imported, marketed, and processed for oils and fats for human use and for meal for vigorous livestock industries; at the same time soybeans are still used in traditional foods and soybean meal is used to make a variety of new food products.

"Republic of Korea: Korea is a traditional soybean market. Nearly all soybeans are processed into human protein foods such as synthetic milk, flour, paste for soup [miso], curd for consumption in more solid form, mash, sprouted beans, soy sauce, and even fermented 'cheese'... About 60 to 70% of the domestic crop of about 200,000 tonnes annually is sold in the country's food markets directly to private and commercial consumers. Total imports in 1968 were 28,000 tonnes–all from the United States."

"Most processing of soybeans for human use is done in individual homes by housewives. For example, nearly every Korean family makes a product known as kochojang, or hot bean mash, which consists of powdered, fermented soybeans mixed with red pepper, salt, and water. Some foodmaking (soybean curd and soy sauce) is organized into cottage industry."

"Most of the soybeans imported from the U.S. are made into traditional soybean foods for rations for the Korean army by one large food factory. Crushing soybeans and other oilseeds for oil is done by about 100 small mills throughout the country. The estimated capacity of all the mills added together is about 200,000 tonnes per year of oilseeds of all types... The largest mills have capacities less than 25 tons per day."

In Taiwan, very little of the imported soybeans are used to make traditional Far East foods. The larger crushing and extraction facilities are clustered around large cities–Taipei, Taichung, Tainan, and Kaohsiung. Only the last is a port, and even there no mills are located on deep water. Imported soybeans are discharged by ships' equipment onto docks, where they are bagged and then stored. Bagged beans are sent by truck or rail to inland processing plants. Modern deep-water bulk discharge facilities are to be built at Kaohsiung along with storage for soybeans and grain.

Japan is the giant of Far Eastern markets for U.S. soybeans. One of the most important recent improvements in soybean logistics has been the development of modern deepwater grain and soybean terminals where soybeans can be rapidly discharged from ships' holds directly to storage, interim transportation, or crushing mills. The first fast-discharge elevator on deep water for soybeans or grain was built by an American-Japanese company. At present four terminals have been built in the Tokyo and Kobe areas, and two more are under construction. Unloading is accomplished by pneumatic suction tubes with capacities of 600 to 800 tons per hour (about 6,000 tonnes per 8-hour day). In Korea and Taiwan, facilities for the fast unloading of large tankers do not exist. Many large, new crushing mills have been built on harbor frontage rather than inland so that they can benefit from bulk transportation methods. The annual capacity of the 15 large, modern mills in Japan is estimated at 1.8 million tons of soybeans. The first mills in Japan were in the mountains because most oilseed crops were grown there. Address: Fats and Oils Div., Foreign Agricultural Service.

663. Kim, Z.U.; Cho, M.J.; Kim, S.S. 1969. [Studies on the preparation of improved soysauce kojis]. *J. of the Korean Agricultural Chemical Society* 11:35-41. April. [Kor]*

• ***Summary:*** In order to determine the proper ratio of wheat to soybean in soysauce koji so that it is suited to the Korean people's taste, sensory evaluation for the soysauces made from soysauce kojis with the various above-mentioned ratios and analysis of chemical components through the brewing period of six months was carried out. The results are as follows:

(1) The specific gravity of all the soysauce increased

© Copyright Soyinfo Center 2021

gradually as the time passed and had maximum values in two months, with nearly constant values thereafter. Concerning soybean / wheat ratio, generally the higher soybean/wheat ratio, the lower the observed specific gravity. However, when the ratio was above 10 to 6, the specific gravity was similar.

(2) The solid material in all of the soysauces increased in the earlier stage, and there were no significant differences among the treatments. However, the soysauces without wheat had a slightly lower content.

(3) The less amount of wheat as raw material, the higher the content of total nitrogen was. The content of total nitrogen in every ratio of raw material increased as the mash aged.

(4) The amino-nitrogen levels were found to have similar tendencies to total nitrogen levels.

(5) The reducing sugar content was higher in the soysauces with more wheat and increased rapidly, up to the maximum level, in two months. Then, the higher the wheat / soybean ratio was, the slower the decrease of the observed sugar content.

(6) The maximum total acidity observed was in the soysauces with a soybean / wheat ratio of 4 to 6, and increased similarly in all the soysauces throughout the period.

(7) According to the sensory evaluation, the short (2-3 months) fermented soysauces showed the best taste when soybean / wheat ratio was 10 to 8 and 10 to 6 if diluted. In long (4-6 months) fermented soysauces, it was 10 to 6 and 10 to 4 diluted. Address: Seoul Agricultural College, Seoul, Korea.

665. *Time.* 1969. Cancer: A clue from under the eaves. 93:81. May 9.

• ***Summary:*** This article discusses the work of Dr. David Seel, who has studied 919 cases of stomach cancer at the Presbyterian Medical Center in Chonju, South Korea. He thinks the culprit "may be a mold used in the preparation of a favorite Oriental delicacy, soya paste."

He explained that each winter, almost every Korean household makes "loaves of soybean mash" [*meju*, soybean koji, used to make Korean soy sauce and soya paste] and stores them in a cool, dark place, often under the eaves, where they become moldy. By early spring, a mycelium of black or gray mold covers the loaves. The Koreans scrape off this mold, then immerse the loaves in brine for a month. Finally, they pour off the black liquid, which is soy sauce, and "make the debris left in the crock into a stiff soya paste," of which some Koreans consume as much as five ounces a day.

Dr. Seel believes the "soya-paste molds" might well be a cause of stomach cancer in South Korea. He suggests there may actually be two causes of the problem: "The most widely used mold is *Aspergillus flavus*, some growths of which secrete substances called aflatoxins. For some animals, these are among the most powerful cancer-causing agents known. Moreover, says Seel, the stomach lining seems especially liable to damage, including cancer. Among Koreans who had both low vitamin A readings and a high consumption of soya paste, stomach cancer was twice as common as among other groups." Aflatoxins have also been found in peanuts, which are consumed by Southern Negroes, among whom vitamin A deficiency is known to be prevalent. A photo shows a person "immersing soya loaf [meju] in brine."

Note 1. For another perspective, see the *SoyaScan Notes* interview on this subject with Dr. C.W. Hesseltine (Feb. 1981), an internationally recognized expert on aflatoxins.

Note 2. This is the earliest English-language document seen (April 2021) that uses the term "soya paste" to refer to miso, or to Korean-style miso.

666. *Medical World News.* 1969. Is the staff of Asian life the stuff of cancer? 10(20):12. May 16.

• ***Summary:*** This article (under the heading "Late News of the Week") seems to be based, at least in part, on a report in *Time* magazine (9 May 1969, p. 66). *Aspergillus flavus* is "a fungus often found in soya paste or soya sauce. These foods are prepared by molding [i.e. from meju]. *Aspergillus flavus* produces toxic metabolites called aflatoxins, apparently the most potent carcinogenic substances ever discovered." Research on stomach cancer patients in Korea seems to support the theory that low intakes of vitamin A or a vitamin A deficiency may open the way to stomach cancer if the diet is loaded with carcinogens. A Korean team led by American missionary doctors [incl. Dr. David J. Seel, associate director of the Presbyterian Medical Center in Chonju] examined the socioeconomic, clinical, and dietary histories of 70 stomach cancer patients and 70 controls, matched by age and sex. "A striking finding was that the average daily intake of vitamin A for the control group was around 3,331 International Units, but for the cancer patients, only 2,853. 'The typical Korean stomach cancer patient is apt to be a farmer with poor education, at the lowest income level,' reports Dr. Seel. For

© Copyright Soyinfo Center 2021

the poor Korean farmer, soya loaves [meju] are a staple. The loaves are prepared each winter from a bean mash and stored for molding in a cool, dark place, often under the eaves of the farmer's house.

"Should the American with exotic tastes limit his horizons to avoid carcinogenic intake? A physician attending the meeting assured MWN [*Medical World News*] that Occidentals who are Chinese and Japanese restaurant buffs have nothing to worry about, since they are probably fully protected by the quantities of vitamin A in Western diets."

668. Barnes, Harris H., Jr.; Randolph, Chet. 1969. A massive program mounted: ASA report. *Soybean Digest.* Sept. p. 19-22.

• ***Summary:*** At the annual meeting of the American Soybean Assoc. in New Orleans last year, there was evidence of a new outlook and attitude. "An entire section of the growers' convention dealt with market development and more precisely the need to mount a massive program to move soybeans and soybean products." The ASA's 15-year-old program in Japan has provided experience and the nucleus for expansion into other countries, including Taiwan, Korea, Germany, and Iran. The ASA has signed a $1.6 million agreement with the Foreign Agricultural Service for market development in 17 countries during the next two years.

"It's particularly encouraging to note that three states have now held soybean checkoff referendums that passed by sound majorities. In Louisiana it was 77%, North Carolina 82%, South Carolina 80%... In addition, Minnesota, Missouri, Texas, and Ohio have all passed enabling acts... The above is evidence growers support the ASA effort to step up market development work." Yet ASA membership has failed to grow. Address: 1. President; 2. Executive vice president. Both: American Soybean Assoc.

669. Funchess, William H. 1969. Soybeans saved my life. *Soybean Digest.* Sept. p. 32-33.

• ***Summary:*** He was captured on November 4 [probably in 1950]. The snow began falling the day after he was captured by the Communists in North Korea. Just before he was captured, he had been shot by a machine gun, so every step was like walking on nails. He had already seen the Communist Chinese shoot and kill one of his men who could not walk. After several days of walking in the freezing cold, wearing only light clothing, he and the other American POWs finally reached a temporary prisoner of war camp. "Snow covered the ground and the temperature was 10 to 20 degrees below zero. Thirty-six of us were assigned to a mud house that had a straw roof, dirt floors, paper windows, and no heat. There was a bundle of dried corn stalks for bedding."

One day he noticed soybean stubble extending several inches through the snow. He found a stick, hobbled out to the small soybean field near his hut, pried out the soybeans from the frozen ground, and collected them one by one in his pocket. When the guard left his fire, Funchess placed the beans on a piece of tin in an effort to roast them. When he saw the guard returning, he would grab his beans and move out of sight. Occasionally, however, when he was not quick enough, his beans were kicked into the fire.

He had never eaten soybeans before but he knew they had a high protein content and would sustain life, so he determined "to acquire as many of those little life-giving nuggets as possible."

His daily rations were a cupful of cooked millet or corn that he got twice a day. He received no additional water from Nov. 4 until sometime in February. But he could eat snow–if he could stand the stomach cramps that followed.

He did not get a grain of salt or any meat for nearly 5 months. By that time, however, the Communists would occasionally throw several handfuls of soybeans into the pot of millet. He was so hungry and thin that those soybeans tasted better than anything he had ever eaten. But many of his fellow prisoners died of starvation. His weight dropped to 105 pounds. He and his friends knew they had to improve their diet.

When he was made to carry bags of soybeans, he learned to "accidentally" tear the bags and fill his pockets during every work detail. Occasionally he found earthen jars of fermented "soybean paste" [miso]. It did wonders to the millet seed that he was constantly eating.

After the peace negotiations began [on 10 July 1951], some 8-9 months after he was captured, their food supply improved. Whole soybeans were added to the rations. First they tried boiling whole beans in water; they enjoyed them seasoned only with salt. Then they cracked the soybeans and mixed them into their millet or rice. After a while they began to grow soybean sprouts, which they found very tasty–and when he enjoys to this day.

Finally they learned to make a product some of the men called "Tofu." The Communists gave them a coagulant, They added a small amount of tofu to everything they cooked–and

© Copyright Soyinfo Center 2021

he began to feel his strength returning. Then they learned to make soybean milk, which they also liked if they were careful not to scorch it. It was so rich, however, that they soon learned to drink only a few ounces at a time.

"Eventually a small amount of soybean oil was provided for cooking purposes... A small dish of oil and a cotton wick made an excellent light at night."

"Soybean oil worked well, too, for chapped hands. Some of us even found that it made pretty good hair tonic.

"While a prisoner of war I learned to appreciate the soybean for its life-giving characteristics. To me, the soybean became not a "way of life" but a "way to sustain life." Needless to say, I gained great affection for the little yellow bean that helped keep us alive in the prisoner of war camps of North Korea.

"Each fall at harvest I still collect some soybeans to roast. I always take great delight in offering roasted beans to my friends. Most people will accept only a few, but I can still sit down and enjoy them by the pocketful."

• ***Summary:*** "This experiment was conducted to determine the optimum row width and plant spacing within row under the tropical environment for a leading soybean variety Palmetto and it was carried out at Eakmat Experiment Station in Vietnam... Highest seed yield was obtained at closet spacing in both dry and rainy season, and these results led to drilling method in seeding where about 20 seeds per meter of row could be recommended. Besides the seed yield, the close planting may produce some advantages, such as increase plant height and decrease lodging, weeds and erosion of surface soil." Address: 1. Formerly FAO Agricultural Officer Radiation Research Institute in Agriculture.

674. Pak, K.H.; Han, K.C. 1969. An analysis of food consumption in the Republic of Korea, 1964-1967, with projective trends, 1968-1971. Seoul, South Korea: Yonsei University. *
• ***Summary:*** A table shows production and food use of beans and consumption of some soybean products from 1964-1967 (reprinted in Wang 1976, p. 56-57). Bean production (see footnote) was 190,000 metric tons (tonnes) in 1964, increasing to 203,000 tonnes in 1965, then to 236,000 tonnes in 1967, with 361,000 tonnes projected for 1971.

The amount of soybeans used for food was 94,000 metric tons (tonnes) in 1964 (49.5% of the soybeans produced), increasing to 104,000 tonnes in 1965, then to 134,000 tonnes in 1967 (56.7% of production), with 206,000 tonnes projected for 1971 (57.1% of the soybeans produced).

Consumption of bean curd [tofu] was 223,000 metric tons (tonnes) in 1964, increasing to 243,000 tonnes in 1965, then to 290,000 tonnes in 1967.

Consumption of soybean sprouts was 227,000 metric tons (tonnes) in 1964 (1.8% more than tofu), increasing to 240,000 tonnes in 1965, then to 270,000 tonnes in 1967 (93.1% as much as tofu).

Consumption of bean sauce [soy sauce] was 57,400 metric tons (tonnes) in 1964, increasing to 61,000 tonnes in 1965, then to 69,700 tonnes in 1967.

Consumption of bean paste [Korean-style miso] was 22,900 metric tons (tonnes) in 1964, increasing to 24,300 tonnes in 1965, then to 27,700 tonnes in 1967 (only 39.7% as much as soy sauce).

Footnote: Based on the average production of the 4 years surveyed, the beans consisted of 85% soybeans, 8.5% red beans [azuki], 1.6% green beans [Mung beans], 1.3% peanuts, and 3.4% other beans. Address: South Korea.

• ***Summary:*** The author conducted a study on soybean sauces collected from 74 manufacturers out of the 228 in Korea from April 6 to July 4, 1969. The pH value, specific gravity, buffer force, salt content, pure extract, arsenic and heavy metals of the sources were analysed. Main findings are as follows:

(1) In the pH value test, out of 74 samples, 6 (8.1%) are outside the government-permitted range of pH 4.5 to 5.8. The mean value of all samples is 5.03.

(2) Specific gravities of 10 samples (13.6%) are lower than the government permitted value, more than 1.142. The mean value is 1.168.

(3) Buffer forces of 20 samples (27.0%) exceed the government-permitted value, more than 17.0% of the sauce. The mean is 19.09%.

(5) The contents of pure extracts of 15 samples (20.3%) are lower than the government permitted value, more than 8.0% of the sauce.

(6) All the sauces are qualified in the test of arsenic, of which the government-permitted value is less than 1.5 ppm of the sauce.

(7) The contents of heavy metals of 13 samples (17.6%) are more than the government-permitted value, less than 20 pm of the sauce. Address: School of Public Health, Seoul National Univ., Seoul, Korea.

677. Meals for Millions Foundation. 1969. Annual report 1968. Santa Monica, California: MFM Foundation. 8 p. Typed with signature on letterhead.
• ***Summary:*** Submitted by I.F. Saunders, Executive Director. Contents: Summary. MFM board and staff. Technical training. Research & development. Multi-purpose food shipments (278,113 lb to 33 countries). Financial condition (Donations in 1968 were $408,000, the highest in MFM's history. Only 7% of income was used for administration and management, and only 13% for fund raising and public relations). U.S. Projects: California ("Governor Ronald Reagan has readily accepted the title of Honorary Chairman of the Meals for Millions California Chapter." He has participated in MFM "activities over the past years, and is acquainted with what we are doing and firmly believes in the way we are doing it"), Nevada, Arizona, Mississippi, South Carolina. Overseas Projects: Japan, Korea, Taiwan, Philippines, Hong Kong, Thailand, India, Ceylon, Pakistan, Iran, Ecuador, Chile, Brazil, Mexico. Remarks.

Note 1. This is the earliest document seen (Dec. 2010) which shows that Meals for Millions Foundation was now located at 1800 Olympic Blvd. in Santa Monica–15 miles west of Los Angeles. Actually, MFM moved to this location in 1967.

Note 2. This is the earliest annual report seen (Dec. 2010) for Meals for Millions.

Chris Dodson of Freedom from Hunger (FFH), who kindly sent this annual report (and almost all subsequent MFM / FFH annual reports) to Soyinfo Center (Dec. 2010), says she can find no evidence of annual reports for 1965, 1966, or 1967 in the FFH archives. Address: 1800 Olympic Boulevard (P.O. Box 1666), Santa Monica, California. Phone: 870-0451.

678. Iwamota, Amy. 1970. Two tasty Korean recipes to add to spring menus. *Hawaii Tribune-Herald* (*Hilo, Island of Hawaii*). Jan. 29. p. 11.
• ***Summary:*** The headnotes for the first recipe state: "As an extra flavor for those who like hot, spicy foods, a hot sauce, which follows the Korean Fried Rice recipe, can be used to season the rice and vegetable mixture. It also can be served with noodle, meat, and vegetable dishes. A small amount of the Korean sauce goes a long way."

The first recipe is for "Korean Fried Rice." At the end of the directions we read: "Mix well. Add rice. If desired, mix in ½ teaspoon of Kochujan Sauce. Makes 6 servings."

Next comes a recipe for "Kochujan Sauce."

"1 teaspoon miso (made from fermented rice and soy beans)

"1 teaspoon soy sauce

"1 teaspoon cayenne

"Combine ingredients together."

Note: In April 2021, when we searched www.newspapers.com, the huge digitized newspaper database, for "kochujan," we got only 5 matches from 1970 to 2010. But when we searched for "kochujang" we got 257 matches from 1978 to 2010. Address: HELCO [Hilo Electric Light Company] Home Economist.

682. U.S. Department of Agriculture. 1970. The annual report on activities carried out under the Public Law 480, 83d Congress, as amended, during the period January 1 through December 31, 1969. Washington, DC: U.S. Government Printing Office. See p. 122-27. Cover reads: Food for Peace: 1969 Annual Report on Public Law 480.

• ***Summary:*** Table 20 is titled "Title II, Public Law 480–Total commodities by program type, fiscal year 1969." The three main program sponsors and distributing agencies are (1) Volag (American voluntary agencies, UNICEF and UNRWA [United Nations Relief and Works Agency] unless otherwise noted), (2) Government to government, and (3) WFP (World Food Program). Each of these are Private Voluntary Organizations (PVO/PVOs), registered with USAID. Only two foods containing soy protein were distributed: CSM (Corn soya mix) and WSB (wheat soya blend). They were lumped together in the statistics and sent in the following amounts (in thousands of pounds) to the following continents and countries: Africa total 89,470 lb: Cameroon 600, Congo 162, Dahomey 80, The Gambia 385, Ghana 976, Kenya 478, Lesotho 775, Malawi 39, Mali 4,500, Morocco 300, Nigeria 78,232, Senegal 80, Sierra Leone 1,810, Tanzania 365, Togo 18, Upper Volta 670.

Near East-South Asia total 222,817: Gaza [occupied by Israel since 1967] 2,653, India 216,176, Jordan 1,527, Jordan-West Bank [occupied by Israel since 1967] 1,042, Lebanon 738, Nepal 18, Pakistan 1, Syria 662.

Far East total 57,861: Burma 360, Indonesia 3,669, Korea 9,698, Laos 53, Macao 113, Malaysia 2,474, Philippines 3,140, Ryukyu Islands [located south of Japan, incl. Okinawa, Sakishima, and Amami island groups. Self governing from 1966. Returned to Japan in 1972] 227, Vietnam 38,127.

Latin America total 45,291: Bolivia 72, Brazil 19,851, Chile 2,605, Colombia 1,696, Costa Rica 142, Dominica 4, Dominican Republic 6,680, Ecuador 608, El Salvador 1,178, Grenada 68, Guatemala 1,773, Guyana 58, Haiti 1,585, Honduras 435, Jamaica 124, Martinique [French] 75, Panama 734, Paraguay 2,477, Peru 4,847, Uruguay 279.

Grand total: 415,439,000 lb of CSM and WSB. The following amounts of CSM/WSB (in 1,000 lb) were distributed by the three groups: Volag 292,587, Government to government 122,851, and WFP 1. Countries receiving more than 1 million lb of CSM and WSB combined (in millions of pounds): India 216.2, Nigeria 78.2, Vietnam 38.1, Brazil 19.9, Korea 9.7, Dominican Republic 6.7, Peru 4.8, Mali 4.5, Indonesia 3.7, Philippines 3.1, Gaza 2.7, Chile 2.6, Malaysia 2.5, Paraguay 2.5, Sierra Leone 1.8, Guatemala 1.8 Colombia 1.7, Haiti 1.6, Jordan 1.5, El Salvador 1.2, Jordan West Bank 1.0.

Note: This is the earliest document seen (Feb. 2002) concerning soybean products (cereal soy blends) in Martinique, or Panama. This document contains the earliest date seen for soybean products in Martinique, or Panama

(1969); soybeans as such had not yet been reported by that date. Address: Washington, DC. Phone: 703-875-4901 (1991).

683. Probst, A.H. 1970. Fifty years of soybean variety improvement. *Soybean Digest.* Aug. p. 66-70.
• ***Summary:*** Contents: Introduction. The trend to yellow seed. Common objectives of soybean breeders: High yield, high oil content, high protein content, disease resistance, improved seed quality, maturity to fit rotations, shattering resistance, desirable plant height, lodging resistance, high podding from soil level. Threat of root rot. Reasons for yields of 100 bushels/acre.

"Soybean varieties have played a vital role in the expansion of soybean production and in the development of a soybean industry which has been favorable to the producer, the processor, and the consumer in the U.S. Soybeans were scarcely known in the U.S. before the beginning of the 20th century. Prior to the numerous introductions by the U.S. Department of Agriculture beginning in 1898, there were not more than eight varieties grown in the U.S.

"The slow but steady growth of the soybean crop in the early part of this century, especially up. to 1920, was tied mainly to its use as a forage crop. The crop was used extensively for hay, and to a lesser extent for soilage, silage, green manure, lambing- or hogging-off when grown as a companion crop with corn, and for direct feeding of the beans.

"The importance of soybeans as grain in this early period related primarily to production of seed for the above purposes. When official production estimates of the crop became available in 1924, of the 1,782,000 acres produced, only 448,000, or 25%, were harvested for beans. It was not until 1941 that 5,881,000 acres harvested for beans surpassed the 5,510,000 acres grown for all other purposes.

"The development of the soybean processing industry was nudged into being mainly by World War I when there was such a shortage of fats and oils in the U.S. that it was necessary to import Manchurian soybean oil. The industrialization of an otherwise entirely farm crop in the U.S. began to take place.

"Although a processing industry was emerging, the need of high-oil-type soybeans continued to have competition from hay-type soybeans. The acreage for hay reached 4.8 million acres in 1940 and then declined very rapidly. Production of soybeans for processing increased at a phenomenal rate following the start of World War II in 1941.

"Thus, through the first 15 to 20 of the past 50 years there was still considerable work done in the development of soybean varieties for hay and nongrain uses. There was an increasing emphasis on development of varieties with a high-oil content as well as emphasis on the development of vegetable varieties for human consumption. In this early period there was a shift in emphasis from black- or brown-seeded hay types to yellow-seeded varieties which were thin-stemmed and would serve a dual purpose for both hay and processing for oil and meal.

"The trend to yellow seed: There was a trend to produce meal only from yellow-seeded soybeans to give a uniform-appearing product. This trend was a factor in t h e development of yellow-seeded varieties.

"Of major importance in variety development in the past 50 years has been the introduction of many varieties and types from the Orient and other areas of the world.

"Well over 10,000 introductions have been brought into the U.S. since 1898. Approximately 4,775 introductions were brought in by W.J. Morse and P.H. Dorsett who spent 2½ years during 1929-1931 on an agricultural exploration trip in Japan, Korea, and Manchuria.

"The germplasm collection today numbers about 3,200 types plus nearly 300 named varieties. These introductions range from very early to very late in maturity and serve as a base for the development of superior varieties.

"Through 1940 most varieties were released either as direct introductions, rogued introductions, or selections from introductions. Some selections from introductions may have been of hybrid origin. A few varieties developed from introductions which played an important role in the rapid expansion of acreage planted for processing 20-50 years ago included Dunfield, Illini, Manchu, Richland, Mukden, Mandarin, Habaro, Boone, Patoka, and Roanoke. All vegetable-type varieties up to 1956 were introductions.

"Only a few varieties released through 1940 are known to have come from artificial hybridization-breeding programs. These include Mamloxi, Mamotan, Mamredo, Ogden, Volstate, Tennessee Non-pop, Oloxi, Pee Dee, and Yelredo.

"Of this group, only Ogden, with numerous good qualities sought in varieties today, was grown extensively for a long period. The popularity of Ogden was such that nearly 30 years after its release in 1941 some of it was still being grown commercially.

"Following 1940, and especially after 1950 there have been few varieties released which have come directly from introductions. A few varieties, developed mainly by farmers or seedsmen, have originated as selections from released varieties. These varieties have seldom, if ever, been a distinct improvement over the best varieties recommended by experiment stations at the time of their release.

"The establishment of the U.S. Regional Soybean Industrial Products Laboratory (now the U.S. Regional Soybean Laboratory) in 1936 at Urbana, Illinois, brought about a tremendous increase in soybean breeding. Variety development immediately lost its provincialism and went 'big league' to have an immediate impact nationally and eventually internationally. Today, the efforts of personnel working both within the agricultural experiment stations and the U.S. Department of Agriculture are reflected in better

© Copyright Soyinfo Center 2021

varieties in many parts of the world, including some areas where the soybean originated.

"Soybean breeders generally have had a common set of objectives in developing new varieties which include:

"High yield
"High oil content
"High protein content
"Disease resistance
"Improved seed quality
"Maturity to fit rotations
"Shattering resistance
"Desirable plant height
"Lodging resistance
"High podding from soil level

"These objectives in total add up to the development of higher yielding, higher protein, and higher-oil-content varieties–all of which are direct benefits to the producer, the processor, and the consumer.

"Threat of Root Rot: During the American Soybean Assn.'s 50-year period there have been times when soybean breeders have had to make a quick change in direction to meet emergencies. The inroad on yield and the threat to eliminate soybeans as a crop created by phytophthora root-rot, especially in parts of Ohio, Indiana, Ontario [Canada], the [Mississippi] Delta area, and elsewhere, dictated immediate action. Phytophthora root-rot-resistant varieties were developed and released in the early 1960's. There has been a succession of resistant varieties since to minimize effects of the disease. Resistance to other diseases are available in numerous other varieties to minimize losses and avoid emergencies.

"The emergency created by the presence and spread of the cyst nematode required a crash breeding program. Obstacles were overcome and varieties were developed quickly which changed the emergency into 'production as usual.' New resistant varieties are now a part of breeding programs where the cyst nematode is a problem.

"Several extensive soybean breeding programs are devoted now to the development of brown-stem-rot-resistant varieties and to improve quality of seed in varieties. These are major problems in extensive soybean-producing areas.

"Soybean breeders have recognized the need for special-purpose varieties, especially for foreign markets. Several vegetable-type and high-protein varieties have been developed.

"Today, there are many excellent varieties available to fit any production area from about 27º latitude in Florida to near 50º latitude in Canada. A recent listing of the leading soybean varieties for the U.S. and Canada included 39, plus seven special-use varieties, five of which were vegetable types and two were high-protein types.

"Since 1943 over 80 varieties have been or are in the process of registration by the American Society of Agronomy or, more recently, the Crop Science Society of America.

"The major part of soybean-variety development in the past has been accomplished by public agencies, particularly the agricultural experiment stations and the U.S. Department of Agriculture. At least one private company has been breeding soybeans for many years; a few for shorter periods" (Continued). Address: USDA Research Economist, and Prof. of Agronomy, Purdue Univ. [Indiana].

684. Probst, A.H. 1970. Fifty years of soybean variety improvement (Continued–Document part II). *Soybean Digest.* Aug. p. 66-70.

• ***Summary:*** (Continued): "During the past few years, a few number of private companies have entered the field of soybean breeding and the development of private-brand soybean varieties, some rather extensively and others to a lesser extent. Still other companies may become active in this endeavor if Congress passes the Plant Variety Protection Bill. This recent activity in soybean breeding is certain to bring many new varieties on the market. Much progress has been made in soybean-variety improvement in the past 50 years. Yield, one of the best criteria with which to measure progress, has increased from a national average of 11 bu/a in 1924 to the all-time high of 27.3 in 1969.

"The impact of recently released, improved varieties should put the national yield average above 30 bu/a in a few years. Some individual state yields have risen from a lowly 11-to-12 bu/a in 1924 to 33 to 33.5 in 1969, which are all-time highs.

"Reasons for the 100-bu. yields: In recent years a number of top soybean growers, who have put all their know-how into production, have consistently produced above 60 bu/a. Some have reported just above 100 bu/a. This yield progress is not due to better varieties alone. Yield depends also on many cultural improvements. But today's varieties do have the genetic potential to produce!

"As an average overall of today's varieties, there has been a reasonably good improvement in oil and protein content over varieties developed and used in the past several decades. Natural shattering losses of seed are of little or no concern in today's varieties. Many varieties have a marked resistance to lodging. Also, many varieties pod well above the ground, which helps to minimize seed loss. Most of today's varieties have resistance to one or even several important diseases.

"No review of the past 50 years of soybean improvement would be complete without recognizing those men who have administered the work. This includes all the administrators in many agricultural experiment stations and the U.S. Department of Agriculture who have quietly, but effectively, helped bring the soybean crop to its place of prominence. Of particular note are those men who have guided the soybean improvement program as USDA soybean project leaders, including the late W.J. Morse, 1907-1949, who probably did more than any other man to bring soybeans to their state

© Copyright Soyinfo Center 2021

of improvement and prominence today; Dr. M.G. Weiss, 1950-1953, now assistant to deputy administrator, Farm Research. USDA; Dr. H.W. Johnson, 1953-1964, now head, department of agronomy and plant genetics, University of Minnesota; Dr. R.W. Howell, 1964-1965, now chief, oilseed and industrial crops research branch, crops research division, Agricultural Research Service, USDA; and Dr. B. E. Caldwell, 1966-present.

"Also playing an important role in soybean development are those men who have directed the work of the U.S. Regional Soybean Laboratory at Urbana, Illinois. These include J.L. Cartter, 1936-1965; Dr. R.L. Bernard, interim geneticist-in-charge, 1966; and Dr. R.L. Cooper, 1967 to present.

"Dr. E. E. Hartwig has coordinated the work in the southern states since 1948 and has contributed immeasurably to variety development in that area."

A large portrait shows: George Kimmons (Ozark, Missouri; the first person to get 100 bu/acre yields, in 1968 with 109.6 bu/acre).

Small portrait photos across the top of page 70 show: W.J. Morse. M.D. Weiss. H.W. Johnson. R.W. Howell. B.E. Caldwell. J.L. Cartter. R.L. Bernard. R.L. Cooper. E.E. Hartwig. Address: USDA Research Economist, and Prof. of Agronomy, Purdue Univ. [Indiana].

685. *Soybean Digest.* 1970. W.J. Morse–the first man who tried harder for soybeans. Aug. p. 23.
• ***Summary:*** "W.J. Morse, as the principal agronomist of the Bureau of Plant Industry, Beltsville, Maryland, imported the varietal strains from the Orient that form the basis for today's U.S. soybean crop.

Note: None of the soybeans introduced by the Dorsett-Morse Expedition to East Asia (1929-31) formed the basis of the U.S. soybean crop in 1970. The eleven major ancestors of all soybean varieties grown in the USA in 1972 were introduced between 1901 and 1927. Nine were introduced from China (including Manchuria) and one each from Japan and Korea. For details see: National Research Council, Committee on Genetic Vulnerability of Major Crops. 1972. "Genetic vulnerability of major crops." Washington, DC: National Academy of Sciences. vii + 307 p. For soybeans, see Chap. 13, p. 207-17.

"He helped organize the American Soybean Assn. and by his efforts kept it alive and gave it invaluable guidance during the early years. He served as president three times. And he was one of the first men ASA elected an honorary life member. No wonder he was called 'Daddy of the Soybean!'

"Mr. Morse has been followed by many, many others as dedicated as he, as full of the vision of the great boon soybeans might be for mankind... Such people are what the Golden Anniversary is all about."

A large, excellent photograph, with his autograph, shows W.J. Morse. The inscription reads: "The best crop in the world–soybeans."

686. Clark, R.W.; Mies, D.W.; Hymowitz, T. 1970. Distribution of a trypsin inhibitor variant in seed proteins of soybean varieties. *Crop Science* 10(5):486-87. Sept/Oct. [11 ref]
• ***Summary:*** Soybean trypsin inhibitor is a protein that was discovered by Bowman (1944) and is regarded as an "antinutritional factor in soybeans."

Consumption of raw soybeans causes pancreatic hypertrophy in chickens (Bray 1964; Chernick et al. 1948) and "is believed to inhibit growth, by upsetting the balance between methionine and cystine in the pancreas" (Booth et al. 1960).

Two different forms of soybean trypsin inhibitor protein were studied using electrophoresis with 294 soybeans. 7% of the soybeans had Rf 0.92 electrophoretic bands and 93% had Rf 0.05 bands, where Rf is the relative mobility of the dye front. Soybean varieties of known origin that had the Rf 0.92 band were from Japan or Korea and were mostly in Maturity Groups 1 through IV; but not all soybeans from Japan or Korea had this band. None of the major commercial varieties of soybeans presently grown in the USA contained the Rf 0.92 band. The Rf 0.92 predominates in vegetable type soybeans. Examples of vegetable types are Agate, Aoda, Burwell, Giant Green, Goku, Jogun, Portugal, Rokusun, Sac, Sato-3, Soursei [sic, Sousei], Tortoise Egg, and Wolverine.

Approximately 90 to 95% of the total soybean acreage in the USA is seeded to varieties derived from six plant introductions that originated in Manchuria: P.I. [plant introduction] numbers 30593, 36653, 36846, 50523, 70502, and A.K.

Note: This is the earliest document seen (Oct. 2013) concerning trypsin inhibitors and seed electrophoresis. It is also the first study of the geographical distribution of various forms of the soybean trypsin inhibitor SBTI-A2. Address: Dep. of Agronomy, Univ. of Illinois, Urbana, IL 61801.

687. Dosti, Rose. 1970. Royal heritage of Korean reflected in her cooking. *Los Angeles Times* (*The*) (*California*). Nov. 27. p. 130-21 (part VIII, p. 6-7).
• ***Summary:*** "Kumi Kang, 26, was born in Seoul, Korea. Her mother came from a royal family and was exposed to palace banquets. So when Kumi learned to cook, the food smacked of palace cooking.

"'All Korean girls must learn to cook even though there are cooks at home,' said Kumi, a delicate beauty who is taking her master's degree at USC."

Kumi's favorite dish is Bul-Kogi, a traditional Korean barbecue dish, in which beef, chicken and pork are cooked in a special perforated pan over coals.

"The seasoning is an all-important characteristic of Bul-Kogi." Each meat is seasoned individually. Pork, for example, "is coated with a red pepper paste, called kochujan,

© Copyright Soyinfo Center 2021

available in Oriental food stores but red pepper may be used instead."

Note: The article also mentions soy sauce and [soy] bean sprouts. Address: Times staff writer.

688. Crane, Paul S.; Rhee, S.U.; Seel, D.J. 1970. Experience with 1,079 cases of cancer of the stomach seen in Korea from 1962 to 1968. *American J. of Surgery* 120(6):747-51. Dec. [14 ref]

• ***Summary:*** This case-control study shows a very high incidence of stomach cancer when compared with other forms of cancer seen in a rural Korean mission hospital. Consumption of miso soup or miso ("soya paste" [doenjang]) was associated with increased risk of stomach cancer. "The fact that *Aspergillus flavus* is found in soya bean cakes [*meju*] raises the possibility that aflatoxins produced by this mold which grows on the soya cakes (from which soya bean paste is made) may be a possible etiologic factor in the high incidence of stomach cancer seen in 1,079 patients with stomach cancer in a 130 bed hospital in the seven year period from 1962 through 1968 in Southwest Korea."

66.5% or 717 of the patients with stomach cancer were farmers. "Koreans with stomach cancer seem to ingest significantly larger amounts of soya bean paste than persons of the same age and sex without stomach cancer." Soya sauce intake was also studied.

Note 1. Dr. Clifford W. Hesseltine, a world-famous mycologist at the Northern Regional Research Laboratory (Peoria, Illinois) published his first study on aflatoxins in 1966. In 1984 he published the definitive paper on the subject, in both English and Japanese *Nihon Shoyu Kenkyujo Zasshi* (J. of Japan Soy Sauce Research Inst.) 10(3):69-92. He showed that aflatoxins are not produced during the process of making soy sauce or miso in Japan.

Note 2. On 25 Nov. 1983 Dr. Clifford W. Hesseltine of the USDA's Northern Regional Research Center (NRRC, Peoria, Illinois) received the award of the Third Class of the Order of the Rising Sun from the Emperor of Japan in recognition of the meritorious services he has rendered: proving the safety of Japan's traditional fermented foods, etc.

Note 3. This is the earliest soy-related document seen that mentions a "case-control study." "A case-control study is a type of observational study in which two existing groups differing in outcome are identified and compared on the basis of some supposed causal attribute. Case-control studies are often used to identify factors that may contribute to a medical condition by comparing subjects who have that condition/disease (the "cases") with patients who do not have the condition/disease but are otherwise similar (the "controls"). They require fewer resources but provide less evidence for causal inference than a randomized controlled trial" (Source: Wikipedia, May 2017).

Concerning observational study designs, see also: Case control vs. cohort; prospective cohort; retrospective cohort.

"OR" stands for "odds ratio" which is a measure of association between an exposure and an outcome. The OR represents the odds that an outcome will occur given a particular exposure, compared to the odds of the outcome occurring in the absence of that exposure.

"RR" stands for relative risk. In statistics and epidemiology, relative risk or risk ratio (RR) is the ratio of the probability of an event occurring (for example, developing a disease, being injured) in an exposed group to the probability of the event occurring in a comparison, non-exposed group. "2. History of soybean culture in Korea: The exact history of soybean culture in Korea is not known, but it is clear that the soybean has played an important role in diversification of agriculture and in providing precious nutrients for the people of Korea for many centuries. Hymowitz (8) stated that the soybean first emerged as a domesticated crop around the 11th century B.C. during the 'Chou Dynasty' which had covered the eastern half of the North China. He based his conclusion on (a) the date recorded in Chinese is reliable after 841 B.C. (1, 32), (b) the term of soybean in Chinese character 'Shu' appears in 'the Book of Odes' during the period from the 11th century to 7th century B.C. The year estimated by Kitamura (11, 12) agreed with the Hymowitz's estimation but he assumed that the soybean in China has probably been grown since 20th century B.C. He mentioned that the soybean was presumably one of the oldest crops next to rice and millet in China.

"The earliest mention of soybean in Korea, is found in a Chinese literature 'Wei-Zu' written in 551 A.D. (C.Y. Lee 1964). According to the writings of 'Wei-Zu', 551 A.D., 'Oh-Kok' which literally means five sacred grains (rice, soybean, wheat, barley, and millet) were grown in 'Ok-Jo' (30 A.D.), an ancient tribal nation covering eastern Manchuria and north eastern part of the Korean peninsula. The Neolithic era of Korea was centered about northern most area of the Peninsula in 3000 years B.C. and it was characterized by the appearance of sickle blades, hoes, mortars and pestles made of stone (C.Y. Lee 1964). According to the Korean history books the agriculture was begun in 6-7 century B.C. Lee (1971) reported that the millet was the oldest crop ever cultivated by ancient Koreans and rice was considered to have been introduced in 200 B.C. via China and spread over entire Korean peninsula. The metal culture was already penetrated into Korea around 600-500 B.C. from China. During the War Era [Warring States period] of China (403-221 B.C.), the migration of northern Chinese to north west of Korea Peninsula via 'Ryontong' was accelerated and they brought the Chinese culture and the seeds of various crops were introduced into Korea. Such event resulted in the agricultural revolution in China. Hymowitz (1970) described that the soybean introduced into Korea during the expansion of the 'Chou Dynasty' (1112-771 B.C.) from China. Nagata (1960a) postulated that the soybean was introduced into Korea directly from North China around 200 B.C. and suggested that the cultivated into Japan via Korean Peninsula. Kitamura (1962) also reported that the cultivated type of soybean was introduced into Japan via Korea sometime between 30 B.C.-70 A.D. According to recent archaeological findings, roasted soybeans have been found in 'Buyo' the capital of 'Paik-Je' Dynasty (15 B.C.-676 A.D.), located in the middle west part of the Korean Peninsula (Sadaoka 1936). These historical facts and the reports indicate that the soybean culture in Korea might have started from 5-4 centuries B.C. as suggested by Hymowitz (1970) on the assumption that soybean was brought in from the North Eastern China to Korea."

Page 13: "The seed weight of the collected land races ranged between 44 grams per 100 seeds and 6.7 grams per 100 seeds. The largest seed collected in Korea (44 gr/100 seeds) is larger than the largest seeds (40 gr/100 seeds) of the USDA collections which was reported by Morse and Carter (18) earlier. The smallest seed size found in the collected lend races was 6.7 grams per 100 seeds, and the, variation for the seed size, however, was large, and especially it was the case with soybeans grown in southern area of the peninsula.

"The seed size of wild soybean was extremely small weighing only 2.1 grams per 100 seeds or less. The seed weight of the intermediate type collected from middle part of the Korean Peninsula ranged between 7.6 and 8.2 grams per 100 seeds. The seeds were greenish in color."

Page 17: "*Glycine gracilis* in *Glycine max.*

"Following the historical review made by Hymowitz (1970; #8), it is likely that the first domestication of soybean took place in the eastern half of North China around the 11th century B.C. But it is quite evident that the large area covering the North China and the northern part of the Korean Peninsula is the original gene center of the soybean for the following reasons:

"(i) Regarding the geological and Climatical circumstances, the Korean Peninsula is similar to the North China where many believe the soybean has originated.

"(ii) Numerous soybean land races ere still grown by Korean farmers.

"(iii) Great diversity exists in the Korean land races.

"(iv) Both wild and intermediate types, *Glycine ussuriensis* and *Glycine gracilis,* are found widely in Korea.

"(v) Some varieties grown in Korea possess primitive nature in seed size."

Tables: (1) "Soybean production in Korea." Production increased from 152 million kg in 1955-64 to 229 million kg in 1969.

Area increased from 277,000 ha in 1955-64 to 305,000 ha in 1969.

Yield increased from 548 kg/ha in 1955-64 to 751 kg/ha in 1969.

(2) "Maximum, minimum, average and standard deviations for flowering, number of days from seeding to maturity, plant height, seed size and protein content of named varieties originated in Korea."

(3) "Protein content of soybean land race seeds collected from Korean peninsula." The 8 variety names appear to be the same as the place collected, e.g. Kyunggi-Do, Kangwon-Do, Chungchung Buk-Do, etc. For each variety is given the maximum, minimum, average, and standard deviation.

(4) "Seed size of collected soybean land races in Korea." The 8 variety names appear to be the same as the place collected, e.g. Kyunggi-Do, Kangwon-Do, Chungchung Buk-Do, etc. For each variety is given the maximum,

709. Spiral Foods Inc. 1971. Price list of macrobiotic foods. Chico, California. 2 p. Undated. 35 x 25 cm.

• ***Summary:*** This single-sheet catalog and price list, printed front and back with reddish-orange ink on green paper, contains 8 panels and is undated. Yet it was sent by Chico-San in a portfolio of sell sheets with a cover letter dated 8 Dec. 1971–from which we can estimate the date. It is also with larger Spiral Foods catalogs issued after the disastrous 1972 fire that destroyed the company's plant. Under the name of each food is given a brief description. It includes the following foods:

Condiments: Tekka ("A traditional flavoring prepared from carrot, burdock, ginger, lotus root, Soybean Puree {Miso}, and sesame oil"), seitan ("A meat substitute made from vegetable protein of wheat gluten and tamari soy sauce"), salt plums, kuzu arrowroot, sesame salt, sesame butter, sesame oil (from organically grown seeds), Lima sesame oil (imported), crude sea salt ("Unrefined, unprocessed, trace sea minerals retained"), white unrefined sea salt, Mishio (Lima, with kombu), moromi ("Mash of soy sauce before pressing. A pungent flavor"), furikake ("A seasoning made from Miso, sesame seed, nori, bonita [sic, bonito] powder, whole brown rice and kombu" {kelp}), Goma Muso ("A seasoning prepared from traditional Miso and whole sesame seeds"), bainiku ekisu (concentrate of green [ume] plums), sesame seeds. Dried fish. Cosmetics. Beverages: Yano (grain beverage), Whole grain cereals. Whole grain noodles. Beans: Azuki red (Dainagon, or Korean), black [soy] beans. Sea vegetables. 100% whole grain brown rice. Sweet rice–mochi gome. Rice cakes. Lima soy sauce ("A traditional soy sauce of exceptional quality"), tamari ("The traditional soysauce, fermented naturally and aged 18 months. Prepared from soybean, wheat, salt and water"). Soybean puree (Miso) ("Made from the cultivation of a special enzyme and aged 18 months. The soybean puree is ideal mixed with sesame butter and used as a spread or can be added to soups and sauces"). Utensils.

Note 1. This is the earliest document seen (April 2011) concerning Spiral Foods, a company organized in 1970 by Bob Kennedy of Chico-San and Peter Milbury to distribute Chico-San products directly to retail stores in the greater San Francisco Bay Area. When Chico-San was established in 1962 there were no natural foods stores in the Bay Area (or in the USA). However by 1970 there were many. They were not being well served by the old-line health food distributors such as K&L and Landstrom which distributed Chico-San's products, yet they wanted to buy Chico-San's products.

Note 2. This is the earliest English-language document seen (Dec. 2006) that uses the Japanese-language term "bainiku ekisu" (literally "plum flesh extract") to refer to a commercial extract of ume plums. Address: 1017 Willow Street, Chico, California 95926.

712. Park, K.I.; Sung, H.S. 1971. [Studies on the chung-kook-jang fermentation. I. Isolation and identification of the bacteria and selection of the best strains for chung-kook-jang]. *Korean J. of Microbiology* (*Misaengmul Hakhoe Chi*) 9:74-85. [Kor; eng]*
• ***Summary:*** A total of 65 strains of bacteria were isolated from natural *chung-kook-jang*, Korean-style natto, in an incubator at 37ºC; 37 strains were from sample K incubated enclosed in rice straw and 28 strains were from sample S from steamed soy beans only. In the first screening, 15 strains were selected for their superior protease activities; 8 strains from K and 7 strains from S. In the 2nd screening, conducted by taste panel tests from the first screening, No. K-27 and S-16 were selected as the best for chung kook jang. These two strains were classified and identified as a variation of *Bacillus subtilis* by Bergey's manual.

Note: This is the earliest document seen (May 2021) that mentions Korean-style natto, which it calls "chung-kook-jang" (in the English abstract). Address: National Industrial Research Institute, Korea.

Washington, DC: U.S. Government Printing Office. 132 p. See p. 113-20. Cover reads: Food for Peace: 1970 Annual Report on Public Law 480.
• ***Summary:*** Table 19 is titled "Title II, Public Law 480–Total commodities by program sponsor, fiscal year 1970." The main program sponsors and distributing agencies, listed alphabetically, are AJJDC (American-Jewish Joint Distribution Committee), CARE, CRS (Catholic Relief Service), CWS (Church World Service), LWR (Lutheran World Relief), SAWS (Seventh-day Adventist World Service), UNICEF, UNRWA (United Nations Relief and Works Agency), WFP (World Food Program). Each of these are Private Voluntary Organizations (PVO/PVOs), registered with USAID. Only two foods containing soy protein were distributed: CSM (Corn soya mix) and WSB (wheat soya blend). They were sent in the following amounts (in thousands of pounds) to the following continents and countries: Africa (50,362 CSM and 6,087 WSB): Cameroon (82 CSM), Ghana (1,104 CSM and 201 WSB), Malagasy [Madagascar] (425 CSM), Malawi (61 CSM), Nigeria (41,343 CSM and 5,886 WSB), Rwanda (200 CSM), Senegal (5,301 CSM), Sierra Leone (699 CSM), Tanzania (887 CSM), Togo (260 CSM).

Near East-South Asia (192,116 CSM and 2,504 WSB): Ceylon (50 WSB), Gaza [occupied by Israel since 1967] (814 CSM and 1,892 WSB), India (189,044 CSM and 105 WSB), Jordan (680 CSM), Jordan-West Bank [occupied by Israel since 1967] (1,110 CSM), Lebanon (160 CSM), Pakistan (457 WSB), Syria (308 CSM).

East Asia (21,530 CSM and 451 WSB): Hong Kong (384 CSM and 100 WSB), Indonesia (9,245 CSM and 150 WSB), Korea (4,586 CSM), Laos (275 CSM), Malaysia (220 CSM), Philippines (1,545 CSM and 201 WSB), Ryukyu Islands [located south of Japan, incl. Okinawa, Sakishima, and Amami island groups. Self governing from 1966. Returned to Japan in 1972] (50 CSM), Vietnam (5,225 CSM).

Latin America (53,761 CSM and 2,305 WSB): Antigua (37 CSM), Bolivia (555 CSM and 173 WSB), Brazil (29,919 CSM and 506 WSB), British Honduras [Belize] (225 CSM and 20 WSB), Chile (1,726 CSM and 151 WSB), Costa Rica (679 CSM and 100 WSB), Dominica (23 CSM), Dominican Republic (7,429 CSM and 105 WSB), Ecuador (1,295 CSM), El Salvador (836 CSM and 200 WSB), Grenada (114 CSM), Guatemala (1,944 CSM), Guyana (72 CSM), Haiti (1,010 CSM), Honduras (674 CSM), Jamaica (208 CSM and 100 WSB), Montserrat (18 CSM), Panama (765 CSM and 450 WSB), Paraguay (491 CSM and 400 WSB), Peru (5,842

© Copyright Soyinfo Center 2021

CSM and 100 WSB), St. Kitts (59 CSM), St. Lucia (69 CSM), St. Vincent (30 CSM), Uruguay (81 CSM).

Grand total by commodity: 317,769,000 lb of CSM and 11,347,000 lb of WSB. Agencies distributing the most CSM and WSB (in million lb): CARE 180, CRS 68, UNICEF 42.

Countries receiving more than 1 million lb of CSM and WSB combined (in millions of pounds): India 189.1, Brazil 30.4, Indonesia 9.3, Dominican Republic 7.5, Peru 5.6, Vietnam 5.2, Korea 4.6, Guatemala 1.9, Chile 1.8, Philippines 1.7, Ecuador 1.3, Jordan-West Bank 1.1, Haiti 1.0.

Concerning "veg oil" (soybean oil) shipped under P.L. 480 Title II in fiscal year 1970: India received 54.227 million lb [24,597 metric tons] (p. 116). Address: Washington, DC. Phone: 703-875-4901 (1991).

• ***Summary:*** No English abstract is given. Address: Seoul, South Korea.

720. Kwon, S.H.; Im, K.H.; Kim, J.R.; Song, H.S. 1972. [Variances for several agronomic traits and interrelationships among several characters of Korean soybean land races (Glycine max (L.) Merrill)]. *Korean J. of Breeding* 4(2):109-12. Feb. [12 ref. Kor; eng]
• ***Summary:*** "Summary: The soybeans, currently grown by Korean farmers, have been grown for many centuries without artificial improvement and it may result an accumulation in abundance of variances. In order to collect the gene sources and to select superior lines from the land races, a continuous collection was made in all parts of the country and planted on line bases to study the character and interrelationships among the characters.

"The average flowering dates were 67 days in the collected population which is earlier than the one studied in the named local varieties. High correlation coefficient was observed between flowering and maturity. Negative correlations between seed yield and maturity or flowering were found, which is contradictory to other reports. The maturity of this population ranged from 106 days to 151 days and highly correlated with plant height, number of nodes per plant and seed weight. Average plant height in the collected population was small as compared to the average height of named local varieties. Variance for lodging and disease were relatively large. Consequently, there are some possibilities to obtain useful gene sources for resistant to lodging and diseases.

"Protein content showed negative correlations with oil content, seed yield, flowering and seed weight, whereas positive correlations with plant height and maturity were observed. Since the small plot size for yield estimate the result was not fully reliable, but the relative seed yield among the collected lines ranged from 60 to 3,484 kg/ha and it is meaningful in breeding for high yielding varieties." Address: Radiation Research Inst. in Agriculture, Office of Atomic Energy, Seoul, South Korea.

721. Meals for Millions Foundation. 1972. Annual report 1971. 25th anniversary year. Santa Monica, California: MFM Foundation. 16 p. 25 x 19 cm.
• ***Summary:*** Submitted by Neil J. O'Donnell, the new Executive Director. On the cover, printed in dark blue ink on light blue, is a stylized globe with equator and the two tropics on a dark blue square. The pages are unnumbered.

Contents: Introduction ("The year of 1971 was a year of shifting gears for Meals for Millions, a time of self evaluation and progress. It was the year in which the Board of Directors re-assessed the goals of the Foundation and made important changes"). History. Program, by director Donald Ebright, PhD (India, Mexico, Ecuador, Korea. In late 1971 the MPF plant in Korea suspended operations "in order to reorganize under new management"). 1971 Multi-Purpose Food distribution report: 201,304 lb were sent to 15 countries overseas and 47,424 lb were sent to locations in the USA for a grand total of 248,720 (as of 18 Jan. 1972). U.S. programs. Training school ("The sixth session of the Meals for Millions Training School began on January 18, 1971." It was demanding: 13 weeks, 7 hours a day, 5 days a week). Research and development. The new executive director.

O'Donnell seated at his desk smiling, with his signature below. Address: 1800 Olympic Boulevard (P.O. Box 1666), Santa Monica, California 90406. Phone: 870-0451.

722. Sawyers, Scott. 1972. Korea–A growing market for U.S. soybeans. *Soybean Digest.* May. p. 26-29.
• ***Summary:*** "Some real changes are occurring today in Korean food habits. Five years ago most people thought of soybeans mainly for use in the form of bean sprouts, bean curd, paste [*jang*], soy sauce [*kanjang / ganjang*], and boiled or fermented soybeans for soups and side dishes.

"Recently, where quantities of soy oil are available, new foods such as soy salad oil, cooking oil, margarine, shortening-mayonnaise and other uses of soy grits and soy flour are becoming a reality. Also, the greater abundance of meat, milk, and eggs made possible through livestock-poultry enterprises is making possible better foods and levels of nutrition. U.S. feed grains and soybean meal are playing a significant role in providing formula feeds to support the modernization and growth of poultry, swine, and cattle production.

© Copyright Soyinfo Center 2021

"Economic situation improves: Per capita income is on the rise among the 32 million people of Korea. Five years ago, yearly per capita income was $150 to $170. Today it is $250. This opens up opportunities for new kinds of foods. Protein foods and fats and oils are now considered essential daily food items rather than the luxury foodstuffs of a few years ago.

"Economic growth has been 9% to 10% per year. This is expected to continue through 1972. This rate of growth is most important for a developing country with limited resources and difficulty in obtaining the necessary foreign exchange.

"The volume of imported food and feed grains jumped 30% between 1970 and 1971. This resulted in a record outlay of $282 million for imported raw materials and some semiprocessed foodstuffs.

"The Korean government has implemented a program to bolster exports in all possible sectors. Plans to increase export earnings from agricultural items some 20% per year include forestry, fish, and livestock products.

"Also, through land reclamation and higher announced support prices for several crops, the government expects to increase the land area used for crop production. Korean agriculture

"The cattle population is down. Swine at 1.5 million head are up 25%. Likewise, poultry numbers have risen 26% over 1970 to an estimated 29.7 million. An increased amount of soybean meal is required as a protein supplement for these expanded numbers of poultry and swine. Also, the government plans to encourage the raising of 30,000 additional cattle.

"Goals for domestic crop production in 1972 include a new total of 287,000 m/t [metric tons = tonnes] of soybeans which would be an ambitious increase of 29% from 1971.

"To close the gap between domestic supplies and total commodity needs, the government has recognized that imports for feed-food grains will need to be at least 3.09 million m/t during 1972.

"Actual demand for food and feed grains and protein meal including imports in all probability will far exceed these government projections. Critical limitations on foreign exchange and long-term credit may prevent any adequate satisfaction of existing demand.

"Domestic prices are also a problem, particularly when they far exceed the CIF cost of imports. Korean soybeans, if available, are at least twice the price of imported soybeans.

"It is evident that as late as 1968 only a small portion of soybeans was crushed as a source of oil, and that rapeseed oil, rice bran oil, and sesame oil were the main supply.

"Until a new processing plant began operation in February 1971, most oil processing had been a family or small press-shop enterprise (see photo). Miscellaneous oilseeds were mechanically pressed in small lots, crudely filtered, then sold from the same shops in a raw-unrefined state. Most sales were measured out into buyers' containers or marketed in used bottles ranging from 100 grams to 1,200 grams in size.

"This year, with soy oil available in larger quantities, bulk sales from 55-gallon barrels are being made by the press-shops, along with limited use of packaged goods. Some small supermarkets now have two or three brands of packaged items on the shelves.

"Quality, refined, packaged vegetable oils, especially soy oil, are a new item for Korean homemakers. It takes time and educational exposure to new items before new purchasing habits can become established.

"Domestic and import pattern: Domestic soybean production and planted area have held even or decreased over several years due to low yields and competition from other cash crops. Total production averaged 150,000 to 160,000 m/t from 1960 through 1967. The 1971 production is estimated at 222,000 m/t.

"Government expectations are that the 1972 soybean crop can be built up to 287,000 m/t. Few industry members feel the government target is attainable and, if so, the cost is prohibitive compared to imported soybeans.

The imports of soybeans to Korea have been as shown below (in metric tons):

"1968 17,400 (1,200 for crushing)

"1969 22,000

"1970 36,000

"1971 61,000 (start of Dong Bang)

"1972 50,000 (projection based on targeted 30% increased domestic production to 283,000 m/t)

A large portion of domestic soybeans is never marketed but consumed directly in rural households.

"Competition: The government purchase price for rapeseed production will be increased 15% for 1972. The possibility of importation of Canadian rapeseed also exists.

"On the meal side, fish meal imports were 12,000 m/t in 1969, 19,000 m/t in 1970, and 22,600 m/t for 1971. Fish meal was redesignated from free-import to restricted listing as of January 1972. Total fish meal demand is projected at 27,000 m/t for 1972.

"Purchases of cooking oils accounted for only 6.81% of total food purchases in 1968. The uses of soy oil and soy protein, such as cooking oil, salad oil, margarine, shortening-mayonnaise, soy flour, grits, and meat extenders, are not as yet well known to the Korean housewife.

"Market development: There is without question a firm and growing demand in Korea for feed proteins to support the growing livestock-feed business. Also there is a potential market for soy oil if the consumer can be properly motivated. Salads with salad oil and deep frying are essentially new food habits yet to be introduced.

"Our purpose can be to popularize the reasons why adequate amounts of soy oil can improve the Korean diet. To gain acceptance and change food preferences require an

© Copyright Soyinfo Center 2021

educational program to reach the prime target group, the homemaker–through displays, printed materials, cooking exhibits, advertisements, and articles in the mass media. Traditional food patterns and changes affecting the consumer market must be studied to assure that funds are used effectively.

"Research and evaluation are an essential part of launching and continuing a successful soy product market in any country and market.

"During the next 6 to 12 months, the ASI program in cooperation with Foreign Agricultural Service and the agricultural attache in Korea will be implemented around the following activities:

"1–Market research. A survey of oil marketing, packaging distribution, and consumer habits will be conducted to provide specific answers and provide guidelines on whether a soy oil merchandising program can be implemented,

"2–A consumer educational program featuring soy oil and soy foods will get underway with Mrs. Jun-Ryun Wang, president of the Korea Food Development Center. This program will utilize TV cooking shows, radio, newspaper women's columns, urban and rural extension cooking courses, food exhibits, and young women attending regular cooking courses at the Center.

"3–Acquiring services of a qualified Korean representative part-time to represent ASI. He will be responsible for on-going activities.

"4–Establish necessary services for feed manufacturing and live-stock developments through cooperation with the Korean Feed Manufacturers Assn., emphasizing feed and soy meal promotion.

"5–Several influential leaders of women's groups will be selected and invited to Japan for a workshop to observe ASA consumer educational programs, publications, and cooking classes there that can be adapted for similar use in Korea. While in Japan, these leaders will have the opportunity to observe many soy-oil and soy-based food items all the way from manufacturing to the consumer.

"6–An identified soy oil advertising campaign in cooperation with the brand manufacturers who qualify will be explored and may be implemented.

"7–Continued high-level rapport with Korean government officials with the purpose of lowering import barriers, tariffs, and duties, in order to obtain fair treatment with competing imported products as necessary.

"8–Commencing in July 1973, a comprehensive market development plan will be outlined in cooperation with the Foreign Agricultural Service, to cover the activity and funding necessary for a 2 to 3-year plan of action.

"In closing, the photo on page 27 shows how most soy oil is sold in Korea today. It's by dipper in a used 4-oz. bottle. If our activities can lead to sales in new larger packages, and to sales of soy meal to feed manufacturers by the ton instead of by the bag, then Korea can be a market for 100,000 m/t of U.S. soybeans in 1973 and 200,000 m/t in 1974."

Photos show: (1) Vegetable oils in plastic bottles and tin cans at a supermarket in Seoul. (2, page 27) In an oil press shop in Seoul, a Korean boy dips soy oil from bulk into a 4-oz. used bottle. Address: American Soybean Assoc. Far East Director.

723. Kwon, Shin-Han. 1972. History and the land races of Korean soybean. *SABRAO Newsletter* 4(2):107-11. July. [17 ref. Eng]

• ***Summary:*** Note: "This paper was read at Symposium A6 (Exploration and conservation of plant genetic resources) of the 12th Pacific Science Congress held at Canberra, Australia, 18-27 August, 1971."

The earliest record of soybean culture in Korea is found in the Chinese document *Wei-zu* written in 551 A.D. According to this, the five sacred grains, namely millet, rice, barley, wheat and soybean, were grown in "Ok-Jo," an ancient tribal nation covering north-eastern China and the north-eastern part of the Korean peninsula.

According to recent archaeological findings, roasted soybeans are obtained in Bu-Yo, the capital of 'Paik-Je' Dynasty (18 B.C.-676 A.D.), located in the middle western part of the Korean peninsula. The roasted soybeans exhibited in the Bu-Yo Historical Museum are still being excavated from the remains of a burned army storage house of the day. Based on this historical evidence, the author considers the soybean culture in Korea to have started in the 5th to 4th century B.C. or earlier.

"Diversity of land races: The majority of soybean varieties currently grown by Korean farmers are not named; their seeds" have been passed down from their ancestors. "Named local varieties derived from pure-line selection are grown by a limited number of farmers only. Wide variations in morphological and physiological characters are found among the land races. They are particularly variable in plant height and seed size. They also vary widely in flowering time, maturity and oil content while their variability in protein content was relatively small.

"Seed samples collected from remote villages exhibit a great variety of colors, *e.g.* greenish yellow, green, brown, reddish brown, black and different patterns of variegation. Some varieties show a net-like appearance resulting from breakage of the seed coat. The hilum color ranges from pale-yellow to brown or black. Protein content varied from 53.7% to 36.3% with a C.V. of 5.7% (variability coefficient).

"The land races ranged in 100 bean weight from 44 g to 6.7 g. The largest seed size, 44 g/100, exceeds the maximum (40 g) reported by Morse and Cartter (1937) with the large USDA collections. Korean varieties generally have a large seed size as compared with those of other countries."

Tables show: (1) Production, acreage and yield per

© Copyright Soyinfo Center 2021

hectare of soybean in Korea. From 1955-64 production (in 1,000 metric tons) was 152, increasing to 229 in 1969. From 1955-64 acreage (in 1,000 ha) was 277, increasing to 305 in 1969. From 1955-64 yield (in kg/ha) was 548, increasing to 751 in 1969. (Source: Year Book of Agronomy and Forestry, Korea 1970).

(2) Character variations of registered local varieties. The characters are: No. of days to flowering (86 max to 59 min.). No. of days to maturity (169 max to 128 min). Plant height (cm) (155 max to 43 min). 100 bean weight (gm) (36.9 max to 11.8 min). Protein content (%) (43.4 max to 38.5 min). Oil content (%) (21.7 max to 16.3 min).

(3) Protein and oil contents and seed size of land races and a wild strain (*G. ussuriensis*). Protein content (%) (53.7 max to 36.3 min). Oil content (%) (21.4 max to 10.9 min). 100 bean weight (gm) (44.0 max to 6.7 min).

Note 1. SABRAO is an acronym that stands for The Society for the Advancement of Breeding Researches in Asia and Oceania.

Note 2. This document contains the earliest date seen for soybeans in Korea, or the cultivation of soybeans in Korea (A.D. 551). The source of these soybeans was probably northeastern China. Note that these are not wild soybeans, even though they are land races.

Note 3. This is the earliest English-language document seen (April) that uses the term "land races" (or "land race," written as two words) to refer to ancient indigenous cultivated soybeans. According to Prof. Ted Hymowitz: A soybean land race is an unimproved line or lines grown out by traditional farmers on their own land or in a village for many generations for food, feed, religious, ceremonial, or medicinal purposes. A cultivar is a line derived by modern plant breeding techniques. Address: Plant Protection Div., Radiation Research Inst. in Agriculture, Office of Atomic Energy, Seoul, South Korea.

724. Lee, Jai Moon; Kim, Yu Sam; Hong, Yun Myung; Yu, Juhyun. 1972. [Studies on the substitution of raw materials in soy sauce. III. Use of corn and barley]. *Korean J. of Food Science and Technology* 4(3):182-86. July. [14 ref. Kor; eng]
• ***Summary:*** "It was found that substitution of up to 60% of the wheat content (30% of the total bean and wheat content) with corn, yielded good quality soy sauce. It was also found that barley can be substituted for 70% of the wheat content (30% of the total content)." Address: Dep. of Food Engineering, College of Science and Engineering, Yonsei Univ., Seoul, Korea.

725. Loring, Kay. 1972. Korean cafes keep growing. *Chicago Tribune*. Aug. 24. p. S_A6.
• ***Summary:*** This is a review of the restaurant Korea House in Chicago, a city where an estimated 10,000 people of Korean ancestry now reside. Four years ago there was only one Korean restaurant in the city; now there four. The main Korean seasonings are garlic, onion, red pepper, soy sauce, and sesame–plus kim chee (kimchi).

"No dairy products are used, because as in Japan and China, there is no room in this thickly populated country for dairy industries. Soy bean curds and soy milk are among substitutes." Vegetable oils, such as sesame oil and [soy] bean oil, are widely used in place of animal fats for cooking.

726. Butz, Earl L. 1972. Setting the pace for agriculture (Continued–Document part II). *Soybean Digest.* Sept. p. 26-28.
• ***Summary:*** (Continued): "Throughout the entire U.S., there are about 60 million acres of unused reserve land–the best kind of strategic reserve the Department of Agriculture can maintain, in my opinion. However, we must recognize that these reserve lands tend not to be our best acreages. Certain portions, including some in the seven major soybean states, may be less than ideal prime farmland.

"The point is, that in order to fill market demands, to keep up with the rising world level of meat consumption, we must have more than acres alone. We need to achieve efficiencies in production and marketing that will enable America to keep its commitments to expanding markets. We need to keep at the job of getting costs down. We need to do our best to make sure that we stay ahead of the competition.

"Uncle can help, as I said, but the real job of accomplishing all this will be yours. As you do this, you can keep posted on the research work being done by the Agricultural Research Service and the states. You can team up for better management in planting rates, weed control, fertilizer use, and harvesting techniques. You will want to influence the scientific community in your states to be on the alert to any and every research program that promises more efficient production.

"For soybeans, yield-increase deserves the highest priority: Whether we are talking about the President's goal of $10 billion in farm exports by 1976 or sooner–and the significant part that soybeans can play in attaining that objective, now that soybean exports have broken the $2 billion mark–or whether we're talking about an average American farmer hoping to get a little more black ink on his balance sheet, what your industry needs most of all is a yield breakthrough.

"Soybean research is just now coming of age. Most of the solid research input took place during the 1960's, and we hope to see research during this decade of the 1970's come up with new concepts, new ideas, and better varieties. We've seen corn yields increase more than 400% from 20 bu/acre in 1930 to 40 bu/a during the 1950's to a national average of 86 bu/a at present We know the contribution that research has made to this advance.

"Over the same years, the improvement in soybean yields has been far more gradual, from 13 bu/a in the 1930's to 28 bu/a today. Where and when a soybean yield

© Copyright Soyinfo Center 2021

breakthrough will occur, causing an upward spurt like that which resulted from corn hybridization, nobody can predict. Perhaps some of the answers will come from plant breeding.

"Since January 1969, 17 improved varieties of soybeans have been released by the Agricultural Research Service through state experiment stations. These will have higher yields and greater resistance to nematodes and disease. One is a newly discovered male-sterile line that could lead to hybrid varieties. Next month we plan to send a plant geneticist to Japan and Korea to collect strains of cultivated soybeans and related species, in the continuing quest for a key to the breakthrough we seek. As one of the many promising outcomes of the President's historic Summit Meeting in Moscow, preparations are being made now at the White House level for an agricultural scientific team to visit Russia. This type of undertaking will be based on a mutuality of interest between the farmers of the two nations–it won't be a one-way street, but an investment in agricultural progress.

"Looking farther ahead, it's not inconceivable that as the bamboo curtain moves open a bit wider, some day it may be possible for American scientists to seek higher-yielding soybean strains from Mainland China. Some of the varieties that have contributed most to our soybean plasm [germplasm] resources have come from China–it's been 40 years since we have obtained varieties from the original home of the soybean.

"So the future has much in store. In the meanwhile, every step you take to economize and move up agriculture's high efficiency rate will count.

"Keep trying to do better–and keep on setting the pace for American agriculture."

727. Wong, William. 1972. The affair of Archbold and La Choy: How love sprouted, then cooled off. *Wall Street Journal.* Oct. 10. p. 4.
• ***Summary:*** "La Choy Food Products, a division of Beatrice Foods Co.," grows so many [mung] bean sprouts (700,000 pounds a week) in Archbold, Ohio, that it uses 70% of the village's water–about 355 million gallons last year. This (and general growth in the area) is threatening to dry up the village's water supply in Bush Creek Reservoir, which can hold only 308 million gallons.

The average growing cycle is six days from mung bean seed to harvest. The sprouts grow in about 24 70-foot-long bins, each about 5 feet wide and 5 feet deep.

La Choy employs 330 workers and pays $175,000 a year in property taxes. But the villagers don't like the designation "Chinatown U.S.A." which has come to be applied to Archbold–even though the town's Chinese population has been zero throughout its 106-year history.

La Choy started because Wallace Smith, in his mid-20s and a business graduate of the University of Michigan, was running a grocery store in Detroit, Michigan. One of his best-selling foods was mung bean sprouts, grown by Chinese residents of Detroit, and sold to Mr. Smith through Ilhan New, a Korean who had attended college with Mr. Smith. Eventually [by 1920] the bean sprouts in his store sold so well, the Mr. Smith asked Mr. New to grow them for him.

Mr. New agreed to do this. The sprouts continued to sell so well that the two men decided to can them. Sales grew even more and the two men formed a company. The word "choy" means "vegetable" in Chinese.

The company diversified into other Chinese foods and sauces. In 1937, shortly before completion of a new La Choy factory in Detroit, Mr. Smith was killed by lightning. So his wife took his place as a director in the budding company.

After World War II started, the U.S. government declared all of La Choy's products nonessential, denied the company tin for canning, then took over the plant for use in making rifle parts.

It so happens that Mrs. Smith came from Archbold, Ohio–as did her brother and father, both of whom were now important La Choy stockholders. The directors decide to move the company to Archbold and to temporarily enter the business of canning tomato juice–which was essential enough to qualify for tin. After the war, La Choy continued with its former business–but in Archbold.

One day in 1958, in connection with a La Choy celebration, the governor of Ohio and the mayor of Archbold designated Archbold as Chinatown U.S.A. Since then the name has stuck since La Choy has used it in news releases. But the residents still dislike it.

Today Archbold is a village of 3,100 people, two traffic lights, and not a single Chinese.

728. *Soybean News* (*NSCIC*). 1972. Bernard on germplasm collection mission. 24(1):6. Oct.
• ***Summary:*** "Dr. Richard L. Bernard, U.S.D.A. research geneticist at the U.S. Regional Soybean Laboratory, Urbana, Illinois, went to Japan and Korea in September to collect exotic soybean germ-plasm. He will spend approximately a month searching for strains to add to our world soybean germplasm collection. Wild species to be used in expanding genetic diversity will be searched for in eastern Asia.

"Dr. Bernard's work for the past 17 years with the northern germplasm collection makes him especially qualified for this mission. He has provided the original crosses for several of our most prominent northern commercial varieties."

730. Kwon, S.H.; Im, K.H.; Kim, J.R. 1972. [Studies on diversity of seed weight in the Korean land races and wild soybean]. *Korean J. of Breeding* 4(1):70-74. [13 ref. Kor; eng]
• ***Summary:*** "Abstract: This investigation was conducted to determine the variation of seed weight for land races, local named varieties, wild type collections, some introduced varieties, and F2 and F3 generations of a cross between cultivar and wild type of soybeans.

"Land races currently grown by farmers were consisted with distinctly different two groups and averages of seed weight of the groups were 12g and 24g respectively. In general, the soybean seeds grown in southern part of Korean peninsular were smaller than the seeds collected in middle part of the peninsula.

"The cultivars grown in Korea are relatively large in seed size in comparison with the varieties grown in other countries. The seed weight of the collected land races ranged between 44.8 grams per 100 seeds and 6.2 grams and the average weight was 22.2 grams. Seed weight of F2 and F3 generations of a cross between wild and intermediate type ranged between parents and the average weight per seed of F2 generation was close to the value of geometric mean of the parents." Address: Radiation Research Institutes in Agriculture, Office of Atomic Energy, Seoul, South Korea.

731. Kwon, S.H.; Im, K.H.; Kim, J.R. 1972. [Diversity of protein and oil contents of the Korean soybean land races (1)]. *Korean J. of Breeding* 4(1):29-32. [12 ref. Kor; eng]
• ***Summary:*** "Abstract: In order to investigate the fundamental informations on protein and oil contents in the soybean land races currently grown by Korean farmers, over 500 land races were collected from the Korean peninsula. From which 211 lines for protein and 172 lines for oil were analyzed and the results are summarized as follows;

"1. Protein contents range from 36.26% to 53.72% with the variability coefficient of 5.70%. The average of protein content for the 211 lines is 43.65%. In general, land races possess higher protein content as compared to the named local varieties and introductions. Variances for protein of land races are also greater than those in the named local varieties.

"2. Oil contents range between 21.4% and 10.9%, and the average is 17.4 %. This result shows that oil content in the land races is extremely lower than that in the introductions. A negative correlation between oil and protein is found.

"3. These results suggest that the land races possessing high protein content may play an important role in an improvement for protein content in soybean breeding whereas those are of no use in an improvement for oil content. Since the great diversity of the land races, there is some possibilities to find high oil lines if an extensive collection is made." Address: Radiation Research Institutes in Agriculture, Office of Atomic Energy, Seoul, South Korea.

739. Kwon, Tai-wan. comp. 1972. Fermented foods in Korea: Annotated bibliography (1917-1971). Seoul, South Korea: Korea Institute of Science and Technology. 185 p. 28 cm. For Fermented Soybean Products, see p. 28-85. [248* ref. Eng]
• ***Summary:*** See next page. One of the best sources on soyfoods in Korea. A very well prepared bibliography. Of the 248 references, 83 are related to soy. Most of the documents cited were published in the 1950s and 1960s; only one (p. 28) was published before 1940.

Contents: 1. Fermented vegetable products (*kimchies* [*kimchi*]). 2. Fermented fishery products. 3. Fermented soybean products (soybean koji {meju, maiju, maeju}, soy sauce {kanjang, ganjang}, soy paste {doenjang, dainjang, dwen-jang}, hot soy paste {kochojang, kochuzang}, etc.). 4. Fermented cereal products (alcoholic beverages). 5. Miscellaneous. Appendix. Author index.

Note 1. Doenjang (Korean soybean paste) is first mentioned on pages 28, 64. Dainjang (Korean soybean paste) is mentioned on page 34. Dwen-Jang (Korean soybean paste) is mentioned on page 42.

Kochojang (Korean red pepper miso) is first mentioned on pages 28, 31, 46. Kochozang (Korean red pepper miso) is first mentioned on page 36. "Red pepper sauce" (Korean red pepper miso) is first mentioned on pages 38, 39. "Red pepper paste" (Korean red pepper miso) is first mentioned on pages 71.

Kanjang (Korean soy sauce) is first mentioned on page 34.

Ganjang (Korean soy sauce) is first mentioned on page 53.

Note 2. This is the earliest English-language document seen (April 2012) that uses the word "Kanjang" or the word "Ganjang" to refer to Korean soy sauce.

Meju (Korean soybean koji) is first mentioned on pages 35, 41, 44, 60. Maiju (Korean soybean koji) is first mentioned on page 34. Maeju (Korean soybean koji) is first mentioned on pages 73, 83. Chung-Kook-Jang (Korean natto) is first mentioned on page 79.

Note 3. This is the earliest English-language document seen (Oct. 2010) that uses the word Chung-Kook-Jang (spelled exactly that way) to refer to Korean-style natto. Address: PhD, Head, Food Resources Lab., Korea Inst. of Science and Technology, Seoul, South Korea.

740. Nakao, Sasuke. 1972. Ryôri no kigen [The origin of foods]. Tokyo: Nihon Hoso Shuppan Kyokai (Japan Broadcast Publishing Association). 225 p. Illust. (some color). Maps. Index. 22 cm. Series: NHK Books No. 173. [Jap]
• ***Summary:*** See page after next. The important chapter titled "The big natto triangle and miso," by Sasuke Nakao (p. 118-27) discusses natto, its relatives and ancestors in East Asia, and the "natto triangle" theory (with a map). Nakao hypothesized that natto (*itohiki natto*, made with one or more strains of bacteria) originated in the monsoon area of Southeast Asia, where there are East Asian evergreen forests. He considered Yunnan province in China to be the hypothetical center of natto's origin.

He states: We don't know much about natto in Japan. Konnyaku was clearly mentioned in the literature of the Heian period [794-1185]. But natto was first mentioned later, during the Muromachi period [1336-1573], therefore I guess it came from Java [sic] at about that time. Many new things from Europe (such as guns) also entered Japan during the Muromachi period.

What I call the "Miso Group" is salted mold-fermented soyfoods–such as miso, shoyu, tamari, and fermented black soybeans (*douchi*)–that originated in northern China outside the Big Natto Triangle, then spread to central China and to other countries such as Japan and Korea. I have shown the Miso Group on the map in an oval to the upper right. So the triangle and the oval shows the locations of these two groups of processed, fermented soyfoods.

In the Big Natto Triangle we find a number of foods that originated in northern China, including konnyaku and sushi. Sake is also fermented with a mold–the koji mold. Bean sprouts (a great Chinese invention, using beans that are hard to cook) also exist in the Miso Oval, but they spread into many areas within the Big Natto Triangle including Burma and Java.

Nyufu [dairy cheese or yogurt; literally "decayed /

spoiled milk"] and tofu: Tofu was also a great invention of northern China–an easy way to eat soybeans. Seen from this point of view, European ways of cooking beans are very primitive.

Note: Traditional European beans generally contain too little protein and too much carbohydrates (especially starch) to enable them to be made into tofu.

Mr. Shinoda Osamu has developed the theory that tofu was invented in China but not in ancient times; probably in the middle of the Tang dynasty [618-906], and it became popular in the middle Song dynasty [960-1279], at which time it became an alternative to *nyufu* made from dairy milk. What I call *nyufu* here is different from *funyu* (fermented tofu), which is made by fermenting tofu, appeared after the invention of tofu, and is found today throughout East Asia. It is difficult to know exactly what *nyufu* was; in my opinion it was probably like *dahi* from India. In any case, it is certain that there was a product in called *nyufu* shortly before the Tang dynasty and during the early Tang.

During most of Chinese history, except when the nomadic milk-consuming Mongols ruled China during the Yuan dynasty (1279-1368), animal milks were not part of traditional Chinese culture.

Tofu was in Japan by 1183 AD (see *Diary of Hiroshige*

© Copyright Soyinfo Center 2021

*NAKAOMI*, entry for 1183). Maybe tofu was brought in by Buddhist monks and consumed in and around Nara. By the end of the Muromachi period [1336-1573] the center of tofu making and use had moved to Kyoto.

Another interesting thing is that in southern China and in Sichuan province, there is a tofu named *reiki* [*li qi*, pronounced "lichi;" "morning prayer]." The name originally referred to *nyufu* but later it came to refer to tofu. The origin of the word *reiki* was considered to be Sanskrit or some European language. It may have been connected with *nyufu* and/or dahi or India. Also, if we consider *reiki* to be the original name of tofu, then *nyufu* and tofu may have originated in Sichuan or southern China and migrated up to Northern China.

In summary: Nakano's theory is based on the observation that there are many varieties of non-salted fermented soyfoods and soy condiments inside the "natto triangle." Yunnan province in southwest China, Thailand, Myanmar (Burma), Bhutan, Nepal, Indonesia, and Japan all fall within this triangle.

Note 1. This is the earliest English-language document seen (Jan. 2012) that contains the term "natto triangle." Yet this term can be misleading, especially for non-Japanese. Natto is the only non-salted fermented soyfood or soy condiment indigenous to Japan. Natto is made by fermenting whole, cooked soybeans with bacteria (*Bacillus natto*, or *Bacillus subtilis*) in a warm place (ideally 104ºF or 40ºC) for about 24 hours. According to various Japanese legends, natto originated almost 1,000 years ago in northeast Japan when cooked soybeans were placed in a rice-straw sack strapped over the back of a horse. The natto bacteria are found abundantly on rice straw, and the warmth of the horse's body aided the fermentation. Under these conditions, the fermentation would take place naturally, without intentional inoculation.

The "natto triangle" refers to the geographical area within a large triangle in East-, South-, and Southeast Asia–the only place in the world where non-salted fermented soyfoods and soy condiments are indigenous. A number of these–such as tempeh in Indonesia and unsalted fermented black soybeans in China–are fermented primarily with molds (e.g., *Rhizopus, Aspergillus*) rather than bacteria. The triangle has its three corners in northeastern Japan (on the northeast, for natto), northeastern India and Nepal (on the west, for kinema), and in Java (Indonesia, on the south, for tempeh). It is incorrect to think of tempeh as a type of natto–by any definition! Applying this correction to the "natto triangle" causes it to fall apart! Extensive research after 1972 on the early history of tempeh and natto gave no support to the conjecture that natto came from Java.

However the incorrect theory actually turned out to have powerful predictive value, especially as close relatives of natto were discovered in northeast India by Tamang and co-workers starting in 1988, more than 15 years after the "natto triangle" hypothesis was proposed.

Sasake Nakao was born in 1916. The chapter titled *Mame no ryôri* [Bean cookery] is on pages 115-26.

741. National Research Council, Committee on Genetic Vulnerability of Major Crops. 1972. Genetic vulnerability of major crops. Washington, DC: National Academy of Sciences. vii + 307 p. For soybeans, see Chap. 13, p. 207-17. Illust. 23 cm.

• ***Summary:*** Chapter 13, titled "Soybeans and other edible legumes," discusses soybeans, peanuts, and dry beans. Contents for soybeans: Origin and history. Importance of crop. Genetic uniformity. Pests and diseases. Status of breeding for resistance.

Concern with genetic uniformity and vulnerability increased dramatically after 1970, when the U.S. corn crop was struck by Southern corn blight. Yields dropped 15% nationwide and more than 50% in certain major states. From 1924 to 1927 Dorsett collected 1,500 types of soybean in Manchuria, and in 1929-31 he and Morse collected 4,578 varieties and types in Manchuria, Korea, and Japan. This was the only expedition ever made into eastern Asia specifically to collect soybean germ plasm. By 1922-43 of the introductions received were found to be suited for seed production in the U.S., and they were named. Approximately 10,500 introductions have been brought to the U.S. since 1898–many of these have been duplicates, so many have been lost. Since 1943, 87 varieties have been registered by the Crop Science Society of America.

The vulnerability of any crop to epidemics depends upon the genetic uniformity of currently grown varieties. The practices that increase the vulnerability of varieties by restricting the germ plasm base are: 1. The parents used to develop new varieties are restricted to a few that tend to produce superior varieties under "normal" conditions. 2. A very few varieties dominate production. 3. Resistance to a given disease in currently grown varieties traces to a single source.

Most of the currently grown varieties can be related to 11 introductions, listed here in descending order of importance based on frequency of occurrence (percentage) in parentage of currently grown soybean varieties. Three percentages are given for each variety after the year of introduction–Northern frequency, Southern frequency, and total frequency. Northern refers to maturity groups 00-IV:

Mandarin (Pehtuanlintza, Northeastern China; 1911–84, 0, 58).

Richland (Changling, China; 1926–60, 0, 42).

AK [A.K.] (China; 1912–32, 63, 42).

Manchu (Niguta, China; 1911–56, 0, 39).

Tokyo (Yokohama, Japan; 1901–14, 58, 27).

Clemson (Nanking, China; 1927–9, 68, 27).

PI 54610 (Changchun, Liaoning Prov. China; 1921–14, 47, 24).

© Copyright Soyinfo Center 2021

Mukden (Mukden, China; 1920–26, 0, 18).

Dunfield (Fancheatun Station, China; 1913–7, 26, 13).

Arksoy (Pingyang [Pyongyang / P'yongyang], Korea; 1914–0, 32, 10).

Roanoke (rogue from Pi 71597, Nanking, China; 1927–0, 26, 8).

The varieties Wayne, Amsoy, Corsoy, Clark or Clark 63, Lee, and Bragg accounted for 56% of the U.S. acreage. Statistics indicate that, for the soybean varieties currently grown, genetic uniformity is pronounced.

742. Smith, A.K.; Circle, S.J. 1972. Historical background (on soybeans and soybean foods). In: A.K. Smith and S.J. Circle, eds. 1972. Soybeans: Chemistry and Technology. Westport, CT: AVI Publishing Co. xiii + 470 p. See p. 1-26. Chap. 1. [53 ref]

• ***Summary:*** Contents: 1. Introduction. 2. U.S. history: Introduction of soybeans, processing for oil, soybean oil. 3. Soybean meal and protein: Animal feed industry, poultry industry, industrial uses. 4. Soybean production. 5. Oriental history: Ancient history, Oriental fermented foods (shoyu, miso, tempeh, ontjom, natto, hamanatto, tao tjo [Indonesian-style miso], kochu chang, ketjap), Oriental nonfermented foods (soybean milk, tofu), wedge press. 6. Soybeans and world food problems: Green Revolution, protein supplements (high protein food formulations, AID funded), amino acids, CSM, cottage industries (tofu, kinako).

Concerning industrial uses (p. 8-9): Soybeans rose in popularity as an agricultural crop in the USA at a time when other crops such as corn, wheat, cotton, and tobacco were being produced in surplus quantities. Soybeans took over much of the acreage vacated by these crops. "At that early period it was the hope of many leaders of agriculture, government, and industry that much of the oil and protein of the soybean could be diverted from the food and feed industries into industrial products such as paints, varnishes, soap stock, plastics, adhesives, plywood glue, paper coating and lamination, paper sizing, textile fibers, and other uses... In 1936 the US organized the Regional Soybean Industrial Products Laboratory for this purpose. These new industrial uses were expected to help relieve the problem of farm surpluses... In 1935 the Glidden Company built the first plant for the isolation of industrial grade soybean protein (transferred to Central Soya in 1958). The largest use of industrial grade protein is in the paper-making industry, for coating and sizing of paper board.

"After World War I, soybean meal, because of its low cost, replaced casein as an adhesive for Douglas fir plywood glue, where it still retains a substantial part of the market for the interior grade product."

"While soybean proteins have several important industrial applications, especially in the paper industry for coating and sizing paper, which are expected to continue for years to come, the original dream of an ever-expanding industrial market [for soy proteins] has faded. In the polymer market it appears that for most applications the proteins cannot be made competitive with the increasing number of low cost, high quality synthetic resins... It is generally recognized that the increasing demand for proteins for feed and food will greatly surpass the anticipated industrial uses."

A graph (p. 1) shows: Soybean production in the United States for seed, 1940-1970. Address: 1. Oilseeds Protein Consultant, New Orleans, Louisiana; 2. Director, Protein Research, W.L. Clayton Research Center, Anderson Clayton Foods, Richardson, Texas.

743. Bernard, R.L. 1973. Soybean breeders need new germplasm. *Soybean News* (*NSCIC*) 24(2):5, 3. Jan.

• ***Summary:*** "The following information is based on an interview with Dr. R.L. Bernard, USDA soybean breeder at the University of Illinois. Dr. Bernard is in charge of the U.S. world soybean germplasm collection. He went to Japan and Korea last September on the first major collection mission since 1931.

"Less than 40 varieties account for over 99% of the commercial soybean acreage of United States and Canada. Furthermore, many of these are closely interrelated. Only about 20 introduced varieties comprise the complete ancestry of today's commercial varieties. Faced with this rather narrow germplasm base, where does the soybean breeder turn for breeding material to produce higher yielding varieties for the future and for resistance to disease and insect pests?

"USDA Soybean Collection: The USDA has maintained since 1949 a germplasm collection of soybeans brought from all over the world and especially from eastern Asia where the soybean originated. Today there are approximately 3500 strains in this collection, 2500 early ones (maturity group IV or earlier) maintained at the U.S. Regional Soybean Laboratory, Urbana. Illinois, and 10000 late ones (group V or later) at the Delta Branch Experiment Station, Stoneville, Mississippi. Thousands of seed packets of these strains are sent out each year to breeders and other researchers throughout the U.S. and the world. They are tested for yielding ability, disease or insect resistance, seed composition, etc., and the promising ones are being put into breeding programs to develop new varieties.

"How good is this collection and does it have sufficient diversity to sustain continued variety improvement? Compared to other major crops (such as wheat with over 15,000 lines in the USDA wheat collection), the soybean collection is rather small. This is especially critical since the U.S., with 75% of the world's soybean production and most of the rest of it in communist China, cannot rely on breeding work and collections in other countries as with more widely grown crops.

"In the last 20 years we have done an adequate job of maintaining the soybean collection and making it available to

© Copyright Soyinfo Center 2021

researchers, but no large-scale attempt to gather all soybean germplasm has been made since the Dorsett and Morse expedition to Asia in 1929-31. These two USDA researchers spent two years traveling through Japan, Korea, and northern China (including Manchuria) and collected about 4500 soybean strains. Unfortunately the soybean was not yet an important crop here and all but about 1,000 of these were discarded before the present collection was established.

"Native wild species and varieties disappearing: In the countries of eastern Asia where soybeans have been grown for centuries, farmers have grown a great diversity of varieties and types in the past. We don't know for sure just how much diversity is still present in these countries that is not represented in the USDA collection. We do know that this diversity is rapidly disappearing as improved experiment station selections replace the diverse primitive varieties, and unless researchers preserve it in germplasm collections it will be lost forever.

"Another and largely untapped source of diversity in eastern Asia is the wild soybean. Although of no economic value in itself, it will cross readily with cultivated soybeans and is therefore a potential source of disease or insect resistance and possibly other traits of usefulness in soybean breeding. It, too, is disappearing in some areas as a result of man's agricultural or building developments.

"Base expanded 30-50 percent by Bernard mission: In view of this, plans have been proposed to have soybean breeders from this country visit all of the countries of ancient soybean culture during the next few years and obtain all available soybean varieties and wild soybeans. As a start, Dr. Richard Bernard of the U.S. Regional Soybean Laboratory visited Japan and Korea this fall, collected wild soybeans from over 100 places, and met with Japanese and Korean soybean breeders, who have generously agreed to supply us with perhaps as many as 2000 native varieties.

"Collection opportunities: Major collecting jobs that remain to be done are:

"1. More thorough collecting of wild soybeans and direct collecting of native varieties in Japan and Korea.

"2. Collecting of soybean varieties and wild soybeans in China, which is the original home of the soybean and the center of genetic diversity. This makes it the most important area in the world for soybean germplasm. Almost all of U.S. commercial varieties trace their origins to China. Current political developments suggest that travel to China may be possible in the near future.

"3. Other areas of eastern Asia where soybean collections should be made:

"3a. North Korea along with China is a center of genetic diversity and its latitude corresponds with our Midwest production center. We have as yet no wild soybeans from there.

"3b. In Siberia adjacent to China very early soybeans have been grown for a long time. Also the very earliest wild soybeans come from there.

"3c. Taiwan and the Ryukyu Islands of Japan have some very primitive soybeans and are the southernmost range of the wild soybean and the northernmost range of wild perennial species closely related to soybeans.

"3d. Southeast Asia has some areas of ancient soybean culture and some wild perennial species related to soybeans.

"4. Other parts of the world (Africa, South America, Europe) may contain soybean germplasm not now available in its eastern Asian homeland. Australia, Africa, and Oceania contain perennial species closely related to soybeans that are of interest to those studying the evolutionary history of the soybean. These are not well known and are in need of more research.

"If these proposed trips can be carried out, it will make a major contribution to the procurement and preservation of soybean germplasm which is so essential to future variety development and to the maintenance of stable and efficient soybean production in this country."

A small portrait photo shows Dr. Richard Bernard.

Note: After this article was written, Prof. Theodore Hymowitz (soybean geneticist at the Univ. of Illinois) took many expeditions collecting wild perennial relatives of the soybean. Address: Univ. of Illinois.

744. Meals for Millions Foundation. 1973. Annual report 1972. Santa Monica, California: MFM Foundation. 16 p. 22 cm.

• ***Summary:*** Submitted by Mark M. Sterner, the new Executive Director. Cover is printed in beige, gold, and dark brown ink showing a stylized Mercator projection map of the world on a white background. The pages are unnumbered.

Contents: A letter from Charles Sweeney, President. Meals for Millions–an idea whose time has come [a phrase later used by the Hunger Project, founded by Werner Erhard, 1977]. Technical assistance: Ecuador (including growing soybeans), Sri Lanka (grow soybeans, make a soy beverage), Korea (developing a soy beverage in Santa Monica). Education: Training school, nutritional instruction. Nutritional programs: United States, overseas. MPF distribution during calendar year 1972: 145,395 lb were sent to 16 countries overseas and 31,215 lb were sent to locations in the USA for a grand total of 176,610 lb [71% as much as last year]. MFM in the news. Balance sheet (as of 31 Dec. 1972): Contributions and other revenues $399,147. Expenses $380,000. Assets and liabilities. History. Volunteers support MFM. Northern California advisory board. Bay Area committee. Board of Directors. A letter from Mark M. Sterner, Executive Director.

Photos show: (1) Charles Sweeney, President. (2) Mark M. Sterner. Plus many small photos. Address: 1800 Olympic Boulevard (P.O. Box 1666), Santa Monica, California 90406. Phone: 870-0451.

745. Bongartz, Roy. 1973. Lost in deepest America. *Saturday Review of Society* 1:61-63. April.

• ***Summary:*** About La Choy Food Products Co., of Archbold, Ohio–which calls itself "Chinatown U.S.A." Located 40 miles west of Toledo, Ohio, Archbold is a nice little town of 3,000 surrounded by cornfields. Yet no men or women of Chinese ancestry were to be found. The La Choy plant uses about 360 million gallons of water a year–so much it has nearly dried up the town's reservoir. It buys none of its food locally.

The company was started in 1920 in Detroit. Two classmates at the University of Michigan, Ilhan New (Korean) and Wallace Smith (American) had started a company making bean sprouts after they graduated; soon the company was also selling a lot of soy sauce and canned foods. Mr. New eventually left the company and in 1937 Mr. Smith was struck by lightning and killed. Smith's wife, a native of Archbold, moved the business back home to Ohio, where it has remained to this day. In 1947 [sic, Sept. 1943], La Choy was purchased by Beatrice Foods, a conglomerate.

La Choy believes it is the only company in America that knows how to grow bean sprouts. The writer and his guide pass through big steel doors into a room where mung beans are sprouted in "bins 5 feet wide, 5 feet deep, and 70 feet long." The mung beans, which are subjected to "various pressures of water spray and degrees of temperature," take 6 days to sprout. The little olive-green beans are transformed "into glorious, yellowish-white, fresh, long sprouts,..." which will soon be canned. The company harvests 40 tons of mung beans a day. Each year La Choy makes a total of 100 million cans of 30 different food products.

But why do they call it Chinatown U.S.A.?

Note: This is not the *Saturday Review* that began publication in 1920. Rather *Saturday Review of Society* (ISSN 0091-8571) was a short-lived magazine that ended up merging with other magazines: World (New York. 1972) ISSN 0049-8009; Saturday Review of Education, ISSN 0091-8555; Saturday Review of the Arts, ISSN 0091-8563; and: Saturday Review of the Sciences, ISSN 0091-8547; to form: Saturday review. World, ISSN 0091-620X.

746. Mogi, Yuzaburo. 1973. Kikkoman–American plant project–From planning to start up. Paper presented at the Governor's Conference on Business Development. 14 p. Held 16 May 1973 at American Baptist Assembly, Green Lake, Wisconsin.

• ***Summary:*** With an introduction by William C. Kidd, Secretary, Department of Business Development, Wisconsin. Mr. Mogi earned a B.A. degree from Keio Univ. in Japan, and a Master's of Business Administration (MBA) at Columbia University in New York City.

"Kikkoman soy sauce was first shipped to Hawaii in the 1860's... Kikkoman also had extensive operations in Asian countries until 1945. We had production plants in China, Korea, Malaysia, and some other countries. Our exports reached a peak before the war in 1939 and sales in the United States were about 50% of the total sales in foreign countries at that time. After the war we again started exporting in 1950. However, we lost the market in China, and in addition, because of an import duty and restrictions, it became quite difficult for us to export to other Asian countries...

"At the present time, our main overseas market is America where we are selling more than 60% of our total export... The main consumers of Kikkoman soy sauce in the United States before World War II were Japanese Americans... Our sales increased as the number of Japanese immigrants increased... After the war, we changed sales targets. Instead of limiting ourselves to the Japanese-American market we started to aim for the general American. In order to penetrate the American market we decided to market small size bottles. Before the war we sold soy sauce only in large bottles, casks, and cans... In 1957, we established an American subsidiary for Kikkoman International Incorporated, with its head office located in San Francisco. The purpose of Kikkoman International is to import Kikkoman products and distribute them in the United States. In the 1950's our first efforts were concentrated in large cities on the West coast, mainly in San Francisco and Los Angeles. The Los Angeles branch office was opened in 1958. In the early 1960's we started to approach large cities on the East coast, for example, New York City. We opened a branch in New York in 1961... and one in Chicago in 1965...

"In order for us to effectively penetrate the American market it was a must for us to have the services of good food brokers. Fortunately we have found very good brokers in various parts of the United States. For example, Myers and Sumder in California are the outstanding food brokers in the nation... Three years ago Kikkoman bought about 55% of the stock in Japan Food Corporation (JFC), the largest Oriental wholesaler in the United States...

"As to the advertising,... in 1956 when Eisenhower was elected President, Kikkoman bought election day T.V. time for vote-count announcements in San Francisco all day long... As we came to spend more money for advertisement we have broadened our advertising strategy. Now we have some national and continuous campaigns...

"About three years ago we built a test kitchen and cooking center in San Francisco, adjacent to the head office of Kikkoman International. We now have home economists there. We have been utilizing these facilities to develop new recipes for soy sauce and to educate customers as to how to use soy sauce not only for Oriental food but also American food...

"In December, 1970... we sent the first investigation team to America. The task of this team was to gather data to enable us to compare the cost of having an American plant rather than exporting the product from Japan. Then it was to find the cost difference among different possible locations

© Copyright Soyinfo Center 2021

for the plant, whether in the West coast, the Mid-West, or the East coast. We asked Mr. Mark Pennington, a consultant in New York, to act as a consultant for the project... We decided that it should be in the Mid-West. The reasons why we made the first decision are as follows: 1. Sales of Kikkoman soy sauce, as I mentioned, have been increasing steadily and have almost reached the stage of making it economically feasible to build a plant. 2. We have to get out from a heavy freight burden. We have been buying most of our main raw materials from the United States, mainly soy beans and wheat from the Mid-West... These freight rates have been increasing sharply every year. Still more, almost every year we suffer from strikes of dock workers. 3. Gradually the cost advantage of Japanese business over the American business has been disappearing. In the past,...labor costs in Japan were much lower than those in the United States... We do not have cheap labor in Japan any more. 4. The yen was devalued. The yen devaluation was not the main factor in our decision...

"The reasons why we made the decision to build the plant in the Mid-West are the following: 1. The present main market for Kikkoman products is the West coast... However, we can expect by looking at the various marketing indexing factors, that there is more market potential for our product in the Mid-West and the East coast. Having a plant in the Mid-West means that we are able to ship the product from there both to the present main market and to the future potential market easily... 2. Our main raw materials are soy beans and wheat, as I mentioned. The Mid-West is the main center for growing these grains. By having the plant there, we can expect to be able to buy the raw materials at lower costs. 3. In the Mid-West there are many food companies. We can expect to sell our product to them for industrial use.

"We chose the Austin Company, Des Plaines, Illinois, as the general contractor... In September, 1971, the president and other top people from Kikkoman, Tokyo, visited the United States and compared six final candidates for the plant site. Then we finally chose Walworth, Wisconsin. The reasons for the decision are as follows: 1. The labor climate there is excellent. 2. The local people are quite friendly. 3. Walworth is a convenient place for transportation. We can expect to keep freight cost and warehousing costs to a minimum... 4. The state of Wisconsin was receptive to Kikkoman from the beginning. I first visited this state in December, 1970, as a member of the first investigation team... 5. The state of Wisconsin is regarded as a state which produces the best quality foods... 6. In Wisconsin we can enjoy beautiful nature. The air is clean, the water is pure, and we have a lot of green here...

"The total investment will be about 9 million dollars." Address: Vice-President, Kikkoman Foods, Inc., Walworth, Wisconsin.

747. Lee, Kap Sang; Chung, Dong Hyo. 1973. [Effects of *Bacillus natto* on Korean soybean paste]. *Korean J. of Food Science and Technology* 5(3):163-68. June. [33 ref. Kor; eng]
• ***Summary:*** "In order to study on the effects of *Bacillus natto* on the soybean paste used to make natto, there were determined the contents of total nitrogen, amino acid, ammonia-nitrogen, total acid, reducing sugar and proteolytic activity etc.

"The results are summarized as follows;

"1. Fermentation of natto paste was faster than koji paste and the fermentation period were sufficient in thirteen days.

"2. The chemical components, color, taste and flavor of natto paste (added 15% natto) were much better than the other soybean paste.

"3. The contents of ammonia-nitrogen and amino acid of soybean paste were gradually increased during thirteen days in the fermentation, while total nitrogen contents were decreased.

"4. After thirteen days of the fermentation, the contents of amino acid were decreased.

"5. The contents of amino acid of natto paste were much more those of koji paste.

"6. Total acid and reducing sugar contents indicated a rapid increase from nine to fifteen days during the fermentation, and a slower and decrease after fifteen days.

"7. Total acid and reducing sugar contents of natto paste were somewhat higher than those of koji-paste.

"8. No significant difference was observed in the contents of reducing sugar and total acid according to the amount of natto added.

"9. The contents of reducing sugar and amino acid were proportional to the proteolytic activity.

"10. A good soybean paste may be produced by adding 15% natto to the raw material in thirteen days of the fermentation." Discusses *Bacillus subtilis.* Address: Kang Won College, College of Agriculture, Chung-Ang University, Korea.

748. *Washington Post, Times Herald.* 1973. The soybean embargo (Editorial). July 2. p. A22.
• ***Summary:*** Excellent analysis. "The administration's soybean embargo is a staggering confession of incompetence. To say that the embargo had become necessary does not render it desirable. It only demonstrates how far our government had let matters slide. This administration lurches from one economic crisis to the next, reacting in haste, with little evidence of thought or careful planning."

Last summer the USDA got an expensive lesson in the costs of carelessness in promoting farm exports, when the Russians unexpectedly bought a billion dollars worth of grain; it sat on its hands while grain traders sold off the nation's wheat stocks. This year they continued to do nothing while traders sold off our soybean stocks. If the USDA didn't know what was happening, the market surely did. The price of soybean meal and soybeans skyrocketed. Why? Because

© Copyright Soyinfo Center 2021

professional brokers realized that, between foreign and domestic sales, they had sold more soybeans than there were to sell.

Earlier this month, the administration was forced to freeze food prices.

"The soybean has become, over the past two decades, crucial to the nutrition of Americans and a large part of the world's population overseas. It is the cheapest and richest of all the sources of protein."

"Particularly in East Asia, soy products are an important part of the human diet. The embargo cuts off the flow of protein to people in Japan and Korea in order to control the prices of eggs and beef in the United States." The administration has made a "sudden and drastic decision to tear up our commitments to deliver the food supplies that we have already sold."

749. Hymowitz, T. 1973. Electrophoretic analysis of SBTI-$A_2$ in the USDA soybean germplasm collection. *Crop Science* 13(4):420-21. July/Aug. [6 ref]
• ***Summary:*** First work on geographic distribution of alleles determined by electrophoretic techniques. Hymowitz reports that the soybean's Ti-b (trypsin inhibitor) allele is present at a much higher frequency in Japanese and Korean soybean germ plasm

germplasm than in soybean populations from other areas of the world.

Note: This is the earliest document seen (Nov. 2003) with the term "soybean germplasm collection" or "USDA soybean germplasm collection" in the title. Address: Dep. of Agronomy, Univ. of Illinois.

750. Smith, Nancy. 1973. UI researcher seeks increased soybean yields: To satisfy world food demand. *News-Gazette* (*Champaign, Illinois*). Aug. 26.
• ***Summary:*** Discusses the work of soybean breeder Dr. Richard Bernard. He notes that soybean research has lagged behind that of other crops. "Many private companies employ corn researchers and hundreds of state and federally supported scientists are engaged in corn research and breeding while soybean research has been carried on by a handful of men." All the leading soybean varieties grown in the North Central states "have been produced by about four breeders."

Between 1952 and 1972, nationwide corn yields increased 132% compared with only 35% for soybeans. This is because, until quite recently, there has been almost no privately financed soybean research, and state experiment stations have shied away from soybean research. But Dr. Bernard reports that the soybean research is now intensifying and the future looks bright.

Dr. Bernard, who is in charge of the USDA germplasm collection for the northern half of the USA, is interested in wild soybeans. He recently visited Japan and Korea to collect samples of cultivated and wild soybeans. He collected almost 600 cultivated Korean soybean varieties and more than 150 wild varieties. His trip will net more than 1,000 new samples of soybean germplasm. "This is the first time in more than 40 years that the U.S. has obtained a large collection of new soybean stock from the Far East" [East Asia]. A photo shows Dr. Bernard checking the growth of a wild soybean plant in a UI greenhouse. Address: News-Gazette Farm Editor.

751. **Product Name:** [Vegimil Vegetable Milk {Soymilk; Renamed Vegemil in 1984} (Vegemil A, Vegemil B, or Vegemil C)].
**Foreign Name:** Vegimil.
**Manufacturer's Name:** Dr. Chung's Foods Company, Ltd.
**Manufacturer's Address:** 194-24 Hwoi Hyun-dong 1-ka, Chung-ku, Seoul, South Korea.
**Date of Introduction:** 1973 October.
**Wt/Vol., Packaging, Price:** Bottle.
**New Product–Documentation:** Soya Bluebook. 1981. p. 60. "Vegimil Soy Milk. Other location: 296-5 Hagal-ri, Kihyeung-myon, Yong In-kun, Kyungki-do." Soya Bluebook. 1983. p. 63. "Vegimil."

Letter from Kyung Lee, ASA country director, Korea, to William Shurtleff at Soyfoods Center. 1983. Nov. 23. Gives history and production statistics. Soya Bluebook. 1984. p. 62. "Vegemil Soy Milk." Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 16, 81-83. This was Korea's first commercial soymilk to be produced on a large scale and bottled. In 1981 their output was estimated at 432 tonnes, increasing to 46,373 tonnes in 1983. STS. 1985. Containers for Soymilk. Shows bottle, green lettering, 180 ml.

Photocopy of Label sent by Anders Lindner. 1989. 200 ml. "Sweet Vegemil B, Soybean Milk."

Note: This is the earliest known commercial soy product made in Korea.

752. **Product Name:** Soft Tofu (Pressed Silken Tofu with Calcium Sulfate), Yaki-dofu (Grilled Tofu), Tubu (Korean-Style Soymilk Curds), Atsuagé (Deep-fried Tofu Cutlets), Agé (Deep-fried Tofu Pouches).
**Manufacturer's Name:** Denver Tofu Co.
**Manufacturer's Address:** 6150 N. Federal Blvd., Westminster (N. Denver), CO 80221. Phone: 808-538-1305.
**Date of Introduction:** 1973-1975.
**New Product–Documentation:** Shurtleff and Aoyagi. 1979. Tofu & Soymilk Production. p. 194. "Tofu cutlet pouches. Firm tofu containing no expanding agent is cut into slices midway in size between the slices for tofu pouches and for tofu cutlets, then fried in a conveyorized deep-fryer in two temperatures of oil causing then to expand somewhat, but not as much as for tofu pouches. Thus they can be used either as soft cutlets or substantial pouches."

Talk with Haru Yamamoto. 1988. Aug. 25. Gives product names and approximate date of introduction.

753. Snyder, Harry E. 1973. [A simple technique for inhibiting production of green, beany flavor in soybeans]. *Korean J. of Food Science and Technology* 5(1):33-35. [7 ref. Eng; kor]
• ***Summary:*** "If soybeans are presoaked, two minutes heating at 100ºC is sufficient to inhibit production of objectionable green beany flavors; with dry beans, three minutes heating at 100ºC accomplishes the same inhibition." However these brief heat treatments are not enough to inactivate growth inhibitors. Address: Food Technology Department, Iowa State Univ., Ames, Iowa.

754. Fairbank, John K.; Reischauer, Edwin O.; Craig, Albert M. 1973. East Asia: Tradition and transformation. Boston, Massachusetts: Houghton Mifflin Co. xvi + 969 p. Illust. Index. 24 cm.
• ***Summary:*** One of the best books ever written on the history of East Asia–a classic.

Note: Edwin Reischauer, born in Tokyo to missionary parents, was a professor of Far Eastern Languages at Harvard University and the author of a number of influential books on the relationships among the U.S., Japan, and China when he was called to the diplomatic corps by President John F. Kennedy. He served as U.S. ambassador to Japan from 1961 to 1966. He died in Sept. 1990 at La Jolla, California. Address: Harvard Univ.

755. Hartwig, Edgar E. 1973. Varietal development (in soybeans). In: B.E. Caldwell, ed. 1973. Soybeans: Improvement, Production, and Uses. Madison, Wisconsin: American Society of Agronomy. xviii + 681 p. See p. 187-210. Chap. 6. [68 ref]
• ***Summary:*** Contents. 1. Introduction. 2. Maturity classification. 3. Photoperiod response: Latitude, light quality. 4. Early history. 5. Growth habit. 6. Germplasm collection: Range of maturity, seed size (seed weight), percent protein and oil, oil quality, protein quality, seed holding (pod dehiscence and shattering), seeds per pod, pubescent type (pubescence density and erectness, glabrous), response to minerals, source of genes for pest resistance (disease resistance).

7. Varietal development: Introduction and history, the northern states (Lincoln, Harosoy, Clark, Hark, Amsoy, Corsoy, Wayne), the southern states (Ogden, Roanoke, Jackson, Palmetto, Lee), mid-Atlantic states. 8. Genetic background for major U.S. varieties. 9. Breeding for special qualities: Phytophthora rot, brown stem rot, cyst nematodes, resistance to feeding by insects, differences in oil and protein content, vegetable types, height of lower pods, adaptation to short-day regions [i.e. southern latitudes]. 10. Comments.

"Varietal development" has been of great importance in establishing the soybean as a major crop in the USA. Understanding photoperiodism in relation to varietal development has also "been of extreme importance. For no other major crop is photoperiodism as important in determining area of adaptation" (p. 187).

Maturity classification: In the early 1900s, soybeans were often classified on a scale from early to late, and the number of days to maturity was given. But various studies, starting with Haberlandt (1877), including Mooers (1908), and especially those by Garner and Allard (1920-1930) on the significance of day length on flowering behavior (photoperiodism), indicated that "days to maturity was not an adequate means of describing these types. Also, it was not adequate to describe them as early or late"–unless the latitude and date of planting was given, since the average days maturity for any given variety depends strongly on both of these variables. As a method of describing this responsiveness to day length, ten maturity groups were developed. For example, groups OO, O, and I are adapted to the longer days in the northern areas of adaptability in the USA and Canada. Varieties classed in Group VIII are adapted to the southernmost portions of the continental United States.

Early history: Discusses–Perry expedition to Japan (1854), Ball (1907–recognized 23 varieties), Piper & Morse (1910–described 47 soybean types and listed 280 types that had been grown in the Washington, DC, area). By 1922 more than 800 introductions had been made by the USDA and tested in various parts of the United States (Piper & Morse 1923). Some 43 introductions, which were found to be suited for production in the USA, were given names. Suitability for forage production was emphasized. During the 20-year period from 1907 to 1927, more than 2,000 lots of seed received from China, Japan, Korea, Siberia, and India were introduced by the USDA for testing (Morse 1927). Dorsett (1927) collected nearly 1,500 seed lots from northeastern China (39-53º north latitude) during a 2½-year period prior to 1927.

Because of the growing interest in soybeans in the United States, the USDA organized the Dorsett-Morse expedition to the northeast prefectures of China, Korea, and Japan during the years 1929 to 1931. This was the only plant exploration program for which the primary objective was soybean collection. A total of 4,578 seed lots were collected. Of these, 3,379 (74%) were from Korea, 622 (14%) were from China, and 577 (13%) were from Japan. Many of the soybeans from Japan were "large-seeded, vegetable types. Several of these were named in anticipation of their acceptance by the U.S. public, but few were ever grown extensively. One of these, PI 80481 named Rokusun, has a 100-seed weight of 55 gm, the largest seed size known in soybeans."

Germplasm collection: "Prior to 1949, no organized effort was made to maintain soybean introductions. Many were discarded after their initial observation if an immediate use was not recognized. Since that time an effort has been made to catalog the characteristics of each introduction and

© Copyright Soyinfo Center 2021

maintain viable seed."

Seed size: The 100-seed weight for soybean varieties currently produced in the USA ranges from 12-18 gm. Varieties classified as vegetable types will usually have a 100-seed weight greater than 20 gm. The seeds of *Glycine max,* the cultivated soybean, range in weight from 4 to 55 gm per 100 seeds. The wild annual soybean, *Glycine ussuriensis,* has very small seeds (1.2 to 1.8 gm/100 seeds).

Concerning vegetable types: "No clear-cut distinction exists to define a vegetable-type soybean. In general, seed size is in excess of 20 gm per 100 seeds and the beans have a milder flavor. Several vegetable-type varieties with somewhat improved agronomic qualities have been released in recent years. Disoy is of Group I; Magna and Prize are of Group II; and Kim, Kanrich, and Verde are of Group III in maturity. Verde produces seed having green cotyledons on maturity, which is assumed to be an advantage when immature seeds are used for canning or freezing."

Tables: (1) Effect of latitude and day length on maturity date of the soybean variety Lincoln planted about May 20. The table shows location, latitude, date it is mature. (2) Approximate length of effective photoperiod at various latitudes for an assumed adapted variety that would be planted May 20 and would mature Sept. 20 at each latitude. (3) Soybean varieties recognized in the U.S. in 1907 and classified as to seed color. There were 6 black, 4 brown, 2 mottled, 2 green, 3 yellowish green, and 6 yellow.

(4) Soybean varieties registered by the Crop Science Society of America since 1942 according to maturity groups and approximate distribution of U.S. acreage by maturity groups. For example, maturity group 00, consisting of Acme, Portage, Flambeau, Altona, and Norman, accounts for only 0.1% of U.S. acreage. Maturity group II counts for 29.0%, III counts for 17.0%, IV counts of 12.0%, etc. (5) Parentage of the ten soybean varieties most widely grown in the U.S. in 1971. For example, Wayne, No. 1, of maturity group III, had as its parentage L49-4091 x Clark.

Note: This chapter was later cited as an early study that classified soybean varieties into different maturity groups based on their photoperiod requirements. Address: Agricultural Research Service–USDA, Stoneville, Mississippi.

756. Office of Rural Development. 1973. Introduction to soybean culture and directions of the research in Korea. Suweon, South Korea. *

• ***Summary:*** In 1923 local varieties were systematically collected in Korea and selections from them were attempted. In 1943 a variety from Japan, Yookoo 3, was released to Korean farmers as an improved variety with high yield.

757. U.S. Department of Agriculture. 1973. The annual report on activities carried out under the Public Law 480, 83d Congress, as amended, during the period January 1 through December 31, 1972. Washington, DC: U.S. Government Printing Office. See p. 103-10.

• ***Summary:*** Table 18 is titled "Title II, Public Law 480, total commodities shipped by program sponsor, fiscal year 1972." The main program sponsors and distributing agencies, listed alphabetically, are AJJDC (American-Jewish Joint Distribution Committee), CARE, CRS (Catholic Relief Service), CWS (Church World Service), LWR (Lutheran World Relief), SAWS (Seventh-day Adventist World Service), UNICEF, UNRWA (United Nations Relief and Works Agency), WRC (World Relief Commission). Each of these are Private Voluntary Organizations (PVO/PVOs), registered with USAID. The following foods containing soy protein were distributed: CSM (corn soya mix), WSB (wheat soya blend), and small amounts of soya flour. The vegetable oil which was shipped to many countries was soybean oil; it is not recorded here. The foods containing soy protein were sent in the following amounts (in thousands of pounds) to the following continents and countries: Africa (8,131 CSM and 5,311 WSB): Botswana (2,198 CSM), Burundi (99 CSM), Cameroon (220 CSM and 245 WSB), Central African Republic (153 CSM), Gabon (33 WSB), Gambia (271 CSM), Ghana (1,056 CSM and 150 WSB), Guinea (100 CSM), Liberia (243 CSM and 111 WSB), Malawi (132 CSM), Morocco (676 CSM and 54 WSB), Nigeria (867 CSM and 4,124 WSB), Rwanda (173 CSM), Senegal (300 CSM), Sierra Leone (1,510 CSM), Tanzania (96 CSM), Tunisia (4 CSM and 43 WSB), Upper Volta (33 CSM and 41 WSB), Zaire (510 WSB and 30 soya flour).

Near East-South Asia (348,766 CSM and 97,345 WSB): Afghanistan (699 CSM), Ceylon (1,462 WSB), Gaza [occupied by Israel since 1967] (1,622 CSM and 1,410 WSB), India (234,993 CSM and 27,006 WSB and 8,726 soya flour), Jordan (2,137 CSM), Jordan-West Bank [occupied by Israel since 1967] (758 CSM and 1,067 WSB), Lebanon (385 CSM), Nepal (55 WSB), Pakistan (1,197 CSM and 325 WSB), Syria (570 CSM), Turkey (275 WSB), NESA regional; emergency feeding of East Pakistani children by UNICEF (106,405 CSM and 65,745 WSB).

Note: This is the earliest document seen (Oct. 2010) concerning soybean products (CSM, WSB) in Bangladesh after it became an independent country. This document contains the earliest date seen for soybean products in Bangladesh (1972); soybeans as such have not yet been reported.

Far East [East Asia] (27,014 CSM and 4,121 WSB): China, Republic of [Taiwan] (15 CSM), Indonesia (6,791 CSM and 2,380 WSB), Korea (2,347 CSM), Laos (1,699 CSM and 1,741 WSB), Malaysia (102 CSM), Philippines (9,107 CSM), Vietnam (6,953 CSM).

Latin America (63,980 CSM and 31,274 WSB): Bolivia (2,197 CSM and 660 WSB), Brazil (25,171 CSM and 11,204 WSB), British Honduras [Belize] (507 CSM and 215 WSB), Chile (300 CSM and 2,812 WSB), Colombia (6,284 CSM

© Copyright Soyinfo Center 2021

and 4,608 WSB), Costa Rica (3,042 CSM), Dominica (2 CSM), Dominican Republic (8,118 CSM and 3,309 WSB), Ecuador (2,013 CSM and 1,722 WSB), El Salvador (1,195 CSM), Grenada (11 CSM), Guatemala (2,037 CSM and 962 WSB), Guyana (370 CSM and 474 WSB), Haiti (1,121 CSM), Honduras (716 CSM and 51 WSB), Jamaica (364 CSM and 198 WSB), Nicaragua (375 CSM and 760 WSB), Panama (409 CSM and 639 WSB), Paraguay (759 CSM), Peru (7,850 CSM and 3,806 WSB), St. Vincent (17 CSM), Surinam (2 CSM), Uruguay (950 CSM and 284 WSB).

Grand total by commodity: 447,891,000 lb of CSM and 138,051,000 lb of WSB. Agencies distributing the most CSM and WSB (in million lb): CARE 268, UNICEF 174, CRS 89.

Concerning "veg oil" (soybean oil) shipped under P.L. 480 Title II in fiscal year 1972: India received 196.069 million lb [88,029 metric tons] (p. 106).

Note: This is the earliest document seen (Aug. 2009) concerning soybean products (Corn-Soy Meal) in Botswana. This document contains the earliest date seen for soybean products in Botswana (1972); soybeans as such had not yet been reported by that date. Address: Washington, DC. Phone: 703-875-4901 (1991).

758. Research Libraries Group (RLG). 1973--. RLIN (Research Libraries Information Network) (Computerized bibliographic database). 1200 Villa St., Mountain View, CA 94041. [19000000* ref]

• ***Summary:*** This database is more academic than OCLC [WorldCat]. According to the *Directory of Online Databases* (July 1990), this database comprises nearly 19 million cataloging records from LC MARC tapes, GPO (Government Printing Office) tapes, National Library of Medicine tapes, tapes of member libraries, etc.

Talk with Jennifer Heartsill of RLIN. 1990. Sept. 27. The database was developed at Stanford University and originally named BALLOTS (Bibliographic Automation of Large Library Operations using a Time Sharing system). Jennifer was there while it was being developed. RLIN originated at about the same time as OCLC; the two were developed independently and in parallel. OCLC took a very different approach to how they capitalized and began operations. RLIN first became available for use in 1973. Shortly thereafter they became the system of choice for RLG, which originated on the East Coast. BALLOTS preceded slightly RLG; they were separated by the continent. Then the system began to grow, with much of the funding from members. In 1989 the system became free of debt. Each user pays a fee for use; formerly this was on a transaction basis, now it is on a search basis. In RLG, there are now 34 governing members, 3 principal members, 60 special members, and a multitude of users–any library or individual can use RLIN. RLIN was originally located on the Stanford campus, but recently the organization moved to nearby Mountain View. RLIN, a non-profit group, still uses the Stanford computers. There is a flat annual fee for members.

OCLC has a large database and each record in it is for a unique title; appended to the record are holding symbols which show which libraries own that title. In RLIN, any library can have a complete record for its copy of a title, and include any special notes about the work (such as branch library location, autographed copy, etc.). Thus RLIN contains over 40 million bibliographic records, but only about 15 million unique titles, compared with 20-22 million for OCLC. RLIN has some unique databases, such as citations files, and the holdings of archival repositories. There are 9 bibliographic files in RLIN based on "material type": books, archival and manuscripts control (which have notes like abstracts), citations, maps, sound recordings, the 18th century Short Title Catalog (everything published in English or in an English-speaking country up to the year 1800), art, research in progress, etc. Both subscribe to the same records that the Library of Congress (LC) and the National Agricultural Library (NAL) put out on tape, but LC enters some records directly into the RLIN database for some things such as East Asiatic and Hebrew vernacular via Multiscript Workstations. They are now going out and looking for machine readable data. They have just added a new "citations file" from Engineering Information Inc. that gives article level information within serials and proceedings. RLIN and OCLC both use the MARC format, with numbered fields, and both now have a CJK (Chinese-Japanese-Korean) language service.

Update: Talk with reference librarians at Cal-Berkeley and Cal-Davis. 1991. March. RLIN is having serious financial troubles. It may either try to merge with OCLC (but OCLC may not want to buy it) or it may just die. The cost for cataloging has been too high. It started out being used only for cataloging, then backed into being a reference tool.

Article in Information Today. 1991. April. p. 24. "RLG board sets course for 1990s." They plan "major expansion of bibliographic access to archival holdings, computer files, and visual materials." RLG president is James Michalko.

Update from Western Archives Institute. 1993. June. RLIN is generally considered a better quality database design than OCLC and catalogers like it better; it allows more subject headings and longer record length. But OCLC is a stronger organization and it is easier to do interlibrary loan on OCLC.

Talk with research librarian at University of California at Berkeley. 1994. July 20. The records in RLIN are of better quality and done to a higher standard than those in OCLC; many of the OCLC records are entered by public libraries. RLIN also has a much better search engine. Address: Mountain View, California. Phone: 800-537-7546.

759. Sterner, Mark M. 1974. Low-cost protein foods: Increasing their supply and acceptance in developing countries. *Cereal Science Today* 19(1):14-17. Jan. [2 ref]

© Copyright Soyinfo Center 2021

• ***Summary:*** Contents: Introduction. Poverty and hunger. Population factors. Inexperienced leadership. Culture-oriented protein foods. Soy products. A total-development approach. New solutions needed. The tragedy of protein deficiency. Technical assistance and training.

World population is growing at about 1.5% each year while world agricultural production is increasing at the rate of about 2% annually. However, the heart of the problem of world protein supply is not what is happening on average or on the whole. "It is the fact that there are great differences in the consumption of proteins between countries, between socioeconomic groups within a country, and between family members in the home."

Today 64% of the world's population are "protein hungry." They do not consume enough protein. Sterner lived in Korea until 5 months ago and has seen the problem first hand. To his surprise, he was told by the administrator of a college in Sri Lanka, Ceylon, that the school's small soy-milk plant (put there by the father of soy milk, Dr. Harry Miller) is kept running at full capacity, when soybeans are available, to keep up with the demand of the college cafeteria. He explained that the students much prefer this unsophisticated form of soy milk to the dried soy milk (DSM) provided by CARE.

The article discusses the work of Meals for Millions and contains four photos related to that organization. Address: Exec. Director, Meals for Millions Foundation, Santa Monica, California.

760. Meals for Millions Foundation. 1974. Annual report 1973. Self-help for a hungry world. Santa Monica, California: MFM Foundation. 6 p. 28 cm.
• ***Summary:*** Submitted by Mark M. Sterner, Executive Director. Cover is printed in orange and black ink on white, as if this were one issue of the *Meals for Millions Newsletter.* In the upper left corner is MFM's new symbol [logo], a plant growing out of mounded soil in a bowl which is half of a globe. Below that: "Self-help for a hungry world." The pages are unnumbered.

Contents: Introduction, by Mark M. Sterner ("As most people the world over now recognize, any long-range view of a solution to the world's global hunger problem must rest on the premise of *improvement through self-help.* To reflect this commitment more precisely, MFM looks with pride to its new symbol image adopted formally by its Board of Directors this past fall" [of 1973]). MFM converts goals into action! Vigorous four point program stresses: technical assistance, through education, through on-going programs & emergency relief, through research and development. MFM reaches out in Friendship (To Mexico {Mexican MPF is named *Protea*}, Mississippi, Brazil, American Southwest).

How MFM spent its donor dollars in 1973. Income: $377,000. Expenses: $446,000 of which 4.64% for administration, 19.29% used for fund raising, 12.58% for public relations, and 81.95% [sic, 63.49%] for programs. Board of Directors.

Photos show: (1) Drilling a well in Ecuador with MFM's mobile well-drilling rig. (2) Mark Sterner with students around a Wenger X-5 extruder–as part of a 4-month intensive training program at MFM's International Institute of Protein Food Technology (IIPFT)®. Plus many other photos. Address: 1800 Olympic Boulevard (P.O. Box 1666), Santa Monica, California 90406. Phone: 870-0451.

761. *Soybean Digest.* 1974. The Far East. May. p. 10-13.
• ***Summary:*** The countries of Korea, Taiwan, and Japan have long been important customers of U.S. soybeans. American Soybean Assoc. market development efforts in each of these countries are discussed. In Japan, the main goals are to increase consumption of soybean oil and meat. "In July 1972, a contract was signed between ASA and Yoshihara Oil Mill Ltd., one of Japan's leading oil manufacturers, to test market and promote identified 100% soy oil on a joint basis. Under the contract, ASA reimburses Yoshihara for 50% of their advertising costs up to a set figure.

"Yoshihara came out with three newly designed packs in varying sizes with the Japanese word 'Daizu' which means 'soybean' on the container front which are being marketed in the Tokyo and Osaka areas. Yoshihara has exercised maximum efforts in merchandising their new products...

"During the first phase of the joint ASA/Yoshihara program, Yoshihara sold 2,200,000 lbs. of identified soy oil, not including oil that was sold through Mitsui brand nor the identified soy oil sold as part of gift sets. Yoshihara has set a precedent by identifying their oil products which, most likely, will be followed by other processing companies in Japan."

Also discusses ASA efforts to introduce new soy foods in Japan through the school lunch program. In 1973 the item given the top rating was "Sloppy Joe," which contained 70% hamburger and 30% soy protein.

"Korea: Millions of Koreans are being introduced to improved cooking methods and high-protein recipes using soy foods through an American Soybean Assn. (ASA) market development project.

"ASA works with the Korean Food Development Center director, Mrs. Jun Wang, in instructing urban and rural homemakers, young women attending cooking classes and university and high school students on improved cooking methods and recipes.

"ASA has been associated with the program since 1970 and its success and acceptance has caused an expansion of activities.

"The program is the initial phase of an expanded market development effort to be implemented when Korean economic indicators are favorable. Koreans are being educated in preparing relatively inexpensive meals high in protein. By showing the people that high-protein meals

© Copyright Soyinfo Center 2021

made from soybeans or cooked in soy oil are tasty, the U.S. soybean producer has been able to expand another one of the world's soybean markets.

"ASA participation, in cooperation with FAS/ Washington, is made possible through market development funds contributed by U.S. soybean producers. Stepped-up ASA participation in the program has provided funds for operating a kitchen bus used in mobile cooking demonstrations, cookbooks, recipes and consumer education materials. Following the cooking demonstration, samples of the prepared dishes using soy products are distributed to members of the audience. Improved cooking methods and high-protein recipes are nutritional areas on which Koreans place much emphasis.

"Newspapers, magazines, radio and television stations and schools are constantly seeking more information on the program. Koreans realize the importance of good nutrition and are educating as many as possible through all available sources.

"Mrs. Wang followed a schedule in the last 6 months of 1973 that made her an often-quoted and familiar face on Korean television. During this time her cooking methods and recipes were featured in 12 magazine articles, 9 newspaper features, 50 television and radio programs, 21 'itinerant' cooking demonstrations, 42 kitchen bus demonstrations and 14 exhibits and classes.

"Korean television and radio officials estimate the programs she has appeared on have been received by millions of Koreans. The newspaper and magazine articles also circulate to millions of Koreans."

762. *Foreign Agriculture* (*USDA Foreign Agricultural Service*). 1974. Koreans expand soybean output by planting rice paddy dikes. July 8. p. 8-9.
• ***Summary:*** Korea, which doubled its imports of U.S. soybeans last year, is again promoting a program to boost domestic oilseed production by planting soybeans on rice paddy dikes. This practice, which was mandatory under the Japanese occupation, had been abandoned until revived last year. In 1973, "dike-bean" acreage was estimated at 86,485 acres. The Ministry of Agriculture and Forestry (MAF) estimates that the maximum area for dike-beans now ranges from 93,900 to 135,900 acres. A significant portion of the crop harvested daily in the summer to be consumed as a cooked, green vegetable, much as Americans eat lima beans. Nearly all of Korea's soybean production is consumed as food. Industry sources estimate that 70% is used in homes for making soy sauce and paste, 20% for bean curd, and 10% for bean sprouts. Address: Office of U.S. Agricultural Attaché, Seoul.

763. *Soybean Digest.* 1974. Korea expands soybean output. Aug. p. 35.
• ***Summary:*** "Despite Korea's efforts to bolster domestic oilseed production by planting soybeans on rice paddy dikes, permanent market growth for U.S. soybean sales in Korea can still occur, according to Agriculture Department officials.

"In 1973, 'dike-bean' acreage was estimated at 86,485 acres, well above the total 'rise in soybean planted area of 68,188 acres. Also in 1973, Korea imported some 81,000 MT of soybeans, all from the U.S., and more than double the 36,680 tons imported in 1972.

"Soybeans led all other Korean oilseed crops last year. Acreage rose by 10% to total 769,963 acres, while production was reported at 245,822 tons.

"Korea estimates the maximum area for dike-beans now ranges from 93,900 to 135,900 acres.

"Production goals for 1974 envisage a 56% increase in oilseed production with soybeans accounting for 82% of the goal. Soybean outturn in 1974 is targeted at 323,000 tons, a gain of 31%, with area planted at 946,000 acres, an increase of 23% of 1973."

764. *Soybean Digest.* 1974. The international outlook of the soybean market. Oct. p. 8-10.
• ***Summary:*** Contents: Introduction. Western Europe. Italy (Ferruzzi). Japan. Taiwan and Korea. Latin America.

"Italy: ASA's [American Soybean Assoc.] already made a solid start in expanding soy oil prospects in Europe with an identified soy oil campaign now in its second year in Italy. Watts calls the agreement with Ferruzzi and Company the one outstanding market development activity carried out in Europe recently.

"'Di Soia Si Vivra' (with soy we live), Italian housewives heard again and again during the advertising campaign. And soy oil sold. 'After 7 months, over 50% of the Ferruzzi production at his two plants was identified soy oil. After 12 months, 96% of it was identified soy,' Watts says. 'In the 12 months of the campaign about 20 million lbs. of soy oil were sold to the Italian people.'

"A major competitor began a similar campaign on its own only a few weeks after Ferruzzi started his promotion effort. 'Now, at least 11 brands of soy oil are on the shelves in Italy,' reports Watts."

Note: This is the 2nd earliest document seen (Aug. 2020) concerning the work of Ferruzzi and Co. with soybeans.

Page 10: Karl Sera is now ASA animal nutritionist in Japan.

A pie chart shows 1974-75 U.S. soybean sales commitments: EEC 45%, other Western Europe 6.1%, Japan 21.9%, China 4%, other 4%, undesignated 19.5%.

Tables show: (1) U.S. soybean exports (July to June fiscal year basis) for two years (1972-73, and 1973-74) in quantity (million bushels) and value (million dollars) to: EEC, Spain, Canada, Israel, Japan, Soviet Union, China, Taiwan, unidentified (transshipments), other. (2) U.S. soybean meal exports; the five biggest buyers are West

Germany, Japan, Italy, Netherlands, and Poland-Danzig. (3) U.S. soy oil exports; the five biggest buyers are Pakistan, Peru, Mexico, Canada, and Yugoslavia.

765. *Soybean News* (*NSCIC*). 1974. Dr. Bernard on U.S. science team visiting PRC [People's Republic of China]. 26(1):6. Oct.
• ***Summary:*** "A plant Science Mission, under the auspices of the National Academy of Sciences and led by Dr. Sterling Wortman, Rockefeller Foundation, departed late August for the People's Republic of China (PRC). The Mission will observe firsthand scientific developments in PRC agriculture, and this will help initiate a closer relationship between scientists of the two countries. Later this year a PRC delegation will visit the United States.

"Members of the Mission include: Dr. Richard L. Bernard, Dr. Norman E. Borlaug, Dr. Glenn W. Burton, Dr. Nyle C. Brady, John L. Creech, Dr. Jack R. Harlan, Dr. Arthur Kellman, Dr. Henry M. Munger, and Dr. George F. Sprague.

"Dr. Bernard is in charge of the U.S. world soybean germ plasm collection. He made a collection trip in Japan and Korea in the fall of 1972." Address: Urbana, Illinois.

766. Im, Yon-t'aek. 1974. Changyu yangjo e issoso ui hyoso chep'um iyong e kwanhan yon'gu [Studies on the utilization of enzyme preparations for the fermented process of soy-sauce]. M.A. thesis, Koryo Taehokkyo. iii + 34 p. Nov. 30. [37 ref. Kor; eng]
Address: South Korea.

767. Phatak, Hemant Chintaman. 1974. Seed-borne plant viruses–Identification and diagnosis in seed health testing. *Seed Science and Technology* 2(1):3-155. [216* ref]
• ***Summary:*** Soybeans and soybean mosaic virus (*Maphiflexus sojae*) are discussed on pages 39-46, and p. 114-18. "Sixteen samples [of soybeans] from four countries, seven each from India and Korea, and one each from Lebanon and Lesotho, were tested during 1969 to 1971. Dry examination revealed morphological abnormalities in some samples, especially the one from Lebanon... The soybean sample from Lebanon had several discolored seeds." Five of the 7 seeds from India, 4 of the 7 from Korea, and the 1 from Lebanon were found to be infected with a virus. Also discusses *Myzus persicae* (an insect; Homoptera: Aphididae).

Note: It is not clear whether or not the soybeans from Lebanon had been cultivated in Lebanon. Address: Danish Government Inst. of Seed Pathology for Developing Countries, Ryvangs allé 78, 2900 Hellerup, Copenhagen, Denmark; Present address: Div. of Mycology and Plant Pathology, Indian Agricultural Research Inst., New Delhi-12, India.

768. Wood, R. Bruce. comp. 1974. Soviet soybean varieties: An annotated bibliography. Urbana, Illinois. 187 p. Photocopied from 5 x 8-inch typed file cards. [20 ref. Eng]
• ***Summary:*** Chapters are divided by regions. A history of the named regional varieties developed is given, along with the source of the germplasm, the name of the plant breeder(s), and the organization with which he or she worked, a description of the plant (incl. morphology, maturity, composition, seed weight {weight of 1000 seeds}, yield), citations for the source of the above information, and in some cases a translation and/or explanation of the name in English. Amur region (Amur Oblast and Khabarovsk Kray) grain varieties and fodder varieties (p. 1-27). Maritime (Primorskiy) Kray grain and fodder varieties (p. 28-36). Central Asian fodder varieties (p. 37-38). Georgian grain varieties (p. 38). North Caucasian grain varieties (within Russia; p. 48-54). Ukranian grain varieties (p. 55-64). Moldavian grain varieties (p. 65-68). Prospective varieties and/or those undergoing trials (p. 68-154). Baltic varieties (Latvia and Lithuania; p. 154-64). Varieties of undetermined origin (p. 164-).

Page 1 states that a number of varieties were developed at the "former Amur Oblast State Agricultural Experiment Station in Blagoveshchensk, now the All-Union Scientific Research Institute of Soy." Many of the stock plants were chosen during the period from 1930 to 1939. Page 43 notes: "Imeretinskaya (mestnaya): This old-variety population is one of three major ecologic types grown for more than 90 years [i.e. since 1884 or before] in the Georgian SSR. (The other two variety populations are Guriyskaya and Chiaturskaya.) This material was originally imported from China, Korea, and Japan. Attempts were made during the 1st Five-Year Plan (1928-32), when the USSR first began to cultivate soy on a large scale, to subject these local populations to the selection process in order to develop purer lines with stable and more desirable characteristics. These were then used for hybridization. According to Enken (1971, 125), these crosses did not yield positive results. The breeders were apparently successful, however, in developing purer strains of the local material, for Imeretinskaya mestnaya was in commercial production by 1930 (Vul'fson, 1935, 59), and first regionalized for the Georgian SSR in 1933 (Generalov, 1968, 146). As such it was one of the first Soviet domestic soy varieties, and one of several original varieties still having regional status after more than 40 years."

The Amur Oblast State Agricultural Experiment Station was organized in 1923-24. "The Amur Yellow Population should not be confused with the soy population used by the pre-Revolutionary Amur Experiment Station in 1912-18, which had a different composition."

Page 188 shows the leading Soviet soybean varieties in 1970, ranked by sown acreage: Salyut 216, Amur region, 346,900 ha (hectares). Khabarovskaya 4, Amur region, 141,267 ha. Amurskaya 41, Amur region, 100,995 ha.

© Copyright Soyinfo Center 2021

Primorskaya 494, Maritime Kray, 76,191 ha. Primorskaya 529, Maritime Kray, 65,233 ha. Primorskaya 762, Maritime Kray, 21,300 ha. Amurskaya 310, Amur region, 18,321 ha. Yubileynaya, Amur region, 14,755 ha.

Table 2 lists the names of all soybean varieties entered in the 1962-69 state variety trials, together with the organization that developed each variety. Each of the many Amurskaya varieties was developed by The All-Union Scientific Research Institute of Soy [soybean research institute] (Far Eastern Region, Amur Oblast, city of Blagoveschchensk).

Note: This is the 2nd earliest document seen (Oct. 2015) concerning the cultivation of soybeans in Latvia. This document contains the earliest date seen for the cultivation of soybeans in Latvia (1974). The source of these soybeans is unknown. Address: Urbana, Illinois.

769. Hun, Kim E. 1974. [Changes in carbohydrates of soybean seeds]. *Kangwon Taehak Yongyu Nonmunjip* (*Research Bulletin of Kang Won University*) 8:24-26. (Chem. Abst. 85:139816u). [Kor]*

• ***Summary:*** The changes were measured using thin-layer chromatography. As germination proceeded, the contents of glucose, fructose, and galactose increased, whereas the contents of raffinose and stachyose (both oligosaccharides, which cause flatulence) decreased. Stachyose disappeared by the end of 96 hours of germination. This shows that sprouting improves the digestibility of soybeans and increases their potential for use as human foods. Address: South Korea.

770. Korea. 1974. Seoul, Korea: International Publicity Corp. 68 p. Illust. (color). 24 cm. [Eng]*

• ***Summary:*** Soybeans can be used to make six different foods: Soy sauce, soybean mash, roasted soy flour, soy sprouts, tofu, and soybean oil. Many Koreans still make their own soy sauce at home, starting in the fall. A detailed description of the process is given.

771. Kwon, S.H. 1974. [Soybean culture under tropical environment]. *Korean J. of Breeding* 6(2):56-59. [Kor] Address: Applied Genetics Lab., Korea Atomic Energy Research Inst., Seoul, South Korea.

772. Park, Yeon-Kyu. 1974. [Effects of varieties and seeding dates on the yield components, protein and oil content in soybean]. *Korean J. of Crop Science* 15:77-83. [33 ref. Kor; eng]

• ***Summary:*** "The major results were as follows.

"1. Yields were less by the late seeding. When early seeded the plants had many branch pods, and had high proportion of empty pods, and one grain pods, but on main stem, the proportion of the number of two and three grain pods was higher than that of branch pods. Among varieties, Chung Buk Baek had a high proportion of two and three grain pods, Keum Doo and Chang dan Beak Mok had a higher proportion of one and two grain pods, and Iksan had a high proportion of one and three grain pods.

"2. Protein content was highest in the plots seeded on May 15th, but oil content was highest in the plots seeded on June 25th, Chang dan Baek Mok had the highest proportion of protein content and Iksan had the highest proportion of oil content." Address: Chung Buk College, Korea.

773. Yang, Charles Y. 1974. Soybean rust. *AVRDC, Seminar Series.* 22 p. *

• ***Summary:*** A good overview of soybean rust. This fungal disease "has been recorded in the northeastern, central, and southwestern provinces of China. It has also been reported in the USSR, Korea, Okinawa, Taiwan, the Philippines, Australia, Ceylon, India, Malaysia, Thailand, Cambodia, and Vietnam. Cultivated varieties of soybean known to be rust resistant in the past are now susceptible. Taichung 4 had much more field tolerance to soybean rust, with relatively fewer pustules, than other cultivated varieties. Two physiological races of this rust have been identified through their characteristic pathogenic reactions... It is believed that there can be 6-8 cycles of the rust produced within one growing season" (from AVRDC 1992, #452). Address: Kyushu Univ., Japan.

774. Hsiao, Liang-lin. 1974. China's foreign trade statistics, 1864-1949. Cambridge, Massachusetts: East Asian Research Center, Harvard University. Distributed by Harvard University Press. xvi + 297 p. 29 cm.

• ***Summary:*** Table 3 (p. 80-82) shows "Principal exports of China 1867-1941, 1945-1948," tracks "Beans and peas," "Bean cake" and "Yellow bean." For each of these three it gives statistics for quantity (in piculs) and value (before 1874 in taels, 1874-1932 in Haikwan taels, 1933-1947 in dollars, 1948 in gold yuan. 000 omitted). The definitions of the three basic products, which change frequently, are explained in detail at the bottom of each page.

The peak year for exports of "Beans and peas" was 1929 (45,588 piculs), with a collapse in exports of "Beans and peas" in 1933.

Statistics for "Bean cake" exports started to be recorded in 1894 and the peak year was 1926 (26,055 piculs), with a collapse in bean cake exports in 1933.

Statistics for "Yellow bean" [soybean] exports started to be recorded in 1913 and the peak year was 1929 (41,015 piculs), with a collapse in yellow bean exports in 1933.

Similar tables show: Kaoliang, millet, wheat, wheat flour (p. 83). Groundnuts, groundnuts–shelled, sesamum seed (p. 99-100).

"China's imports and exports by principal countries 1864-1941, 1946-1948," shows imports, exports and total for Italy, Japan, Korea (p. 152-53).

© Copyright Soyinfo Center 2021

"China's imports and exports by principal ports 1867-1941, 1946-1948," shows imports, exports and total for Antung, Canton, Dairen, Hankow, Harbin and Tsingtao" (p. 168-73).

"Foreign exchange rates 1862-1941 (Equivalent of one Haikwan tael before 1933, one dollar from 1933 to 1941)" shows rates for the British pound (from 1862), American dollar (from 1868), French franc (from 1868), Reichmark (from 1886), Hong Kong dollar (from 1881), Japanese yen (from 1903), Mexican dollar (from 1881), Russian ruble (from 1913), and Indian rupee (from 1895).

775. U.S. Department of Agriculture. 1974. The annual report on activities carried out under the Public Law 480, 83d Congress, as amended, during the period January 1 through December 31, 1973. Washington, DC: U.S. Government Printing Office. See p. 94-101.

• ***Summary:*** Table 18 is titled "Title II, Public Law 480–total commodities shipped by program sponsor, fiscal year 1973." The main program sponsors and distributing agencies, listed alphabetically, are AJJDC (American-Jewish Joint Distribution Committee), CARE, CRS (Catholic Relief Service), CWS (Church World Service), LWR (Lutheran World Relief), SAWS (Seventh-day Adventist World Service), UNICEF, UNRWA (United Nations Relief and Works Agency), and WRC (World Relief Commission). All of these are Private Voluntary Organizations (PVO/PVOs), registered with USAID. The following foods containing soy protein were distributed: CSM (corn soya mix), WSB (wheat soya blend), and small amounts of soya flour. The vegetable oil which was shipped to many countries was soybean oil; it is not recorded here. The foods containing soy protein were sent in the following amounts (in thousands of pounds) to the following continents and countries: Africa (24,340 CSM and 6,8857 WSB): Algeria (1 WSB), Botswana (1,398 CSM), Burundi (464 CSM), Cameroon (47 CSM), Central African Republic (67 CSM), Chad (1 CSM and 1 WSB), Congo (115 WSB), Dahomey (124 CSM), Ethiopia (395 CSM), Gabon (46 WSB), Gambia (211 CSM), Ghana (843 CSM and 1,272 WSB), Ivory Coast (546 WSB), Kenya (409 CSM and 400 WSB), Lesotho (299 WSB), Liberia (1,247 CSM and 487 WSB), Malagasy (365 CSM and 2 WSB), Malawi (210 CSM), Mali (230 CSM), Mauritania (235 CSM), Morocco (908 CSM and 890 WSB), Niger (289 CSM), Nigeria (1,197 CSM), Rwanda (82 CSM and 570 WSB), Senegal (643 CSM), Sierra Leone (2,309 CSM), Sudan (3,826 CSM), Swaziland (57 CSM), Tanzania (3,991 CSM and 5 WSB), Togo (1,083 CSM and 1,562 WSB), Tunisia (2,368 CSM and 485 WSB), Upper Volta (878 CSM and 14 WSB), Zaire (419 WSB and 190 WSB), Zambia (44 CSM).

Europe (27 CSM): Malta (27 CSM).

Near East-South Asia (269,188 CSM and 94,141 WSB): Afghanistan (1 CSM), Bangladesh (99794 CSM and 54,631 CSB), Egypt (3,593 CSM and 2 WSB), Gaza [occupied by Israel since 1967] (1,509 CSM and 3,564 WSB), India (156,216 CSM and 15,768 WSB and 775 soya flour), Iraq (997 CSM), Jordan (2,319 CSM and 536 WSB), Jordan-West Bank [occupied by Israel since 1967] (549 CSM and 1,186 WSB), Lebanon (227 CSM and 411 WSB), Nepal (1,000 CSM and 55 WSB), Pakistan (9,933 WSB), Sri Lanka (1,000 WSB and 50 soya flour), Syria (470 CSM and 473 WSB), Turkey (6,582 WSB), Yemen (People's Democratic Republic of Yemen, or South Yemen) (151 CSM), Yemen (Yemen Arab Republic) (2,513 CSM).

East Asia (41,450 CSM and 20,694 WSB): Fiji (2 CSM and 2 WSB), Indonesia (268 CSM and 12,981 WSB), Korea (1,997 CSM), Laos (2,378 CSM and 750 WSB), Macao (29 CSM), Malaysia (1,124 CSM and 65 WSB), Philippines (22,416 CSM), Singapore (10 WSB), Vietnam (13,236 CSM and 6,886 WSB).

Latin America (94,598 CSM and 42,404 WSB): Bolivia (1,534 CSM), Brazil (33,197 CSM and 5,676 WSB), British Honduras [Belize] (333 CSM and 110 WSB), Chile (548 CSM and 6,038 WSB), Colombia (13,043 CSM and 5,202 WSB), Costa Rica (2,792 CSM), Dominica (78 CSM), Dominican Republic (11,584 CSM and 3,486 WSB), Ecuador (2,253 CSM and 5,446 WSB), El Salvador (1,343 CSM and 2,466 WSB), Grenada (41 CSM), Guatemala (4,007 CSM and 1,090 WSB), Guyana (631 CSM), Haiti (1,581 CSM and 3,395 WSB), Honduras (1,297 CSM and 1,523 WSB), Jamaica (1,150 CSM and 657 WSB), Nicaragua (6,850 CSM and 4,126 WSB), Panama (853 CSM and 699 WSB), Paraguay (3,385 CSM), Peru (7,522 CSM and 1,993 WSB), St. Lucia (81 CSM), St. Vincent (51 CSM), Trinidad and Tobago (2 CSM and 1 WSB), Uruguay (442 CSM and 496 WSB).

Grand total: 429,603,000 lb of CSM and 164,124,000 lb of WSB. Agencies distributing the most CSM and WSB (in million lb): CARE 204, UNICEF 163, CRS 151.

Concerning "veg oil" (soybean oil) shipped under P.L. 480 Title II in fiscal year 1973: India received 61.881 million lb [28,069 metric tons] (p. 97).

Note: This is the earliest document seen (March 2021) concerning soybean products (soy flour, CSM, or WSB) in Chad, Mauritania, and Niger. This document contains the earliest date seen for soybean products (cereal-soy blends) in Chad, Mauritania, and Niger (1973); soybeans as such had not yet been reported by that date. Address: Washington, DC. Phone: 703-875-4901 (1991).

776. American Soybean Assoc. 1974? Soybeans: From America's fertile soils the worlds versatile protein resource. Hudson, Iowa. 16 p. Undated. No page numbers. All color.

• ***Summary:*** On a page titled "Utilization," color photos show many soy products including: Milnot (can), Worthington Soyameat (can), Nabisco Sociables (paperboard box), Candied Pernuts: Toasted Soybeans (paperboard box), Bac*Os (glass jar), Crisco (shortening; can), Hain Soy Oil

© Copyright Soyinfo Center 2021

(glass jar), Dream Whip: Whipped Topping Mix (paperboard box), Hamburger Helper (paperboard box), Worthington Veja-Links (can), RG Lecithin (jar), Yoshihara Oil Mill, Ltd. Golden Soybean Salad Oil (can, 2 sizes), and 3 brands of bottled soymilk made in Korea. Another page shows Soyor bottled soy oil. The addresses of American Soybean Association offices in Hudson, Iowa (USA), Tokyo (Japan), Taipei (Taiwan), Brussels (Belgium), Hamburg (West Germany), Vienna (Austria), and Mexico City (Mexico) are given. Address: Hudson, Iowa.

777. *Honolulu Advertiser* (*The*) (*Hawaii*). 1975. Deer Garden is home of authentic Korean cuisine. Jan. 19. p. 128-29.
• ***Summary:*** Deer Garden is on the second floor of the Waikiki Resort Hotel. "A most exotic 'meal in a bowl' is Bi Bim-Pahb..."

"Chilis, mushrooms, denjang (Korean miso), seaweeds,... and red hot bean paste all brought from Seoul or purchased from local importing Korean stores."

"One other dish that must be described here however is Sin Sul Lo, which tops the menu at $7.50, and is suitable as a dish to share. This is an ancient royal food of Korea, always containing nine different ingredients. Prepared at table in the exquisite and traditional Korean brass cooking pot with a little flame heater in the middle it contains seasoned beef strips or sliced chicken breasts or shrimp, with fresh mushrooms, bean curd [tofu], fresh egg noodles..."

778. Canupp-Penrod, R. Lewis. 1975. Soy you want soy sauce [Make yer own]. *Mother Earth News* No. 31. Jan. p. 36-37. [2 ref]
• ***Summary:*** The author is writing a book on soybean products. "Perhaps the best description of the basic chemical process involved [in making soy sauce] was given by a traveler named Bishop, who visited Korea between 1894 and 1897. He wrote, 'Oil of sesamum is largely used in cooking, as well as vinegar, soy and other sauces of pungent and objectionable odors, the basis of most of them being capsicums and fermented rotten beans.' In Bishop's time, Koreans made soy sauce in the fall, after the harvesting of the dried soybeans." He proceeds to describe the ancient Korean process for making mei-ju [meju, soybean koji] and from it soy sauce.

Then he describes briefly how to make Korean miso (*toin-chang* {*doenjang*}), tofu (*yu-bu*), soybeans boiled in soy sauce (*kong-cha-ban*), dry roasted soynuts, soy sprouts, and pickled soy sprouts.

Illustrations show: (1) A truncated cone of pounded soybeans, 8-10 inches high by 12 inches in diameter, as it begins its period of fermentation on a homemade mat of cattail leaves. (2) The cone is later enclosed in tapered strips of unbleached muslin and hung from a hook–as under the eaves or a rafter.

779. Meals for Millions Foundation. 1975. The question is not whether we will help, but how [Annual report 1974]. Santa Monica, California: MFM Foundation. 6 p. 28 cm.
• ***Summary:*** Mark M. Sterner is Executive Director. Cover is as if this were one issue of the *Meals for Millions Newsletter.* In the upper left corner is MFM's logo (slightly redesigned) of a plant growing out of mounded soil in a bowl which is half of a globe. Below that: "Self-help for a hungry world." The pages are unnumbered.

Contents: MFM provides the "how" in Korean beverage plant (The plant began regular operation in July 1974, producing Super D soy beverage, bottled and inexpensive enough to compete with soft drinks. Mr. Jong-Yoon Chun is president of Sam Yang Foods). MFM sends seeding machine to Ecuador for planting soybeans. MFM moves into new self-help project in Midwest (Bootheel, Missouri). MFM's International Institute of Protein Food Technology (Patricia Stevens, program director, says "the course will bear the official title of 'Low-Cost, High Protein Foods'"). Tennessee. Uganda. New Mexico. Shipments of MPF to drought victims in countries bordering the rainless Sahara.

How MFM spent its donor dollars in 1973. Income: $486,544 (up 28.9% from last year) of which 3.4% used for general administration, 9.5% for public relations, 17.5% for fund raising, and 69% for programs.

Photos show: (1) Mark Sterner with Mr. Chun in Korea. (2) Korean woman operating bottling equipment. (3) Two Korean boys holding bottle of Super D beverage. Hank Sterner, MFM's Pilot Plant Supervisor, loading agricultural equipment for shipment of Ecuador. (4) Starving African children. Address: 1800 Olympic Boulevard (P.O. Box 1666), Santa Monica, California 90406. Phone: 870-0451.

780. Ene, L.S.O. 1975. A potential for soybean (Glycine Max. Linn. Merrill) production in parts of the Eastern States of Nigeria. *Nigerian J. of Science* 9(1):111-29. March. [7 ref]
• ***Summary:*** "Yield trials in various locations indicate that there exists a reasonable potential for soybean production in some parts of Eastern States of Nigeria... A yield of 2000 kg/hectare dry beans was considered economic...

"The main soybean growing area in Nigeria is the Southern Guinea zone of Northern Nigeria." The author screened 71 soybeans varieties (1 from Ogoja, Nigeria, 7 from Korea, 35 from the USA, and 10 from Ceylon) for 2 years in 7 centers (Umudike, Adani, Ogoja, Obubra, Abakaliki, Igbariam, Ohaji) for yield performance and agronomic traits. The trials started in 1965, were discontinued from 1968-71, then resumed in 1972. The best seed yield was from Bossier, 3,389 kg/ha. Address: Federal Agricultural Research and Training Station, Umudike, Nigeria.

781. Razowski, Józef; Yasuda, Tosiro. 1975. On the Laspeyresiini genus *Matsumuraeses* Issiki (Lepidoptera,

© Copyright Soyinfo Center 2021

Tortricidae). *Acta Zoologica Cracoviensia* (*Krakow, Poland*) 20(2):89-106. July 31. [17* ref. Eng]
• ***Summary:*** The known species of the genus *Matsumuraeses* are reviewed. A key for the identification of the males based on the genitalia is included. One new species is described and redescriptions or notes are given of others. The genus was originally established as monotypic by Issiki in 1957. The host plants are mainly *Papilionaceae.* Only *Matsumuraeses phaseoli* (Matsumura; originally named *Semasia phaseoli* Matsumura in 1900) and *M. falcana* (Walsingham; originally named *Eucelis falcana* Walsingham in 1900) are pests of the soybean.

*M. phaseoli* uses as its host plants: Azuki beans and soybeans (*Glycine max* and *Glycine hispida*). Distribution: Japan (Hokkaido, Honshu, Shikoku), North Korea (Phiongjang-si district), and USSR (Amur district).

*M. falcana* uses *Glycine max* as one of its hosts. Distribution: Japan (Hokkaido, Honshu, Shikoku, Kyushu), China (Zi-kawy), Taiwan, Nepal.

*M. capax* is a new species, which uses as its host the leaves of *Astragalus membranaceus* Bunge in March and April. Its distribution includes Mongolia. It is not clear in which countries the insects were found growing on soybeans. Address: 1. Inst. of Systematic and Experimental Zoology, Polish Academy of Sciences, Krakow, Slawkowska 17 [Poland]; 2. Entomological Lab., College of Agriculture, Univ. of Osaka Prefecture 7491: Mozuumemachi, Sakaim Osaka, Japan.

782. Shuttleworth, John. 1975. Eastern procedures with soybeans are not difficult: Mother Earth news. *Sun* (*Baltimore, Maryland*). Aug. 30. p. A8.
• ***Summary:*** First describes, in prose format, how Korean soy sauce is made at home. Then describes, in recipe format, how to make it at home today. Finally describes, in prose format, how to make Korean tubu ("Japanese tofu, or bean curd") at home.

A very similar version of this article, with two small illustrations of Korean meju (soybean koji, in the shape of a truncated cone) appeared in the *Chicago Tribune* on Sept. 28 (p. N_A11).

Note. This is the earliest English-language document seen (April 2013) that uses the term "tubu" to refer to Korean-style tofu.

783. *Soybean Digest.* 1975. Korean / German teams study soy protein [on U.S. tour]. Nov. p. 29.
• ***Summary:*** "A Korean Soy Protein Team recently visited the U.S. on a 16-day study tour to help acquaint them with the latest developments in using soy protein and oil in foods. The group studied the uses of soy protein products–textured soy protein, soy flour, meat analogues and dairy analogues–as a means of improving human diets. "'For centuries soybeans have been a major source of protein in the Korean diet,' said ASA Market Analyst Kyung Lee who accompanied the team. 'However, this consumption of soybeans has been through the traditional Oriental foods, which account for 70% of the total Korean soybean consumption.'

"Team members, Mrs. Jun Ryun Wang of the Korean Food Development Institute; Mr. Churl Woo Park, a government food policy official; and Mrs. Kyung Hwa Chun, a member of the Korean press, will relay information on new soy protein developments to the government, food industry and public.

"Their visit, which included stops in Minnesota, Illinois, New York, Missouri and California, was arranged by ASA in cooperation with the Foreign Agriculture Service. Places visited during the trip included: the department of food science at the Univ. of Minnesota; General Mills in Minneapolis, Minnesota; Central Soya, Chicago, Illinois; the Univ. of Illinois, Champaign; Nabisco International Co., New York; and Ralston Purina, St. Louis, Missouri.

"According to Dr. Lee, the demand for better diets including more protein can be met partially by the soy protein foods which have been developed in recent years.

"A team of country feed dealers from West Germany also visited Iowa and Nebraska during the month of September to update their knowledge of mixed feed production, grain elevator operation, livestock production and animal science research. The group of 23 spent time at the Story Cooperative at Story City, Iowa; the Don Newby hog operations in Bondurant, Iowa; the Livestock Exchange in Omaha, Nebraska; and at the Univ. of Nebraska in Lincoln.

"'In 1973, U.S. agricultural exports to West Germany amounted to $1.5 billion of which $570 million was for soybeans,' said Dr. Lee, who helped arrange the trip. 'These soybeans imported are consumed for livestock feed and in this respect, the role of country feed dealers in the soybean industry in Germany is very important,' he said."

784. Shurtleff, William; Aoyagi, Akiko. 1975. The book of tofu: Food for mankind. Hayama-shi, Kanagawa-ken, Japan: Autumn Press. 336 p. Illust. by Akiko Aoyagi. Index. Dec. 15. 28 cm. Rev. ed. 1977 Autumn Press, Brookline, MA. [53 ref]
• ***Summary:*** This pioneering work started the "tofu revolution" in America. Contents: Preface. Acknowledgments. Part I. Tofu: Food for mankind. 1. Protein East and West. 2. Tofu as a food: Introduction, rich in high quality protein (NPU, biological value, protein score, amino acid content), high protein complementarity (tofu contains an abundance of lysine, an essential amino acid that is deficient in many cereal grains; increase usable protein by combining tofu with wheat, rice, corn, etc.), easy to digest, an ideal diet food, low in saturated fats and free of cholesterol, rich in vitamins and minerals, a health-giving

© Copyright Soyinfo Center 2021

natural food, backbone of the meatless / vegetarian diet, free of chemical toxins, low in cost, easily made at home, quick & easy to use, versatile.

3. Getting started: Introduction, buying and storing tofu, basic ingredients (whole-wheat flour, miso {rice-, barley-, and soybean miso, special Japanese miso, Chinese chiang}, oil, brown rice, salt, shoyu {natural shoyu, shoyu, Chinese soy sauce, synthetic or chemical soy sauce}, sugar, vinegar, monosodium glutamate {MSG}), Japanese kitchen tools (each illustrated), preparatory techniques (salt rubbing, rinsing and pressing leeks and onions, soaking burdock root, reconstituting dried sea vegetables {dried hijiki, wakame, agar}, wheat gluten and kampyo [kanpyo], parboiling, cutting tofu and vegetables, using sesame seeds, toasting nori, preparing a steamer), basic recipes (soup stocks and broths {dashi}, basic shoyu dipping sauces {*tsuke-jiru*}, miso toppings {sweet simmered miso / *nerimiso*, miso sauté / *abura miso*, special miso toppings and dipping sauces, finger lickin' miso, and regular miso}, miso salad dressings, nut and seed butter toppings (incl. sesame butter or tahini, peanut butter), spreads and dressings, basic sauces, rice, noodles and other basic preparations).

Our favorite tofu recipes (lists about 80 recipe names for each of the different types of tofu, plus soymilk, yuba, whole soybeans, gô, okara, and curds; very favorites that are also quick and easy to prepare are preceded by an asterisk).

Part II. Cooking with tofu: Recipes from East and West (500 recipes). 4. Soybeans: History of soybeans and "soybean foods," cooking with whole dry soybeans, roasted soybeans (*iri-mame*), fresh green soybeans (*edamame*, incl. a recipe for "Sweet emerald bean paste {*Jinda*}),*"* kinako (roasted full-fat soy flour, incl. Japanese health food treats such as *kinako amé, gokabo, kokusen, kankanbo,* and *abekawa mochi*), soybean sprouts (*daizu no moyashi*), natto ("sticky fermented whole soybeans," with "gossamer threads"), tempeh (fermented soybean cakes), Hamanatto and Daitokuji natto (raisin-like natto), modern western soybean foods (natural soy flour [full-fat], soy granules, defatted soy flour and grits, soy protein concentrates, soy protein isolates, spun protein fibers, textured vegetable protein {TVP}, soy oil products). 5. Gô (a thick white puree of well-soaked uncooked soybeans). 6. Okara or Unohana. 7. Curds and whey. 8. Tofu (includes history, and preparatory techniques: Parboiling, draining, pressing {towel and fridge method, slanting press method, sliced tofu method}, squeezing, scrambling, reshaping, crumbling, grinding, homemade tofu (basic, from powdered soymilk, fermentation method related to soymilk yogurt), tofu quick and easy {incl. Chilled tofu–Hiya-yakko}, tofu dressings, spreads, dips and hors d'oeuvre {incl. Creamy tofu dressings and dips, Tofu mayonnaise dressing, Tofu tartare sauce, Tofu cream cheese, Tofu sour cream, Tofu cottage cheese, Tofu guacamole}, tofu in salads {Western style and Japanese style salads incl. Shira-ae}, tofu with sandwiches and toast, tofu in soups {Western style and Japanese style soups, incl. miso soup}, tofu in sauces, tofu in breakfast egg dishes, tofu baked, tofu sautéed, stir-fried or topped with sauces {incl. Mabo-dofu [Ma Po doufu]}, deep-fried tofu, tofu with grains, tofu broiled {incl. Tofu dengaku}, tofu simmered in one-pot cookery and seasoned broths, tofu steamed, tofu desserts {incl. Tofu whipped cream or yogurt, Banana tofu milkshake, Tofu icing, Tofu ice cream, Tofu cheesecake, Tofu-peanut butter cookies}).

9. Deep-fried tofu: Thick agé or nama-agé (incl. *atsu-agé* meaning "thick deep-fried tofu," "three-cornered agé" {*sankaku-agé*} in Kyoto, agé cubes {*kaku-agé*}, "five-color agé" {*gomoku-agé*}), ganmo or ganmodoki (incl. *hiryozu / hirosu*, "Flying Dragon's Heads," "treasure balls," "Ganmo treasure balls"), agé or aburagé (incl. *kiji*, "agé pouches," "crisp agé", *kanso aburagé*, "agé puffs," "fried soybean cakes," "hollow agé cubes," "Smoked tofu," p. 189-91, 197).

Note 1. This is the earliest English-language document seen (April 2013) that contains the following terms related to deep-fried tofu (p. 180-90): "Thick agé," *nama-agé, atsu-agé, Hiryozu*, "Dragon," "Flying Dragon's Heads," "treasure balls," "five-color agé," *gomoku-agé*, "Ganmo treasure balls." "fresh or raw deep-fried tofu," "three-cornered agé," *sankaku-agé*, "agé cubes," *kaku-agé, kiji.* "agé pouches," "crisp agé," *kanso aburagé*, "agé puffs," "fried soybean cakes," or "hollow agé cubes."

10. Soymilk. 11. Kinugoshi ("*Kinu* means 'silk'; *kosu* means 'to strain'; well named, kinugoshi tofu has a texture so smooth that it seems to have been strained through silk." It is made from concentrated soymilk). 12. Grilled tofu (incl. sukiyaki). 13. Frozen and dried-frozen tofu. 14. Yuba (incl. many meat alternatives such as Yuba mock broiled eels, Buddha's chicken, Buddha's ham, sausage). 15. Tofu and yuba in China, Taiwan, and Korea (incl. Savory tofu {*wu-hsiang kan*}*;* see p. 258 for illustrations of many meat alternatives, incl. Buddha's fish, chicken, drumsticks, and duck, plus vegetarian liver and tripe, molded pig's head, and molded ham). One type of Korean soybean miso is called *kotsu jang* [sic, *kochujang*]. When tofu is served with miso [Korean-style, *Tenjang*] as the dominant seasoning, and with rice, "it becomes the popular *Tenjang Chige Pekpem"* (p. 262). 16. Special tofu.

Note 2. This is the earliest (and only) English-language document seen (March 2009) that uses the word "Tenjang" to refer to Korean-style soybean jang (miso).

Part III–Japanese farmhouse tofu: Making tofu for more and more people. 17. The quest. 18. Making community tofu. 19. The traditional craftsman. 20. Making tofu in the traditional way.

Appendices: A. Tofu restaurants in Japan; many are vegetarian: In Tokyo: Sasa-no-yuki / Sasanoyuki, Goemon, Hisago, Sanko-in, Shinoda-zushi, Dengaku (south of Tokyo in Kamakura). In Kyoto: Nakamura-ro, Okutan, Takocho, Izusen, Junsei, Nishiki, Hakuun-an, Rengetsu, Sagano,

Sorin-an. Tea ceremony cuisine (*Kaiseki ryori*), Zen temple cookery or Buddhist vegetarian cookery (*Shojin ryori*), Tea ceremony cookery from China (*Fucha ryori*), Wild gathered cookery (*Sansai ryori*). A directory of these and others, with addresses and phone numbers, is given (p. 312).

B. Tofu shops in the West (Directory of 43 shops in the USA, 3 in Europe, and 3-7 in Latin America {Mexico City, Rio de Janeiro and Sao Paolo, Brazil}). C. People and institutions connected with tofu. D. Table of equivalents. Bibliography. Glossary. Index. About the authors (autobiographical sketches; a photo shows Shurtleff and Aoyagi, and gives their address as New-Age Foods Study Center, 278-28 Higashi Oizumi, Nerima-ku, Tokyo, Japan 177). Sending tofu in the four directions.

Pudding recipes include: Rice pudding with gô and apple (p. 76, incl. 2 cups soymilk). Tofu chawan-mushi (p. 147; Steamed egg-vegetable custard with tofu). Tofu fruit whips (p. 148). Tofu rice pudding (p. 150, incl. 1 cup soymilk). Tofu custard pudding (p. 152). Soymilk custard pudding (p. 208). Brown rice pudding (p. 208, with 2 cups soymilk). Soymilk chawan-mushi (p. 209). Chawan-mushi with yuba (p. 249).

Dessert recipes include: Tofu whipped cream or yogurt (p. 148; resembles a pudding or parfait). Tofu ice cream (p. 149, with chilled tofu, honey, vanilla extract and salt). Banana-tofu milkshake (p. 149). Tofu cream cheese dessert balls (p. 149). Tofu icing (for cake, p. 149). Tofu cheesecake (p. 150). Tofu-pineapple sherbet (p. 151). Also: Soymilk yogurt (cultured, p. 205). Healthy banana milkshake (p. 206). On p. 160 is a recipe for "Mock tuna salad with deep fried tofu."

Note 3. This is the earliest English-language document seen (Sept. 2013) that uses the term "Tofu ice cream" to refer to soy ice cream or that contains a recipe for "Tofu ice cream."

Note 4. This is the earliest English-language document seen (April 2013) that uses the term "Tofu Cheesecake" and the first to give a recipe for a tofu cheesecake.

Note 5. This is the earliest English-language document seen (Oct. 2013) that uses the term "Tofu sour cream" (p. 109) or that contains a recipe for "Tofu sour cream."

Note 6. This is the earliest English-language document seen (April 2013) that uses the term "tofu milkshake" or that gives a recipe for a shake made with tofu.

Note 7. This is the earliest English-language document seen (Jan. 2012) that uses the term "sticky fermented" to refer to natto.

Note 8. This is the 2nd earliest English-language document seen (April 2013) that uses the term "dried-frozen tofu."

Note 9. This is the earliest English-language document seen (April 2013) that describes preparatory techniques for tofu (p. 96-98).

Note 10. This is the earliest English-language document seen (April 2013) that contains the term "smoked tofu."

Note 11. This is also the earliest English-language document seen (April 2013) that uses the term "kinugoshi tofu" to refer to silken tofu.

Note 12. As of March 2007, the various English-language editions of this book have sold more than 616,000 copies.

Note 13. This is the earliest English-language document seen (Aug. 2011) that contains the term "Modern Western soybean foods" (see p. 69), a term that Shurtleff would soon (by 1983) replace by the more accurate "Modern soy protein products."

Note 14. This is the earliest published English-language document seen (Jan. 2012) that contains the term "creamy tofu dressings" (or "dressing").

Note 15. This is the earliest English-language document seen (Sept. 2012) that contains the term "Soymilk yogurt."

Note 16. This is the earliest document seen (Oct. 2012) that contains an adequate or detailed description of how to make yuba at home.

Note 17. This is the earliest English-language document seen (June 2013) that contains the term "whole dry soybeans."

Note 18. This is the earliest published English-language document seen (Oct. 2013) that contains the term "Tofu whipped cream" (regardless of capitalization). This term appears on pages 113, 148 (with recipe), 149, 153, and 179.

• ***Summary:*** Contents: Introduction. Three varieties of tofu. Doufu: Known as *tojo* or *tokua* in the Philippines, or as *tahu* in Indonesia. Pressed tofu (*doufu-kan*)*:* Savory tofu (*wu-hsiang kan*), soy-sauce pressed tofu (*chiang-yu doufu-kan*), pressed tofu sheets (*pai-yeh*, incl. pressed tofu noodles or "beancurd shreds" {*doufu-ssu, kan-ssu*}, pressed tofu loops {*pai-yeh chieh*}, Buddha's Chicken {*su-chi*} or Buddha's Ham {*suhuo-t'ui*}, salted dry tofu {*doufu-kan*}). Chinese soft kinugoshi (*shui-doufu, sui-doufu, nen-doufu, nan-doufu, shin-kao doufu*). Warm soymilk curds: Chinese smooth curds (*doufu-nao, dou-nao;* often served for breakfast by street vendors), curds-in-whey (*doufu-hua*). Deep-fried tofu (*yu-doufu, cha-doufu, doufu-kuo, kuo-lao doufu*). Frozen tofu (*tung-doufu, ping-doufu*).

Note 1. This is the earliest English-language document seen (April 2013) that uses the term *tung-doufu* or the term

© Copyright Soyinfo Center 2021

A soymilk vender

*ping-doufu* to refer to frozen tofu.

*Doufu-ru* [fermented tofu]: white fermented tofu (*pai doufuru,* incl. 5 different types such as red pepper, sesame oil and red pepper, five-spice, etc.), red fermented tofu (*hung doufuru, nanru, nanyu,* made by adding Chinese red fermented rice [red rice koji] {*ang-tsao*} to the brining liquor to give it a deep red color, thick consistency, and distinctive flavor and aroma; soy sauce is generally used in place of rice wine; another variety is rose essence fermented tofu), stinky fermented tofu (*tsao-doufu, ch'ou doufu,* incl. green stinky fermented tofu), chiang-doufu (prepared by pickling firm cubes of tofu for several days in either Chinese-style miso {*chiang*} or soy sauce).

Soymilk (*doufu chiang, dou-chiang, dou-nai, dou-ru*)*:* Widely enjoyed as a spicy hot breakfast soup (p. 204) or a warm, sweetened beverage (p. 207). Sometimes sold bottled by street vendors.

Yuba: Yuba is much more popular and much less expensive in China and Taiwan than it is in Japan. There are hundreds of yuba shops throughout Taiwan and probably thousands in China, and yuba plays an important role in the nutritional life of the people in home and restaurant cookery. Called bean curd "skin" or "sheets" in most Chinese cookbooks, yuba is known in Mandarin as *doufu-p'i* ("tofu skin") or *doufu-i* ("tofu robes"). "One of the obvious differences between the uses to which yuba is put in China as compared to Japan is the remarkable ingenuity and inventiveness employed by the Chinese in giving yuba the semblance of meat. Imagine walking by the display case of attractive restaurants or marketplace yuba shops and seeing perfect replicas of plucked hens, roosters, and ducks, light-brown fish (complete with fins, gills, eyes, and mouth), juicy hams, tripe, liver and rolled meats–all made from yuba (fig. 111). Rich red sausage links hang in rows and deep-fried drumsticks are handsomely arranged on a large platter–together with a life-sized pig's head. Most of these imitation meat dishes are prepared by pressing fresh yuba into a hinged (wooden or aluminum) mold," clamping the mold closed, then steaming it until the yuba's shape is fixed. Served at *su-tsai* restaurants which specialize in Buddhist vegetarian cookery, each has its own well-known name: Buddha's Chicken (*suchi*), Buddha's Fish (*suyu, sushi*), Buddha's Duck (*suya*), Vegetarian Tripe (*taoto*) or Liver (*sukan*)*;* Molded Pig's Head (*tutao*), Molded Ham (*suhuo*), Sausage Links (*enchan*), Buddha's Drumsticks (*sutsai tsui*), Deep-fried Duck (*suya*). A full-page illustration (p. 258) shows these products. Fresh yuba. Dried yuba (*kan doufu-p'i,* incl. sweet yuba and Bamboo yuba {*fuchu* [*dried yuba sticks*]}). Tofu and yuba in Chinese cookery: Mandarin cookery, congee (rice porridge), "red broiled" sauces (*hong-sao*), meatless days, vegetarian restaurants.

787. Shurtleff, William; Aoyagi, Akiko. 1975. Sukiyaki (Document part). In: W. Shurtleff and A. Aoyagi. 1975. The Book of Tofu. Hayama-shi, Kanagawa-ken, Japan: Autumn Press. 336 p. See p. 224-25.

• ***Summary:*** "A Japanese cookbook written over 350 years ago contains the following recipe for Sukiyaki: 'Obtain either wild goose, wild duck, or antelope, and soak the meat in *tamari* shoyu. Heat a well-used Chinese plow (*kara-suki*) over an open fire. Place the meat on the plow, garnish with thin rounds of *yuzu*, and broil on both sides until the color changes. Serve and be happy.'

"The word sukiyaki–pronounced skee-ya-kee–means 'broiled on the blade of a plow.' Although the modern preparation generally features beef as the basic ingredient, sukiyaki was traditionally prepared with wild game, fowl, fish, or shellfish. Wild boar was also a favored ingredient, and seafoods such as tuna, yellowtail, whale, wreath shells, and scallops were and, in areas such as Kyoto, still are widely used in the dish.

"Before reaching its present form, sukiyaki passed through a number of unusual historical transformations. The earliest preparation was undoubtedly developed by farmers, hunters, and fishermen who broiled their catch over an open fire using a plow or whatever other utensil was available. Since the earliest plow, the predecessor of the present *nabe*, was nothing but a flat iron plate, it was unable to hold cooking liquids. It was probably for this reason that the meat came to be marinated or basted with tamari shoyu, a technique that is still practiced in some Japanese restaurants. Gradually, sake or *mirin* came to be used in the marinade, various vegetables and grilled tofu were broiled with the meat, and the traditional flat plow or griddle became inadequate to hold the juices of this cornucopia of new ingredients. A new container was needed, and at this point, the ancient tradition of broiling wild meat on a plow merged with the newly-imported tradition of *shippoku*, a type of beef-*nabe* cookery which originated about 300 years ago, just after the first contact with Western traders and missionaries.

"Developed in the international port town of Nagasaki, *shippoku* was said to have its historical culinary roots in Holland, Portugal, China, and Korea. As a result of the merger, the original sukiyaki ingredients eventually came to be cooked in heavy iron or Korean-style stone pots, and the dish was served as a one-pot meal prepared at the table. Consequently 'sukiyaki' became a misnomer, for the new dish was neither broiled nor prepared on a griddle-like plow. But neither was the new sukiyaki a true *nabe* dish, since its ingredients were not simmered in a seasoned broth. Rather, this unique Japanese creation straddled three categories: it was a broiled dish insofar as the meat was first cooked in a sizzling-hot pan; it was a *nabe* dish since it was a one-

© Copyright Soyinfo Center 2021

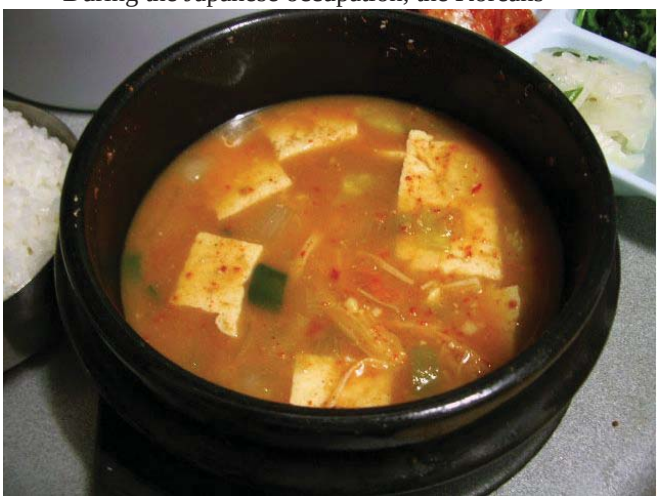
pot prepared at the dining table; and it was a *nimono,* or simmered dish, insofar as the meat and vegetables were simmered together in a rich mixture of shoyu, sake, and dashi.

"Up until this time, the Japanese had never apparently considered using beef or other livestock in sukiyaki. According to a popular legend, *kamado-gami,* the god of the kitchen hearth, is said to have instructed the Japanese people in ancient times to refrain eating the meat of all four-legged animals, especially of livestock. This admonition was reinforced by the nation's emperors and the vegetarian teachings of Buddhism, so that for about 1200 years–from the 8th century until the 19th century–most Japanese did not eat meat. However with the arrival of Christianity in the 16th century, the eating of beef was also forbidden, and sukiyaki was once again prepared exclusively with seafood, wild game, or poultry. Those who developed a longing for broiled meat, but who were not allowed to prepare it in the family's common pot or in the presence of those who kept the faith, were compelled as a last resort to prepare their sukiyaki the traditional way, substitution using a plow or mattock for the kettle and enjoying the forbidden delicacy alone and in secret in the barn, field, or forest. This tradition of 'underground sukiyaki' is said to have continued until about 1900.

"With the opening of Japan to the West in the mid 19th century and the relaxation of traditional prohibitions, meat eating gradually became fashionable in the cities. Yet most Japanese tasted their first beef with considerable trepidation, having been warned by priests and traditionalists that their action was an affront to their ancestors and that dire consequences would befall them. Little by little, however, beef sukiyaki came to be accepted.

"The first Japanese who worked up the courage to actually eat beef did not prepare it Western-style as steak or roast beef. Rather, they cut the meat into paper-thin slices, employing the same method they had used for centuries to prepare *sashimi,* or raw fish. And they seasoned this meat with shoyu in much the same way they would season simmered vegetable or tofu dishes. Many Japanese probably ate their first beef in the form of sukiyaki, and different parts of the country soon developed unique styles of serving it. To this day in the Kyoto area, restaurants place dispensers of shoyu, *mirin,* and sugar on the table and allow each guest to season his food to taste, whereas restaurants in Tokyo have developed their own unique mixtures of these ingredients to form standard cooking liquids.

"Throughout the world people now associate sukiyaki with fine Japanese cookery. In a sense, this is ironic because Japanese cuisine makes relatively little use of meat, and much of sukiyaki's historical influence came from abroad. The ancient delicacy of Japanese hunters and the imported *nabe* preparation have now been totally transformed to become Japan's most famous international dish. And although tofu plays a relatively inconspicuous role in creating the flavor of this dish, sukiyaki has nevertheless been the vehicle whereby thousands of Westerners have had their first taste of 'soybean curd.'



"Although most present-day sukiyaki uses beef as the featured ingredient, our recipe uses ganmodoki–mock goose–in deference to the earliest traditions of using wild fowl. Homemade frozen tofu and frozen thick-agé, the textures of which resemble that of tender beef, make excellent substitutes. Although regular tofu is occasionally used in sukiyaki, grilled tofu is generally preferred for its ability to absorb the flavors in the rich broth; its substantial, almost meaty texture; its ability to keep its form during the frequent stirring; and its barbeque flavor. In Japan, more grilled tofu is used in sukiyaki than in any other type of cuisine." A recipe follows. Address: Lafayette, California.

788. Shurtleff, William; Aoyagi, Akiko. 1975. Tofu in Korea (Document part). In: W. Shurtleff and A. Aoyagi. 1975. The Book of Tofu. Hayama-shi, Kanagawa-ken, Japan: Autumn Press. 336 p. See p. 262.

• ***Summary:*** "Although tofu is an important staple in Korean cookery, it does not play quite the essential role that it does in China, Taiwan, and Japan. Koreans eat about one-third as much tofu as do the Japanese. This tofu is made at the more than one thousand small tofu shops (*tubu kongjang*) scattered throughout the country, 150 of which are located in the capital city of Seoul. Most shops use a fire-heated cauldron and calcium sulfate solidifier. A great deal of tofu is still prepared at home in farmhouses, especially on festive occasions.

"Regular Korean tofu, called *tubu,* is slightly firmer than its Japanese counterpart but not as firm as Chinese tofu (*doufu*). This tofu is widely sold in outdoor marketplaces. Shopkeepers and venders buy flats of tofu from tofu shops in returnable wooden boxes, each 10 by 13 by 2 inches deep. The tofu is placed on wooden pallets, then cut into cakes weighing 12 to 16 ounces. Tubu is the only traditional variety of Korean tofu.

"During the Japanese occupation, the Koreans

© Copyright Soyinfo Center 2021

developed a number of varieties of deep-fried tofu (*tofu kuii* or *twigin tubu*). Agé strips (*yubu*) are pieces of deep-fried tofu about 7 by 1 by 3/4 inches. Ten strips are sold together in a sealed plastic bag. This food is unlike any deep-fried tofu in Japan or China. Agé pouches (*fukuro*) are similar to Japanese agé but are sold in different sizes; the smallest is 2½ inches square, the medium size is 4½ by 2½ inches, and the largest size is 8½ by 3 inches. Each variety can be opened and filled with various stuffings, and many are used to make Inari-zushi (p. 194) or Oden Kinchaku (p. 196).

"Okara (*piji* [*biji*]), soymilk curds (*sun tubu* [*soondubu*]), and whole soybeans (*kung kong*) are used widely in Korean cookery. Fermented tofu (*tubu kuppa*), available mostly in Chinese food markets, is not. Kinugoshi, grilled tofu, soymilk, and yuba are rarely if ever seen.

"Korean cuisine is extremely hot and spicy. Tofu serves to soften the flavors of red peppers and other strong seasonings while lending body and protein to soups, stews, and sautéed vegetable dishes. The most famous Korean tofu dish is *Tubu Chige* [*Dubu Jjigae*] or "tofu soup," a fiery preparation containing tofu cubes, thin slices of beef, and shellfish seasoned with red and green hot peppers, ground red peppers, Korean soybean miso (*kotsu jang* [*gochujang*]), and soy sauce. The soup is served bubbling hot in a small iron pot set on a wooden platter. When it contains miso as the dominant seasoning and is served with rice, it becomes the popular *Tenjang Chige Pekpen* [*Doenjang Jjigae*]. When seasoned with *kimchi* pickles, it is known as *Kimchi Chige*, and when it contains more broth and is prepared with less salt, it is known as *Tubu Kuk.* Tofu is also sautéed in oil until golden brown, then cooked with vegetables for 5 to 10 more minutes to create the favorite household preparation *Tubu Puchim.* Sautéed with soybean sprouts, tofu becomes the dish known as *Konamul Kuge Tubu"* [sic, *Kongnamul Kuge Dubu*]. Address: P.O. Box 234, Lafayette, California 94549.

• ***Summary:*** Contents: Introduction. Agronomy: Varieties, cultivation, yields. Soybean composition. Protein nutritional value. Traditional processing into nonfermented foods: Soybeans as a table vegetable ("cooked green soybeans. "Certain large-seeded varieties are often referred to as 'garden' or 'vegetable' type soybeans in contrast the better known {smaller seeded} 'field' type"), soy milk, tofu (soybean curd), yuba, kinako, salted soybeans, soybean sprouts. Traditional processing into fermented foods: Miso and shoyu, tempeh. Others (p. 55) include: natto, hamanatto, sufu (soy cheese), tao-tjo, kochu chang, ketjap, ontjom, and yogurt-like products.

Contemporary processing without defatting: 'Debittering' by aqueous treatment, whole bean processing, full-fat flour ("Extrusion cooking to produce full-fat soybean flour has received considerable attention"), soy milk and curd. Contemporary defatting processes: Defatting by aqueous processing, defatting with organic solvents, composite flour ("Substitutes or extenders for wheat flour in baked goods and pasta products are termed 'composite flours,' whether or not they contain some wheat." Many of these include soy protein products), soy flours, protein concentrates, protein isolates and textured soy products (Based on "protein fractionation after hexane defatting of soy meal." Recipes for using soy protein products in foods are available from several publications–which are listed). Address: Anderson Clayton Foods, W.L. Clayton Research Center, 3333 Central Expressway, Richardson, Texas 75080.

studied.

The soybean is not mentioned in the index of this book. However in Chapter 4, "Park village" (located in southwest Korea, not far north of Korea's largest port, Pusan), the section on crops and land (table 9, p. 104-05) shows that rice, barley and wheat are the three major crops and cash crops. Besides these, "the farmers grew other grains such as rye, hulled barley, millet, sorghum and corn. Other crops are pulses, soybean, red bean, green bean..." Address: 1. Korean scholar of agricultural economics, Seoul, Korea.

793. U.S. Department of Agriculture. 1975. The annual report on activities carried out under Public Law 480, 83d Congress, as amended, during the period July 1, 1973 through June 30, 1974. Washington, DC: U.S. Government Printing Office. See table 17.

• ***Summary:*** Table 17 is titled "Title II, Public Law 480–total commodities shipped by program sponsor, fiscal year 1974." The main program sponsors and distributing agencies, listed alphabetically, are AJJDC (American-Jewish Joint Distribution Committee), CARE, CRS (Catholic Relief Service), CWS (Church World Service), LWR (Lutheran World Relief), SAWS (Seventh-day Adventist World Service), UNICEF, UNRWA (United Nations Relief and Works Agency), and WRC (World Relief Commission). All of these are Private Voluntary Organizations (PVO/PVOs), registered with USAID. The following foods containing soy protein were distributed: CSM (corn soya mix), CSB (corn soya blend), WSB (wheat soya blend), and small amounts of soya flour. The vegetable oil which was shipped to many countries was soybean oil; it is not recorded here.

Foods containing soy protein were distributed to the following countries or areas:

Africa: Botswana, Burundi, Cameroon, Central African Republic, Chad, Congo–Belgian, Dahomey, Ethiopia, Gabon, Gambia, Ghana, Ivory Coast, Kenya, Lesotho, Liberia, Malagasy, Mali, Mauritania, Morocco, Niger, Nigeria, Rwanda, Senegal, Seychelles, Sierra Leone, Somali Republic, Sudan, Swaziland, Tanzania, Togo, Rhodesia, Upper Volta, Zaire, Zambia.

Near East–South Asia: Bangladesh, British Solomon Islands, Egypt, Gaza, India (incl. soy flour), Gaza, Jordan–East, Jordan–West Bank, Nepal, Pakistan, Sri Lanka, Turkey, Yemen, Palestine Refugee Program.

East Asia: Cambodia, Indonesia, Korea, Laos, Malaysia, Philippines, Singapore, Vietnam.

Latin America: Antigua, Bolivia, Brazil, British Honduras, Chile, Colombia, Costa Rica, Dominica, Dominican Republic, Ecuador, El Salvador, Guatemala, Guyana, Haiti, Honduras, Jamaica, Nicaragua, Panama, Paraguay, Peru, St. Kitts, St. Lucia, St. Vincent, Uruguay.

Concerning "veg oil" (soybean oil) shipped under P.L. 480 Title II in fiscal year 1974: India received 43.325 million lb [19,652 metric tons] (p. 84). Address: Washington, DC. Phone: 703-875-4901 (1991).

794. La Choy Food Prods. 1975? Brief history of La Choy. 2 p. Undated. Unpublished manuscript.

• ***Summary:*** "Archbold, Ohio, with a population of only 2,500 is the home of La Choy Food Products, largest producer of canned Chinese foods in the world–including China!

"The business actually was started in 1920, by Wally Smith and Ilhan New, who became friends while attending the University of Michigan. Smith had a grocery store in Detroit and wanted to sell fresh-grown bean sprouts. New, a Korean, knew how to grow them [mung bean sprouts].

"Sometime later, the pair conceived the idea of canning bean sprouts in glass jars. The next logical step was to use metal cans, and this was accomplished in 1922 when the company was incorporated. New left the company shortly after 1930 and Smith was killed by lightning in 1937.

"After several moves, each time to larger quarters, the first La Choy plant was built in 1937 in Detroit. This was sold to the government at the start of World War II and the firm moved to its present 25 acre Archbold site. The La Choy plant today covers approximately 7½ acres under roof.

"'Chinatown, U.S.A.' is more strategically located for the efficient and economical production of Chinese foods than a glance at a map would indicate. Just to the north are the famed celery beds of Michigan. La Choy is the largest single user of Michigan celery in the nation. More than 5,000 tons are used annually in the new process developed by La Choy which produces up to 50 tons a day of extra-fancy fine cut celery for chop suey and chow mein dishes.

"To the east is the famed Pennsylvania mushroom belt, and La Choy is among the largest users of fresh mushrooms in the nation." Note: An attached photocopy of an ad (with no date or source) titled "La Choy operates the world's largest Chinese food plant," contains two photos: (1) Large aerial view of the La Choy plant in Archbold, Ohio. (2) Portrait photo of Gordon E. Swaney, General Manager. He was named General Manager of La Choy Food Products in 1962. He joined La Choy 18 years ago after graduating from Indiana University.

The text below the photo of the plant states: "This multimillion dollar facility was expanded in 1958 and doubled La Choy production. No other Chinese food processing plant anywhere approaches it in output." The plant is situated on 25 acres.

"La Choy became a division of Beatrice Foods Company in 1943, a year after it moved from Archbold, Ohio, from Detroit, Michigan, where the company was started in 1920." Since it became a Beatrice unit, sales have increased more than 700%. Address: La Choy.

• ***Summary:*** During the last year or so, many new Korean-run fruit and vegetable shops, selling fresh produce, have opened throughout New York City. "The real bonus for the shopper is the Oriental vegetables, spices and specialty items they offer as well. It is not unusual, for example, to find Chinese cabbage, bean sprouts [Koreans prefer soybean sprouts], tofu (bean curd) and hunks of fresh ginger..."

797. Kozaki, Michio. 1976. Fermented foods and related microorganisms in Southeast Asia. *Proceedings of the Japanese Association of Mycotoxicology* No. 2. p. 1-9. March 20. [16 ref]
• ***Summary:*** Table 1, "Main fermented foods using molds, yeasts or bacteria in Southeast Asia," contains four columns: Name of fermented food, raw materials, main related microorganisms, and remarks (incl. names in other countries). Fermented foods listed include amazake (tapé / tapeh in Indonesia, with *Rhizopus* spp. instead of *Aspergillus oryzae*), tempeh, sufu, ontjom, natto (soy bean fermented with *Bacillus subtilis* var. *natto;* Teranatto [fermented black soybeans] is same as original miso, Taosi in Philippines).

Table 2, "Main fermented foods using molds plus bacteria, molds plus yeasts, yeasts plus bacteria and molds, or yeasts plus bacteria in Southeast Asia," contains the same four columns. Fermented foods listed include soy sauce (*Aspergillus oryzae*, *Saccharomyces rouxii, Pediococcus halophilus;* called Jan [kanjang] in Korea and Thua nao [sic] in Thailand), Miso (same 3 microorganisms as in soy sauce). Address: Tokyo Univ. of Agriculture, Dep. of Agricultural Chemistry, 1-1, Suragaoka, Setagaya-ku, Tokyo.

798. *Foreign Agriculture* (*USDA Foreign Agricultural Service*). 1976. Outlook better for soybeans in three Far East markets. March 22. p. 2-4.
• ***Summary:*** The improved forecast is for Japan, Taiwan, and South Korea. Once virtually free of competition for the important Japanese soybean market, the U.S. must now reckon with Brazil as a competitor, while facing Malaysian palm oil in the vegetable oil market. Brazil's soybean exports to Japan last year, for instance, probably totaled only about 60,000 tons, compared with the 2.8 million tons of U.S. beans. The cost of shipping Brazilian beans to Japan in 1975 averaged $5-$10 per ton more than from the U.S. This difference reflected the longer distances from Brazilian ports, plus Brazil's use of smaller ships. The 10-day-longer shipping time from Brazil is especially important in Japan, where timeliness of cargo is a key market factor.

There is only one major oilseed crusher and meal supplier in Korea. The Government production plan calls for self-sufficiency in soybeans and the country has launched a strong drive in this direction. Current Korean production of soybeans totals about 311,000 tons. The low-oil variety of bean produced in Korea is best suited for food use (e.g. miso).

Taiwan is the largest per capita consumer of soybeans in the Far East, with a per capita soybean oil consumption of about 11 pounds in 1975 (out of 13 pounds for all vegetable oils).

799. Ito, Hiroshi. 1976. Hamanattô [Hamanatto]. *Nippon Jozo Kyokai Zasshi* (*J. of the Society of Brewing, Japan*) 71(3):173-76. March. [Jap; eng+]
• ***Summary:*** Contents: Introduction. A brief history of Hamanatto. Methods of production: Yamaya and Horinji methods, Daifukuji method. The microbiology and chemistry of Hamanatto fermentation. Hamanatto's special characteristics. Serving Hamanatto. Conclusion. Acknowledgments.

Two flowcharts show Hamanatto production methods at Horinji and Daifukuji. Tables: 1. Distribution of various microorganisms in Hamanatto (cells per gram) at Yamaya, Horinji, Daifukuji. 2. Nutritional composition of Hamanatto (from Yamaya, Horinji, and Hamana), Daitokuji natto, and regular sticky natto. 3. Composition of free amino acids (mg per 100 gm defatted, and gm per 10 gm protein) in Yamaya Hamanatto, Daitokuji natto, Yamaya Hamanatto, soybean miso (temperature controlled- and natural fermentations), and Hatcho miso. 4. Composition of Hamanatto fats. 5. Volatile acids in Hamanatto. 6. Aromatic compounds in Hamanatto.

In Japan, there are basically two types of natto: Regular natto (*itohiki-natto*) and salty natto (*shiokara-natto*). Generally the word 'natto' refers to the former but in Shizuoka prefecture in and around Hamamatsu city a type of salty natto called *hamanatto* is famous. Totally unrelated to regular natto except in name and the fact that both are fermented soyfoods, it is actually a close relative of soybean miso in terms of its flavor and the way it is produced. However unlike miso, the soybeans retain their original form, uncrushed, and the product has its own unique flavor

© Copyright Soyinfo Center 2021

and aroma. Another type of salty natto is Kyoto's Daitokuji-natto.

A brief history of hamanatto: Hamanatto originated in ancient China and is one of the progenitors of today's miso and shoyu. Many old documents show that its relatives *kokusho* ('grain chiang') and *teranatto* ('temple natto') were brought to Japan from ancient China. A type of fermented, salt-preserved cooked soybeans called *tou-ch'ih kyo* was excavated together with articles buried with one *Mao-tai,* a ruler of the early Han dynasty who lived about 2200 years ago. This was the earliest form of hamanatto. According to the first scholars and envoys from Japan to T'ang dynasty China, *chiang* and *kuki*, both progenitors of miso and shoyu, were introduced to Japan from China. Records show that the great T'ang dynasty Buddhist master Ganjin, who came to Japan by boat in 753, brought with him 1428 gallons of 'sweet kuki,' an early type of salty natto. The first mention of salty natto in Japan appears in Fujiwara Akihara's *Shinsaru Gakki / Shin Sarugakuki*, written in 1286 [Note: Others give the date as 1068]. The first character of the word 'natto' means 'to pay, supply, or dedicate;' the second means 'bean or soybean.' According to the *Honcho Shokkan,* written in 1697, the first character was derived from the fact that natto were first prepared in Japanese temple kitchens which are known as *na-ssho,* the place which supplied the monk's food. Since the propagation of salty natto throughout Japan was done primarily by temples, they also came to be known as 'temple natto' (*tera-natto*). They served as an important source of protein and savory seasoning in the Buddhist vegetarian diet. Kyoto's Daitokuji-natto, Ichimei Ikkyuji-natto, and Tenryuji-natto, each made in temples, and the Hamanatto made at Daifukuji and Horinji temples in and around Hamamatsu city are popular to this day. Hamanatto first became known when the monks of Daifukuji temple presented some to the seventh Ashikaga shogun, Ashikaga Yoshikatsuko, during the 1400s. during the Warring States Period (1467 to 1568) they also presented Hamanatto to lords of the families of Imagawa Toyotomi, and Tokugawa.

Note: This is the earliest document seen (Nov. 2011) that mentions "Ikkyuji" or "Ichimei Ikkyuji" in conjunction with Daitokuji natto.

Because of its unique flavor and aroma and good keeping qualities, hamanatto became known throughout Japan. in some cases the skin of sansho seeds (Japanese pepper; *Zanthoxylum piperitum*) were mixed in and the product called *kara-natto* ('spicy natto'). When Toyotomi Hideyoshi undertook his Korean campaigns, he took lots of hamanatto with him. When he arrived in the ancient province of Hizen in northwest Kyushu, just before his soldiers embarked in boats to Korea, he gave this food the same name, *kara-natto,* but written with characters which mean 'beans for subjugating T'ang dynasty Korea.' This name, he hoped, would bring him luck in his campaign. After returning to the Hamamatsu area in central Japan, he donated land to makers of hamanatto to encourage their craft.

Later, when Tokugawa Ieyasu took over Hamamatsu castle, he used hamanatto as soldiers' provisions. Each year the local monks gave hamanatto as a gift to the shogun, who in turn used it as a New Year's offering. Still later, produced by temple cooks and craftsmen, it was given as a New Year's gift to parishioners; it also had a symbolic meaning since the word for soybeans (*mamé*) has also come to mean healthy and robust. In 1968 Yamaya, a producer of tamari shoyu (soy sauce) under the direction of Suzuki Yasuke, attempted to make an improved version of the product previously prepared at Daifukuji temple and first affixed the name 'hamanatto.' Thus the name of the product developed in the following order: *shiokara-natto* ('salty natto). *kara-natto* (T'ang dynasty natto), *hamana-natto,* and *hama-natto.* To this day, Daifukuji has maintained its own special method of production, but this too has been commercialized.

Methods of production: Today hamanatto is prepared by two methods: the traditional method handed down from generation to generation since ancient times, and the modern industrialized method which made improvements on the traditional method without harming the special flavor and aroma. Yamaya company and Horinji temple use closely related methods; the former is industrialized while the latter is a handmade process using koji starter. Daifukuji uses a different traditional process without koji starter since the ancient incubation room, wooden trays, and rice-straw covering mats are each permeated with starter mold spores. The soybean koji (molded soybeans) is combined with brine and put into vats for the second fermentation in September. Since the room temperature during the koji making (first fermentation) is 20º to 25ºC (68-77ºF) no special incubation heat source is needed. Yet since the molds propagate naturally, without special inoculation, the koji making takes a long time, up to ten days.

There are numerous points of difference from regular miso production; when making salty natto [fermented black soybeans] the soybeans are not crushed; the koji is incubated with brine in a keg or vat with a heavy pressing lid; and the final product is sun-dried. At the factory, the soybeans are only partially reconstituted [by soaking in water] until they reach 1.5 to 1.6 times their dry weight; this takes 2 hours in winter and 1½ hours in summer. They are then drained and allowed to stand for 4-5 hours so the absorbed water penetrates deeper. If they are drained for too long, the beans become hard. They are then steamed for 4-5 hours [at atmospheric pressure] and allowed to stand overnight in the steamer. At Daifukuji, the unsoaked beans are dropped into boiling water, parboiled for 7-8 minutes, steamed for 7-8 hours in a 2 meter deep steamer, then allowed to stand in the steamer until the next morning. Care is taken that the beans are not crushed or dehulled. Nowadays, since it is known that the process of leaving the beans overnight in the steamer lowers their net protein utilization and makes

© Copyright Soyinfo Center 2021

them more difficult for the enzymes to digest, this step is generally omitted. Traditionally it was always used to darken the beans; there were apparently no problems with bacterial contamination, perhaps because the reaction of sugars and amino acids under heat produces substances which reduce the proliferation of bacteria and yeasts. In fact, the overnight period in the steamer may have been done expressly to encourage this effect. Continued.

800. Ito, Hiroshi. 1976. Hamanattô [Hamanatto (Continued–Document Part II)]. *Nippon Jozo Kyokai Zasshi* (*J. of the Society of Brewing, Japan*) 71(3):173-76. March. [Jap; eng+] • ***Summary:*** (Continued): The steamed beans are then spread on a thick rice straw mat (*mushiro*), drained well, sun dried, sprinkled with roasted barley flour, and mixed until each bean is well coated. The straw mat helps to absorb excess water. In factories, the roasted flour is premixed with koji starter (*Aspergillus oryzae* mold spores). They dried the straw mat and used it year after year. Molds such as *A. oryzae, A. soyae,* and *Rhizopus* species inoculated the beans during mixing with the flour. The mixture is covered for one night with rice straw mats, then the next day transferred to wooden koji trays, which are arranged in the koji incubation room to make koji. Care must be taken that excess heat does not develop during fermentation, lest alien bacteria proliferate and the product's flavor and aroma decline. To prevent this, the koji mycelium is broken up three times by hand in the trays during the incubation.

At factories, the finished koji is sun-dried for 4 to 5 hours in winter (Hamamatsu is famous for its dry fall winds) or for 2 hours in summer so that the moisture content is reduced to below 30 to 35 percent. IF this drying is insufficient, after the beans have been put into the vats they easily get crushed. The vat used is a 19-gallon wooden vat or a small wooden tub. The koji is divided among several vats, brine made by combining salt with boiled water is added, a pressing lid equal to twice the weight of the vat contents is set in place, and the mixture is allowed to ferment for 80 to 90 days in summer or 150 days in winter. (In some places (Daifukuji), unpasteurized shoyu is used in place of brine).

The use of a heavy pressing lid is preferable since it causes the fermentation to proceed slowly; a light one helps it to go faster, but the soybeans more easily lose their form. At temples they sliver the middle skin of sansho seeds and place these at the bottom of the vat, then add the finished koji and finally the brine. In factories they add a more concentrated brine and ferment the mixture for at least 2 months. The fermentation room (*kura*) should have good air circulation and ventilation, otherwise the product may develop and unpleasant moldy or musty odor.

After draining off the brine scooping the beans out of the vats, they are spread on rice straw mats (traditionally *mushiro* from the Ryukyu islands; today *tatami* matting), sun-dried, and sifted to remove small pieces, which are discarded. In a separate process, gingerroot is cut thinly, soaked in boiling water, sun dried, and soaked in moromi (shoyu mash) for about 10 days to make pickled gingerroot. Sansho seeds are also added to some types.

The microbiology and chemistry of Hamanatto fermentation: The molds found in fresh hamanatto koji and commercial hamanatto, in addition to *Aspergillus oryzae,* include *Rhizopus* species and *A. niger.* Hamanatto such as that made at Daifukuji using a low incubation temperature (20-25ºC) and a long time contains a large proportion of *Rhizopus* on the surface of the soybeans. Moreover the amylase and protease enzymes in these molds are weaker and less active than those from the koji used for commercial shoyu or miso. For this reason the soybeans are not broken down, but rather remain in their whole form. If the koji is made mechanically, the enzyme strength and quality increases. The incubation proceeds more quickly in summer since the temperature is higher; the koji is ready in 3 days.

In general during the koji production, amylase, protease, and pepsidase activity reach a maximum at 50 hours, but in order to dry it, it must be left longer which causes the activity to decrease. In addition to molds, lactic acid bacteria and film yeasts, which are related to *Pediococcus,* are found in all hamanatto; they are mixed in during contact with the straw mats. If air circulation during koji production is poor, lactic acid bacteria proliferate more than usual. Unlike most lactic acid bacteria, they ferment soybean sugars creating undesirable effects, but do not ferment lactose. After the koji-brine mixture is in the vats, film yeasts proliferate among the various flavors; at 45 days they are most abundant, then later decrease. Especially on the surface of vats with poor air circulation, they are found as a white mold. These yeasts produce hamanatto's unique aroma.

Hamanatto's special characteristics: Because the fermentation time is long, the color turns a dark brown. The form of the beans is well preserved. The composition of nutrients is shown in figure 2. Compared with regular natto, hamanatto has less moisture and more salt. Free amino acids are shown in figure 3. Those abundant are glutamic acid, leucine, and proline, while cystine, tryptophan and methionine are the most scarce. Compared with soybean miso, arginine, cystine, and histidine are also relatively scarce. Since soybean miso undergoes an even longer fermentation than hamanatto the difference is the amino acids freed from the soybeans, which is particularly enhanced by protease enzymes from the koji molds. Hamanatto flavor is rich and full-bodied, somewhat like that of soybean miso, but with a special aroma, more tartness, and a unique flavor component that Japanese call *egumi.* The latter, related to oil rancidification, imparts what some describe as a subtle harsh or unpleasant stimulation to the tongue or throat. Kiuchi et al, in 1976, in an analysis of hamanatto lipids, found that this egumi originates from linoleic acid. Hamanatto fats, unlike those of regular natto,

© Copyright Soyinfo Center 2021

are more than 70 percent of free fatty acids. The majority of fats in both natto and soybeans are triglycerides, with other fat components being relatively low. The lipase in hamanatto koji breaks down a large percentage of the fats but the composition of the resulting fatty acids is not different from those found in soybeans; in both cases, linoleic acid comprises more than 50 percent of the total.

Hamanatto's volatile acids and aromatic compounds are shown in figures 5 and 6. The aroma of Yamaya's hamanatto was superior to that of Daifukuji or Hamana. This aroma was very poor just after the koji was made but during the ripening of various flavors, isobutyl aldehyde, isobutyl alcohol, and various amines decrease together with a decrease in the poor aroma. However if the air circulation is bad while making koji or during the vat fermentation, alien microorganisms proliferate, leaving an undesirable aroma.

801. Ito, Hiroshi. 1976. Hamanattô [Hamanatto (Continued–Document Part III. Continued)]. *Nippon Jozo Kyokai Zasshi* (*J. of the Society of Brewing, Japan*) 71(3):173-76. March. [Jap; eng+]

• ***Summary:*** (Continued): Serving Hamanatto: Hamanatto is used both as a seasoning and as a protein source. Like Daitokuji-natto it is sprinkled as a seasoning over hot rice in a small bowl, then doused with hot green tea to make the popular Ochazuke. It may also be served as an hors d'oeuvre with sake, used in place of tea cakes with whisked green tea as Chauke, or served as a rice seasoning in box lunches like shoyu-simmered kombu. Since ancient times it has been used in Zen Temple Cookery as a source of subtle flavor, diced and mixed with grated daikon, sprinkled with vinegar, or used in the Chinese tofu dish Mabo-dofu. Its abundance of glutamic acid and nucleic acids enrich the flavor of any food with which it is served.

Conclusion: Hamanatto, a progenitor of today's miso and shoyu, has been made by traditional methods since ancient times. Long lasting, it embodies the fermentation and nutritional wisdom of our forebears. Thus its scientific study reveals new and valuable information. In its traditional processing methods there are points that should be improved, yet today it is a long lasting food with its own distinctive characteristics.

Acknowledgements: I would like to thank the Yamaya and Hamana companies for supplying documents and samples, and allowing me to quote selected portions; Professor Kayo Kon of Shizuoka Women's University; and my colleagues at the National Food Research Institute, Kan Kikuchi, Teruo Ota, and Shinkuni Sasachi.

Figures show: (1) Hamanatto production methods: Flow charts of the Yamaya-Horinji method (Horinji is in parentheses), and of the Daifukuji method.

Tables show: (1) Distribution of microorganisms in Hamanatto made by Yamaya, Horinji, and Daifukuji. For each maker, there is one column for surface and another for interior. The types of microorganisms are: General bacteria, micrococcus, streptococcus, pediococcus, halophilic lactic acid bacteria, firm-forming yeasts, and molds (Mostly *Aspergillus oryzae* and *Rhizopus* species).

(2) Nutritional composition of three varieties of Hamanatto (Yamaya, Horinji, Hamana), Daitokuji natto, and regular "stringy" (*itohiki*) natto.

(3) Composition of free amino acids in various fermented foods: (A) Yamaya Hamanatto, Daitokuji Natto (both in mg per 100 gm defatted); (B) Yamaya Hamanatto, Daitokuji Natto, Soybean miso (made at controlled temperature), Soybean miso fermented at natural ambient temperature (all four in gm per 100 gm of protein); (C) Hatcho miso (in mg per gm). In the far left column 18 amino acids are listed.

(4) Composition of Hamanatto lipids. The four vertical columns are: TG = Triglycerides. DG = Diglycerides. ST = Cholesterol. FFA = Free fatty acids, MG = Monoglycerides. The four horizontal rows are: Soybeans, dry. Soybeans, steamed. Natto. Hamanatto.

(5) Hamanatto volatile acids. (6) Hamanatto aromatic compounds.

802. Rasmussen, Wayne D.; Baker, Gladys L.; Ward, James S. 1976. A short history of agricultural adjustment, 1933-75. *USDA Economic Research Service, Agriculture Information Bulletin* No. 391. 21 p. March.

• ***Summary:*** The concept of "agricultural adjustment involves "supporting the prices of farm products and encouraging farmers to adjust production to demand,..."

Contents: Origin of adjustment programs. The Agricultural Adjustment Act of 1933. The Soil Conservation and Domestic Allotment Act of 1936 (in response to the Supreme Court's ruling against the production control provisions of the Agricultural Adjustment Act of 1933). The Agricultural Marketing Agreement Act of 1937. The Agricultural Adjustment Act of 1938. Wartime measures [World War II]. Post-war price supports. The Korean War. Levels of price support–Fixed or flexible? The Soil Bank (designed to take farmland out of production). Farm programs of the 1960s (pilot food stamp plan, expand school lunch program, make better use abroad of American farm surpluses). The Food and Agricultural Act of 1965. The Agricultural Act of 1970. The Agriculture and Consumer Protection Act of 1973.

These acts were passed by Congress, signed into law by the president, then administered by the U.S. Department of Agriculture (USDA). In the USA, this type of legislation began with the Agricultural Adjustment Act of 1933, during the Great Depression, which struck first and hardest at the farm sector of the economy. "For agriculture and rural America, it was the worst economic-social-political wrenching in history... Foreclosures were the order of the day." In 1932, realized net income of farm operators was less

© Copyright Soyinfo Center 2021

than one-third of what it had been in 1929. Farm prices fell more than 50%. Before World War I, the U.S. was a debtor nation; after the war she was creditor nation–owing money to others. In the summer of 1920, the relative decline in the farmers' position began. For "a decade they were caught in a serious squeeze between the prices they received and the prices they had to pay before the situation became critical and a major element of the Depression."

The Agricultural Marketing Act of 1929 established the Federal Farm Board; it hoped to help cooperative marketing organizations. The main crops benefited by these programs were those with large surpluses such as wheat, cotton, tobacco, wool, rice, sugar, peanuts, tobacco, milk, and feed grains (corn, grain sorghum, barley).

Soybeans (p. 20) will be aided to alleviate distress caused by natural disaster. During the past few years there has been greatly increased foreign demand for U.S. agricultural commodities. Address: National Economic Analysis Div., Economics, Statistics, and Cooperatives Service, USDA.

sweet simmered miso / nerimiso. Modern Miso: Akadashi miso, dehydrated or freeze-dried miso, low-salt / high-protein miso.

Part II. Cooking with Miso (400 recipes). 5. Getting started. 6. Recipes from East and West: Miso toppings, miso in dips & hors d'oeuvres, miso in spreads & sandwiches, miso dressings with salads, miso in soups & stews, miso in sauces, miso with grains, beans & tofu, miso in baked dishes, miso sautéed & simmered with vegetables, miso in grilled dishes, miso in deep-fried dishes, miso & eggs, miso in desserts, miso pickles, koji cookery.

Part III. The Preparation of Miso. 7. Making miso at home and in communities. 8. Japanese farmhouse miso (incl. miso-dama). 9. The traditional miso shop. 10. The modern miso factory.

Appendixes: A. A brief history of chiang, miso, and shoyu: Introduction, Chinese chiang, early Japan, the Nara Period (710 A.D. to 784 A.D.), the Heian Period (794 A.D. to 1160 A.D.), the Kamakura Period (1185 A.D. to 1333 A.D.), the Muromachi Period (1336 A.D. to 1568 A.D.), tamari–the forerunner of shoyu (Priest Kakushin returns to Japan from China, where he learned how to make Kinzanji miso, settles at Kokoku-ji temple near town of Yuasa, discovers tamari), miso during the Edo Period (1603 A.D. to 1867 A.D.), the development of shoyu the Meiji and Pre-war Periods (1867 A.D. to 1941 A.D.), modern times, transmission to the West.

B. The varieties of Chinese chiang, Korean jang and Indonesian Tao-tjo. C. The chemistry and microbiology of miso fermentation: Introduction, koji starter molds, making koji starter, making koji–the first fermentation, cooking the soybeans, preparing the miso–the second fermentation, the finished miso. D. People and institutions connected with miso: In Japan–Miso research scholars and institutes, exporters of natural miso and koji to the West, traditional or semi-traditional shops making natural miso, Japan's ten largest miso factories (gives the production in tons/year for several companies), other well-known miso makers. Makers of koji starter and koji, Japanese restaurants specializing in miso cuisine. North America–Miso research scholars and institutes, commercial miso makers, companies importing Japanese miso, koji, or koji starter, individuals interested in miso. Europe (Belgium, England, France, Germany, Holland, Italy, Portugal) and Latin America (Brazil, Costa Rica, Mexico, Venezuela). E. Miso additives. F. Miso with seafoods, chicken, and meat. G. Table of equivalents. H. So you want to study miso in Japan? Bibliography. Glossary. About the authors (autobiographical).

Note 1. This is the earliest English-language book seen (April 2021) that has the word "miso" in the title. It is also the first book in the Western world written entirely on the subject of miso.

Note 2. This is the earliest document seen (April 2021) that mentions "Hatcho miso" (spelled that way, without a hyphen–which is now the typical romanization). Hatcho is a Japanese place name meaning (approximately) "Eighth Street."

Note 3. This is the earliest document seen (April 2021) that gives illustrated details about commercial miso production.

Note 4. An advertisement on the inside back cover of the paperback edition of this book announced that the authors were preparing *The Book of Sea Vegetables.* That book was half researched and written but never published because of concern with pollutants in sea vegetables, and increased interest in soyfoods. Address: 790 Los Palos Dr., Lafayette, California 94549.

809. Shurtleff, William; Aoyagi, Akiko. 1976. The book of miso (Illustrations–line drawings) (Document part). Hayama-shi, Kanagawa-ken, Japan, Soquel, California, and Brookline, Massachusetts: Autumn Press. 256 p. Sept. Illust. by Akiko Aoyagi. [60 ref]

• ***Summary:*** Continued: Illustrations (line drawings, both numbered and unnumbered) show: The two Japanese characters for miso. Three men "Putting Hatcho miso to bed" by piling nearly round river stones on top of a huge vat; the pyramid shape makes the pile earthquake proof. A child holding a sheaf of grain. A round *zaru* (woven split bamboo tray) with a circle of salt in the middle. A square wooden measure (*isshô-baku*) filled with soybeans. The top of rice and barley plants showing grains and leaves. A wooden vat of red miso tied with rice-straw ropes. A miso maker standing by large wooden vats of two different sizes, with braided bamboo hoops. A well stocked miso shop in Japan (at Kichijoji train station, Tokyo). A woman standing behind two deep earthenware crocks filled with miso; balls of miso are in a basket. A sunken open-hearth fireplace (*irori*) in a traditional Japanese farmhouse with a pot hanging over the coals on a hook (*jizai kagi*) and tofu dengaku being grilled around the coals, their skewers stuck into the ash.

Nine wooden kegs of different kinds of miso piled up on 3 levels. A field of soybeans planted in rows. A hand holding soybeans pods still attached to the stem. A soybean pod split open to show the beans. (1) Bar chart of protein from different sources vs. protein returned. (2) Diagram of energy flow through two different food chains, one with a steer in the middle, the other with direct consumption of soy and grains. (3) Development aid from affluent nations as a percentage of GNP (1960-1971). Stylized soybean plant growing out of a stylized Planet Earth. Miso gift pack, with poly bags of rice, barley, and Hatcho miso. A Japanese pipe *kiseru.* (6) Graph of intestinal cancer vs. meat consumption among females in selected countries; the more meat consumed, the more cancer. Miso aging (from *Miso Daigaku*). (7) The varieties of miso and their characteristics (full-page table). (8) The percentage of salt in different miso varieties.

(9a) Map of Japan showing where the different types

of miso originate. (9b) Map of Japan showing geographical miso preferences. A head of rice. (10) Famous sub-varieties of salty rice miso. Two heads of barley. Table about two types of barley miso. Two sets of soybean leaves with pods. Table about three types of soybean miso. The Japanese characters for Hatcho Miso. (11) A wooden sign in a Hatcho miso office: "Supplier to the Imperial Household." (12) Two cross-section views of a tamari miso vat. A small pottery crock of sweet simmered miso (*Nerimiso*). Packages of different types of modern miso: Peanut miso, akadashi miso, low-salt, high protein miso, Instant miso soup with dried frozen tofu, leeks, wakame. (14) Different types of miso packaging, both traditional and modern. A sample miso label. (13) Varieties of miso available in the West, plus characteristics of each. Squeezing a bean of miso out of the cut corner of a plastic bag. Three different shoyu containers. Six different types of tofu on a cutting board. (15) Oriental kitchen tools (utensils; full page). A small crock of salt with a wooden spoon in it.

Suribachi and modern sesame seed grinder. Tofu preparatory techniques. Broiling tofu with chopsticks on a broiling screen. Four forms of kombu. Two stylized crossed sheaves of rice. A traditional farmhouse kamado (raised earthenware cooking area). Pottery crock. Black and white sesame seeds and plant. Yuzu. Sprig of kinome. Head of garlic. Two burdock roots. Two leeks (*negi*). Making broiled miso. Hoba miso. Kaiyaki miso. Yubeshi miso. Wakame plant. A bowl of miso soup. A woman drinking hot miso soup next to a vending machine. Vegetables cut for miso soup (*mi* or *gu*). Table of the most popular ingredients in miso soup. How to make miso soup at home (4 views). Miso-koshi (woven bamboo strainer). Mad monks grinding miso. (19) Full-page table of miso soup throughout the four seasons. Shiso / beefsteak leaves. Kabocha. Daikon. Irori and jizai kagi (sunken farmhouse fireplace and overhead hanging hook). Woman serving miso by a sunken / open hearth fireplace. Woman kneeling, grinding miso with a pestle (*suri kogi*) in a *suribachi* (serrated earthenware mortar / mixing bowl).

(20) Rice patties with nori (*o-musubi*, *o-nigiri*). Bamboo noodle tongs. Homemade noodles in a pot. (21) Broiled mochi wrapped with nori. (22) Steamed tofu. A Chinese cleaver, with its tip stuck into a chopping block. Cultivated shiitake mushrooms growing on a log. Kabocha. Daikon. (23) Miso oden. Doténabé [Dotenabe]. Konnyaku twists. Dengaku Hoshi. Tofu dengaku (2 pieces, skewered; 3 pieces skewered in a box). Japanese eggplant (*nasu*) scored and Shigiyaki. Deep-frying with a wok. Lotus root stuffed with miso. (24) Deep-fried sandwiches. (25) Gashouse eggs. (26) Layered omelets. Japanese bamboo steamer. Kashiwa mochi. Selling miso pickles. Two pickling containers. (27) Salt-pressing. Air-drying daikon and turnips (*kabu*). Miso pickles with tea and chopsticks. Amazaké at the Nakamura-ro restaurant.

Note: This is the earliest English-language document seen (July 2012) that uses the term "Amazaké" to refer to amazake.

How to make miso at home: Utensils, ingredients, and process (7 figures). (29) Miso fermentation crocks. Corona hand-mill. Soft mat koji.

© Copyright Soyinfo Center 2021

42. Sept. [4 ref. Kor; eng]
• ***Summary:*** Composition of sterols in soy sprouts, measured by mass spectrometry (MS), was found (on a dry weight basis) to be 4.52 mg% campesterol, 10.35 mg% beta-sitosterol, and 7.75 mg% stigmasterol. Address: College of Engineering, Inha Univ., Incheon, South Korea.

811. Shurtleff, William; Aoyagi, Akiko. 1976. Appendix B: Varieties of Chinese chiang, Korean Jang, and Indonesian Tao-tjo [Tauco] (Document part). In: W. Shurtleff and A. Aoyagi. 1976. The Book of Miso. Hayama-shi, Kanagawa-ken, Japan, Soquel, California, and Brookline, Massachusetts: Autumn Press. 256 p. See p. 277-331. Sept. Illust. by Akiko Aoyagi. Revised ed. 1981. New York, NY: Ballantine Books, 620 p.
• ***Summary:*** Contents: Introduction. Note: Of the romanized Chinese names given in curly brackets below, the first is in the Wade-Giles transliteration; the second is in the more modern pinyin transliteration.

Chinese chiang: Introduction, Red or regular chiang (chunky chiang, hot chunky chiang, Szechwan red-pepper chiang, Hamanatto chiang, Cantonese red chiang, great chiang, yellow-red chiang), black chiang (sweet wheat-flour chiang, black chiang), assorted chiangs (introduction, red-pepper chiang, Canton sweet simmered chiang, dried chiang, other varieties (none of which contain soybeans or grain koji; sesame chiang, peanut chiang, umeboshi chiang, shrimp chiang, corbicula chiang, tangy chiang, semi-fermented chiang)), chiang sauces (bean sauce, hoisin sauce {*hai-hsien chiang, haixiang jiang*}, oyster sauce, barbecue sauce, other chiang sauces, none of which contain soybeans or grain koji; shrimp sauce, Chinese Worcestershire sauce, Chinese ketchup). Note 1. The Chinese (Wade-Giles) names and characters for each of these sauces are given on page 230.

Korean jang: Introduction, Korean soybean jang (*doen jang*), Korean red-pepper jang (*kochu jang*), Mild red-pepper jang (*mat jang*), Chinese sweet black jang (*cha jang* or *chungkuk jang*), Japanese red jang (*wei jang* or *ilbon jang*).

Note 2. This is the earliest English-language document seen (March 2009) that uses the word "kochu jang" (or "kochu-jang") to refer to Korean-style red pepper and soybean paste (miso).

Indonesian tao-tjo: Summary.

Note 3. This is the earliest English-language document seen (Jan. 2012) that uses the term "chungkuk jang" to refer to a fermented Korean soyfood or seasoning. Actually, the term refers to Korean-style natto which, although it is a salted paste, is fermented using bacteria (*Bacillus subtilis*) and therefore does not belong in a book about miso. Address: 790 Los Palos Dr., Lafayette, California 94549.

812. Shurtleff, William; Aoyagi, Akiko. 1976. Appendix A: A brief history of chiang [jiang], miso and shoyu (Document part). In: W. Shurtleff and A. Aoyagi. 1976. The Book of Miso. *Retailing Korean jang*

• ***Summary:*** "As in China, both Korean-style miso (*daen-jang* [*doenjang*]) and Korean soy sauce (*kan jang* [*kanjang*]) are widely prepared in farmhouses and urban dwellings; each family is allotted 6 pounds of free salt per year for just this purpose. A typical downtown high-rise apartment in Seoul

© Copyright Soyinfo Center 2021

Korean Jang

will have six to eight brown earthenware crocks containing homemade *jang* and *kan jang* on 80 to 90 percent of its balconies. For this reason, *jang* is sold on only a relatively small scale at the miso-and-pickle sections of outdoor markets and food stores. *Jang* is widely used in hot spicy soups (*chigé* [*jjigae / chigae*]) which are generally thicker than Japanese miso soups. *Kan jang*, sweeter and stronger than Japanese shoyu, is made with soybeans, salt, and water, without the use of koji grain.

"Korean Soybean *Jang* (*daen jang* or *doen jang*)*:* The only traditional Korean *jang*, this variety is light grayish brown and slightly chunky from the small proportion of uncrushed soybeans it contains. Two varieties of this salty and very strong-flavored jang are found in traditional markets; neither contains grain koji and one is slightly more salty and lumpy than the other. Most of this jang is still made in private homes, even that which is sold commercially, since most Koreans prefer the homemade product.

"To prepare *daen jang*, cooked soybeans are pounded and mashed in a mortar, shaped into balls (like Japanese miso dama, p. 193), wrapped in rice straw, and hung under the rafters until each ball is covered with a white bloom

© Copyright Soyinfo Center 2021

of natural mold. The balls, called *mezu* [*meju*], are then crushed and mixed with salt and water (and sometimes with sesame seeds or sesame leaves) and placed in an earthenware container of 1 to 10 gallons capacity. The container is covered (but has no pressing lid) and placed outdoors on the balcony or rooftop, or in a courtyard. The fermentation period generally lasts for six months, from March to September. At present *mezu* is sold in marketplaces and used as the basis for some homemade *jang*. And some families have recently begun to inoculate the cooked beans with koji starter (*tané koji*) mixed with a little wheat flour; the inoculated beans are placed in a warm place (79ºF to 86ºF) for about 24 hours, or until they are covered with white mold. They are then dried, crushed, and mixed with salt and water as above.

"In the United States a commercial variety is now available in 1-pound cans at Japanese and Korean food markets. Labeled "Bean Mash" (*doen jang*), it contains soybeans, wheat, salt, and water.

"Korean Red-pepper Jang (*go-chu jang* [*gochujang*] or *kocho jang*)*:* This hot-and-spicy jang is bright brownish red, has a smooth texture, and is somewhat softer than Japanese miso; each of the three main varieties contain slightly different amounts of red peppers. Boiled soybeans are mashed, hung up in rice-straw sacks, and cured for 2 to 3 months. This material is then broken up, dried in the sun, and ground to a fine powder, usually in a hand-turned stone mill. The powder is combined with finely-ground red peppers, salt and water, mixed well, placed in crocks and allowed to ferment for 2 to 3 months. In some areas, rice flour is mixed with water to form dumplings which are dropped into boiling water and cooked. These are mashed together with *mezu* [*meju*] (see above) and powdered red peppers. One third of the salt is added each day for three days. The red-pepper jang may be served on the fourth day, but is usually fermented for 6 months. It is said that some varieties are also prepared from rice koji and wheat flour, or from glutinous rice (*mochigomé*) or *mochi* and soybeans.

"Many Korean families prepare homemade red-pepper jang. It is a favorite base of a thick soup or stew containing thinly sliced or ground meat and sweetened lightly with sugar.

"In the United States, a commercial variety is now available in 1-pound cans at Japanese and Korean food markets. Labeled "Hot Bean Mash" (*kocho jang*), it contains rice, red pepper, soybeans, salt, and water.

"Mild Red-pepper Jang (*mat jang*)*:* This variety is similar to Korean Red-pepper Jang but contains more mezu [meju], less red pepper, and less salt. Glutinous rice is often used to add natural grain sugars and a sweet flavor. The jang is wrapped in blankets and fermented in a warm place for a relatively short time (about 2 weeks). Like Japanese Finger Lickin' Miso, it is often served with fresh vegetables or tofu as a dip, topping, or garnish.

"Chinese Sweet Black Jang (*chajang* or *chungkukjang* [*Korean natto*])*:* This soft, jet black miso is a close relative of Chinese Sweet Wheat-flour Chiang (p. 228). Most of the Korean varieties are made by Chinese in Korea or imported from China. It is most popularly served with noodles in a dish called *Cha Jang Mien* (p. 126). The words *cha* and *chungkuk* both mean "Chinese."

"Japanese Red Jang (*wei jang* or *ilbon jang*)*:* This is a salty red rice miso similar to Japanese Sendai miso but with a flavor adapted to Korean tastes. It is saltier than the Japanese product. A smooth, reddish brown jang, it originated in Japan and was sold during the 36 years of Japanese occupation. It

© Copyright Soyinfo Center 2021

is now produced in large quantities in Korea. The words *wei* and *ilbon* both mean "Japanese." Address: 790 Los Palos Dr., Lafayette, California 94549.

814. Shurtleff, William; Aoyagi, Akiko. 1976. Preface (Document part). In: W. Shurtleff and A. Aoyagi. 1976. The Book of Miso. Hayama-shi, Kanagawa-ken, Japan, Soquel, California, and Brookline, Massachusetts: Autumn Press. 256 p. See p. 9-11. Sept. Illust. by Akiko Aoyagi. Revised ed. 1981. New York, NY: Ballantine Books, 620 p. [60 ref]
• ***Summary:*** "I received my first introduction to fine miso while working as a cook at California's Tassajara Zen Mountain Center. It was there that I first participated in the preparation of miso–we made a 50-gallon vatful once each year–and learned its many uses as a seasoning. But it was only while living in Japan and working together with Akiko on *The Book of Tofu* that we both really discovered the enormous wealth and variety contained in the world of miso and began to recognize the great value this soybean food has to offer the world. This learning experience was an adventure and not the least of its many pleasures was shopping for the different varieties of miso needed to prepare our recipes.

"Throughout Japan, thousands of small shops specialize in the sale of miso (and miso pickles), and a sampling of forty to fifty varieties will generally be available. Each is displayed in a 5-gallon cedar keg ringed with broad hoops of braided bamboo and marked in bold black characters with the miso's name, price, and province of origin. The hues and shades create a festival of autumn-maple colors, and the total atmosphere has all the warmth and rustic beauty of a Florentine cheese shop or a small wine cellar in the French countryside.

"We enjoyed learning the names of Japan's traditional favorites and their distinguished makers, and slowly developed the ability to judge quality and character. Using miso as a seasoning in our daily cookery, we found it made many of our Western-style dishes even more delicious. Its versatility seemed almost unlimited and its deep, rich flavors served to enrich and add variety to our meatless diet. In fine restaurants, we enjoyed a wide variety of different dishes featuring miso and found that it had long been important in the two main schools of Japanese haute cuisine: Zen Temple Cookery and Tea Ceremony Cuisine. I soon came to understand that, for many Japanese, miso is the very epitome of the satisfying flavors and aromas of home cooking; the mere mention of mother's or grandma's miso soup can evoke all the warm feelings that come to most Westerners at the thought of a loaf of home-baked bread, piping hot from the oven.

"As our interest deepened, we began to visit, learn from and eventually become friends with a number of the more than 2,400 master craftsmen who make Japan's miso. Working in shops which are usually located adjacent to their homes, many of these men honored the traditional spirit of fine craftsmanship in a way that transformed daily work into an art and spiritual practice. We were drawn to their handsomely crafted tools, their high-roofed shops with massive arching rafters, and their huge cedar vats–often more than 150 years old–that stand taller than a man. In the morning air, billows of steam would rise from the great iron cauldron and large cedar steamer in which half a ton of soybeans and rice were being cooked. When freshly harvested koji (mold rice) was removed from its granite-hewn incubation room, it would fill the entire shop with an incomparable lingering aroma, rich and subtly sweet, like that of freshly-roasted chestnuts or coffee.

"I was eventually given the opportunity to do an informal apprenticeship with Mr. Kiyoshi Tsujita, an exemplary miso master living quite near our home. A strong traditionalist and purist at heart, he made the most delicious miso–and the only brown-rice miso–that we had ever tasted. Studying with him and watching him at work, I began to appreciate the mysteries of the fermentation process, the complexities of its chemistry and microbiology, and the harmony of its interaction with the great movements of the four seasons. He stressed that the essence of his art could not be transmitted in words, for it was linked to one's local climate and the soil in which soybeans, rice, and barley grow; embodied in the strains of microorganisms which for generations had permeated the air, wood, and rock walls of a shop; half hidden in the muscles and bones, feeling and intuition of each craftsman. It was a total understanding, rooted in a particular place and in a man who becomes imbued with it like one who, unbeknownst to himself, becomes wet by walking through a mist. As in the ancient wine chateaux throughout Europe, it reflected a tradition and culture that took centuries to mature.

"Nevertheless, he wanted to help both Akiko and me to understand his craft and convey its fundamentals to people in the West. He therefore encouraged us to begin making our own miso and helped us get started. Under his tutelage, we prepared many small batches and, for more than a year, patiently endured the suspense of waiting, wondering how they would turn out. When we seemed pleased with the results, he teased us with the Japanese proverb saying that, naturally, every person likes his own homemade miso best!

"Over a period of some four years, Akiko and I had the opportunity to visit miso shops throughout Japan and study the preparation of most of the main traditional varieties. Though ordinarily quite protective of their traditional secrets, the shops' masters were pleased to see our sincere interest in their work and, without exception, spared no time or effort in showing us everything we wanted to see, answering all our questions, and in some cases, later carrying on a detailed correspondence.

"Early in the spring of 1973, we made our first contact with country-style miso, a tradition started hundreds of years ago by Buddhist priests in their temples and rural peasants in

© Copyright Soyinfo Center 2021

their farmhouses, and which still accounts for an estimated 17 percent of all Japanese miso production. At the Banyan Ashram, a community of young people living a simple life of meditation and farming on tiny Suwanose Island, we learned how to make barley koji (mold barley) in the ancient way by 'catching' natural wild mold spores floating in the air. Invited one sunny April morning to join in the work, we used a large wooden mortar and heavy pestles to mash koji and cooked soybeans together. In an atmosphere of down-home merriment, everyone lent rhythm to the pounding by clapping, stomping, and chanting. The women packed the mashed ingredients into tall earthenware crocks, which were then ceremoniously sealed. We were urged to return for the grand opening when the fermentation had finished, but warned not to be late, since even fifty gallons of homemade barley miso wouldn't last long in a large community of hungry, hardworking men and women.

"As our book began to take form, we traveled to Taiwan and Korea to visit local miso makers at their work, study new varieties of Chinese- and Korean-style miso in sprawling outdoor marketplaces, and sample miso cuisine at restaurants representing the full gamut of provincial cooking styles" (Continued). Address: 790 Los Palos Dr., Lafayette, California 94549.

815. **Product Name:** Soy Sprouts, Mung Bean Sprouts.
**Manufacturer's Name:** Aqua Agra.
**Manufacturer's Address:** 1521 Avalon Blvd., Castlebury, Florida. Phone: 305-339-8157.
**Date of Introduction:** 1976 October.
**How Stored:** Refrigerated.
**New Product–Documentation:** Talk with Don Wilson. 1993. Nov. 24. His wife is Korean. The first two products made by their business were mung bean sprouts and soy sprouts, both started at about the same time in about Oct. 1976, six months before his son was born (in June 1977). They first made them out of their garage at 1521 Avalon Blvd., Castleberry, Florida, then they moved into a large commercial location on Seminola Blvd., Castleberry, Florida. Then they introduced alfalfa sprouts. Soon they were sprouting just about everything that would sprout. In the beginning, the company was mainly a sprouting company.

He had to close the company after 6 years, in about 1983. At that time they were making about 75 products. He and his wife were each working 100 hours a week. "The doctor gave me a choice. He said, 'You can either get rid of that business and live, or you can keep it and die! But you're gonna do one of the two.'"

• ***Summary:*** A full-page table (p. 183) gives the following information on soybean germ plasm collections worldwide: Country and curator, address, number of accessions, nature and origin of accessions. There are major collections in the following places: Toulouse, France (500 accessions). Amravati, Haharashtra (1,800), and Pantnagar, Uttar Pradesh (4,000), India. Bogor, Indonesia (400). Hiratsuka, Kanagawa prefecture (2,928), and Iwate University, Morioka (200 Glycine species), Japan. IITA, Ibadan, Nigeria (2,000). Harbin, and Kirin Province, China. Pretoria, South Africa (600). Suweon (300 Glycine species), and Cheong Kyang, Seoul (1,300), Korea. Algot Holmberg and Soner AB, Norrkoping, Sweden (1,200). AVRDC, Tainan (9,000), and Taichung (2,800), Taiwan. Urbana, Illinois (4,100), and Stoneville, Mississippi (1,700), USA. Leningrad, USSR (2,500).

There are additional collections in Australia, Bulgaria, Hungary, Philippines, [Southern] Rhodesia (Salisbury [Harare]), and Romania.

Table 1. Divisions of USDA soybean germ plasm collections (Urbana, Stoneville, Total). Table 2. Maturity grouping of the USDA soybean germ plasm collection, 1976 (In the northern region [maturity group 00 to IV] there are 237 named varieties, 51 FC [Forage Crop] strains, 2,999 P.I. [Plant Introduction] strains, and 3,287 total. In the southern region [maturity group V to IX] there are 101 named varieties, 39 FC [Forage Crop] strains, 1,514 P.I. strains, and 1,654 total).

Table 3. History of soybean introductions into the United States. The earliest period given is 1898-1907; the great surge in soybean introductions was in 1929-32 during the Dorsett-Morse expedition to East Asia; A total of 11,594 strains have been introduced. Table 4. Maturity grouping and origin of accessions through 1976 in USDA wild soybean (Glycine soja Sieb. and Zucc.) germ plasm collection (there are 361 accessions; Country of origin: Japan 180, Korea 134. China and Taiwan 32. USSR 15). Table 5. Species distribution of USDA perennial Glycine collection, 1976 (8 species [*G. canescens, G. clandestina, G. falcata, G. latrobeana, G. tabacina, G. tomentella, G. wightii*] and 161 accessions from Australia, India, Africa, Taiwan, Japan, Philippines, Ethiopia).

Note: The assignment of FC numbers began in about 1911 and was discontinued in 1957. Address: USDA.

• ***Summary:*** Contents: Introduction. Major problems related to increased soybean production: Weather, varietal improvement, planting time, soil fertility and pH, cultural practices (cropping systems, planting patterns, seed treatment and inoculation), soybean pathology and entomology. Present and future research problems.

"Good quality soybeans with large grain size have been cultivated for thousands of years in the middle and northern part of the east coast of Korea. Because soybeans have been grown primarily for subsistence, they have not been regarded as a cash crop by Korean farmers... Soybean cultivation in 1974 and 286,188.4 hectares, thus making soybeans the third major crop of Korea in hectarage...

"Soybean production has gradually increased from 231,994 metric tons in 1970 up to 318,576 metric tons in 1974. Although total soybean production has increased, it has not kept up with demand as indicated by the fact that imports have increased from 36,291 metric tons in 1970 up to 66,370 metric tons in 1974...

"Home consumption is the major area for soybean use, about 122,000 metric tons being consumed in 1974. Soybeans are prepared by mix-boiling with rice or vegetables, or are eaten in the form of curd, sprouts, sauce, paste, milk, and flour. The government uses soybeans primarily for military needs. Soybean oil is used for industrial purposes." Address: 1. College of Agriculture, Seoul National Univ.; 2. Corps Exp. Station, Office of Rural Development; 3-4. Inst. of Agricultural Science, Office of Rural Development; 5. Crop Improvement Research Center, Office of Rural Development. All: Suweon, Korea.

821. Bookwalter, G.N. 1976. Trip report on lectures and demonstrations at Meals for Millions (MFM) Foundation, 1800 Olympic Boulevard, Santa Monica, California 90406, on November 1-4, 1976. Peoria, Illinois. 3 p. Dec. 6. Typed, without signature. [1 ref]
• ***Summary:*** This is a report for the ED [Engineering and Development Laboratory] files. Contents: Personnel contacted: Mark Sterner, Hank Sterner, and Gideon Zeidler. Student participants in training program (name and country of 7 students from India, Costa Rica, Chile, Malaysia, Nigeria, Korea, Turkey). Preparation of instantized corn meal. Preparation of mixed weaning food. Taste panel. Texturized soy protein research. Equipment development.

Bookwalter concludes: "My general impression of both the MFM and student participants was extremely high. MFM has a highly productive research program with a small staff. The student participants were all intelligent and well educated. I've never seen so much friendliness, enthusiasm, discussion, and dedication, both within MFM personnel and the student participants. I left with the feeling that a great deal of good would come from this." Address: USDA ARS Northern Regional Research Center, Peoria, Illinois 61604.

• ***Summary:*** Soy-related recipes include: Japanese [mung] bean sprouts and cucumbers with sesame dressing (*Moyashi no goma su ae*) uses 1 teaspoon of soy sauce (p. 74). Korean watercress salad-relish (*Namul*) uses 2 tablespoons of soy sauce (p. 74). Soy is not used in any other recipes. The author was born 1921.

829. Bernard, R.L. 1976. United States national germplasm collections. In: L.D. Hill, ed. 1976. World Soybean Research [Conference I: Proceedings]. Danville, Illinois: Interstate Printers and Publishers, Inc. xvii + 1073 p. See p. 286-89.
• ***Summary:*** "The U.S. Department of Agriculture has attempted to acquire and maintain all available soybean germplasm since about 1949. In that year two collections were established, one of early varieties (Group IV and earlier) at Urbana, Illinois and one of the later ones (Group V and later) at Stoneville, Mississippi. The USDA was able to gather from various experiment stations many of the old varieties introduced from eastern Asia during the previous 50 or 60 years, about 1500 strains altogether. In addition to the foreign varieties, all of the old United States and Canadian varieties that still could be found were preserved.

© Copyright Soyinfo Center 2021

The Collection has grown steadily since that time until today there are over 5000 strains being maintained. Seeds of these are made available to researchers throughout the world.

"The collection now consists of several divisions. The Named Variety Collection (Table 1) consists of commercial varieties, past and present, of the United States and Canada. The older varieties in this division are simply introductions, brought from eastern Asia in the 1910's, 1920's, and 1930's and grown commercially here. The more recent ones are mostly pure-line selections following controlled hybridizations. Currently there are many privately developed varieties, blends, etc., being sold to the farmer, but, because of the confusion involved, we are not now putting any varieties of secret origin in the germplasm collection.

"The largest division in the collection is that of the foreign varieties, several thousand in number identified by FC and PI numbers. Table 2 shows the history of their collection. The active collection periods of the 1920's and of the past two years contrast with the slow accession rate for most of the past 40 years. The northern collection is predominately from eastern Asia with about 30 percent from China, 30 percent from Korea, 20 percent from Japan, and 20 percent from Europe. The southern collection is predominantly from eastern and southern Asia with major collections from Korea, Japan, India, Indonesia, the Philippines, and other countries of southeast Asia with some recent additions from South America and Africa. These accessions range from primitive native varieties to recently developed experiment station varieties. Many of them have come in from commercial or other non-agricultural sources and we have no information at all about the nature of their origin. Altogether, there are over 4000 accessions in this division.

"The Genetic Collection was established to aid in the preservation of material of use in qualitative genetic study. In one part, called The Genetic Type Collection, we try to preserve each known gene (not in a named variety) preferably in the original strain used by the author who described the trait. There are about 100 strains including a number of mutants not yet studied genetically. In addition to the Type Collection there is an isoline collection (Table 3) developed by backcrossing and involving about 60 genes and 5 recurrent parents, resulting in over 300 isolines including combinations of two or more genes. A third subsection of the Genetic Collection is the recently established Cytogenetic Collection which will be developed and maintained by Dr. Reid Palmer, Cytogeneticist at Iowa State University." (Table 3).

"In the Species Collection we have represented all or almost all of the known species of *Glycine* including *G. soja* (Table 4) and seven perennial species (Table 5). We are actively collecting for the annual wild soybean (*G. soja*), which appears to have the most potential value to the breeder since it will cross with the cultivated soybean while the perennial species will not.

"Collections lists or evaluation reports are available by writing to the Soybean Laboratory in Urbana, Illinois or for the late-maturing material (Group V and later) write to Dr. E.E. Hartwig in Stoneville, Mississippi." Address: U.S. Regional Soybean Laboratory, Agricultural Research Service, USDA; and Dep. of Agronomy, Univ. of Illinois, Urbana-Champaign.

830. Iwadare, Shoji. 1976. Miso, nattô, tôfu kenkô-hô [Miso, natto, tofu: The way to health. Shiokara natto, kara natto, and tera natto] (Document part). Tokyo: Yomiuri Shinbun-sha. 238 p. Illust. 18 cm. [Jap]

• ***Summary:*** Page 141: The word "natto" first appeared in 1286 in the *Shinsaru Gakki*, by Fujiwara Myoe, whose epicurean sister was said to love *shiokara natto* or salty natto [fermented black soybeans]. The ingredients used to make this salty product are 100 kg soybeans, 100 kg barley flour, and 30 kg salt. It is also called T'ang natto (*kara-natto*) and was used as an hors d'oeuvre with saké or in place of tea cakes (*chauke*) with tea.

Tera-natto used as gifts at O-bon and New Years: At Nara's temples Kofukuji and Todaiji, the monks made salty natto and gave them to the parishioners at O-bon and New Years. Later the tradition was transmitted to Kyoto and became the now famous Daitokuji natto and Tenryuji Natto (?), each varieties of "T'ang natto" (*kara-natto*) or "shiokara-natto."

Note: This is the earliest (and only) document seen (Nov. 2011) which states that salty natto [fermented black soybeans] were made at Kofukuji temple in Nara.

All these types contain salt, are inoculated with a mold, have a dark color (and no strings), and have a long shelf life. Today at Daitokuji one can still see the splendid *Nassho* (offering place or natto place) which, according to the book *Honcho Shokkan*, was given this name since that was where natto were (originally?) made [and used as an offering]. Natto were an important protein source for the vegetarian monks.

Differences between tera-natto [salty natto] and itohiki-natto [stringy, unsalted natto]: Tera-natto first came to be made by monks in temples. These savory fermented black soybeans and chunks were close relatives of miso and shoyu. Japanese Buddhist monks who went to China to practice during the T'ang dynasty (618-906) learned how to make these condiments and brought the knowledge back to Japan, where they made them in temples. They are made with molds (mainly *Aspergillus oryzae*) rather than bacteria (which are used to make itohiki natto). Cooked soybeans are dusted with roasted wheat or barley flour which is mixed with mold spores, incubated until a mycelium forms, sun-dried, pickled in brine with seasonings, then sun-dried again. Daitokuji natto is crushed then reshaped into lumps, while Hamanatto, made at Daifukuji is sold as is. When Tokugawa Ieyasu

© Copyright Soyinfo Center 2021

(military ruler / shogun of Japan, 1600-1603) conducted his military campaign in Korea [1592] he had large quantities of Hamanatto produced as food for his soldiers; later it became a commercial product, today's Hamanatto. The "natto" that appear in ancient documents are mostly these fermented black soybeans [salty, fermented soybeans]. Address: Tokyo, Japan. President of Manyu Eiyo KK. Teaching at Nihon Daigaku Daigaku-in and Meiji Daigaku Nôgaku-bu. Prof. at Shobirin Joshi Tanki Daigaku.

• ***Summary:*** Contents: Introduction. Materials and methods. Variation of plant characters. Conclusion. References.

"Introduction: "The Korean peninsula lies between 33º 06' and 43º north latitude and it measures about 1,000 km in total north-south length. The typical topography of the land includes numerous valleys. The total land area of the peninsula is 220,848 km2 and the Republic of Korea comprises 98,758 km2 but only 23 percent of the land is arable [9].

"The yearly precipitation varies from about 1,500 mm along the coastal region of the southern part to 600 mm in the northern interior. During the period of the rainy season (June to August), an average of 60 percent of the total yearly precipitation is recorded. The summers are hot with an average August temperature above 240 C. The mean temperature during the crop season (May to October), ranges from 160 to 21º C, and the number of frostless days varies from 169 to 228 [1]. The soil of Korea is mostly of granitic origin and is acidic and low in fertility. In general, environmental conditions of the Korean peninsula are suitable for soybean production.

"The exact history of soybean culture in Korea is not known, but it is clear that the soybean has played an important role in diversifying agriculture and providing human foods for many centuries. Based on numerous reports and historical evidences [2, 6], it is assumed that the Korean soybean culture started in the fourth to fifth century B.C. or earlier [3].

"Acreage, production, and yield per hectare for the 10-year period, 1964-1974, in Korea are presented in Table 1 [9]. Although the acreage of the soybean did not increase in that 10-year period, the total production of soybean seed increased from 163,000 tons in 1964 to 319,000 tons in 1974 simply due to increased yield per unit area–from 580 kg per hectare in 1964 to 1,110 kg per hectare in 1974. The sharp increase of seed yield per unit area may be the result of the favorable weather of the year and improvement of cultural management. The acreage and production are exceeded by 666,000 tons of barley harvested from 375,000 hectares and 4.417 million tons of rice from 1.189 million hectares of paddy field in 1974. In spite of the increase in total production, it is not sufficient to meet the local consumption, and therefore Korea imports soybeans from other countries.

"In Korea, soybean yield per hectare is low as compared with other major soybean producing countries in the world. This low productivity may be attributed to the use of low yielding varieties, low soil fertility, and delayed plantings after barley and wheat harvest. To meet the national soybean consumption, yield potential must be increased instead of expanding limited farm land." Address: Applied Genetics Lab., Korean Atomic Energy Research Inst., Seoul, South Korea.

• ***Summary:*** Discusses: (1) Pakka and kachcha [kaccha] foods, which relate to Hindu dietary laws. Pakka food contains ghee (clarified butter), a very costly fat believed to promote health and virility. Hindus regard raw foods as possessing the greatest purity; they will accept them even from untouchables.

(2) Dairying: It seems to have been first practiced in about 4000 B.C. in the Near East and North Africa (Simoons 1971). The nonmilking zone embraces all of Southeast Asia from Burma eastwards as well as most of East Asia including China, Korea, and Japan. Much of Africa is also non-dairying; in Africa dairying spread southward from Kenya after the start of the Christian era. People generally did not consume dairy milk if it caused gas intestinal and/or cramps, diarrhea, or even vomiting. Nearby dairying peoples were the Mongols and Tibetans.

The failure of dairying to spread throughout Asia and Africa does not involve a single cause but rather a series of factors from culture, environment, and ecology. Also, most people (70-100%) above age 3 in the nonmilking zone have low levels of the intestinal enzyme lactase that hydrolyzes lactose (milk sugar) into glucose and galactose, which can be readily absorbed by the body. This, it should be emphasized, is the same condition that prevails in other land mammals, and it is believed to be the normal pattern found among primitive men. Address: Dep. of Geography, Univ. of California, Davis, Davis, California 94616.

833. Solomon, Charmaine. 1976. The complete Asian cookbook. New York, NY: Summit Books. 511 p. Illust. Color plates. Index. 29 cm.
• ***Summary:*** This artistic cookbook is loaded with full-page color plates plus a good glossary. Soy-related recipes include: Bean curd omelettes (Tahu telur, from Indonesia, p. 188). Fried bean curd with peanuts (Tahu goreng kacang, from Indonesia, p. 204). Fried bean curd with soy sauce (Tahu goreng kecap, from Indonesia, p. 204). Fried fish

with salted soya beans [miso] (Ikan goreng tauceo, from Malaysia, p. 224). Bean curd in salted soya bean paste [tofu in miso] (Taukwa tauceo, from Malaysia, p. 233). Bean curd and bean sprouts [probably mung bean sprouts] (Taukwa dan taugeh, from Malaysia, p. 233). Stuffed soy bean cake [with fried tofu] (Tauhu sod sai, from Thailand, p. 316). Glutinous rice and soybean sauce (Nuoc leo, from Vietnam, p. 341). Soup with bean curd (Canh dau hu, from Vietnam, p. 342). Misu tomato sauce (with red misu = red miso, from the Philippines, p. 351). Bean curd in barbecue sauce (Chu hau jeung mun dau fu, from China, p. 414). Bean curd with crab sauce (Hai yook par dau fu, from China, p. 414). Ginger soy sauce (See yau ghung jeung), Chilli soy sauce (See yau laht jiu jeung), Black bean sherry sauce (Dau see sheung jing jeung, with canned salted black beans = fermented black soybeans), Black bean garlic sauce (Suen tau dau see, with fermented black soybeans) (from China, p. 431). Sesame seed sauce (Cho kanjang, from Korea, p. 451, with "4 tablespoons light soy sauce"). Dumpling soup (Mandoo, from Korea, p. 453, with "1 square fresh bean curd" and "2 tablespoons light soy sauce"). Soup of soybean sprouts (Kong namul kuk, from Korea, p. 453, with 500 gm soy bean sprouts and 1 tablespoon soy sauce). Rice with fried bean curd (Kitsune domburi, from Japan, p. 460). Steamed egg custard with tofu (Kuya mushi, from Japan, p. 471). Bean paste soup (Miso shiru, from Japan, p. 477). Sushi in fried bean curd (Inari-Zushi, from Japan, p. 480).

Soy-related glossary entries (p. 485-502) include: Aburage. Akamiso. Black beans, salted (Chinese: dow see = salted black beans). Bean curd (Chinese: dow foo; incl. yellow bean curd, dried bean curd, red bean curd). Chinese bean sauce (ground = *mor sze jeung* or chunky = *min sze jeung* similar to Malaysian *taucheo* or *tauceo*). Dow foo pok (Chinese-style fried bean curd). Miso. Mushroom soy (Soy sauce flavored with mushrooms during the last stage of processing). Soy sauce (light or dark, shoyu, kecap manis). Yellow beans, salted (=salted yellow beans). Yellow bean paste.

Note 1. It is also the earliest document seen (April 2012) that uses the term *kecap manis* to refer to sweet Indonesian soy sauce.

Interesting glossary entries (p. 485-502): Aburage, bean curd (fresh, yellow, dried, red), black beans, salted (Chinese: *dow see;* made from soy beans, heavily salted and sold in cans and jars), Chinese bean sauce (ground or chunky, like Malaysian taucheo or tauceo), fish sauce (Vietnamese: *nuoc mam.* Burmese: *ngan-pya-ye.* Thai: *nam pla.* Tagalog: *patis*). Miso. Mushroom soy (Soy sauce flavored with mushrooms during the last stage of processing). Red misu (See miso). sesame seed (Hindi: *till.* Sinhalese: *thala.* Malay: *bijan.* Chinese: *chih mah.* Japanese: *goma.* Indonesian: *wijen*). Sesame oil ("The sesame oil used in Chinese cooking is extracted from toasted sesame seeds..."). Sesame paste ("Sesame seeds, when ground, yield a thick paste similar to peanut butter. Stores specialising in Middle Eastern foods sell a sesame paste known as *tahini,* but this is made from raw sesame seeds, is white and slightly bitter, and cannot be substituted for the Chinese version–which is made from toasted sesame seeds, and is brown and nutty"). Wakame. Wasabi or wasabe. Yellow beans, salted (Very similar to canned salted black beans, but lighter in color). Yellow bean paste (It is not really yellow, but brown. Sold in cans).

Note 2. This is the earliest English-language document seen (March 2009) that uses the word "tauceo" to refer to Indonesian-style miso.

834. U.S. Department of Agriculture. 1976. The annual report on activities carried out under Public Law 480, 83d Congress, as amended, during the period July 1, 1974 through June 30, 1975. Washington, DC: U.S. Government Printing Office. See table 17.

• ***Summary:*** Table 17 is titled "Title II, Public Law 480–total commodities shipped by program sponsor, fiscal year 1975." The main program sponsors and distributing agencies, listed alphabetically, are AJJDC (American-Jewish Joint Distribution Committee), CARE, CRS (Catholic Relief Service), CWS (Church World Service), LWR (Lutheran World Relief), SAWS (Seventh-day Adventist World Service), UNICEF, UNRWA (United Nations Relief and Works Agency), and WRC (World Relief Commission). All of these are Private Voluntary Organizations (PVO/PVOs), registered with USAID. The following foods containing soy protein were distributed: Soy fortified sorghum grits (SFSG), CSM (Corn soya mix), WSB (wheat soya blend), and small amounts of soya flour. The vegetable oil which was shipped to many countries was soybean oil; it is not recorded here.

Foods containing soy protein were distributed to the following countries or areas: British Solomon Islands, India, Indonesia, Khmer Republic [Cambodia], Korea, Laos, Nepal, Philippines, Singapore, Sri Lanka, Vietnam.

Afghanistan, Egypt, Gaza, Jordan–East Bank, Jordan–West Bank, Morocco, Tunisia, Yemen.

Benin, Botswana, Burundi, Cameroon, Cape Verde, Central African Republic, Ethiopia, Gambia, Ghana, Guinea, Ivory Coast, Kenya, Lesotho, Liberia, Malagasy Republic, Mali, Mauritania, Mauritius, Niger, Nigeria, Rwanda, Senegal, Seychelles, Sierra Leone, Somalia Republic, Sudan, Tanzania, Togo, Upper Volta, Zaire.

Belize, Bolivia, Brazil, Chile, Colombia, Costa Rica, Dominican Republic, Ecuador, El Salvador, Guatemala, Guyana, Haiti, Honduras, Jamaica, Nicaragua, Panama, Peru.

Concerning "veg oil" (soybean oil) shipped under P.L. 480 Title II in fiscal year 1975: India received 14.189 million lb [6,436 metric tons] (p. 116). Address: Washington, DC. Phone: 703-875-4901 (1991).

835. Wang, H.L.; Mustakas, G.C.; Wolf, W.J.; Wang, L.C.; Hesseltine, C.W.; Bagley, E.B. 1976. An inventory of

information on the utilization of unprocessed and simply processed soybeans as human food. Peoria, Illinois: USDA Northern Regional Research Center, Interdepartmental Report. AID AG/TAB-225-12-76. 197 p. On contract AID AG/TAB-225-12-76. Undated. No index. 27 cm. Comb bound. [65 ref]

• ***Summary:*** This was submitted to The Agency for International Development.

Contents: Introduction. Home and village traditional soybean foods by country. 1. Soybean food uses and production in Asia. Soaking dry soybeans. In China: Tou chiang (soybean milk; preparation, ways of serving), tou fu (soybean curd; yen-lu is the Chinese name for nigari), tou fu nao (soft curd), tou fu kan (dry / firm bean curd), chien chang (pressed tofu sheets), yu tou fu (fried tou fu), tung tou fu (frozen tou fu), tou fu pi (protein-lipid film; yuba), huang tou ya (yellow bean sprout or soybean sprout), mao tou (hairy bean, green soybean, or immature soybean), dry soybeans (roasting and frying, stewing and boiling), roasted soybean flour. Fermented soybean foods. Production and consumption of soybeans (China and Taiwan).

Japan: Tofu (soybean curd), kinugoshi tofu, processed tofu products (aburage or age, nama-age and ganmo), kori tofu (dried-frozen tofu), yaki tofu (grill tofu), yuba (protein-lipid film), soybean milk, gô (ground soybean mash), daizu no moyashi (soybean sprouts), edamame (green vegetable soybeans), whole soybeans, kinako. Fermented soybean foods: Production and consumption.

Korea: Tubu (soybean curd), soybean sprouts, whole soybeans (green soybeans, parched or roasted soybeans, boiled soybeans), soybean flour ("Soybeans are first roasted and then ground to a flour. The flour is extensively used as an ingredient in various food preparations." Note: This is the earliest document seen (Nov. 2012) that mentions roasted whole soy flour in Korea–however no Korean name of this roasted soybean flour is given), soysauce, bean paste [Korean soybean miso], natto (no Korean name is given), production and consumption of soybeans.

Indonesia: Tahu or tahoo (soybean curd), bubuk kedele (soybean powder), tempe kedele, tempe gembus [the name in Central and East Java for okara tempeh], oncom tahu [the name in West Java for okara onchom], other soybean products (soybean sprouts, green soybeans, roasted and boiled soybeans, kecap or soysauce, tauco or bean paste [miso]), food mixtures (Saridele, Tempe-fish-rice or TFR, Soy-rice baby food, soybean residue [okara]-fish-rice), production and consumption of soybeans.

To make bubuk kedele (p. 58): "Soybeans of the white variety are roasted until no beany flavor can be detected. They are ground into a powder and mixed with such spices as garlic and chili. Bubuk kedele is kept in a jar and served on special occasions with a rice product, longtong (rice wrapped in banana leaves and boiled for 3 to 4 hours). Bubuk kedele is always homemade and is eaten by everyone" (Source: I. Gandjar 1976, personal communication).

Note 1. This is the earliest English-language document seen (Nov. 2012) that uses the word *bubuk* or the term *bubuk kedele* to refer to Indonesian roasted soy flour.

Thailand. Philippines: Soybean sprouts, soybean coffee, soybean cake (made from equal amounts of soybean flour and wheat flour), soybean milk, tou fu and processed tou fu products, production and consumption. Burma. India. Malaysia. Nepal. Singapore. Sri Lanka (Ceylon). Vietnam. West Asia [Middle East; Iran and Turkey]. References–Soybean food uses in Asia.

2. Soybean food uses and production in Africa. Ethiopia: Injera, wots and allichas, kitta, dabbo, dabokolo, porridge. Kenya. Morocco. Nigeria: Whole soybeans, soybean paste, corn-soy mixtures (soy-ogi). Tanzania. Uganda. Production. References–Soybean food uses in Africa.

3. Soybean food uses and production in Europe [both Eastern and Western]. 4. Soybean food uses and production in Latin America. Argentina. Bolivia. Brazil. Chile. Colombia. Ecuador. Guyana. Paraguay. Peru. Uruguay. Venezuela (fried arepas with textured soy). Mexico: New village process, commercial developments of soy-based food products, Gilford Harrison, Ruth Orellana, Seguras Social. Honduras. Costa Rica. Panama. Dominican Republic. Jamaica. Haiti. Trinidad. References–Soybean food uses in Latin America.

5. Soybean food uses and production in North America. United States: Oriental populations, vegetarian communes, The Farm in Tennessee. Canada. References–Soybean food uses in North America. 6. Soybean food uses in Oceania. Australia. New Zealand. 7. Summary of soybean food uses. Traditional soybean foods: Soybean milk, soybean curd and processed soybean curd products, protein-lipid film, soybean sprouts, tempe (tempeh), green soybeans, boiled soybeans, roasted soybeans, soybean flour, soysauce, fermented soybean paste, fermented whole soybeans [Toushih, hamanatto], natto, fermented soybean curd. Experimental soybean foods: Whole soybean foods, soybean paste, soy flour, soy beverage. Production and consumption.

8. Recent simple soybean processes, other than traditional. Simple village process for processing whole soybeans: Equipment, process, sanitation requirements, quality of product, evaluation of product in formulas and procedures for family and institutional use in developing countries. NRRC village process. Foods from whole soybeans developed at the University of Illinois (drum dried flakes, canned and homecooked soybeans, soy beverages and beverage products, spreads, snacks).

Ways of cooking and serving soybeans in the American diet. 9. Industrial processes. Industrial production and selling prices of edible soybean protein products. 10. Barriers to acceptability and utilization of soybeans in food and research recommendations: Availability. Cultural and social factors. Texture. Flavor. Nutrition and food safety.

© Copyright Soyinfo Center 2021

Technology development. Technology transfer. Research recommendations [concerning each of the above barriers].

Concerning Morocco: Cereal-soy blends have been used extensively in Morocco; in fiscal year 1974 some 14.7 million lb were shipped to Morocco. Mmbaga (1975) reported that soy flour is being used in making porridge, with 1 part soy flour to 3 parts maize / corn flour.

Tables show: (1) Soybean production and imports in Taiwan, 1962-1975 (tonnes = metric tons, p. 33). Production rose from a 53,000 tonnes in 1962 to a peak of 75,200 tonnes in 1967, then fell to 61,900 tonnes in 1975. Imports skyrocketed from 62,400 tonnes in 1962 to a record 827,300 tonnes in 1975. (2) Consumption of soybean foods in Taiwan, 1964-1974 (kg/capita/year, p. 34). Total soybean foods not including tofu rose from 1.08 kg in 1964 to a peak of 2.61 kg in 1972 then fell to 1.99 kg in 1974. Consumption of tofu (80% water) rose from 18.75 kg in 1964 to a peak of 33.89 kg in 1972, then fell to 32.04 kg in 1974. (3) Supply and disposition of soybeans in Japan, 1971-1974 (p. 49). Total supply is beginning stocks, plus domestic production, and imports. Total disposition is crushing, plus traditional foods and feed. In 1974 imports accounted for 87.5% of the supply, and crushing accounted for 71.0% of the disposition. (4) Whole soybeans used in the production of traditional foods in Japan, 1970-74 (tonnes / metric tons, p. 50). Tofu and others rose from 508,000 in 1970 to 539,000 in 1974. Miso rose from 177,000 in 1970 to 192,000 in 1974. Shoyu rose from 13,000 in 1970 to 14,000 in 1974. (5) Defatted soybean meal used in the production of traditional foods in Japan, 1970-74 (tonnes / metric tons, p. 51). Shoyu rose from 163,000 in 1970 to 176,000 in 1974. Tofu and others was constant at 130,000 from 1971 to 1973. Miso decreased from 4,000 in 1970 to 2,000 in 1974. (6) Production of traditional soybean foods in Japan, 1970-74 (tonnes / metric tons, p. 52). Tofu and others rose from 1,867,800 in 1970 to 2,264,900 in 1973. Shoyu rose from 1,334,1000 in 1970 to 1,455,800 in 1974. Miso rose from 552,200 in 1970 to 587,200 in 1974. (7) Production and food use of beans [various types] and consumption of some soybean products in Korea, 1964-1967 (p. 56-57). In 1967 consumption (in tonnes / metric tons) was: Bean curd 290,000. Bean sprouts 270,000. Bean sauce 69,700. Bean paste 27,700. Total: 11.6 kg per capita per year. (8) Soybean production in Indonesia, 1960-1974 (p. 65). It rose from 442,862 tons in 1960 to 550,000 tons in 1974. (9) Consumption of soybeans in various parts of Indonesia in 1970 (p. 66). (10) Production of soybean foods in the province of Central Java, 1968-1972 (tons, p. 67). Kecap rose from 914,695 in 1968 to 1,524,000 in 1972. Tahu decreased from 18,570 in 1978 to 17,000 in 1972. Tempe rose from 506 in 1968 to 39,000 in 1972. (11) Area planted to soybeans and total soybean production in Thailand, 1964-1974 (p. 70). Area rose from 213,000 rais (6.25 rais = 1 ha) in 1964 to 1,016,000 rais in 1974. Production (in metric tons) rose from 31,300 in 1964 to 252,400 in 1974. (12) Utilization of soybeans by soybean-consuming countries, 1964-66 (based on FAO 1971 Food Balance Sheets, 1964-66 average, p. 150). The countries leading in per capita consumption (kg/person/year) are: China (PRC) 6.7. Japan 5.1. Korea(s) 5.0. Singapore 4.3. Indonesia 2.8. Malaysia 2.6. Taiwan (ROC) 1.1. (13) Amounts of cereal-soy blends distributed under Title II, Public Law 480 in fiscal year 1974 (p. 152-155). (14) U.S. exports of full-fat soy flour, 1974-75 (p. 156). Address: Northern Regional Research Center, Agricultural Research Service, Department of Agriculture, Peoria, Illinois 61604.

836. Takai, Wataru. 1976? History of Takai Seisakusho Co., Ltd., 1917-1975. Ishikawa-ken, Japan. 3 p. Undated. Unpublished manuscript. [Eng]

• ***Summary:*** "Date of establishment: July, 1917.

"Capital: 31 million yen.

Major executives:

"The President: Motoo Takai.

"Vice-president: Akio Takai.

"Executive director: Akira Takai

Size of this factory:

The head office: Site 8,156 sq. meters. Building: 4,808 sq meters.

"Matsuto factory: Site 1,875 sq. meters. Building: 1,047 sq meters.

History of our company:

1917 July–Takai brotherly company was established, and production of bean curd machine and its selling were begin.

1931 April–The old name was replaced by Takai Co., Ltd.

1946 Jan.–The name was replaced by Takai Mfg. Co., Ltd.

1957 Jan.–A bean curd automatic manufacturing machine was developed

1958 Aug.–This company was commended as a superior enterprise by the Smaller Enterprises Agency.

1958 Dec.–The ex-president Kamejiro Takai was conferred *Shiju-hosho* (Violet Ribbon Medal)

1959 Nov.–Our company was given a governor's special prize at the ceremony of awarding an honor of a corporation of a society of invention.

1960 April–The 7th anniversary of the operation of the patent system, our company was given a prize of invention at the nationwide ceremony of a corporation of invention.

1960 Sept.–Our company received a subsidy for the experiment of invention from the Scientific Technique Agency.

1960 Oct.–The ex-president was decorated with the Fifth Order of Merit with the *Zuihosho.*

1961 April–An organization of agency "A nation wide Takai society" was formed.

1962 July–A new factory was built at Inari, Nonoichi-machi Ishikawa-gun, Ishikawa-prefecture.

© Copyright Soyinfo Center 2021

1962 July–Our company was given a governor's special prize at the local ceremony of a corporation of a society of invention.

1963 April–Our company was given a prize of invention at the nationwide ceremony of a corporation of a society of invention.

1965 Nov.–Our company was commended officially as a superior factory in labor management by a Labor Standard Office in Ishikawa-prefecture.

1966 Jan. Our company was named "a model factory of rationalization of the smaller enterprises" by the Smaller Enterprises Agency.

1966 Aug.–Our company was telecasted nation wide by NHK educational television titled "Industrial operation–establishment of a long-range plan".

1969 Jan.–Our company was given a citation as a superior corporation by a Taxation Office in Natsuto-city.

1969 April–A large-sized bean curd plant was built at Nada-Kobe co-operative association.

1969 Nov.–Our company was telecasted nationwidely by NHK educational television titled "A new age of operation–A plan of mechanization for making 10 million cakes of bean curd".

1970 July–Our company was commended officially as a superior factory in safe management of factories by a Labor Standard Office in Ishikawa-prefecture.

1971 Oct.–A large bean curd plant was built in the Republic of Korea.

1972 May–A smaller bean curd plant was developed.

1974 Feb.–Matsuto branch factory was built at Miyamaru-machi Matsuto-city.

1974 March–Our company was commended as a superior factory in rationalization of the use of electricity by Hokuriku Electric Society.

1974 June–IBM computers introduced.

1974 Oct.–Our company was commended on account of co-operation of traffic transportation.

837. Meals for Millions Foundation. 1977. Annual report 1976: A commitment to self-help for a hungry world. Santa Monica, California: MFM Foundation. 9 panels. Each 9 x 23 cm. Complex folding.

• ***Summary:*** Peter J. Davies is now President and Chief Executive Officer; he resides at the New York office. On the black and white cover is a photo of two pairs of cupped hands overflowing with soybean seeds. MFM's former logo is absent.

Contents: Message from the president (Davies). Highlights of 1976: New president (Davies) appointed in April 1976 after a two-year search, additional grants from US AID and PACT, financial summary. The commitment. MFM meets its commitment through self-help programs: Technical and material assistance (Ecuador, Korea, Bootheel, Missouri, Africa {Ghana, Kenya}, the Caribbean {Jamaica, Haiti}). Technical and professional training (India, International Training Institute in Santa Monica; two 8-week training sessions were held during 1976). Transfer of technology (Research & Development, MFM extruder and village texturizer). Nutrition education.

Income for 1976 by source: $756,028 (total). Statement of functional expenses for the year ended Dec. 31, 1976 ($353,202). Board of Trustees. A portrait photo shows Peter Davies. Address: 1. Western office–IIPFT, 1800 Olympic Boulevard (P.O. Box 680), Santa Monica, California 90406; 2. Eastern office, 815 Second Ave., Suite 501, New York City, NY 10017. Phone: (213) 829-5337 or (212) 986-4170.

838. **Product Name:** Island Spring Delicious Steamed Tofu in Sauce.
**Manufacturer's Name:** Island Spring, Inc.
**Manufacturer's Address:** P.O. Box 747, Vashon, WA 98070.
**Date of Introduction:** 1977 March.
**Ingredients:** Tofu, soy sauce, soy oil, sesame seeds, honey, ginger powder, garlic powder, cayenne pepper, black pepper.
**Wt/Vol., Packaging, Price:** 12 oz.
**How Stored:** Refrigerated.
**Nutrition:** Per 3 oz.: Calories 88, protein 10.3 gm, carbohydrate 2.9 gm, fat 7 gm.
**New Product–Documentation:** Label. 1979. 2 by 1 inch oval. Self adhesive. Black on gold. "Serve Hot Or Cold." Leviton. 1981. Soyfoods. Winter. p. 43. "One thousand pounds of tofu a week are converted into Delicious Steamed Tofu, fresh griddled slabs of tofu packed in soy sauce."

Label. 1982. 6 by 5 inches. Plastic film. Brown and yellow on clear. "Delicious steamed tofu is good served hot or cold for snacks, sandwiches, hors d'oeuvres, or as a main course." Talk with Luke Lukoskie. 1987. Oct. 19. "Suni [his wife, and a Korean-American] joined Island Spring in March 1977, and we started our flavored tofu at that time." Form filled out by Yvonne Kuperberg. 1988. Oct. 1. Lists original ingredients. Label. 1986. 5 by 4 inches. Pink, green, blue, and black. Shows moon rising over mountains and water with sprig of plum blossoms in left foreground. "A fitness food from the Pacific Northwest, USA."

839. Kolb, H. 1977. Herkoemmliche Verfahren zur Nutzung von Soja im asiatischen Raum [Traditional processes for using soya in Asia]. *Alimenta* 17(2):41-45. March/April. [35 ref. Ger]

• ***Summary:*** Discusses each of the following foods briefly and gives sources of further information: Kinako (roasted soy flour), soymilk, yuba, tofu, kori tofu (dried-frozen tofu), aburaage, namaage, kinugoshi tofu, sufu, soy cheese (Western style), soy yogurt, ganmodoki, natto, Hamanatto, koji, tempeh, miso, tao-tjo [Indonesian-style miso], kochu-jang, shoyu, and ketjap.

Note 1 This is the earliest German-language document

• ***Summary:*** Contents: Korean soy sauce: Kanjang (is made by primitive methods in the home), steps in preparation, microbiology, biochemical changes (p. 465-66). Korean doenjang and kochujang: Description (Soy sauce and miso were introduced to Japan, from Korea, during the Nara period {645-793 AD}), patterns of consumption (Daily per capita consumption of doenjang and kochujang are estimated to be about 15 gm and 10 gm, respectively), steps in preparation (utensils, substrates, essential microorganisms), control of process, biochemical changes, economics of production and distribution.

Note: This is the earliest English-language document seen (April 2021) that uses the word "kochujang" to refer to Korean-style red pepper and soybean paste (miso).

Illustrations show: (17) Flow sheet: Production of Korean doenjang (soybean paste). Soak soybeans, boil, mash, form into balls, wrap in rice straw, and incubate under rafters until covered with mold (*meju*). Crush, mix with salt brine, and ferment for 6 months to obtain doenjang. (18) Flow sheet: Production of Korean kochujang (soybean paste). Soak soybeans, boil, mash, suspend in rice straw sacks until overgrown with mold (*meju*). Crush, sun-dry, and pulverize to obtain 10 liters of crushed meju. Add cooked gelatinous rice flour (2 liters), hot pepper flour (0.5 to 0.7 liters), kanjang (Korean soy sauce), dried beef, jujube flour, honey, and salt brine. Mix. Ferment for 2 months to obtain kochujang.

A table (p. 487) shows the amino acid composition of doenjang. Address: 1. Food & Nutrition Dep., Sacred Heart Women's Univ., Bucheon, Kyungki-do, South Korea.

844. Hymowitz, T.; Newell, C.A.; Carmer, S.G. 1977. Pedigrees of soybean cultivars released in the United States and Canada. *INTSOY Series* No. 13. 23 p. Nov. (College of Agric., Univ. of Illinois at Urbana-Champaign). [17 ref]

• ***Summary:*** Contents. Introduction. Abbreviations. Pedigrees of soybean cultivars released in the United States and Canada (Five-column table, p. 4-15). Strain identification. Parentage of strains. Registration of soybean cultivars. References.

The 337 soybean varieties listed in this publication, named or released from 1889 to 1976, are currently (1977) in the USDA germplasm collection, and were released in the USA and Canada. "Cultivars having an experimental strain pedigree and preceded by an asterisk, and the strain is underlined" (e.g., Beeson, Bonus, Bragg). This information was compiled from many sources, including USDA Bureau of Plant Industry Bulletins.

In the information on early soybean varieties below (adapted from the 12-page "Pedigrees" table), column 1 is the year introduced to the USA, column 2 (separated by a comma) is the cultivar name, 3 is the Maturity Group, 4 is the pedigree (P.I. is the "Plant Introduction" number and F.C. is the "Forage Crop" number, both from the USDA, Beltsville, Maryland), and column 5 is the year named or released. Only the early (pre-1915) introductions are listed here, in chronological order:

1889, Medium Green or Guelph, III, 1903 and 1907.

1889, Kingston, IV, P.I. 17255 (From Japan), by 1907.

1894, Easycook, VI, P.I. 34702 (From Shantung Prov., China), by 1923.

1900 or before, Mammoth Yellow, VII, Unknown, Unknown.

1900, Wisconsin Black, I, P.I. 5039 (From Paris, France), by 1910.

1901, Austin, V, P.I. 17263 (From Pingyang [Pyongyang / P'yongyang], Korea), by 1910.

1901, Ebony, IV, P.I. 6386 (From Pingyang, Korea), by 1907.

1901, Haberlandt, VI, P.I. 6396 (From Pingyang, Korea), by 1910 [sic, 1905].

1901, Midwest, IV, P.I. 6556 (From Central China), by 1922.

1901, Tokyo, VII, P.I. 8424 (From Yokohama, Japan), by 1910.

1902, Hollybrook, V, Rogue in Mammoth Yellow, by 1910.

1905, Cloud, III, P.I. 16790 (From Hangchow, China), by 1910.

1905, Tarheel Black, VIII, P.I. 14952 (From Shanghai, China), by 1923.

1906, Elton, I, P.I. 20406 (From Khabarovsk, USSR), by 1910.

1906, Habaro, I, P.I. 20405 (From Khabarovsk, USSR), by 1913.

1906, Morse, IV, P.I. 19186 (From Newchang, or Yingkow [Newchwang or Ying-k'ou / Yingkou], Manchuria), by 1910.

1906, Peking, IV, P.I. 17852B (From Peking, China), by 1910.

1906, Wilson, IV, P.I. 19183 (From Newchwang, Manchuria), by 1910.

1907, Chestnut, III, Selection from Habaro, by 1910.

1907, Shingto, III, P.I. 21079 (From Teiling, Manchuria), 1910.

1907, Virginia-N, IV, P.I. 19186D (Selection from Morse), by 1920.

1907, Virginia-S, V, P.I. 19186D (Selection from Morse), -.

1908 [sic, ca. 1943], Acadian, VIII, P.I. 60406 x F.C. 04910, 1943.

1908, Arisoy, VIII, P.I. 86736 (From Konosu, Japan), 1930.

1908, Arlington, V, P.I. 22899 (From Paotingfu [later Baoding, Hebei], China), by 1910.

1908, Barchet, VIII, P.I. 23232 (From Shanghai, China), 1923.

1908, Biloxi, VIII, P.I. 23211 (From Tangsi, China), by 1917.

1908, Columbia, III, P.I. 22897 (From Paotingfu, China), by 1910.

1908, Hong Kong, IV, P.I. 22406 (From Hong Kong), by 1910.

1910, Manchuria, I, P.I. 28050 (From Harbin, Manchuria), by 1912.

1910, Minsoy, 0, P.I. 27890 (From Paris, France), ca. 1926.

1910, Soysota, I, P.I. 28019 (From Naples, Italy), by 1923.

1911, Black Eyebrow, II, P.I. 30744 (From Wulukai, Manchuria), by 1917.

1911, Hoosier, I, P.I. 30746 (From Wulukai, Manchuria), by 1927

1911, Manchu, III, P.I. 30593 (From Ninguta, Manchuria), by 1917

1911, Mandarin, I, P.I. 36653 (From Pehtuanlintza, Manchuria), by 1920.

1911, Otootan, VIII, (From Taiwan via Hawaii), by 1923.

1911, Wea, II, P.I. 30600 (From Shuangchengpu, Manchuria), ca. 1926.

1912, A.K. (F.C. 30761), IV, Selection from A.K., by 1940.

1913, Dunfield, III, P.I. 36846 (From Fanchiatum Sta., Manchuria), by 1923.

1914, Arksoy, VI, P.I. 37335 (From Pingyang, Korea), -.

1915, Hahto, VI, P.I. 40118 (From Wakamatsu, Japan), by 1921.

Talk with Ted Hymowitz. 1998. July 5. Ted and his colleagues created a computerized database, with the data entered on 80-column paper punch cards, using software that Sam G. Carmer borrowed from Washington State University. In hindsight, Ted wishes he had divided the column titled "Year named or released" into two. The first would be "Year named" and the second would be "Public release." This database no longer exists. The many thousands of punch cards were discarded after Sam Carmer died. Address: Dep. of Agronomy, Univ. of Illinois.

845. Kim, Chul-Jin.; Byun, S.M. 1977. [Effects of soy protein isolate on quality and acceptability of soy protein isolate substituted beef patties and ice cream]. *Korean J. of Food Science and Technology* 9(3):190-93. [15 ref. Kor; eng]
• ***Summary:*** Beef patties were made with 0, 15, 30, 45, 60, 75, and 100% replacement of beef with soy protein isolate (SPI). Ice cream was made with 0, 25, and 50% replacement of milk solids-not-fat with SPI. Sensory analysis by a taste panel showed that beef patties containing 30% or less SPI were not significantly different that 100% beef patties. The ice cream with 25% and 50% SPI had the same textural quality as dairy ice cream but had a significant "beany" off-flavor. Address: Dep. of Biological Science and Technology, Korea Advanced Inst. of Science, South Korea.

846. George, Susan. 1977. How the other half dies: The real reasons for world hunger. Montclair, New Jersey: Allanheld, Osmun & Co. xxix + 308 p. Index. 21 cm. [500+* ref]
• ***Summary:*** Soybeans are discussed in several places: Between 1972 and 1973 U.S. soybean production increased by 25% (p. 9).

Chapter 4, titled "Technology: Now who pays to do what to whom?" shows that no new technology, not even a new crop is neutral in the effects it has on different classes of people. A report on soybeans in Brazil commissioned by the French Government Center for External Trade showed that they are becoming an increasingly important crop there. Since Brazil can produce and sell its crop between the two U.S. soybean harvests, the government's official agricultural policy encourages Brazilian farmers to grow more soybeans since they are a profitable export crop. The price of soybeans is attractive, so farmers have abandoned corn, a traditional crop, as well as wheat (to a lesser extent) because soybeans demand less fertilizer. Since soybean production is easily mechanized, fewer Brazilians need be employed. Soybeans are usually crushed to make oil and meal. This complex processing technology is being taken over by the world's most competent processors–large multinational agribusiness firms, such as Cargill and Bunge. Small Brazilian processors are going bankrupt. Since Brazil's infrastructure for transporting and loading the soybeans is substandard, the World Bank has been kind enough to contribute half the price of new private export corridors to the seaports, which the Brazilian government has kindly declared necessary for the multinationals. No doubt the Brazilian soybean industry will be profitable for multinational agribusiness, but what will be the consequences for ordinary Brazilians. From 1970 to 1972, the price of corn, a traditional staple food and feed, has risen 60%, while the price of chicken has gone up 33%. Soybeans have drastically decreased the amount of land previously used for growing the *feijao* or black bean–another staple crop and key human protein source; during this period its price jumped by 275%. Rice production also suffered from the soybean competition. All of these developments hurt average Brazilians, and especially the poor.

In addition, real estate prices in areas best suited to soybean production have risen dramatically; one hectare in Rio Grande do Sul, which sold for 1,500 cruzeiros in 1972, sold for less than 10,000 cruzeiros less than a year later. Thus, smaller farmers with less mechanization are losing out to those who can afford to buy more than and agricultural equipment. Soybean production in Brazil directly counteracts the efforts of the Brazilian government to limit inflation (p. 67-69).

Chapter 6, titled "Planned scarcity," notes that in the USA, one acre in 6.5 is now planted to soybeans. Europe is only 2% self-sufficient in plant protein production. After World War II, Europe introduced American hybrid corn to replace local varieties; though the yield was higher, the protein content was lower. Thus a new protein source had to be found for feeding livestock, and U.S. soybean meal seemed to be the most rational and inexpensive solution. Export of soybean meal from the U.S. to Europe jumped from only 47,000 tons in 1949 to nearly 5 million tons in 1972-73. Major U.S. processors set up crushing mills in Europe. In short, the entire post-war European livestock industry has been developed on the basis of extensive use of low-price soybean meal. The U.S. established a "near-monopoly position for supply not only of Europe but of Japan and other nations."

Discusses the 1973 U.S. soybean export embargo, which began in June and sent prices soaring to $12 a bushel,

© Copyright Soyinfo Center 2021

from $2. The embargo was removed 3 months later and at year's end it became clear that the scare over shortages was unwarranted. The Food for Peace program introduced soya oil into countries like Spain and Tunisia that had never before tasted anything but their own olive oil. Even the butter-rich Netherlands now consumes more imported soy margarine than butter. "Far be it from me to suggest collusion I can't prove, but it is at least evident who profits from higher prices and who suffers. A futures market in soya meal was opened in London in April 1975 as a measure that might check price fluctuations." Yet the key fact is that European countries do not produce soybeans, nor any alternative protein crop.

Discusses the new effort to extend the use of soya beyond feeding animals by promoting TVP, and the international conference held at Munich, Germany, in Nov. 1973. Earl Butz (U.S. Secretary of Agriculture) led the American delegation; Hubert Humphrey stated: "Food is a new form of power. Food is wealth. Food is an extra dimension in our [U.S.] diplomacy." "Americans presented 24 out of the 38 papers (including 13 by agribusiness representatives and 10 by USDA people). Only one was by a nutritionist. "One sees absolutely no alternative to continued US MNC (multinational corporation) control of the world plant-protein production and prices." "The only rational way to offset price and foodstock manipulation by the giant traders would be to have grain stocks held in government hands, to be released or held back as the market situation demanded." The grain traders are "frantically opposed to any reserve system..." (p. 122-25).

Chapter 8, titled "Food aid?... Or weapon," discusses: Importance of feedgrains exports, Soybean Council of America, American Soybean Association, PL 480, promotion of soybean exports to Spain, Iran, and Korea, Ralston Purina and Cargill, Food for Peace counterpart funds used to finance research in recipient countries, "common defense" military expenditures (p. 172, 176).

Chapter 11, titled "What can 'they' do?" discusses alternative food sources, single-cell protein (SCP), America's energy-devouring food-production system which could exhaust U.S. fossil fuel reserves within 25 years, research by DuPont showing that when soybeans are experimentally flooded by carbon dioxide, they quadruple yields and fix more nitrogen (p. 239-40). Address: A Smith College graduate now studying at the Sorbonne. Fellow of the Transnational Inst.

847. Igata, Sadaaki. 1977. Nihon kodai kokumotsu-shi no kenkyû [Research on the ancient history of cereal crops in Japan]. Tokyo: Yoshikawa Kobunkan (Koshikawa Bunkan). p. 130-49, 170. [3 ref. Jap; eng+]

• ***Summary:*** Introduction: Soybeans seem to have originated in East- or Southeast Asia. Origin of cultivation: (1) Literature" Soybeans are mentioned in the *Kojiki*. Norinaga Motoari accepted the myth of the Five Grains and thought that soybeans and the other four grains had been cultivated since the age of the Gods. Soybeans and adzuki beans are grouped together and mentioned as "beans" in the *Nihonshoki*.

(2) Archaeological study: According to a report in the journal *Toro* (Japan Archaeology Society, p. 358), wild soybeans (*tsurumame*) were excavated from the ruins of Toro.

On pages 148-49 is a section on *Edamame* (Green vegetable soybeans), which notes that the *Engishiki* (A.D. 927) describes the offering of fresh, podded soybeans at Buddhist temples. According to Taichi Fukazawa's report, soybeans were found in a pit in Komoriyama, Senya Village, Senhoku-gun, Akita prefecture, Japan. See "The pit from which grains were excavated," by R. Moriomoto (1933).

According to Dr. Nobuo Ito of Tohoku University, the naturally carbonized layer of soybeans dates back to the 1st or second century.

According to *Nara-cho shokuseikatsu no kenkyu* [Research on the eating habits of the Nara period (A.D. 710-784) in Japan], by S. Sekine (1969, p. 30), soybeans were excavated not only from the Komoriyama ruins, but also from the Yasuda Okayama ruins in Mioka Village, Kumage-gun, Yamaguchi prefecture, Japan, and from the Iba ruins in Hamamatsu city, Shizuoka prefecture, Japan.

Mr. Yoshinori Segawa mentioned that soybeans were found in the ruins of Taguchiyama, Maikata city, Osaka (*Sankei Shinbun Morning News*, 29 Sept. 1974). In summary, archaeological evidence from the Komoriyama ruins suggests that soybeans were grown in Japan by the 1st or second century A.D.

Comparison of Korea and Japan: Soybeans were cultivated in the southern Korean peninsula along with several kinds of grains, and these were found in the ruins of an army storage house in [illegible place name], Korea. These grains and beans date back to the middle of the 7th century A.D., but the earliest known mention of soybeans in Korean literature dates from the middle of the third century A.D. The author concludes that soybean cultivation seems to have started in Japan before it began in Korea, indicating that soybeans were not imported but were probably domesticated from wild soybeans.

Soybeans also appear in the *Sankoku-shiki* (Vol. 1, No. 1; Vol. 2, No. 2., Vol. 4, No. 4, and Vol. 23, No. 1).

Mr. Matsumoto wrote *Shina ni okeru Giso oyobi Shaso, Shimin seikatsu, kochi seido, kokumotsu no meisho no kenkyu* (A study of the Giso and Shaso storage houses, and the life of the Shimin people, the cultivated field system, and the names of grains). Page 148 states that "shu" includes both soybeans and azuki beans, and page 166 states that before the 6th century, both soybeans and azuki beans were cultivated. The "Five Grains" always includes "shu."

Process of cultivation: Soybeans and azuki beans are

© Copyright Soyinfo Center 2021

mentioned as emergency foods used to relieve shortages in A.D. 840. (See the *Zoku Nihon Koki*, vol. 9, and the *Reishûkai*, vol. 13). Therefore soybeans must have been grown widely, since they were offered to the government in place of millet when farmers could not afford millet in difficult situations.

According to the *Nihon Sandai Jitsuroku*, vol. 14, in March of A.D. 867 Japanese farmers burned the holly mountain to grow soybeans. This seems to indicate these farmers' active attitude toward growing soybeans.

In the 8th and 9th centuries, soybeans were grown in the Omi, Tanba (or Tamba), [two areas whose characters are not recognized], Bizen, Bitchu, Bingo, Kii, Awa, Sanuki, and Iyo areas. These are mainly centered around the Inland Sea area (*Seto-naikai*) of southern Honshu (Japan's main island).

The *Engishiki* (vol. 24) states that a certain island [characters not recognized] offered 24 *to* (1 *to* = 18 liters or 4.76 gallons) of soybeans.

Note: Concerning areas mentioned above in Japan in the 8th and 9th centuries: According to a map titled "The provinces of Japan" in *A history of Japan to 1334*, by George Sansome (1958, p. 2). Omi was located by today's Lake Biwa (Japan's largest lake), northeast of Kyoto. Tanba is located in the Kyoto area. Bizen, Bitchu, and Bingo are located adjacent to and directly north of the Inland Sea. Kii occupied what is today Wakayama prefecture and part of Mie prefecture. Awa, Sanuki, and Iyo were provinces on the northern side of Shikoku island.

848. Korean Society of Food Science and Technology. 1977. Comprehensive review of the literature on Korean foods. II. (1969-76). Seoul, South Korea: 235 p. *
Address: Korea.

849. Moomaw, J.C.; Park, H.G.; Shanmugasundaram, S. 1977. The role of legumes in South and Southeast Asia. *College of Tropical Agriculture* (*Univ. of Hawaii*), *Miscellaneous Publication* No. 145. p. 155-69. J.M. Vincent, A.S. Whitney, and J. Bose, eds. Exploiting the Legume-Rhizobium Symbiosis in Tropical Agriculture. [39 ref]
• ***Summary:*** Contents: Introduction: Role of legumes in agricultural production, role of legumes in human nutrition, future role of legumes.

"People in South and Southeast Asia rely heavily on cereals and legumes for their major nutrients. FAO statistics (FAO, 1975) clearly show that protein needs are inadequately met and that vulnerable groups are suffering from both calorie and protein deficiency. At least 90 million people, mostly children, are suffering from moderate to severe malnutrition. Greater legume production is necessary to provide even the generally inadequate protein and vitamins to the 2,200 million people living in the region." Legumes are usually presented in four broad categories: food legumes, oil seeds, forage and cover crops, and miscellaneous" (p. 155).

"The role of legumes in agricultural production is small relative to that of cereals, but the role of legumes in human nutrition is more important than their relative acreage or production volume (harvested crop) indicate" (p. 158).

"Among the 13,00 species of legumes, about 20 are eaten in significant quantities by man directly as food. Soybean is easily the most important of these, especially in China, Japan, Korea, Taiwan, and Indonesia. Mungbean (*Vigna radiata*), black gram (*V. mungo*), chickpea (*Cicer arietinum*), pigeon pea (*Cajanus cajan*), lentil (*Lens esculenta*), dry beans (*Phaseolus vulgaris*), lathyrus pea (*Lathyrus sativus*), broad bean (*Vicia faba*), cowpea (*Vigna sinensis*), groundnut (*Arachis hypogaea*), and dry pea (*Pisum sativum*)."

Soybean research in Asia (AVRDC 1976) has five major priorities (see p. 165).

Tables show: (1) Area, yield and production of pulses in Asia, North America, and the world, 1961-65 and 1974. Source: FAO Production Yearbook, 1974. In Asia, area harvested and production have decreased. In North America, area harvested is unchanged but production has increased. Worldwide, area harvested and production have both decreased. (4) Soybean production cost and returns in Thailand, Philippines, and Taiwan. Source: ARDC 1976. There is a very small net return (profit) on soybeans in Thailand and Philippines, and a small loss in the Philippines. (5) Protein productivity of certain tropical food crops. Soybeans produce 9.1 kg of protein per ha per day, more than twice as much as any other crop shown in this table. No. 2 are lima beans (4.5), followed by cowpea (3.3), winged bean (3.0), peanut (2.7), and chick pea. (6) Nutritional contribution of AVRDC's six crops toward balancing a rice diet. Soybean is the best source of protein (36.8 gm per 100 gm), followed by mungbean (22.9).

Figures show: (1) Food grain yields (for cereal grains) have increased dramatically since about 1966 in developing countries as a result of the introduction of "Green Revolution" technology. Source: After Chancellor and Goss 1976. Address: AVRDC, Shanhua, Taiwan.

850. U.S. Department of Agriculture. 1977. The annual report on activities carried out under Public Law 480, 83d Congress, as amended, during the period July 1, 1975 through September 30, 1976. Washington, DC: U.S. Government Printing Office. See table 17.
• ***Summary:*** Table 18 is titled "Title II, Public Law 480–total commodities shipped by program sponsor, fiscal year 1976." The main program sponsors and distributing agencies, listed alphabetically, are AJJDC (American-Jewish Joint Distribution Committee), CARE, CRS (Catholic Relief Service), CWS (Church World Service), LWR (Lutheran World Relief), SAWS (Seventh-day Adventist World Service), UNICEF, UNRWA (United Nations Relief and

© Copyright Soyinfo Center 2021

Works Agency), and WRC (World Relief Commission). All of these are Private Voluntary Organizations (PVO/PVOs), registered with USAID. The following foods containing soy protein were distributed: Soy fortified sorghum grits (SFSG), CSB (corn soya blend), CSM (corn soya mix), WSB (wheat soya blend), and small amounts of soya flour. The vegetable oil which was shipped to many countries was soybean oil; it is not recorded here.

Foods containing soy protein were distributed to the following countries or areas: Near East: Bhutan, Egypt, Gaza, Jordan, Jordan West Bank, Morocco, Tunisia, Yemen.

Latin America: Bolivia, Brazil, Chile, Colombia, Costa Rica, Dominican Republic, Ecuador, El Salvador, Guatemala, Guyana, Haiti, Honduras, Nicaragua, Panama, Paraguay, Peru.

Africa: Benin, Botswana, Burundi, Cameroon, Cape Verde, Central African Republic, Ethiopia, Gambia, Ghana, Kenya, Lesotho, Liberia, Malagasy, Malawi, Mauritania, Mauritius, Niger, Rwanda, Senegal, Seychelles, Sierra Leone, Sudan, Tanzania, Togo, Zambia.

Asia: Bangladesh, India, Indonesia, Korea, Nepal, Pakistan, Philippines, Singapore, Sri Lanka.

Concerning "peanut oil" shipped under P.L. 480 Title II in fiscal year 1970: India received 37,776 million lb (Table 18). Address: Washington, DC. Phone: 703-875-4901 (1991).

851. Yokotsuka, Tamotsu. 1977. Shokuhin Kagaku Daijiten: Shôyu [McGraw-Hill encyclopedia of food, agriculture & nutrition: Soy sauce]. Tokyo: McGraw-Hill Kodansha. See p. 309-310. [Jap]

• ***Summary:*** History: Hishio and Kuki production techniques came to Japan from China and Korea. According to the Taiho Ritsuryo (702 A.D.), various types of Hishio and Kuki and Miso (this is the Misho character–NOT the present Miso one) were made from soybeans in the Hishio Tsukasa of the Kunaisho. It is in later times that they started to use the liquid which was separated from the above three as seasonings. In the Kamakura (1185-1333 A.D.) period in the Wakayama prefecture they collected the liquid accumulated in the bottom of Miso Oke. In the Muromachi period (1338-1573 A.D.) they added water to miso and squeezed it to extract the liquid (called Usudare or Taremiso). Shoyu (which is different from miso) was first mentioned in Ekirinbon Setsuyoshu (1597 A.D.). Address: Kikkoman Corporation, Noda, Japan.

852. **Product Name:** Tofu.
**Manufacturer's Name:** Boo Han Oriental Food Manufacturing.
**Manufacturer's Address:** South Tacoma Way, Lakewood, Washington.
**Date of Introduction:** 1977?
**New Product–Documentation:** Talk with Ed Elkin. 1991. Feb. 8. About 12-15 months ago Boo Han changed hands; it is now named Hang Yang, owned by Mr. Choy, a Korean-American, who does not speak English–although his brother does. Hang Yang is very aggressive and doing well; he just upgraded to a new tofu system. The company is at the same location it was when he purchased it from Boo Han.

Talk with Peter Lesser, founder of Pacific Soyfoods. 1991. Feb. 8. Starting in Feb. 1982 he began to buy okara from Mr. Boo Han, a Korean-American tofu maker located at something like 100 South Tacoma Way, Lakewood, Washington. Originally Mr. Han's shop was located in the back of his retail Asian food store. Then he moved it around the corner. He used a big old boiler. Peter has no idea when Mr. Boo Han started his tofu company. He still owns his retail store; he sold his tofu company. He speaks pretty good English.

In Feb. 1991, the phone directory has a listing for Boo Han Oriental Food Manufacturing, 9122 S. Tacoma Way, Tacoma, Washington. Phone: 206-588-7300. The owner's name is Mr. Boo-Nam Han.

853. Meals for Millions Foundation. 1978. Annual report 1977: A commitment to self-help for a hungry world. Santa Monica, California: MFM Foundation. 9 panels. Each 9 x 23 cm. Complex folding.

• ***Summary:*** Peter J. Davies is President and Chief Executive Officer; he resides at the New York office. On the orange, black and white cover is a photo of a little girl. MFM's former logo of the plant growing in the upturned bowl is now at the bottom of the cover.

Contents: Message from the president (The "trickle-down" theory of investing in infrastructure does not work). Highlights of 1977: The Borsook Fund was established, the National Committee of Sponsors was formed, with Mrs. John Steinbeck as chairperson, generous grants were received from a long list of organizations, starting with US AID and PACT. Since 1974 MFM has emphasized self-help programs, moving away from distribution of MPF. Technical and material assistance (Ecuador, Honduras, Egypt, Korea, Jamaica, Kenya). Transfer of technology (Village texturizer, India–Robert and Jeanne Nave). Multi-Purpose Food (sent to Syracuse, New York). Technical and professional training (IIPFT, Bolivia). Nutrition education (Tucson, Arizona. In June 1977 MFM held its first Nutrition Education Workshop for 28 field nutritionists).

Income for 1977 by source: $893,765 (total). Statement of functional expenses for the year ended Dec. 31, 1976 ($529,028). Board of Trustees. National Committee of Sponsors. MFM officers. A small portrait photo shows Peter Davies. Address: 1. 1800 Olympic Boulevard (P.O. Box 680), Santa Monica, California 90406; 2. 815 Second Ave., Suite 501, New York City, NY 10017. Phone: (213) 829-5337 or (212) 986-4170.

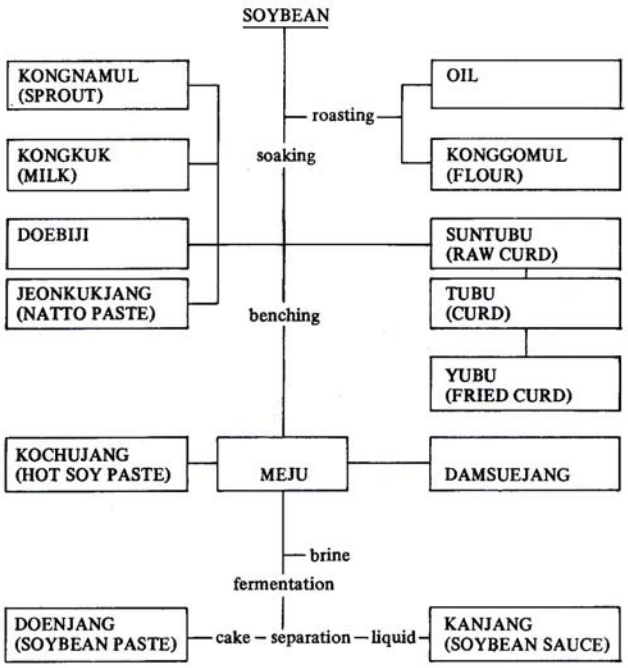
Traditional soybean foods in Korea. In: American Soybean Assoc., ed. 1978. International Soya Protein Food Conference, Proceedings. Hudson, Iowa: ASA. 136 p. See p. 43-47. [13 ref]



Annual Production and Import of Soybean

| Year | Production (M/T) | Import (M/T) | Total (M/T) |
|---|---|---|---|
| 1970 | 231,994 | 36,291 | 268,285 |
| 1971 | 222,302 | 60,573 | 282,875 |
| 1972 | 223,939 | 31,468 | 255,407 |
| 1973 | 245,822 | 72,964 | 318,786 |
| 1974 | 318,576 | 66,370 | 384,946 |
| 1975 | 310,555 | 61,000 | 371,555 |
| 1976 | 294,949 | 147,854 | 442,803 |

• ***Summary:*** "The origin of soy sauce and paste in Korean literature dates back to 683 A.D. (Shinmu King 3rd year of the United Silla period). Since an old Japanese literature [document], *Hwameyruitsuroku* [*Wamyô Ruijusho;* Collections of Japanese Names, by Subject], of Heyan [Heian] records that 'Maljang (Meju) is a Korean soy sauce and paste' and a record on Maljang was also observed in the ruins of Nara, it is evident that soy sauce and paste were introduced from Korea to Japan during the Nara period (645-793 A.D.). Therefore, it is believed that the beginning of their consumption in Korea should be in the third century of Kokuryo period."

"Soybean has been a major protein source in the Korean diet." Figure 1 shows: Consumption pattern of soybean foods (1976). Some 442,803 tonnes (metric tons) of soybeans were used in Korea as follows: oil and defatted meal 28.5%, curd

(*tubu*, or tofu [*suntubu* is raw curd/fresh curds]) 24.5%, paste (*doenjang*) 18.3%, soy sauce (*kanjang*) 10.6%, soy sprouts (*kongnamul*) 9.0%, hot soy paste (*kochujang*, made from meju, hot pepper flour, and cooked glutinous rice) 6.6%, soymilk (*kongkuk*) 0.14%, and other 2.4%. Other includes roasted soy flour (*konggomul*, used for coating rice cakes [mochi]), fried tofu (*yubu*), salted natto paste (*jeonkukjang / cheonggukjang / cheonkukjang*). *Doebiji* is fresh soybean puree, made by grinding soaked soybeans. When used as a food, it is usually cooked with vegetables, kimchi, and meat. Meju is balls of soybean koji like Japan's miso-dama. All fermented Korean soybean foods except Joenkukjang are prepared from meju. Its characteristic flavor results from *Aspergillus*, *Penicillium*, and *Mucor* species of molds on the surface of the balls and *Bacillus subtilis* on the inside. *Damsuejang* (*Makjang*) is a quick fermented soy paste made by crushing meju to a powder, adding a warm brine solution, then allowing it to ferment and ripen.

Note: This is the earliest English-language document seen (March 2009) that uses the word "Damsuejang" to refer to Korean-style soybean paste (miso).

The above usage is the equivalent of 12 kg per capita per year. The daily per capita consumption of soy sauce (kanjang) is 20 ml, of soybean paste (doenjang) is 15 gm, and of hot soybean paste is 10 gm. Most of the soy sauce (64%), doenjang (82%), and kochujang (76%) and all of the salted natto paste (joenkukjang) and quick fermented soy paste (damsuejang) are produced at a household level and consumed directly.

Tables show: (1) Annual production and import of soybeans.

Both soybean production and imports have grown in

855. Chung, Sung-Soo; Chang, H.N.; Park, M.Y. 1978. [Dehydration of soybean residue by hot-air in conjunction with filter pressing]. *Korean J. of Food Science and Technology* 10(1):1-7. March. Food Sci. Technol. Abstr. 79-01-G0072. [8 ref. Kor; eng]

• ***Summary:*** "The wet soybean residue [okara], a byproduct of soymilk industry having potential food value has been tried to dehydrate for the purpose of storage. The total solid of the byproduct was composed of 28.9% protein, 13.6% fat, 4.4% ash and 53.0% carbohydrates.

"The original water content of 593% (dry-weight basis) was reduced to 378% by pressing mechanically. The sufficient pressure and time for the pressing were found to be 0.5M/T and 5 minutes, respectively.

"The partially dehydrated soybean residue was formed into pellets of 3mm in diameter and 10mm in length. By applying hot air on the thin layer of pellets the moisture could be further reduced to the level of 10% which is equivalent to that of the commercial wheat flour. No significant color deterioration in the product was observed if the hot air dehydration procedure was within the limits of 95 minutes at 120ºC under the air flow velocity of 160 feet per minute." Address: Korea Advanced Inst. of Science, Chung's Foods Co., Ltd., Seoul [Korea].

• ***Summary:*** The highly rated Jang Won restaurant in Seoul served traditional Korean dishes such as "raw vegetables with *toenjang* (a fiery dip made of soybean paste and peppers). Then there were raw sea cucumber with hot bean sauce, *kochu-jang;* raw abalone,..." Address: Sun staff writer.

857. Mori, Masao. 1978. Moyashi kôgengaku to sono bunka [Thoughts on bean sprouts and their culture]. *Ajinomoto-sha Ajiko News* No. 61. 9 p. April 30. [Jap; eng+]

• ***Summary:*** In 1974, consumption of all kinds of sprouts in Japan reached 260,000 tonnes/year. Per capita consumption is one of the highest among vegetables. The main seed sprouted is black mappe (*kokuryoku-tô*). In the old days, soybeans and mung beans (*ryoku-tô*) were the two most widely sprouted seeds. In Japan, sprout production as an industry started in the first decade of the 20th century, and after the Great Kanto Earthquake of 1923 it grew rapidly. During the period from about 1910 to 1915 the popularity of Chinese cooking grew rapidly in Japan. Because sprouts are widely used in Chinese cookery, they became firmly settled in the food tastes of regular Japanese. During the period from 1945 to 1965, the number of sprout products increased significantly. Producers were located mostly in the large cities of Yokohama, Tokyo, Osaka, and Kobe. Among the producers who joined the Japanese Bean Sprout Industry Association (*Mame Moyashi Kogyô Kumiai*) were 34 small producers and 667 individuals (insiders). The outsiders who didn't join the Association increased too.

The new seed for sprouting, black mappe [*Vigna mungo*], was originally imported from Burma only, but later Thailand entered the market, and became the main source of the beans starting in about 1965. In 1975 this seed cost less than 100,000 yen/tonne, but by 1977 the price had doubled, making it difficult for small producers to buy black mappe. So they started to mix mung beans with black mappe, but this made it difficult to produce sprouts of uniform quality.

The reason the Japanese switched from using soybeans and mung beans to using black mappe had to do with an incident in Nagasaki between China and Japan. The Chinese said the Japanese had treated their flag with disrespect. They got mad and for a while stopped trading with Japan–although the two countries are now becoming friendly again. Yet only a very small amount of soybeans and mung beans are imported from China.

It is believed that humans discovered the fact that seeds sprout in about 10,000 to 5,000 B.C. In the early Han dynasty, before the Christian era, the emperor of China wrote that "sprouts give health," and recorded their health effects. In Japan, the earliest record of bean sprout production dates from the Northern and Southern dynasties period (*Nanboku-cho*) (1336-1392). There is a legend that before that time the Chinese who landed by boat (accidentally) in Kyushu or Shikoku introduced sprouts to Japan. It is known that soy sprouts were made in Korea at an early date. There was

© Copyright Soyinfo Center 2021

a theory among the people in the sprout industry that soy sprouts were introduced to Japan when KATO Kiyomasa brought at least one Korean soy sprout maker to Japan at the time of Toyotomi Hideyoshi's war there (during the 1590s). Kato is said to have ordered the Korean to make soy sprouts using spring water from Suizenji park in Kyushu, and these sprouts are said to be Japan's first commercial sprouts–but there is so solid evidence or documents to prove that this really happened.

Japan's sprout industry consists almost entirely of small producers. In Kagoshima there are 75 producers–the largest number in any one part of Japan. Tokyo, Chiba, and Saitama together have 85 producers. Also Ashikaga in Tochigi prefecture (north of Tokyo) produces large amounts of sprouts. There are about 1,282 sprout producers in Japan. Of these 611 companies (with a 49% market share) have 1-5 workers, 553 companies (43%) have 6-20 workers, 95 companies (7%) have 21-50 workers, 13 companies (0.1%) have 51-100 workers, and 10 companies (40.1%) have 101-200 workers.

Professor Tadayoshi TAZAKI of Tokyo Agricultural and Industrial University (*Tôkyô Nôgyô Kôgyô Daigaku*), Agricultural Dept., proved that ethylene (*echiren*) gas can be used to produce fat sprouts–it prevents them from growing long and thin. Address: Shokuryo Gakuin Kyoju Kyoritsu Joshidai Koshi, Japan.

858. *Foreign Agriculture* (*USDA Foreign Agricultural Service*). 1978. Despite big harvests, Korea's corn, soybean imports remain high. June 12. p. 6-8.
• ***Summary:*** Korea was the sixth largest export customer for U.S. farm products in 1977. The country imported record volumes of corn, soybeans, and tobacco. 70% of the total came from the U.S. All of the soybeans in the shipments came from the U.S.

In 1977, Korea's 318,735-ton soybean crop was 8% higher than the 1976 level, largely because of greater use of improved varieties, favorable weather, and a 1% expansion in area to 250,620 hectares. Soybean yields reached a new peak–1,270 kg/ha. Korea's imported soybeans–150,600 tons included 109,385 tons for crushing, 15,814 tons for food-industry use, 5,401 tons for military use, and 20,000 tons for price-control purposes. Address: U.S. Agricultural Attaché, Seoul.

859. Birnbaum, Alfred. 1978. Re: Natto, the word *kara* and the history of early Japanese-Korean relations, and sea vegetables. Letter to William Shurtleff at New-Age Foods Study Center, Lafayette, California, July 12. 1 p. Handwritten (in pencil) and signed.
• ***Summary:*** Alfred will try to finish translating the chapter on Nattô from *Daizu Shokuhin* before he leaves Japan for southern California on about Aug. 10; he has found certain scientific terms hard to translate.

He has been reading a somewhat controversial Japanese-language publication titled *Nihon no naka no Kankoku bunka* (*Korean culture inside Japan*). It states that the Japanese word *kara* (as in *kara-natto*), meaning simply "from the continent" was first applied to Korea, from Korea's Sam-Han & Three Kingdoms periods and Japan's Kofun (A.D. 250-552), Asuka (552-645), and Nara (646-794) periods–before Japan had any relations with China. The first usage was the Chinese character (1 Cc = 1 Chinese character given) which, although it appears to refer to Han dynasty China, was adapted by the early Korean Japanese "Kara" clan (which Alfred believes later became the *Higashi-no-Aya* clan). The next usage was (1 Cc, pronounced "kara"), as in Sam-Nan clans of Korea and the Karakuni Jinja (4 Cc) in Nara (still extant). Then the character changed to (1 Cc), still meaning "Korea" (not salty), and finally (1 Cc)–all pronounced *kara*.

Note: This is the earliest English-language document seen (Nov. 2011) that contains the term "kara-natto."

Alfred was introduced to these studies in early Japanese-Korean relations and the falsifications in the *Kojiki* etc. by a Korean linguist in Los Angeles. It became obvious how twisted the stories on the Japanese side became and how anxious the ancient ruling class Japanese (who were largely Korean) was to prove it was separate and unrelated to Korea.

Concerning Hama-natto [from Yamaya]: It is a special product of Hamamatsu, used as an accompaniment to rice, tea, or fried egg yolks. Two sources give two processes.

He still hopes to find time for a trip to Kyoto, and he is still interested in working together on a book about sea vegetables. During Aug. he will stay with his parents in Rancho Palos Verdes, California. From Sept. he will be visiting a friend in Columbia, Maryland. Address: Tama-sô No. 1, Inokashira 1-28-30, Mitaka-shi, Tokyo 181, Japan. Phone: 0422-47-7130.

860. Whigham, D.K.; Judy, W.H. 1978. International soybean variety experiment: Third report of results, 1975. *INTSOY Series* No. 15. x + 369 p. Aug. (College of Agric., Univ. of Illinois at Urbana-Champaign).
• ***Summary:*** In the ISVEX trials, soybeans were tested in the following regions and countries: Africa: Algeria, Burundi, Cameroon, Congo, Dahomey, Egypt, Ethiopia, Gambia, Ghana, Ivory Coast, Lesotho, Mali, Mauritius, Niger, Reunion, Rhodesia (Salisbury), Rwanda, Senegal, Sierra Leone, Swaziland, Tanzania, Togo, Upper Volta, Zambia.

Asia: Afghanistan, Bangladesh, India, Indonesia, Korea, Nepal, Pakistan, Philippines, Sri Lanka, Taiwan, Thailand.

Europe: Hungary, Italy, Spain, Yugoslavia.

Mesoamerica: Bahamas, Belize, Costa Rica, Honduras, Jamaica, Martinique, Nicaragua, Panama, Trinidad & Tobago.

Middle East: Iran, Israel, Jordan, Lebanon, Saudi Arabia.

North America: United States.

Oceania: Fiji, Tahiti.

South America: Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, French Guiana, Guyana, Peru, Venezuela.

Note 1. This is the earliest document seen (March 2021) concerning soybeans in Niger, or the cultivation of soybeans in Niger. On 3 July 1975 fifteen soybean varieties were planted at Maradi, Niger; two days later the same 15 varieties were planted at Gaya, Niger. The research was conducted under the auspices of the Director, Institut de Recherches Agronomiques Tropicales (IRAT), Station de Tarna, B.P. 6, Maradi, Niger. At Maradi, Forrest gave the highest yield, 3,501 kg/ha and nine varieties gave yields of over 3,000 kg/ha. At Gaya, Jupiter gave the highest yield, 1,925 kg/ha.

Note 2. This is the second earliest document seen (Jan. 2002) for the cultivation of soybeans in French Guiana (12 Dec. 1975). On 12 Dec. 1975, cooperators Mr. J. Larcher and Mr. P. Midras (Institut de Recherches Agronomiques Tropicales, Station de Cabassou, B.P. 60, 97301 Cayenne, French Guiana), planted fifteen varieties of soybeans at Cayenne. Jupiter gave the highest yield, 3,445 kg/ha.

Note 3. This is the 2nd earliest document seen (April 2005) concerning soybeans in French Polynesia (or Tahiti), or the cultivation of soybeans in French Polynesia. This document contains the 2nd earliest date seen for soybeans on French Polynesia, or the cultivation of soybeans on French Polynesia (3 Dec. 1975). Thirteen varieties were tested at Papeete (capital of French Polynesia on the island of Tahiti), under the direction of Mr. Jean-Louis Reboul and Mr. Robert Yau-Akui, *Service de l'Economie Rurale*, B.P. 100, Papeete, Tahiti, French Polynesia. Davis gave the highest yield, 4,902 kg/ha.

This is the earliest document seen (Jan. 2005) concerning soybeans in Niger, or the cultivation of soybeans in Niger. This document contains the earliest date seen for soybeans in Niger, or the cultivation of soybeans in Niger (3 July 1975). Fifteen varieties were tested at Maradi under the direction of IRAT, Station de Tarna, B.P. 6, Maradi, Niger. Forrest gave the highest yield, 3,501 kg/ha. On 5 July 1975, fifteen varieties were tested at Gaya; Jupiter gave the highest yield, 1,925 kg/ha.

This document also contains an early clear date seen for soybeans in Senegal, and the cultivation of soybeans in Senegal (9 July 1975; one of two documents). Fifteen varieties were tested at Sefa under the direction of Mr. Jean Durovray, C.N.R.A., Sefa, Senegal. Jupiter gave the highest yield, 2,025 kg/ha.

This is the earliest document seen (Jan. 2005) concerning soybeans in Martinique, or the cultivation of soybeans in Martinique. This document contains the earliest date seen for soybeans on Martinique, or the cultivation of soybeans on Martinique (10 April 1975). Fifteen varieties were tested at Fort de France, under the direction of Mr. Daly, IRAT, Le Lamentin, B.P. 427, Fort de France, Martinique. Improved Pelican gave the highest yield, 2,154 kg/ha.

This is the earliest reliable document seen (March 2006) concerning soybeans in Togo, or the cultivation of soybeans in Togo. This document contains the earliest solid date seen for soybeans in Togo or the cultivation of soybeans in Togo (2 May 1975). On May 2 fifteen varieties of soybeans were planted at Davié in southern Togo under the direction of Mr. J. Marquette, Le Chef de la Mission, IRAT au Togo, B.P. 1163, Lome, Togo. Davis gave the best yield, 3,563 kg/ha. On May 7 fifteen varieties were grown at Amoutchou; Jupiter gave the best yield, 3,667 kg/ha. On July 8 eleven varieties were grown at Kitangbao; Jupiter gave the best yield, 3,292 kg/ha. The source of the soybeans in each country was INTSOY for ISVEX trials. Address: College of Agriculture, Univ. of Illinois, Urbana-Champaign.

861. Robin, Mike. 1978. The reign in the U.S. lies mainly in the grain. *Lincoln Gazette* (*Nebraska*). Sept. 20. [7 ref]
• ***Summary:*** Contents: Introduction. The Soviet wheat deal. Cargill and the state. Tradax. And back home. Food for Peace in Korea. Soybeans in Brazil.

This 4-page report shows how Cargill has grown through efficiency, predicting the future, taking advantage of every opportunity, and–whenever possible–using public monies and subsidies to finance its operation

The Soviet wheat deal: "Because farmers had no advance knowledge of the Russian sales, they sold their grains at prices ranging from $1.25 to $1.50 a bushel. The grain companies scurried about trying to buy these cheap grains from farmers, co-ops, and government-held reserves all through the early part of the summer of 1972. Several months later, when the Soviet sales were announced and the price of wheat rose as much as 50 percent, farmers realized the extent of the beating they had taken on what came to be known as the 'Great American Grain Robbery'. Agriculture Department officials claimed that even they had no knowledge of how much wheat had been sold to the Russians. Then Agriculture Secretary Earl Butz stated at a press conference, 'Farmers knew precisely as much as the grain companies. Some money has been made in the deal. Some trading companies made it. But it's the name of the game.'"

Although Cargill is adamant about the merits of free trade and looks askance at government regulation of the grain trade, the company nevertheless has many friends and employees in high government positions.

"Tradax: In order to market and export its grain, Cargill set up a new corporate entity, Tradax International, in Panama. Vice President Walter Saunders explained: 'Organizing the new company in Panama enabled us to conduct our trading activities in the international grain market on the same tax footing available to our major competitors.'"

"Finding that Panama was less than ideal for doing

© Copyright Soyinfo Center 2021

business, Cargill then set up a Swiss Company called Tradax Geneva. Tradax is so large that by itself it ranks as one of the world's largest grain traders. Cargill Chairman Erwin Kelm told the U.S. Senate subcommittee on multinationals that Cargill sells as much as 50 percent of its grain yearly to its own subsidiaries abroad. Now, when the Soviets buy U.S. grain, they no longer go to Cargill in the U.S. as they did in 1972. Instead, they buy from Tradax Geneva, which makes it difficult to monitor Soviet purchases–U.S. law doesn't require Tradax to report its sales,–and, additionally, Cargill does not pay U.S. taxes on its sales through Tradax."

"Soybeans in Brazil: Again in Brazil, Cargill was successful in using public monies to finance its operations. In 1972 Cargill received a loan of $25 million from OPIC, a semi-public agency, to build a soy-bean crushing plant in Brazil. The Export-Import Bank also helped by underwriting loans of more than $1 million. Soybean prices were skyrocketing in the early 1970s, and Brazil had already emerged as one of the world's largest soybean producers, second only to the U.S. Cargill jumped at the opportunity to get a foothold in the Brazilian market and its potential large profits.

"What both of these lending agencies and Cargill chose to overlook is the fact that much of Brazilian soybean production is for export and would be competing with United States-grown soybeans in world markets, thus undercutting the position of U.S. soybean farmers in the international market.

"As Verl Loyland of the Finley Farmer Grain and Elevator Company of North Dakota told the Senate Committee on Multinationals in 1976, 'I think the big problem, the way we look at it, is that these few [grain] companies are multinational companies. They are really not our salesmen. The multinational companies can pick up grain in any country they so desire, at whatever price advantage, or what have you. Just because a big sale is made to Russia doesn't necessarily mean they are going to buy from the U.S.'

"To underline this point, in 1976 Cargill's European subsidiary, Tradax, sold 37 million bushels of soybeans to the Soviets. Terms of the sale allowed the beans to originate anywhere.

"Dennis Blankenship, director of market development for the American Soybean Association, claims that the soy processing boom in Brazil accounts in part for the recent drop in volume of American meal shipped to Western Europe. The Brazilian government heavily subsidizes its soybean exports and ships abroad as much as 70 percent of its soy production, most of which is processed by subsidiaries of the grain giants, such as Cargill Agricola, Dreyfus, Bunge, and Archer-Daniels-Midland.

"While there appears to be little question that American agribusiness promotion of soybeans in Brazil has had harmful effects for U.S. producers, the expansion of soybeans has been far more deleterious to Brazil farmers and consumers alike. *How The Other Half Dies,* by Susan George [1977], summarizes a French government report on the introduction of soybeans to Brazil. Much of what follows is drawn from that study.

"The authors of the report are certain that soybeans have drastically reduced the amount of land previously devoted to staple crops, particularly the feijao or black bean... [see Susan George]

"In this article I have tried to break the veil of secrecy that has shrouded Cargill and its activities from public view. Cargill's influence on our lives is profound, and demands much more study..."

862. **Product Name:** Tofu Tahini Spread.
**Manufacturer's Name:** Michele's Beautiful Spreads and Dressings.
**Manufacturer's Address:** 1214 Manor Rd., Havertown, PA 19083. Later Philadelphia, PA. Phone: 215-474-8638 (9/92).
**Date of Introduction:** 1978 September.
**Ingredients:** Incl. soft tofu, sweet carrots, sesame tahini, fresh herbs (10/87).
**How Stored:** Frozen.
**New Product–Documentation:** Spot in Natural Foods Merchandiser. 1987. Oct. p. 23. "Tofu Dressing." The product seems to be named "Michele's Original Tofu Tahini Spread." The company is now named Michele's Original Gourmet Tofu Products, located at 6441 Haverford Rd., Philadelphia, Pennsylvania 19151. 9 oz. Retails for $2.55.

Manufacturer's catalog. 1987. Richard Rose review. 1987. Oct. 28. "Bland, uninspiring."

Talk with Robert Ashton of Natural Alternatives in Washington, DC. 1992. Sept. 14. Michele's Tofu Spread (which is still on the market) is very similar to the one he has long made. Note: This product is not made by Michele's Bakery in Philadelphia. Talk with John Liss of Michael's Bakery. This product is still on the market. Talk with Howard Waxman of Essene in Philadelphia (Phone: 215-922-1146). 1992. Sept. 21. He carries Michele's tofu spreads and dressings. The small business, which operates out of a store front (but does not sell retail), is run by a woman named Michele. Gives phone number of Michele's.

Talk with Michele D'Ambrosio, founder and owner of Michele's Original. 1992. Sept. 21. She became a vegetarian in 1974 in college and started making this product that year for herself and for one restaurant (named The Sunflower; she worked there while she went to St. Joseph's University in Pennsylvania. "We used to make it for a Pita Pocket, a Yogi Hoagie"). After the restaurant closed, she started in Nov. 1978 to sell it to a few health food stores (since that's all there were) in Havertown. She now made this, her first tofu product, out of the pantry of her home in Haverford. It was her original idea and it is still her best-seller. Other people have copied the idea since. Her company made only

© Copyright Soyinfo Center 2021

this one product for a number of years. In 1980 she changed the company name to Michele's Original and moved to her present address, a commercial deli kitchen at 6441-43 Haverford Ave., Philadelphia PA 19151. Phone: 215-474-8638. But she still lives in Havertown.

Talk with Michele D'Ambrosio. 1998. June 29. Her company produces vegetarian sandwiches made with soy meats (such as tofu and baked tofu), plus tofu spreads, tofu dressings, tofu salads, and tofu in the pasta. It's a whole vegetarian menu. She is age 48. The Tofu Tahini, a spread, is still her best-seller. It is prepared with carrots and other vegetables, which are pureed, then tahini is added; its like an orange whipped cream. She buys her tofu from a Korean company located in Chinatown in Philadelphia, Tung Yu [which is actually a wholesale distributor for tofu made by Sun Yee]. Her distributors are Cornucopia, Stow Mills, and Neshaminy Valley. In 1979 her community published a little cookbook titled *The what to do with tofu cookbooklet: Recipes for soybean curd.* It contained cute illustrations. It used to be distributed by her co-op, the Grow-cery, later renamed the Philadelphia Co-op. Her community practiced meditation from Guru Maraji; she is still his disciple.

863. *Soyanews* (*Sri Lanka*). 1978. Boneless meat [tofu]. 1(3):1, 8. Nov.
• ***Summary:*** About tofu. "A curd formed from soya milk that's as delicious as meat is dietary staple in a great part of Asia, said Mrs. Gai Kim, President of the United Nations Women's Guild, at the Hotel School in Colombo on October 17th. Over 50 representatives from the leading women's associations in Sri Lanka were present to hear Mrs. Kim explain why soya curd [tofu] is receiving such praises from both gourmets and nutritionists.

"The curd making demonstration was organized by the Sri Lanka Women's Conference..." Two photos show Mrs. Kim demonstrating how to make "soya curd," and how it can be cubed or "sliced for currying, frying, grilling and salads."

She said it is available at the "Modern Chinese Cafe on Havelock Road [in Colombo] where it is available at Rs. 4/- a pound. If it made at home, the cost is less than Rs. 1.50, she said, and will provide a little more than half the daily protein needs of an adult."

"Unlike high protein foods like meat, bean curd is not acidic but has an alkaline composition."

Mrs. Kim said that she would like to see curd called "'Boncheese' because it sounded like 'bonchi' the word for bean in Sinhala. 'Bon' means 'good' in French which would give the name 'boncheese,' derived from 'this god-sent grain,' a truly international character."

864. **Product Name:** Tofu.
**Manufacturer's Name:** Korean Farms.
**Manufacturer's Address:** 3456 N. Clark, Chicago, Illinois 60613. Phone: 312-525-3823.
**Date of Introduction:** 1978 December.
**How Stored:** Refrigerated.
**New Product–Documentation:** Shurtleff & Aoyagi. 1978, Dec. *The Book of Tofu* (Ballantine pocketbook edition). "Appendix B: Tofu Shops and Soy Dairies in the West." p. 395. Street mistakenly written as 3456 N. Cloud. Owner: Unknown.

Soyfoods Center. 1980. Sept. Tofu shops and soy dairies in the West (2 pages, typeset). Gives the company's name as Korea Farm at 3456 (or 3707) N. Clark. Owner: Mr. Young Sun Yo.

865. **Product Name:** Tofu.
**Manufacturer's Name:** Tofu, Inc.
**Manufacturer's Address:** 1900 Oak Crest, Roseville, MN 55113. Phone: 612-633-1098.
**Date of Introduction:** 1978 December.
**How Stored:** Refrigerated.
**New Product–Documentation:** Shurtleff & Aoyagi. 1978, Dec. *The Book of Tofu* (Ballantine pocketbook edition). "Appendix B: Tofu Shops and Soy Dairies in the West." p. 396. Owner: Unknown.

Letter/Order for the book *The Book of Tempeh* (profession edition) from Sonja Rank of Tofu, Inc. 1979. Nov. 16. The company is located at 1900 Oakcrest, Roseville, Minnesota 55108.

Soyfoods Center. 1980. Sept. Tofu shops and soy dairies in the West (2 pages, typeset). Tofu, Inc., 1900 Oak Crest, Roseville, MN 55113. Owners: Mr. Dam Choi and Mr. Lee R. Lee, Korean.

FIND/SVP. 1981, May. "The tofu market: Overview of a high-potential industry." p. 80. The company now makes about 12,000 to 13,000 lb/week of tofu in the soft and firm styles. Address is 1900 Oak Crest, Roseville, MN 55113. Phone: 612-633-1098.

Note: This is the earliest record seen (May 2019) concerning Tofu, Inc., which was later renamed Eastern Foods Corp., then Mainland Express.

866. **Product Name:** Tofu.
**Manufacturer's Name:** Aqua Agra.
**Manufacturer's Address:** 100 Highline Dr., Longwood, FL 32750. Phone: 305-339-8157.
**Date of Introduction:** 1978.
**How Stored:** Refrigerated.
**New Product–Documentation:** Shurtleff & Aoyagi. 1979. July. New Tofu Shops & Soy Dairies in the West. Don Wilson, owner. Soyfoods Center. 1980. Sept. Tofu shops and soy dairies in the West (2 pages, typeset). Gives the company's name, address, and phone number. Owner: Don Wilson.

Talk with Don Wilson. 1993. Nov. 24. His wife is Korean. He started making tofu in 1978, after he was sprouting soybeans and growing several other types of

869. **Product Name:** [Tofu: Soybean Cake].
**Foreign Name:** Tofu: Gâteau aux Feves de Soya.
**Manufacturer's Name:** Pyung Hwa Food Co. Inc.
**Manufacturer's Address:** 2139 Dundas St., Toronto, ONT, M6R 1X1, Canada. Phone: 416-534-0237.
**Date of Introduction:** 1978.
**Ingredients:** Soya beans (Feves de soya), water, magnesium chloride (chlorure de magnesium), calcium sulfate (sulfate de calcium).
**Wt/Vol., Packaging, Price:** 600 gm.
**How Stored:** Refrigerated.
**New Product–Documentation:** R. Leviton. 1980. Soyfoods magazine. Summer. p. 16-17. "Mr. Jhasun Koo's Korean tofu shop (2139 Dundas St.) is located underneath a garage and service station. The traditional-style shop, which began operation in 1976, produces about 5,000 pounds of tofu weekly, in the form of 2000, 40-ounce containers of nigari-made tofu." He has 7 workers. Two-thirds of Pyung Hwa's market is Oriental stores, the rest going to natural foods stores. With Vital Eat handling his tofu distribution now, and Mr. Koo's recent conversion to nigari and organic soybeans, he expects to increase sales to the natural foods trade.

Soyfoods Center. 1980. Sept. Tofu shops and soy dairies in the West (2 pages, typeset). Gives the company's name, address, and phone number. Owner: Mr. Jhasun Koo.

Label. 1983, undated. 5 by 4.25 inches. Plastic film. Blue and light blue on clear film. "Soybean cake. Gateau aux feves de soya. Keep refrigerated."

Talk with Martha Gifford Thompson of Rochester Zen Center. 1989. April 11. She once visited a small tofu shop on Dundas in Toronto. She is not sure what nationality of people ran it. Talk with Jon Cloud of Soy City Foods. 1989. May 3. Pyung Wa was an early tofu company on Dundas St.

Talk with Jhasun Koo, owner and founder. 1989. May 4. He started making tofu in 1978 (not 1976) on Dundas St. Before that he had made soy sprouts in his home basement. In 1978 the only other tofu companies in Toronto were Yet Sing (probably the first) and Hwa Chang. Both were run by Chinese-Canadians and both are still in business. In 1986 he moved from Dundas St. to his current address: 115 McCormack St., Toronto, ONT, M6N 1X8. Phone: 416-767-7604.

870. Passmore, Jacki. 1978. All Asian cookbook: Japan, China, Korea, India, Malaysia, Singapore, Indonesia, Laos, Thailand, Burma, Cambodia, Vietnam, Philippines, Sri Lanka. Secaucus, New Jersey: Chartwell Books. 224 p. Illust. (color photos). Index. 29 cm.
• ***Summary:*** Soy-related recipes: Vietnam: Soya sauce pork (Thit bho to, p. 71, with light soya sauce). Malaysia and Singapore: Mixed vegetables with salted black beans [fermented black soybeans] (the black beans are crushed, p. 103). Stuffed beancurd, peppers and black mushrooms (with 6 pieces hard beancurd, each 5 cm {2 inches} square, p. 103). Fried beancurd squares (Taukwa goreng, with 6 squares hard beancurd and dark soya sauce, p. 103). Chinese soup with pickled vegetables, beancurd and mixed meat (with 2 squares soft beancurd, p. 106).

Indonesia: Sweet pork (Babi kecap, with sweet soya sauce {kecap manis}, p. 118). Soya sauce sambal (with dark soya sauce, p. 124). Mixed vegetable soup (Sayur campur, with 2 cakes soft beancurd, p. 126).

Philippines: Lumpia (with dark soy sauce in the sauce, p. 136).

China: Fish with hot bean sauce (with hot bean paste or hoisin sauce, p. 146). Lobster with salted black beans and chili (p. 11). Stewed spare ribs with salted black beans (p. 159). Mixed green vegetables with salted black beans (p. 163). Hotpot of vegetables and beancurd (with 8 squares soft beancurd, p. 164). Ma po beancurd (with 6 squares soft beancurd, p. 166). Cold beancurd salad (with 6 squares soft beancurd, p. 166). Fried beancurd (with 8 squares soft beancurd, p. 166). Sharks fin soup (with dark soya sauce, p. 167). Wonton soup (with light soya sauce, p. 168).

Japan: Soya bean paste (miso, homemade from canned chick peas + soya sauce!, p. 178). Tuna glazed with miso (Gyoden, with dark miso paste, p. 180). Sukiyaki (with 3 squares soft bean curd, p. 187). Braised pork and leek rolls (Teriyaki, with light soya sauce, p. 188). Fried eggplant in miso sauce (with white miso paste, 194). Miso soup (miso shiru, with diced bean curd and white miso paste, p. 195).

The Glossary includes: Bean paste, hot (made from chilies and soya beans, La do ban jiang, Chinese). Bean paste, salted (also known as yellow bean paste, made from soya beans, Taucheo, Chinese). Bean paste, sweet (either tien mien jiang or do ban jiang, made from soya beans, Chinese. See also hoisin sauce). Beancurd. Beancurd

• ***Summary:*** In the early 1970s existing extruders presented a number of problems. So "by 1974 Meals for Millions had initiated work on an extruder of its own.

"A grant from U.S. AID in the following year made possible comprehensive design and development work, and a prototype unit was ready by 1976. This machine and its later developments are described in the paper by H. Sterner.

"At this time the Foundation was active in Korea and Ecuador and was planning to use extrusion cooking in projects in both countries. The potential for this type of cooking seemed particularly high in Ecuador, since the use of soy to enrich foods was a logical extension of an existing project to teach farmers to raise soybeans.

"An extruded mixture of soy and rice was developed as the base for a strawberry flavored drink." Unfortunately the project was terminated in mid-1977."

"Meanwhile, plans were developing for a project in Korea. It was now decided to make and market highly-nutritious low-cost extruded foods, starting with snack foods and progressing to weaning foods and powdered food bases. These activities were to be focused on Wonseong County, a rural area about 100 km east of the capital [Seoul], with a specific target of nutritionally at-risk groups, such as infants, young children, pregnant and lactating women–about 10,000 people in all.

"The main objective of the project was to find ways to induce the poorer at-risk members of the community to purchase and consume highly nutritious foods." Three secondary objectives are listed.

"The Wonseong County was from the very beginning a joint effort involving Meals for Millions, the Korean Institute of Science and Technology (KIST), ASI" (a leading market and research firm), and nutritionists from the Korea University and the Korean Government. "I will explain this project and its status by reviewing the work done by each of these groups.

Tables show: (1) Composition of snack food products (18% protein; containing 68% corn and 20% defatted soy flour). (2) Product raw material cost ($0.90 per kg). (3) Product selling cost: $2.31 per kg or $0.09 per 40-gm bag–incl. 39% raw materials, 22% manufacturing expenses, 15% administrative expenses, 15% sales expenses (incl. packaging), 10% Value Added Tax (VAT) 9%.

Figures show: (1) Flow chart for the production of HN/LC foods. (2) Organizational chart. Address: PhD, Meals for Millions Foundation, Santa Monica, California.

© Copyright Soyinfo Center 2021

Engineering, Colorado State Univ.). Held in Dar es Salaam, Tanzania. [4 ref]

• ***Summary:*** Contents: Introduction. The Wonseong County Comprehensive Nutrition Program in Korea. The MFM-KIST extruder. Development of high-nutrition low-cost (HNLC) food with a LEC system for the Wonseong Country program. Partial cooking of rice and corn for a pasta program with the MFM-Kist extruder. Experiments for rice bran stabilization by the extrusion process. Future program.

"Extrusion cooking is now practiced widely in the production of snack foods, blended foods, textured vegetable protein and inactivation of enzymes (Crowley, 1976). The Korean Institute of Science and Technology (KIST) has had several years of experience in the development of a high-nutrition low-cost (HNLC) food utilizing barley, soybean and sesame (BSS) and corn, soybean sesame (CSS) compositions through the extrusion process."

The MFM-KIST extruder is 1½ [2½] inch diameter single-screw unit, and the screw has constant pitch. It is driven by a 30-Hp [horsepower] motor whose speed can be changed with a 3-speed gear box. The barrel is divided into three sections without any cooling or heating jacket." It "is capable of producing 100 kg of product per hour.

Tables show: (1) Specification of MFM-KIST Extruder. (2) Trials for test production of proposed formulas with MFM-KIST extruder. (3) Chemical composition of proposed products. (4) Amino acid composition of proposed formulas. (5) Protein Efficiency Ratio (PER) and adjusted PER of proposed products. The PER ranges from 3.37 to 3.64. The adjusted PER (relative to casein, which has a PER of 2.5) ranges from 2.33 to 2.53. (6) Results of sensory evaluation of products (based on flavor, taste, texture, and color). (7) Effect of extrusion temperature and retention time on moisture content and residual peroxidase [enzyme] activity in extruded rice bran.

Figures show: (1) Graph of effect of extrusion temperature on free fatty acid development in rice bran during storage at 30ºC and 87% humidity. (2) Photo of dryer, enrober and packaging machine at KIST. Address: Korea Inst. of Science and Technology, Seoul, South Korea.

876. Shurtleff, William; Aoyagi, Akiko. 1979. Appendix C: Varieties of tofu in East Asia (Document part). In: W. Shurtleff and A. Aoyagi. 1979. The Book of Tofu. New York: Ballantine Books. 433 p. See p. 402-05.

• ***Summary:*** Gives the local, vernacular name for and a description of many varieties of tofu found in China and Taiwan, Indonesia, South Korea, Philippines, Thailand, and Vietnam.

China and Taiwan:

Taiwan, with a population of 15 million people, has about 2,500 tofu shops. There are no statistics yet available on the number of shops in mainland China, but if the proportion of shops to people is the same as in Taiwan, we can expect there to be 158,000 shops serving China's 950 million people. Unless otherwise stated, all Chinese terms are standard Mandarin. The "t" in toufu is pronounced like the "d" in "doe."

Chinese-style Firm Tofu (*toufu; dowfu* or *daufu* in Cantonese). The most popular type. Coagulated with calcium sulfate (gypsum) and sold in 3-inch squares weighing about 4½ ounces each. Contains 10 percent protein. One special type made in Shantung province is called *t'aian toufu;* another made in Anhui province, Chunnan, is called *pa-kung-shan toufu.*

Pressed Tofu (*tofu-kan*)*:* Similar to firm tofu but pressed until as firm as ham. Contains 22 percent protein. Often simmered in mixtures of water and burnt millet sugar, molasses, turmeric, or tea to create a variety of colors and flavors and increase shelf life.

Five-Spice Pressed Tofu (*wu-hsiang toufukan* or *hsiang toufukan*)*:* Made by simmering pressed tofu squares in a mixture of soy sauce, oil, and "five spice powder" (ground anise, cinnamon, cloves, plus fennel and Szechuan chili powder or ginger and nutmeg). Now prepared in San Francisco, it has a flavor and texture resembling smoked ham.

Soy-sauce Pressed Tofu (*chiang-yu toufu-kan*)*:* Made by simmering small squares of pressed tofu in a mixture of soy sauce and water.

Pressed Tofu Sheets (*pai-yeh* or *ch'ien-chang*)*:* Tofu pressed into very thin sheets that look like a 6-to-12- inch-square of canvas.

Pressed Tofu Noodles (*toufu-ssu* or *kan-ssu*)*:* Made by cutting pressed tofu sheets into noodlelike strips.

Pressed Tofu Loops (*pai-yeh chieh*). Made by cutting pressed tofu sheets into ½-inch-wide strips. Each is then tied into a simple overhand knot.

Salt-dried Tofu (*toufu-kan*)*:* Made from squares of pressed tofu that are rubbed with salt, tied together with strands of rice straw, and hung in the sunlight to dry.

Hard tofu (*lao-toufu*)*:* A general term for all tofu that is not soft.

Chinese Silken Tofu (*shui-toufu, nan-toufu, nen-toufu,* or *shih-kao toufu*)*:* One popular type is like a soft Japanese silken tofu; another is so soft it cannot be cut into cakes.

Smooth Soymilk Curds (*toufu-nao*)*:* Literally "tofu brains." Sold in the West as Tofu Pudding. Sold by street vendors in China topped with a brown sugar & peanut sauce.

Curds-in-Whey (*toufu-hua* or *rou-hua*)*:* Literally "tofu flowers." Available at some Chinese restaurants in the West.

Deep-fried Tofu (*yu-toufu* or *cha-toufu*)*:* A general term for deep-fried tofu cutlets, cubes, triangles, or netlike cutlets.

Hollow Deep-fried Tofu Cubes (*toufu-kuo* or *cha-toufu*)*:* Made by deep-frying 1-inch cubes of firm tofu.

Sautéed Tofu (*kuo-lao toufu*)*:* Made by thinly slicing firm tofu and frying it over low heat in a skillet until it turns a rich brownish yellow.

© Copyright Soyinfo Center 2021

Frozen Tofu (*tung-toufu* or *ping-toufu*)*:* Made by setting firm tofu out overnight in the snow.

Fermented Tofu (toufu-ru): See Chapter 14. Varieties include *nan-ru, nan-chiang toufu, ru-fu, mei-kui ru-fu,* and *chiang-toufu.*

Soymilk (*toufu-chiang tou-chiang,* or *tou-ru*)*:* See Chapter 10.

Chinese-style Yuba (*toufu-p'i* or *doufu-i*)*:* See Chapter 14.

Bamboo Yuba (*fu-chu* [*dried yuba sticks*])*:* U-shaped, dried rolls.

Okara (*tou-cha*)*:* See Chapter 6.

Indonesia:

Over 11,000 tofu shops make tofu for this country's 130 million people.

Indonesian tofu (*tahu*)*:* Similar to Chinese firm tofu (*toufu*). In many shops, the whey, allowed to stand overnight until it ferments, is used as the coagulant. Pressed tofu simmered in turmeric (also called simply *tahu*) is popular.

Deep-fried Tofu Cubes (*tahu goreng*)*:* 1¼-inch cubes deep-fried fresh by market vendors. Served crisp and hot, often with a fiery chili perched on top.

Tofu Chips (*krupuk tahu*)*:* Salted tofu sliced into long, thin strips and sun-dried. Broiled until crisp, then eaten as a snack or topping for Gado-gado (cooked vegetables with peanut sauce).

Fermented Tofu (*taokoan* or *takoa*)*:* Steamed and pressed into thin slices before being fermented.

Okara (*ampas tahu*)*:* Usually made into delicious okara tempeh or okara onchom.

South Korea:

There are more than 1,000 tofu shops scattered throughout this country of 32 million population. If there were a proportional number in North Korea, there would be 470 shops for 15 million people.

Korean Tofu (*tubu*)*:* Slightly firmer than its Japanese counterpart; not as firm as Chinese toufu.

Deep-fried Tofu Strips (*yubu*)*:* Each strip is about 7 by 1 by 3/4 inch. Unique.

Soymilk Curds (*sun tubu*)*:* Widely used.

Okara (*piji*)*:* Also popular.

Philippines:

Philippine Tofu (*tokwa*)*:* Identical to Chinese firm tofu (toufu).

Soymilk curds (*tajo* [*tajo*])*:* Pronounced ta-HO; made by Chinese. Sold topped with a little brown sugar.

Brine-fermented Tofu (*tahuri*)*:* Made like Chinese brine-fermented tofu but with an *Aspergillus elegans* mold and a little soy sauce in the brining liquor.

Thailand:

Thai Tofu (*tao-hu*)*:* Identical to Chinese firm tofu (*toufu*). Made mostly by Chinese.

Deep-fried Tofu (*tao-hu tod*)*:* Small (l¼-inch) cubes of deep-fried tofu. Often sold strung on split bamboo and tied in a loop.

Soymilk (*nom rua-liung*)*:* Sold hot each morning by Chinese. A thin soymilk is called *nam tao-hu.*

Soymilk Curds (*tao-huey*)*:* Sold by street vendors, topped with grated gingerroot and brown sugar syrup.

Red Fermented Tofu (*tao-hu yee*)*:* A Chinese product. Sold in 2-inch squares wrapped in either banana leaves or paper.

Lactone Silken Tofu (*tau-hu lord* or *tau-hu lawd*)*:* A modern product.

Vietnam:

Vietnamese Tofu (*dau hu* or *dau phu;* these and all of the following terms are spelled with many diacritical marks): Similar to Chinese firm tofu.

Smooth Soymilk Curds (*dau hu*)*:* Similar to the Chinese product of the same name. Served warm in a sauce of brown sugar and ginger.

Fermented Tofu (*chao*)*:* Similar to Chinese fermented Tofu.

Soymilk (*sua dau nanh*)*:* Identical to Chinese soymilk.

Pressed Tofu Sheets (*mi cang*)*:* Identical to the Chinese product.

Yuba (*dau phu truc*)*:* Identical to Chinese yuba.

Note 1. This is the earliest English-language document seen (April 2013) that uses the word "daufu" to refer to Chinese-style tofu.

Note 2. This is the earliest English-language document seen (Oct. 2010) that uses the word "nan-ru" to refer to fermented tofu. Address: P.O. Box 234, Lafayette, California 94549.

877. Sterner, Hank. 1979. Panel presentation: Characteristics of LEC's and manufacturing experiences. *LEC Report* No. 7. p. 163-64. D.E. Wilson, ed. Low-Cost Extrusion Cookers: Second International Workshop Proceedings (Fort Collins, CO: Dept. of Agric. and Chemical Engineering, Colorado State Univ.). Held in Dar es Salaam, Tanzania.

• ***Summary:*** "During 1975, while on the staff of Meals for Millions Foundation (MFM), I was assigned to develop a low-cost extruder cooker for the production of structured vegetable protein (SVP). Other imposed design objectives were that the machine could be manufactured and repaired in developing countries. The first was built in MFM's machine shop which was equipped with a Bridgeport milling machine, an engine lathe and a welder. Automobile parts, available the world over, were used in the power train. The first attempt at dissemination of this technology took place in Korea at the Korean Institute of Science and Technology (KIST). Performance of this machine is reported in other papers."

878. Wang, H.L.; Mustakas, G.C.; Wolf, W.J.; Wang, L.C.; Hesseltine, C.W.; Bagley, E.B. 1979. Soybeans as human food: Unprocessed and simply processed. *USDA Utilization Research Report* No. 5. iv + 54 p. Jan. Slightly revised, July 1979. Jan. No index. 28 cm. Compiled for USAID. [50+ ref]

• ***Summary:*** Contents: Introduction. 1. Soybean food uses in Asia. China: Soaking dry soybeans, tou chiang (soybean milk), tou fu (soybean curd), processed tou fu products, tou fu pi (protein-lipid films), huang tou ya (soybean sprouts), whole soybeans, fermented soybean foods, production and consumption.

Japan: Tofu (soybean curd), kinugoshi tofu, processed tofu products, yuba (protein-lipid film), soybean milk, gô (ground soybean mash), daizu no moyashi (soybean sprouts), whole soybeans (edamame {fresh green soybeans}, whole dry soybeans, kinako), fermented soybean foods: Production and consumption.

Korea: Tubu (soybean curd), processed tubu product, soybean sprouts, whole soybeans (green soybeans, parched or roasted soybeans, boiled soybeans), soybean flour ("Soybeans are first roasted and then ground into flour. The flour is used extensively as an ingredient in food preparations." Note: The name of the roasted soy flour is not given), fermented soybean foods (Soy sauce and [soy] bean paste are commonly used in Korea as flavoring agents. Natto is also enjoyed), production and consumption [of soybeans in Korea].

Indonesia: Tahu or tahoo (soybean curd), bubuk kedele (soybean powder. "Soybeans of the white variety are roasted until no beany flavor can be detected. They are ground into a powder and mixed with such spices as garlic and chili"), tempe kedele, tempe gembus [the name in Central and East Java for okara tempeh], oncom tahu [the name in West Java for okara onchom], other soybean products (soybean sprouts, green soybeans, roasted and boiled soybeans, kecap {soy sauce}, tauco {soybean paste}), food mixtures, production and consumption.

Thailand: Tofu (*tauhu*), soy sauce, green soybeans in the pods (*tourae*).

Philippines: Soybean sprouts, soybean coffee, soybean cake, soybean milk, tou fu and processed tou fu products, production and consumption.

Burma. India. Malaysia. Nepal. Singapore. Sri Lanka (Ceylon). Vietnam. Middle East. References–Soybean food uses in Asia.

2. Soybean food uses in Africa. Ethiopia: Injera, wots and allichas, kitta, dabbo, dabokolo, porridge. Kenya. Morocco. Nigeria: Whole soybeans, soybean paste, corn-soy mixtures (soy-ogi). Tanzania. Uganda. Production. References–Soybean food uses in Africa.

3. Soybean food uses in Europe and U.S.S.R.

4. Soybean food uses in Latin America. Argentina. Bolivia. Brazil. Chile. Colombia. Ecuador. Guyana. Paraguay. Peru. Uruguay. Venezuela. Mexico: New village process, commercial developments. Honduras. Costa Rica. Panama. Dominican Republic. Jamaica. Haiti. Trinidad. References–Soybean food uses in Latin America.

5. Soybean food uses in North America. United States. Canada. References–Soybean food uses in North America.

6. Soybean food uses in Australia. 7. Summary of soybean food uses. Traditional soybean foods: Soybean milk, soybean curd and processed soybean curd products, protein-lipid film, soybean sprouts, tempe (tempeh), green soybeans, boiled soybeans, roasted soybeans, soybean flour, soy sauce, fermented soybean paste, fermented whole soybeans, natto, fermented soybean curd. Experimental soybean foods: Whole soybean foods, soybean paste, soy flour, soy beverage. Production and consumption.

8. Simple village process for processing whole soybeans: Equipment, process, sanitation requirements, quality of product, evaluation of product in formulas and procedures for family and institutional use in developing countries. NRRC village process. 9. Industrial production and selling prices of edible soybean protein products.

10. Barriers to accepting and using soybeans in food: Availability. Cultural and social factors. Texture. Flavor. Nutrition and food safety. Technology development. Technology transfer.

Tables: (1) Soybean production, imports, and total supply in Taiwan, 1962-1975. (2) Consumption of soybean foods in Taiwan, 1964-1974 (incl. tofu, which increased from 18.75 kg per person per year in 1964 to 32.04 kg per person per year in 1974). (3) Supply and disposition of soybeans in Japan, 1971-1974. (4) Whole soybeans (metric tons) used in the production of traditional foods (miso, shoyu, tofu and others) in Japan, 1970-1974. (5) Defatted soybeans meal (metric tons) used in the production of traditional foods (miso, shoyu, tofu and others) in Japan, 1970-1974.

(6) Production (metric tons) of traditional soybean foods in Japan (miso, shoyu, tofu and others). (7) Production and food use of beans and consumption of some soybean products in Korea, 1964-67. Note: The beans consisted of 85% soybeans, 8.5% red beans [azuki], 1.6% green beans, 1.3% peanuts, and 3.4% other beans. (8) Soybean production (metric tons) in Indonesia, 1960-74 (Winarno 1976). (9) Consumption in kilograms per capita per year of soybeans in various parts of Indonesia in 1970 (Winarno 1976). (10) Production (metric tons) of 3 soybean foods in Central Java, 1968-1972 (Winarno 1976).

(11) Area planted to soybeans and total soybean production (metric tons) in Thailand, 1964-1974. Page 27: Sales (metric tons) of faffa and soy-wheat-flour in Ethiopia, 1973-75. Page 29: Soybean area and production in 6 leading African countries, 1976. Page 30: Soybean area and production in 6 leading European countries, 1976. Page 36: Consumption of soy as human food in Mexico (in metric tons per capita per day).

(12) Supply and disposition of soybeans in the United

Held 15-18 Jan. 1979 at Hotel Kilimanjaro, Dar es Salaam, Tanzania (Available from: Department of Agricultural and Chemical Engineering, Colorado State Univ., Ft. Collins, CO 80523). [100 ref]
• ***Summary:*** Contains about 34 papers by various authors; at least 19 of these are cited separately. Also contains four sets of opening remarks, numerous discussions, and a directory of workshop participants (45 representatives of 18 countries).

The workshop was co-hosted by: (1) the Dept. of Food Science and Nutrition, Colorado State Univ., Fort Collins, Colorado; (2) National Milling Corporation, Dar es Salaam, Tanzania. It was sponsored by: (1) U.S. Agency for International Development, Development Support Bureau, Office of Nutrition; (2) USDA Office of International Cooperation and Development, Nutrition and Agribusiness Group. The Preface is by G. Richard Jansen and R.E. Tribelhorn of Colorado State Univ. R.E. Tribelhorn is technical editor. Address: Research Associate, Dep. of Agricultural and Chemical Engineering, Colorado State Univ., Fort Collins, Colorado 80523.

880. Meals for Millions Foundation. 1979. Annual report 1978: A commitment to self-help for a hungry world. Santa Monica, California: MFM Foundation. 12 panels. Back to back. Each panel 22 x 9.5 cm.
• ***Summary:*** Submitted by Peter J. Davies, President; he works at the New York office. Hugh J. Roberts, Ph.D., is vice president for program. Alfred C. Bartholomew, D.D., Ph.D., is chairperson, board of trustees. On the cover, printed with red and black ink on white paper, is a photo of a Latin American man standing behind his wife against a black background. Contents: Message from the president. Highlights of 1978. Financial highlights of 1978 ("To fund its expanding programs, MFM's income broke the $1 million barrier in 1978. General support from the public continued to be the backbone. Generous grants were received from the U.S. Agency for International Development (A.I.D.),...").

"As we went to press [March 1979] the MFM Board of Trustees approved our becoming successor to the American Freedom from Hunger Foundation and changing our name to Meals for Millions / Freedom from Hunger Foundation."

Contributions made to Meals for Millions are tax deductible. It is a 501(c)(3) corporation. Los Angeles Social Service Permit #2108.

Statement of income and expenses. Where the money comes from. Where the money goes (Programs and services 77.3%). Board of trustees. National committee of sponsors. Meals for Millions / Freedom from Hunger Foundation (officers and addresses).

Technical and material assistance: Ecuador, Honduras, the Caribbean (Jamaica), Korea, Philippines. Transfer of technology. Village Texturizers are being field tested in Colombia, Ghana, India, Jamaica, the Philippines, Samoa, and Trinidad. India: SPRA in Bareilly, Uttar Pradesh. Multi-Purpose Food (sent to Brazil and Haiti; no statistics are given). Nutrition education: U.S. Southwest, Papago Indians, Child and Youth Nutrition Education, Urban Community Gardens & Self-Care Health Program, Healthy Lifestyle for Seniors. Food and Nutrition Institute. Research and Development. Contains 10 photos without captions, one showing a Village Texturizer at work. Address: 1800 Olympic Boulevard (P.O. Box 680), Santa Monica, California 90406. Phone: (213) 829-5337.

881. Nordquist, Ted. 1979. Re: Planning a natural soy products industry in Sweden. Letter to William Shurtleff and Akiko Aoyagi at New-Age Foods Study Center, undated. 1 p. Typed, with signature. [Eng]
• ***Summary:*** "Thank you again for the lovely evening [19 May 1979, in Lafayette] and all the helpful materials. A great deal has transpired here since we last met. I am now in the process of planning a 'natural soy products' industry in Sweden, along with a long time friend and Engineer, Ki Yong Kim. Towards this end, Kim will be visiting Japan in August." He would like to visit medium- and large-scale companies that make tofu equipment.

"Ray Nagai of Traditional Tofu mentioned the ideas of soy-milk yogurt and tofu salad dressings as good starters on the Swedish market (Swedes have a taste for 'sour' milk products)."

© Copyright Soyinfo Center 2021

"We are in the process of researching all available Swedish machinery suitable for soy products. We are aiming at December [1979] as the month when we put together our findings concerning machinery, marketing, distribution, initial products, aims, etc. and can present a convincing deal to probable financiers, hopefully by February of 1980... It took me a great deal of deep thinking to make the final jump from academics to soy products. Now that I have turned down a two-year grant and both Anne-Marie and I have decided to 'make or break' our lives on soy products I have a good gut sensation that I am headed in the right direction.

"My love to you both. Om Tat Sat. Ted A. Nordquist, FD."

Note: This is the earliest English-language document seen (Sept. 2012) that contains the term "soy-milk yogurt." Address: Blodstensvägen 16, 752 44 Uppsala, Sweden.

882. Shurtleff, William. 1979. The tofu and soymilk industry in the United States (News release). Lafayette, California: New-Age Foods Study Center. 1 p. June.

• ***Summary:*** The first statistics compiled on the U.S. soyfoods industry. "There are presently 150 tofu shops and soy dairies in the U.S. Ninety of these, mostly run by Caucasian Americans, have opened within the past 3 years since publication of *The Book of Tofu;* they now have about 35% of the industry sales. The remaining 60 are Japanese and Chinese run; they have an estimated 65% of the market. The industry has a brisk sales growth rate of 25% per year.

"The largest tofu factory in the U.S. is the Matsuda-Hinode company in Los Angeles; they produce about 16,000 pounds of tofu a day under fourteen different labels. The largest of the new breed of Caucasian-run plants is the New England Soy Dairy in Greenfield, Massachusetts. Founded in 1977, it now produces some 4,500 pounds of tofu a day and expects revenues of $750,000 in 1979. In its April 12 front page story on the tofu industry, *The Wall Street Journal* focused on The New England Soy Dairy.

"The U.S. tofu and soymilk industry presently uses approximately 7000 tons of dry soybeans per year.

"In July of 1978, tofu and soymilk producers founded the Soycrafters Association of North America (SANA), an educational and trade association. Its quarterly publication *Soycraft* is the primary source of information on soy protein foods in the Western World. For details contact:

"Ira Leviton, president
"Soycrafters Association of North America
"305 Wells St.
"Greenfield, MA 01301

"Worldwide, the tofu and soymilk industry is rapidly expanding. There are presently a total of 211,000 producers, including 38,000 in Japan, 158,000 in mainland China, 11,000 in Indonesia, 2500 in Taiwan, and 1470 in Korea. The largest tofu factories, located in Japan, produce over 100,000 pounds of tofu a day (15,000 tons a year) and the largest soy dairy [Vitasoy], located in Hong Kong, produces 500,000 bottles of soymilk a day (150 million bottles a year).

"Most of the new tofu shops and soy dairies in the U.S. have gotten into production using the technical manual *Tofu & Soymilk Production* by William Shurtleff & Akiko Aoyagi (who also wrote *The Book of Tofu,* which now has over a quarter million copies in print). This technical manual is available for $17.50 from:

"New-Age Foods Study Center
"P.O. Box 234
"Lafayette, California 94549. Tel: 415-283-2991." Address: 790 Los Palos Manor, Lafayette, California 94549.

883. *Soyworld* (*American Soybean Association, St. Louis, Missouri*). 1979. Korea office. 1(2):2. June.

• ***Summary:*** "The bustling Korean economy is one of the fastest growing new markets for American soybeans. In the last three years Koreans have nearly doubled their purchases of U.S. soybeans from 155,000 metric tons in 1976 to over 300,000 metric tons in 1978. Growth is expected to continue, climbing to over a million metric tons by the late 1980's.

"For several years the American Soybean Association has served the Korean market through offices in Tokyo. However, because of the recent jump in soybean imports, and the need to provide a closer working relationship with Korean importers and end users of soybeans, it has been determined that ASA market development activities on behalf of American farmers can best be served by establishing an office in Seoul. The office, which will open in July of 1979, will be headed by Dr. Kyung Lee, a native Korean and graduate of University of Illinois. Now a U.S. citizen, Dr. Lee has been an ASA employee for nearly six years.

"The remarkable growth of the Korean economy is bringing the nation's population up from subsistence incomes to levels of income that allow more flexibility in spending.

"One beneficiary of Korea's new affluence has been agriculture, as Korean's seek to improve their diets with more protein. Demand for meat and livestock products has increased dramatically in the last three years. In order to fulfill the demand animal numbers have risen significantly with an equally significant increase in demand for feed grains and protein meal."

A portrait photo shows Dr. Kyung Lee.

• ***Summary:*** "The soybean crop was established in the Midwest using Chinese varieties introduced from northeast China (the area called "Manchuria" at that time), an area with soils and climate similar to those of our Midwest and one where soybeans were already being grown on a large commercial scale. In contrast to most of the rest of eastern Asia where soybeans were grown in gardens or small plots for local food use, in Manchuria soybeans were grown on a large commercial scale (as much as 50% of the total crop area) and were used for oil extraction with the meal used for animal feed or fertilizer. Large shipments of soybeans were made to Japan and to oil extraction mills in western Europe.

"During the early part of this century many hundreds of soybean varieties were introduced from eastern Asia and tested by U.S. agronomists for performance here. Virtually all of the successful ones were from central and southern Manchuria, where large scale commercial production had already been underway for several decades. Thus, the success of the Midwest soybean industry was based to a large extent on the earlier successful development of a similar industry of soybean production and oil extraction in northeast China. We owe a debt of gratitude to the unknown Chinese plant breeders or farmer-selectors who developed these basic commercial-type soybean varieties.

"Beginning in the late 1930's and 1940's soybean breeders in the USDA-state experiment station breeding programs, through hybridization and selection, were developing improved varieties with higher yielding ability and more resistance to lodging and shattering and to the prevalent diseases. By the 1950's virtually all acreage was planted to these products of the scientific breeders' art, yet even down to the present day these American varieties trace the bulk of their ancestry to a small group of successful introductions, largely from northeast China. This is specified in Table 1 for major northern and southern US varieties. The introduced parental varieties and their place of origin is listed across the top of the table. Most of these have American names because they were grown here commercially after being introduced. The eleven northern varieties listed occupied 2/3 of the northern US acreage in 1978 and trace to eleven introduced varieties, all but two from northeast China. The nine southern varieties occupied over 80% of the south-central acreage and trace to twelve introduced varieties with five of them in common with the northern varieties. The remaining acreage is planted to various varieties, each with less than 2% of the regional acreage. Almost without exception these are from the same parentage as those listed, and so, if all US commercial varieties had been included, there would be very few ancestral varieties added to the table. Thus, only fifteen introduced varieties have provided the germplasm on which our soybean industry is based. Much research, testing, evaluation, and hybridization has been done with some of the thousands of other soybeans introduced to the U.S., but much more work remains to be done in the effort to broaden and improve our germplasm base. One of the first and most basic steps is to obtain, maintain, and make available to researchers soybean germplasm from all over the world.

"The history of soybean introduction in the United States can be divided into seven periods from 1898 to the present (Table 2). Prior to 1898 "... there were not more than eight varieties of soybeans grown in the United States" according to C.V. Piper and W.J. Morse writing in "The Soybean" (1923). Prior to 1925 soybean introductions were obtained through consuls, missionaries, and seedsmen, as well as local agronomists and a few agricultural explorers such as Frank Meyer who traveled extensively in China. A major contributor was USDA plant explorer P.H. Dorsett, who collected nearly 1,500 soybean types in Manchuria in 1925 to 1927. An agricultural exploration trip in northern China, Korea, and Japan in 1929 to 1931 by Dorsett and W.J. Morse brought in 4,578 varieties.

"As the soybean grew in importance in this country and access to its homeland was restricted because of war and political problems, it was realized that a permanent system of maintaining soybean germplasm must be established. Relatively few varieties were grown in this country, and these, being closely interrelated, provided only a very limited range of germplasm. Until just 30 years ago no formal preservation system for soybean germplasm existed. Most of the introduced varieties had been discarded if not of immediate usefulness. Of the 8526 soybeans introduced, only 1580, or less than 20%, were still around in 1949 when the present germplasm collection system was begun. Under the direction of Dr. Martin Weiss of the USDA's Soybean Investigations a soybean germplasm collection was established with the late varieties (Group V and later) to be

© Copyright Soyinfo Center 2021

maintained at Stoneville, Mississippi, and the early ones at Urbana, Illinois. Dr. E.E. Hartwig has been curator of the southern collection from the beginning, and I have looked after the northern collection since 1954. Table 2 indicates how this collection has grown to its present size of over 8000 and Table 3 gives the breakdown by maturity group as of last January. After a long period of passive additions (1933 to 1968) we have renewed our efforts to actively collect the world's soybean germplasm. Large collections have been obtained from colleagues in Japan, South Korea, and the Soviet Union. Of course, China is a most important source of soybean germplasm. Most of the older introductions including those of Dorsett and Morse are from northern China, leaving large areas of southern and western China virtually untapped. In recent years we have begun to obtain a large number of soybeans from China, many of them via the Soviet Union. With the present favorable relations we are hoping to greatly increase the number of accessions from China in the near future.

"In addition to the major collections of U.S. and foreign varieties, we maintain a heavily used Genetic Collection of over 400 strains of special interest to geneticists. This includes a large collection of genetic isolines which we have developed and which are widely used by researchers in genetic studies and in assaying the effects of individual traits, such as pest resistance, time of maturity, growth type, leaf shape, pubescence type, etc.

"We have a very extensive collection of species related to soybeans. The wild soybean (*Glycine soja*) is the closest relative, and since it can be easily crossed with soybeans; offers a potential source of pest resistance or other traits not present in soybeans. Just 10 years ago there were 8 entries of this species in the collection. Now, by virtue of some collection trips that I have made and through the help of colleagues in eastern Asia the number has grown to 558 (Table 4). The other species of the genus *Glycine* are all perennials from Australia, southeast Asia, and South Pacific islands, and although they cannot be cross-pollinated with soybeans, they provide interesting material for research into the botanical origin of soybeans. We now have a collection of over 100 accessions of these species (Table 5). All of these are made available on request to research workers throughout the world.

"The soybean collection is heavily used, with over 10,000 packets sent out each year. Some of the traits for which soybean germplasm has been evaluated are listed in Table 6. Success stories can be told about finding resistance to cyst nematode, new races of phytophthora root rot, soybean mosaic virus, etc. Future progress in yield, pest resistance, plant growth type, and seed composition will depend heavily on this germplasm collection as a source of new desirable genes for the varieties of the future." Address: AR-SEA-USDA, Univ. of Illinois.

887. *Soybean Digest.* 1979. Korean demand spurs soybean imports: Escalating economy opens new market for protein, oil. July/Aug. p. SID-1-2.

• ***Summary:*** "Korea's thriving economy presents the fastest growing new market for American soybeans. Between 1966 and 1970 annual Korean imports of soybeans and soybean products totalled 40,000 metric tons (MT). In the next 5 years imports increased to 58,000 MT. Then, in 1976, purchases leaped to 300,000 MT. Market growth is expected to continue, climbing to over a million MT in the 1980's.

"With affluency has come a sharp consumer demand for animal protein and edible oil."

888. Hymowitz, T.; Kaizuma, Norihiko. 1979. Dissemination of soybeans (*Glycine max*)*:* Seed protein electrophoresis profiles among Japanese cultivars. *Economic Botany* 33(3):311-19. Sept. [22 ref]

• ***Summary:*** Seed protein electrophoresis is shown to be a powerful tool for resolving problems of taxonomy, evolution, and paths of dissemination of domesticated plants. By the use of these seed protein banding patterns, which act like silent fingerprints, the movement of germplasm and the paths of dissemination of soybeans to and within Japan may be clarified.

Seed protein extracts from 477 cultivated Japanese soybean varieties were analyzed by polyacrylamide gel electrophoresis to determine the distribution of the alleles of three trypsin inhibitor loci (Ti-a, Ti-b, Ti-3c) and two special protein loci (Sp1-a, Sp1-b) with respect to the maturity group and area of adaptation of each variety. A map (Fig. 2) shows Japan divided into 5 geographical areas. About 60% of the soybean varieties had the Ti-a allele. The frequency of the Ti-b allele was found to be highest in southeastern Japan and lowest in northeastern Japan. The Ti-c allele, discovered in 6 varieties, was traced to two possible sources adapted to the Tohoku area.

In conclusion, the writers conclude that the present population of cultivated Japanese soybean varieties was developed from two distinct sources of introductions: (1) A short-season crop cline or summer-season type having almost exclusively the Ti-a Sp1-b genotype. (2) The full-season crop cline having either the Ti-a Sp1-b or T1-a Sp1-b genotype. The full-season crop cline probably came from north-central China through to Japan. The short-season crop cline appears to have evolved in either Korea or on Kyushu, Japan's southernmost main island.

The problem of determining the origin of the short-season crop cline "is complicated by the fact that the movement of soybeans from Korea to Japan and vice versa across the Korea Strait has been going on since at least the third century A.D. and perhaps earlier."

Talk with David Druding. 1987. Oct. The company started in 1974 as a bakery. Rodale Press published their Uprisings Cookbook. Label. 1988. 3 by 4 inches. Blue and brown on tan.

Talk with David Druding. 1988. May 18. They started making tofu in September 1979 in a place they rented in the Community Cannery, which was about 8 blocks from the main bakery, and located at 1508 West 6th St. in Fayetteville. Steve Keltner learned the process from a Korean man who had worked with Thom Leonard in Lawrence, Kansas. He also learned from *The Book of Tofu.* They would cut up the tofu as soon as it was chilled, transport it to the main building, package it and make carob pudding, tofu onion dip, and creamy tofu dressing. They sold the products locally (Fayetteville and Little Rock) and in Missouri, not to the 11-state region that was part of New Destiny Federation. The formal trade name of the company/co-op from the beginning was Summercorn Foods Inc. The name on the incorporation paper is Summercorn Collective Co, Inc. but at time the trade name Summercorn Bakery and Soyfoods was used, informally. The latter never appeared on labels.

Talk with David Druding. 1994. Nov. 2. He moved in about Dec. 1992 from 401 West Watson St. to 1410 Cato Springs Rd., Fayetteville, Arkansas. Same phone. At that time he changed the business name from Summercorn Bakery and Soyfoods to Summercorn Foods. His business is doing well. He just started selling his tofu to Walmart, which is selling it at their new natural and gourmet foods department in several of their division 1 stores. A health inspector said that he must establish another barrier to botulism and other food poisoning bacteria in his vacuum packed tofu.

890. Ohlund, Tim. 1979. Re: Ted Nordquist and Aros Soymilk Products in Sweden. Letter to William Shurtleff at New-Age Foods Study Center, P.O. Box 234, Lafayette, California, Nov. 26. 1 p. Handwritten.
• ***Summary:*** "Ted [Nordquist], a business man named Gunnar, a Korean–Professor Kim, and myself are now deeply involved in setting up the Aros Soymilk Products company. We've found a suitable factory location in Örsundsbro (my village) at a reasonable price. Now the architect is busy working out the floor plan [500 square meters] which will have to be approved by the health authorities. An estimate of the factory remodeling plus all other prospected costs will be the basis for a loan from the State development agency. We hope to get a loan for the whole shebang. The interest rate and other conditions will be very favorable. If all goes well we hope to start production of tofu, soymilk, salad dressing and later a few other products next fall. We'll let you know more later as it develops. Love–Tim, Annalena & Finn."

Note: The date of this letter is not clear. It was probably 26 Nov. 1979 but could be 20 April 1979, with a follow-up card from Tim on 5 Dec. 1979 (or 12 May 1979). The books were finally sent on 10 Dec. 1979.

Note: This is the earliest document seen concerning the work of Ted Nordquist with soyfoods in Sweden. Address: Box 559A, 19063 Örsundsbro, Sweden.

891. Shurtleff, William. 1979. Rapid growth of tofu shops and soy dairies in North America (News release). Lafayette, California: New-Age Foods Study Center. 1 p. Nov.
• ***Summary:*** "There are presently 164 tofu shops and soy dairies in North America and, as shown in the accompanying graph, the increase in numbers is rapidly accelerating. Ninety-six of these run by Caucasian Americans have opened in the past 3 years since publication of *The Book of Tofu*, by Shurtleff & Aoyagi, which has sold over a quarter of a million copies. The industry has a brisk sales growth rate of 25 to 30% a year, and uses an estimated 35% of the industry sales; the 68 Oriental shops have 65%.

"The largest tofu factory in the U.S. is the Matsuda-Hinode company in Los Angeles; they produce about 16,000 pounds of tofu a day under 14 different labels. The largest of the new breed of Caucasian-run plants is the New England Soy Dairy in Greenfield, Massachusetts. Founded in 1977, it now produces some 4,500 pounds of tofu a day and expects revenues of $750,000 in 1979. In its April 12 front page story on the tofu industry, *The Wall Street Journal* focused on The New England Soy Dairy...

"Worldwide, the tofu and soymilk industry is rapidly expanding. There are presently a total of 211,000 producers, including 38,000 in Japan, 158,000 in mainland China, 11,000 in Indonesia, 2,500 in Taiwan, and 1,470 in Korea.

© Copyright Soyinfo Center 2021

The largest tofu factories, located in Japan, produce over 100,000 pounds of tofu a day (15,000 tons a year) and the largest soy dairy, located in Hong Kong, produces 500,000 bottles of soymilk a day (150 million bottles a year).

"Most of the new tofu shops and soy dairies in the U.S. have gotten into production using the technical manual *Tofu & Soymilk Production* by William Shurtleff & Akiko Aoyagi, which has just been published in both paperback and hardback editions." Address: P.O. Box 234, Lafayette, California 94549. Phone: 415-283-2991.

892. *SoyaScan Notes.* 1979. Chronology of soybeans, soyfoods and natural foods in the United States 1970s (Overview). Dec. 31. Compiled by William Shurtleff of Soyfoods Center.

• ***Summary:*** Overview of the 1970s:

The Soyfoods Movement Begins. This industry focused on traditional, low-tech soyfoods such as tofu, soymilk, tempeh, and miso. Many of the pioneer Caucasian-American (non-Asian) soyfoods companies started during this decade, often for philosophical and ideological reasons. The founding of the Soycrafters Association of North America in July 1978 marks the beginning of this movement.

By Dec. 1979 there are 159 tofu manufacturers in the United States. Ninety of these are run by Caucasian Americans and are less than 3 years old. There are also 18 tempeh companies and 3 commercial miso companies (not including those in Hawaii).

Natural Foods and Vegetarian Movements Grow. The basic philosophy of natural foods and vegetarianism became more widely accepted, and this greatly helped the soyfoods movement.

Unprecedented Interest in Nutrition, Health, and Fitness. During this decade, the interest in nutrition grew dramatically, both among consumers and professionals. Consumers, seeking ways of protecting themselves from the ravages of heart disease and cancer, try more healthful diets. Exercise and looking healthy are now "in." For example, the New York Marathon, which had 55 finishers (no women) in 1970, boasted 10,477 finishers (including 1,621 women) in 1979. Preventive medicine is becoming a new profession.

Steady Increase in Population of Asian-Americans. The number of Asian- and Pacific-Americans living in the USA increased from about 800,000 in 1960 to 1,369,000 in 1970 to 3,500,000 in 1980, at which time they comprised 1.5% of the total U.S. population. Their burgeoning numbers were a major factor in steadily growth of the soyfoods industry, since many Asians use soyfoods in their daily diets.

U.S. Soy Sauce and Miso Consumption Grows. Soy sauce consumption grew from about 9,000 kiloliters in 1970 to about 38,000 kl in 1979, a 4.2-fold increase during the decade. In 1974 domestic production passed imports.

U.S. miso consumption grew from about 750 metric tons (tonnes) in 1970 to about 1,800 tonnes in 1979, a 2.4 fold increase.

Shipments of Soy-Fortified Foods in the Food For Peace (P.L. 480) Program jumps. Shipments of two products in 1970 totaled 131,000 tonnes. In 1979 a record 664,000 tonnes of ten products were shipped to needy countries, a 5-fold increase during the decade. In 1979, the main products shipped were SFB (soy-fortified bulgur), CSM (corn-soy-milk), and WSB (wheat-soy blend).

The Ongoing Protein-Versus-Calories Debate. As Nevin Scrimshaw concluded prophetically in his insightful 1977 lecture "Through a Glass Darkly: Discerning the Practical Implications of Human Dietary Protein-Energy Interrelationships": "To the extent that the pendulum swung too far in emphasizing protein in the 1960s, and too far in emphasizing calories in the 1970s, it must come to a more appropriate position for the 1980s and beyond." He noted that two big protein issues concerned (1) human requirements for protein at different ages and physiological states, and (2) the evaluation of the protein quality of foods as related to human requirements.

Reappraisal of the Value of Plant and Animal Proteins. During the late 1960s and early 1970s, animal proteins probably reached their historical peak of popularity in the U.S. A diet rich in animal protein was considered a "better diet." However during the 1970s a growing body of nutritional and ecological evidence, and changing attitudes toward world hunger and animal rights, led to a new appreciation of the quality, now more broadly defined, of plant (and soy) proteins. They were more healthful, less expensive, more efficient in utilizing farmland, energy and water, less polluting, and obviated animal slaughter.

Switch from Animal to Vegetable Oils. In the early 1950s Americans were consuming approximately equal amounts of animal and vegetable fats. By 1978 the ratio of vegetable to animal fat was 84 to 16. The same shift occurred worldwide, where the 1978 ratio was 71 to 29.

There were at least three basic reasons for this shift: (1) The growing concern, especially after 1960, with the health dangers associated with consumption of saturated fats and cholesterol, most of which came from animal fats such as butter and lard; (2) Hydrogenation, which allowed vegetable oils to be used in making substitutes for butter and lard (i.e., margarine and shortening); and (3) the lower price of vegetable oils, shortening, and margarine.

Production of soy oil grew dramatically during the postwar period, filling most of the increased demand for vegetable oil.

Boom Years for U.S. Agriculture. The 1970s was a decade of rapid growth for U.S. farmers. With high inflation and low interest rates, American farm products dominated world trade. The boom ended with the second "Oil Shock" of 1979-80, which set off the most serious recession of the post-war era, and marked the start of the Latin American debt crisis that later had a major negative effect on U.S.

© Copyright Soyinfo Center 2021

soybean farmers. 1979 was the last year of roughly 50 years of essentially non-stop, rapid soybean growth. During the next decade, U.S. soybean production zigzagged sideways and declined slightly.

Rapid Increases in Soybean Production in New Third World Countries. Prior to the 1970s, soybeans had never been widely grown in the tropics or semi-tropics (except perhaps in Indonesia). But during this decade a host of countries in such areas started to grow soybeans on a large scale for the first time. Major causes for this were the U.S. soybean boycott of 1973, the pioneering work done by INTSOY in Illinois, IITA in Nigeria, and AVRDC in Taiwan, and the development of day-neutral soybean cultivars that gave high yields at low latitudes. The major areas of rapid new production growth were...

Latin America. Total production increased from 1,746,000 tonnes in 1970 to 15,384,000 tonnes in 1979, an 8.8 fold increase during the decade. Latin America's three leading soybean producers in 1979 were Brazil, Argentina, and Mexico. Brazil's production rose 7.8 fold between 1970 and 1979, but Argentina's jumped 137-fold!

In 1979 soybean production in Latin American passed that in all of Asia, the birthplace of this ancient crop, and became second only to that of North America (61,722,000 tonnes in 1979/80).

In 1974, Brazil passed China to become the world's second largest soybean producing nation after the USA. The ranking in 1979 by tonnage was USA, Brazil, China, Argentina, Mexico, Indonesia, Paraguay, USSR, Romania, India, and North Korea.

Africa: Total production increased from 67,000 tonnes in 1970 to 300,000 tonnes in 1979, a 4.5 fold increase during the decade. By 1979 Egypt had become the largest soybean producing country in Africa, followed by Zimbabwe, Nigeria, and South Africa. This promising growth was doubly important because it came at a time of steadily falling per capita food production in Africa as a whole, down 20% from 1970 to 1987.

India. Total production increased from a mere 18,000 tonnes in 1971 (production was negligible in 1970) to 450,000 tonnes in 1980, an astonishing 25-fold increase in ten years, and a growth rate greater than that of Latin America. Meanwhile, in Asia as a whole soybean production was slowly declining.

893. Tajiri, Takashi. 1979. Mamerui moyashi no seizô to sendo hojisei ni kansuru kenkyû. II. Mamerui moyashi no sendo hoji ni oyobosu chozô ondo to hôsô shizai [Studies on production and keeping quality of bean sprouts. II. Effect of packaging materials and storage temperatures on the keeping quality of bean sprouts]. *Nippon Shokuhin Kogyo Gakkaishi* (*J. of the Japanese Society for Food Science and Technology*) 26(12):542-46. [6 ref. Jap; eng]
• ***Summary:*** The shelf life of soy sprouts, mung bean sprouts, and adzuki bean sprouts was studied in 6 packaging materials. PVDC (Saran Wrap) and PVDC laminated with cellophane were found to be suitable packaging materials. Shelf life at 0-5ºC was 14-15 days for soy sprouts, versus 10-11 days for the other two types of sprouts. Address: Lab. of Food Process, Faculty of Agriculture, Kinki Univ., Kowakae, Higahsi-Osaka, Osaka-fu.

894. **Product Name:** [Green Milk (Soy Milk Beverage), and Hae Pyo Doo Yoo Soymilk].
**Foreign Name:** Green Milk, Hae Pyo Doo Yoo.
**Manufacturer's Name:** Green Milk Co., Subsidiary of Dong Bang Oil and Flour Mills Co., Ltd.
**Manufacturer's Address:** No. 2 Yangpyung-dong 4-ka, Yungdungpo-ku, Seoul, South Korea. Plant at Jin Hae, Kyung Nam.
**Date of Introduction:** 1979.
**New Product–Documentation:** Soya Bluebook. 1981. p. 60.

Letter from Kyung Lee, ASA country director, Korea, to William Shurtleff at Soyfoods Center. 1983. Nov. 23. Gives history and production statistics.

Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 16, 81-83. Dong Bang, Korea's biggest oilseed crusher, established a subsidiary, Green Milk Co., in 1979 in Seoul to make Green Milk brand soymilk. In 1981 they made an estimated 3,000 tons in four flavors, packaged in cartons, increasing to 5,253 tons in 1983.

895. Han, Bong-Ho; Kim, K-S; Cho, D-J. 1979. [Processing of soy curd powder with soybean and krill]. *Bulletin of the Korean Fisheries Society* 12(3):137-41. [6 ref. Kor; eng]
• ***Summary:*** Soy curd [tofu] was made using the traditional process. The use of 3% glucono-delta-lactone (GDL) at 90ºC gave the highest bulk yield in relation to the crude protein of the tofu. Soy curd powder was prepared by spray drying soybean milk. It was then suspended in water and coagulated by adding GDL at 90ºC. When krill autolysate was dried with the soymilk then made into tofu, coagulated under the same conditions, it produced a softer tofu. Another powder, made by spray drying the mixture of soybean milk, krill autolysate, and GDL could be coagulated by suspending in water, bringing to a boil, then letting it stand at room temperature for 2 minutes.

Note: Krill (*Euphasia superba*) are planktonic crustaceans and larvae that constitute the main food of baleen whales. Address: Dep. of Food Science & Technology, National Fisheries Univ., Busan, Korea.

• ***Summary:*** Shoyu and varieties of miso: 1. Historical background: The major foods used in Korea that contain

© Copyright Soyinfo Center 2021

soy are soy sauce (kan jang), soybean miso (doen jang), and red-pepper miso (kochu jang). Also there are jonkutsu jang, tamusu jang (makujang) and jupu jang. The suffix jang is the same as the Chinese chiang and the Japanese hishio, meaning mash. The origins of the varieties of shoyu and miso are not clear. But there was a character, tojang, in "Ronko" which was written by Oju? of the Gokan period. Also, there are some references to jang in the Analects of Confucius (Lun yu; Jap. Rongo). They indicate that jang existed years before Christ. In the "Kaitoyakushi?" there is a quotation from "Shintosho?" (618-907) that "shi" (fermented black soybeans or misodama) was a well known product of Bokkai (north of the Yellow Sea) in those days (Sakueki). It is thought that jang first appeared in Manchuria (Manshu was called Kokuri in those days) where soybeans were originally grown. Soybeans later spread to China and Japan.

In Korea the oldest record of any variety of jang was found in *Sangokushiki* (683) as "shôshi?". This indicates that people were already making shoyu and miso quite early on. In the *Ch'i-min yao-shu* (AD 530-550) a method of shi (or kaki) making was recorded. We guess that shi was the predecessor to today's meju (= misodama). The classic book Kyukosetsuyo? that was compiled in 1554 (Richo? period–Meisoo 9) is the oldest book that contains the techniques for making the Korean varieties of jang. About 8 different methods of production were recorded, amongst them the sink gan (chinjangho) and zojangho methods. In those days, meju (= misodama) was called misho. It is written that they steamed the soybeans, roasted and ground the wheat, then mixed the soy and the wheat in a 2:1 ratio. From this they made koji and dried it in the sun. That method was very similar to the koji-making method used in Japan. In Japan it was called kokori, hishio, or misho. Later, shoyu became known as jang? Miso became massho? and then returned to being called misho. Address: Presently: Tokyo Daigaku Biseibutsu Kenkyusho #3 Kenkyubu. Formerly: Seoul, South Korea. Tokoku Daigaku Shokuhin Kogakubu.

898. Barer-Stein, Thelma. 1979. You eat what you are: A study of ethnic food traditions. Canada: McClelland & Stewart, Ltd. xii + 13-624 p. Index. 23 cm. [550+* ref]
• ***Summary:*** This is largely a compilation of information from many other books and articles. On the cover is a color painting of The Gardener (or Vertumnus), from his series, The Four Seasons, c. 1590, by Giuseppe Arcimboldo (or Arcimboldi) of Milano.

In Chapter 12, on China, the section titled "Meats and alternates" (p. 110-13) notes that the soybean is called the "Chinese Cow" [sic, "Cow of China"] because of its versatility. Soybeans are used as whole dry beans and as sprouts, or they can be made into a firm white curd called "Chinese cheese" [sic], which can be used in many different ways. Soybean milk may be used in much the same way that westerners use cow's milk. They are fermented to make the favourite condiment, soy sauce. "Bean curd sauce is fermented bean curd that is packed in jars and sold as red bean curd sauce or white bean curd sauce,..." Cantonese names for soy products are (p. 111-12): Mien chiang: A syrup-like sweet bean paste. Dow-foo (tofu). Foo yu (fermented tofu). Tiem jook (dried yuba, broken into pieces [sweet dried yuba sticks]). Wow doo [Wu dou]. Black soybeans. Dow see [doushi, fermented black soybeans]: Salted, fermented black bean paste [sic, fermented black soybeans] often garlic flavoured and used in small amounts as a condiment or seasoning.

In Chapter 30, on Japan, the section titled "Meats and alternates" (p. 336-37) notes that products made from soybeans include: (1) "Shoyu, a sweetish soy sauce made from wheat and barley [sic], soybeans, salt, and water." (2) Miso, or "fermented soybean paste," used mostly for flavouring soups [miso soup]. (3) Tofu, or soybean curd, is a staple in Japanese cookery. "Its smooth, custard-like texture and bland flavour make it an ideal ingredient. It is extremely versatile and readily absorbs other flavours. Many "restaurants in Japan take great pride in their tofu dishes."

In Chapter 31, on Korea, the section titled "Fruits and vegetables" (p. 350-51) discusses soybeans and their products at length. Soy sauce is used to season *kim* (nori) and other edible seaweeds. Soy sauce is an ingredient in "hot pepper mash" [*kochu jang*]. Soybeans are used to make "soybean mash" [*doen jang*]. Dry soybeans are roasted in an iron pot, then ground, and the roasted soy flour is used as a garnish over rice cakes [mochi] or plain cooked rice; children enjoy eating the coarser roasted bits that are sifted out of roasted flour or meal. Soybeans sprouts are eaten lightly cooked as a vegetable. Soybeans are also made into tofu (*tu bu*)*;* a brief description of the process is given, in which the drained curds are left in their hemp bag to form a firm cake, which may be cut, dipped into soy sauce, or fried in sesame oil. "Oil can also be made from the soybeans, but it is not commonly used or prepared."

Although commercial soy sauce, made in factories, is now widely available, many Korean households still prepare their own soy sauce each fall. Boiled soybeans are pounded, molded into a cone shape, and set to dry until hard. They are then wrapped with rice straw, hung from eves, rafters or ceilings, and allowed to ferment for several weeks [until they become *meju*]. During the winter, these fermented cones may be stored in huge rice-straw bags kept in a cool place.

In the spring, break the cone into small pieces and place in a large earthenware jar, nearly filled with water. Add salt,

© Copyright Soyinfo Center 2021

spices, red peppers, and a few charcoal lumps. Leave this in the sun for a few days [sic, 30-60 days] until the molded soybean chunks float to the top and the resulting liquid turns black. Ladle out and filter the black liquid, then boil it to make soy sauce. The solids remaining in the jar are used as soybean mash [after the charcoal is removed].

A portrait photo of the author, with a brief biography, appear on the back cover and in the Introduction. Address: Ph.D. student, Ontario Inst. for Studies in Education, Toronto, Ontario, Canada.

899. Jansen, G. Richard; Harper, Judson M. 1979. Application of low-cost extrusion cooking to weaning foods in feeding programs. Fort Collins, Colorado: Dept. of Agricultural and Chemical Engineering. 43 p. Illust. 28 cm. [31 ref]

• ***Summary:*** Introduction: Background, food extrusion, alternative extrusion systems (low cost extrusion cookers), objectives of the LEC program (at Colorado State Univ.). Description of food products: Blended foods (such as CSB or corn/soy blend), full-fat soy flour, full-fat cottonseed flour, costs of processing. Current applications in developing countries: Sri Lanka and Thriposha, Costa Rica, Tanzania and Lisha, Guyana and Cerex, other countries (Guatemala, Honduras, Korea, India, Indonesia, Philippines, Thailand). Commercial applications: Pro-Nutre in Costa Rica, Maisoy in Bolivia, Ciatech in Mexico. Nutritional issues: Calories, protein-calorie ratio, fiber, vitamins and minerals, impact of supplemental food in Sri Lanka. Significant aspects of development: Technology transfer, funding, raw material aspects, quality control, packaging, storage and distribution, implementation and evaluation. Conclusions.

"The concept of adapting low-cost extruders to the production of low cost weaning foods in developing countries was originated by Mr. Paul R. Crowley, USDA, and the program has been under his general guidance since that time."

Tanzania: The Tanzanian Government decided to locate a weaning food plant at the National Milling Corporation in Dar es Salaam. "With assistance from Colorado State University, an LEC plant (fig. 4) went into production in May 1978, and since then has been continuously making CSM by extruding a corn soy mixture and blending in milk solids, vitamins and minerals." Named Lisha, the product is distributed to Maternal and Child Health (MCH) Centers under the auspices of the MInistry of Health. It is intended to augment CSM imported into Tanzania under the Food for Peace Program (p. 13).

"CIATECH of Chihuahua, Mexico, has designed an LEC full-fat soy processing plant at Delicious, S.A., an agricultural cooperative. The product is being sold commercially to bakeries as an egg solids replacer in small bags through retail grocery channels and as a major ingredient in a frozen ice cream like product" (p. 20).

Note: Also published as an article in *Food and Nutrition* 1980; 6(1):2-9 and 6(2):15-23. Address: Colorado State Univ.

900. Wang, Hwa L.; Hesseltine, C.W. 1979. Mold-modified foods. In: H.J. Peppler and D. Perlman, eds. 1979. Microbial Technology. 2nd ed. Vol. 2. Fermentation Technology. New York: Academic Press. 544 p. See Vol. 1, p. 95-129. [90 ref]

• ***Summary:*** Volume 1. Microbial processes. Volume 2. Fermentation technology. Contents: 1. Introduction. 2. Soy sauce. 3. Miso. 4. Hamanatto. 5. Sufu [fermented tofu]. 6. Tempeh. 7. Ang-kak (red rice, used as a color agent). 8. Absence of mycotoxins in fermented foods. 9. Conclusions.

For each food is given: General description, method of preparation, composition [chemical / nutritional]. In addition for tempeh is given: Tempeh-like products, biochemistry and physiology of *Rhizopus oligosporus*, changes occurring during fermentation, nutritional value.

"Soy sauce "is known as chiang-yu on China, shoyu in Japan, kecap in Indonesia, kanjang in Korea, toyo in the Philippines, and see-iew in Thailand. In the Western World the product is often referred to as soy sauce." Japan is the leader worldwide in sauce production; it has the largest fermentation plant and uses the most advanced technology.

Hamanatto: Products similar to Japan's hamanatto are known as tou-shih in China, tao-si in the Philippines, and tao-tjo [sic] in the East Indies [Indonesia]. A typical process for making hamanatto in Japan, based on information supplied by Dr. T. Kaneko of Nagoya Univ., Japan, is as follows: Wash soybeans, then soak, steam until soft, drain, and cool. Mix with parched wheat flour in the ratio of 2 parts soybeans to 1 part flour. Inoculate the soybeans with a short- or medium-stalked strain of *Aspergillus oryzae*. Incubate for 1-2 days until the beans are covered with a fragrant mycelium and have become soybean koji. Pack the soybeans in a container [wooden keg] with (for example) 2.5 kg soybean koji, 650 gm salt, 3.6 liters water and some freshly sliced gingerroot. Cover the container tightly and age under pressure for 6-12 months. Remove beans from liquid and dry them in the sun to give hamanatto. The composition of the brine may differ among manufacturers.; thus the finished hamanatto differs somewhat in taste and appearance. "Japanese hamanatto is rather soft, having a high moisture content. Chinese tou-shih has a much lower moisture content... and therefore is not so soft. Tao-tjo tends to have a sweet taste because sugar is often added to the brine."

Shoyu in Japan: Although there are more than 4,000 shoyu makers in Japan, the largest 4-5 companies produce about 50% of the total.

Note: A wide variety of dairy cheeses, especially those of French origin, are made with surface mold growth. Typical varieties are Camembert, Coulommiers, and Brie. Address: Northern Regional Research Center, Peoria, Illinois.

901. Scourtes, Mary D. 1980. You can dine Korean-style in Tampa. *Tampa Tribune* (*The*) (*Tampa, Florida*). Jan. 10. p. 73, 77 (p. E1, E5).
• ***Summary:*** Tampa has its first Korean restaurant named Madame Butterfly at 3715 West Cypress St. It is actually half Japanese and half Korean. "Both countries serve meals on 10-inch tall lacquer-finished tables. They remove their shoes and sit on cushions [on the floor] while eating. In both countries all foods are served at the same time, rather than in courses."

"Koreans eat sashimi too, but serve it with vegetables and a hot bean sauce called kochujang made with vinegar, sesame oil, garlic and a dash of sugar." Address: Tribune food writer.

902. White, Jim. 1980. Close encounter of the tofu kind: A white custardy thing zooms out of the Orient onto your lunch counter. *Toronto Star* (*Ontario, Canada*). Jan. 18. Family section.
• ***Summary:*** This full-page feature states: "Brace yourself, Toronto, for the experience, because there's every indication tofu's going to do more than hover on the horizon like a fleet of sci-fi spacecraft." Victor Food Products in Scarborough [a suburb of Ontario] says that sales of tofu have nearly tripled in one year, from 720 lb/day to more than 1,900 lb/day. Shoppers can now buy tofu in selected Dominion, Lowlaws, Miracle Mart, and A&P outlets. "When the big boys take a bite of the action, you know something is cooking."

The article includes a listing of tofu makers and retailers in the Toronto area. Makers: (1) Pyung Hwa Co., 2139 Dundas St. W. Jhasun Koo. Phone: 534-0237. Korean-style tofu. Firm, 10-oz. cakes cost $0.55. (2) Wah Chong Co., 88 Ossington. Phone: 532-0841. Chinese style. $1.20/dozen. (3) Yet Sing Co., 11 Baldwin St. Phone: 863-0818. Custardy tofu. $0.70/dozen. (4) Victor Food Products. A photo shows Stephen Yu, standing with has packaged tofu and soymilk products.

Paul Smith, owner of Baldwin St. Natural Foods, runs a small night class once a month on making tofu. Branson Hospital (Seventh-day Adventist) has been serving vegetarian meals to patients for 22 years. Much of the protein comes from soyamilk, soya curd, and other soya products. Interest in tofu has been spread by the publication of *The Book of Tofu*, by William Shurtleff and Akiko Aoyagi.

Note: This is the earliest published document seen (Aug. 2019) about Victor Food Products of Scarborough. Address: Star Food Writer.

903. *Soycraft* (*Colrain, Massachusetts*). 1980. Soybeans for sprouting [from Rodale Press' Organic Gardening & Research Center]. 1(2):9. Winter.
• ***Summary:*** "Those who have sprouted soybeans, at home or commercially, have probably noted that they tend to be more problematical to sprout than other smaller seeds. Partly in recognition of this difficulty, and pursuing the possibility that raw soybeans may have a cancer inhibitory effect, the Organic Gardening and Farming Research Center in Kutztown, Pennsylvania, is actively developing lines of small-seeded soybeans suitable for home or commercial sprouting. The following report was submitted by Anne Duncan Edwards, researcher for Rodale Press:

"We feel that the soybean has potential as a sprouting bean because of its high nutritional value, its ease of cultivation, and its range of climatic adaptability. Varietal selection now needs to be researched for type suitability. The small-seeded soybean plots here are made up of yield trials and seed increases for some of our more promising sprouting soybean types. These varieties were chosen from 111 different soybeans grown in 1978 that included varieties from Korea, Indonesia, Taiwan, and the United States.

"Size is one important factor considered in the evaluation of these soybeans for sprouting purposes. Differences among varieties can easily be seen by observing the weight (in grams) of 100 beans of each type. Corsoy, a commercial bean, weighs between 17 and 19 grams per 100 seeds. Varieties being considered for sprouting include: No. 11, Korean, 6-10 gms; No. 46, USA, 5-6 gms; No. 48, USA, 8-9 gms; No. 17, Korea, 9-11 gms. Also considered is attractiveness, taste, and agronomic characteristics. Results of last year's yield trials are not yet available, but many of the beans set large numbers of well-filled pods.

"The soybean project for next season is being expanded to include sprouting bean, vegetable bean, and tofu bean variety trials. Our plot work will be closely linked to the Test Kitchen in Emmaus, where taste testing, recipe formulation, and suitability for tofu-making will be analyzed. We hope to add many more varieties to our collection for next year's research and are currently in the midst of a search for suitable types.

"For more information write: Organic Gardening & Research Center, P.O. Box 323, RD 1, Kutztown, PA 19530."

904. Meals for Millions / Freedom from Hunger Foundation. 1980. Annual report 1979: A commitment to self-help for a hungry world. Santa Monica, California: MFM Foundation. 16 panels. Each 9 x 22 cm. March.
• ***Summary:*** Peter J. Davies is president; he works at the New York office. Alfred C. Bartholomew, Ph.D., D.D., is chairman of the board of trustees and executive committee. On the green, black and white cover is a photo of a two children. MFM's logo of a plant growing in an upturned bowl is at the bottom of the cover.

Contents: Message from the president. Overseas programs: Ecuador, Honduras, Caribbean (Barbados, Jamaica), India, Korea ("The new food processing plant in Wonseong County was dedicated on March 31, 1979 and began processing a high protein, vitamin and mineral

© Copyright Soyinfo Center 2021

enriched snack food called Wooryang-a for young children") Philippines. Transfer of technology. Multi-Purpose Food (small quantities sent to Haiti, Brazil). Domestic programs: Papago Indians, Tucson seed bank [Arizona], urban community gardens, reaching the youngest ("Anti-junk food Public Service Announcements were widely aired on radio and TV during National Nutrition Week, March 5-9, 1979 and throughout the following months), reaching the oldest ("through the Healthy Lifestyles for Seniors program in Santa Monica and Active Wellness in Tucson..."). Training in food and nutrition (Training school, nutrition training in Central America, Fiji). Research and development (leaf protein). Resource center. Highlights of 1979 ("Early in 1979, we were asked by the American Freedom from Hunger Foundation to assume their limited remaining assets. Our Board supported the move... Freedom from Hunger is perhaps a more apt description of our role today than Meals for Millions, a name by which we have become well known to many of you. We are considering a name change to MFM / Freedom from Hunger Foundation. Is it a good idea?"). Financial highlights: Contributions from nearly all sources amounted to $1.295 million in 1979, up from $1 million in 1978. Individual donors across the country provided the largest share (36.7%), followed by US AID (23.2%), foundations (22.3%), churches 8.7%, host governments 5.4%, etc. The many agencies that made generous grants are listed. Where the money goes: Program services 75.0%, administration 10.2%, public support [fund raising] 14.8%. Total expenses: $1.278 million. National Committee of Sponsors. Board of Trustees and executive committee. MFM officers. Address: 1. 1800 Olympic Boulevard (P.O. Box 680), Santa Monica, California 90406; 2. 815 Second Ave., Suite 501, New York City, NY 10017. Phone: (213) 829-5337 or (212) 986-4170.

905. Edwards, Anne Duncan; Hirsch, Anita. 1980. Sprouting soybeans. *Rodale Research Report* (*Emmaus, Pennsylvania*) No. 80-5. 9 p. April. [5 ref]
• ***Summary:*** Small-seeded soybeans, weighing less than 10 grams per 100 beans, can be used to make highly nutritious and tasty sprouts. Research at the Organic Gardening and Farming Research Center (conducted from May 1978 to Nov. 1979) has led to the selection of the five most promising varieties from 209 accessions tested. Tables show: (1) Soybeans tested for sprouting. For each is given: Accession number, seed source, maturity group, pedigree/variety. (2) Top five soybeans with potential as sprouts. For each is given: Accession number, origin/source (The source of four of these was Korea), pedigree name, grams/100 seed (ranges from 5.5 to 9.1), yield on farm (kg/ha; ranges from 1,681 to 1,524), flower color, kitchen germination percentage (ranges from 80% to 100%), average length (ranges from 1.62 to 3.18 inches). Raw taste (acceptable or good). Address: 1. New Crops Section; 2. Rodale Test Kitchen. Both: Emmaus, Pennsylvania.

906. Harrison, Kelly. 1980. Promotion important to sustain U.S. soybean efforts. *Foreign Agriculture* (*USDA Foreign Agricultural Service*). April. p. 19.
• ***Summary:*** "We are still assessing the short- and long-term impacts of the President's suspension of soybean exports to the Soviets, as a result of their aggression in Afghanistan... "Our more mature markets in developed countries seem to be indicating a slower growth trend. Our sales success in developed foreign markets has led to increased competition from other soybean exporters such as Brazil and Argentina. Thus, to maintain our foreign market sales growth in the years ahead, a larger share of U.S. exports must be to emerging growth markets such as Korea and Mexico." Address: General Sales Manager and Associate Administrator, Foreign Agricultural Service.

907. Hesseltine, C.W.; Wang, H.L. 1980. The importance of traditional fermented foods. *BioScience* 30(6):402-04. June. [12 ref]
• ***Summary:*** Table 1 gives, for each food, the name, area or country, microorganism used, substrate, nature and uses. The following soy-related foods are included: Soy sauce (chiang-yu, shoyu, toyo, kanjang, kecap, see-ieu), miso (chiang, doenjang, soybean paste, tauco), Hamanatto (toushih, tao-si, tao-tjo [sic, tao-tjo = tauco is Indonesian-style miso]), sufu (fu-ru, fu-ju, tou-fu-ju, bean cake, Chinese cheese), tempeh, bongkrek, ontjom (oncom), natto. Address: Northern Regional Research Center, Peoria, Illinois.

908. United Press International (UPI). 1980. Tofu–Food that mixes with almost anything. *Journal Star* (*Peoria, Illinois*). July 7.
• ***Summary:*** This article begins: "Remember the lovable schmoo in Al Capp's Dogpatch comic strip–the critter that could turn itself into the most succulent dish or almost anything else? The oriental version of the schmoo could be tofu (toe-foo)." Lee L. Lee, tofu manufacturer and owner of Tofu, Inc. in Roseville, a suburb of Minneapolis, says tofu can be used to make anything from appetizers to desserts. He considers tofu the perfect health food. Lee came to the USA from Korea in 1963. His handmade tofu began to sell well in about 1975. In 1977, when one woman started buying ten pounds at a time, he bought Japanese equipment to mass produce the product. By April 1978 his production has reached 2,000 lb/week, rising to 13,000 lb/week by Jan. 1980. His tofu retails for $0.90 to $1.00 a pound.

909. Lukoskie, Suni. 1980. Popular Korean soy sprout recipes (Interview). *SoyaScan Notes.* July 9-13. Interview conducted by W. Shurtleff of Soyfoods Center.
• ***Summary:*** Suni's sister-in-law is a gourmet Korean cook.

The recipes are listed here in order of popularity: Clear and hot soy sprout soup (*Kongnamul kuk*). Cooked soy sprout salad (*Kongnamul*). Soy sprouts atop rice (*Kongnamul pap*). Ingredients (but not amounts) and the method of preparation are given for each recipe. Address: Island Spring, P.O. Box 747, Vashon, Washington 98070. Phone: 206-622-6448.

910. **Product Name:** Tofu, and Soymilk.
**Manufacturer's Name:** Jack and the Beanstalk.
**Manufacturer's Address:** Buckeye Building, 65 W. Carmel Valley Rd. (P.O. Box 525), Carmel Valley, CA 93924. Phone: 408-659-4366.
**Date of Introduction:** 1980 July.
**How Stored:** Refrigerated.
**New Product–Documentation:** Soyfoods Center. 1980. Sept. Tofu shops and soy dairies in the West (2 pages, typeset). Gives the company's name, address, and phone number. The owners are Paula and Nobukatsu Terui. Bill and Akiko Shurtleff visited them and stayed overnight at their home in the Carmel Valley at about the time they started production.

Michael Shedlin. 1985. Monterey Life. Feb. p. 12 "Tofu: That chameleon of the food world." Buck and Leslie Patton, owners of Jack and the Beanstalk, make tofu in Carmel Valley Village. They make 1,700 lb/week of nigari tofu.

Letter announcing sale of business. 1985. "Jack and the Beanstalk began manufacturing tofu in July 1980. Leslie and Buck Patton bought the business in May 1983. It is the only tofu manufacturer in Monterey County. Current tofu production is 1,800 to 2,000 lb/week. Soymilk production is about 15 gallons a week [it is not clear when soymilk production started]. Sale price is $50,000. The gross income grew from $43,705 in 1981 to $81,000 in 1985, when profit was $13,100."

Talk with Russel Hicks of Sweet Earth. 1991. Jan. 31. His company now buys its tofu from Jack and the Beanstalk, which is located in Salinas.

Talk with Albert Park, owner. 1991. Feb. 1. The company, whose name has not changed, is now located at 401 Victor Way, Suite 16, Salinas, California 93907. The previous owner, Mr. Hun Kim, moved it to that location from Carmel Valley about 5 years ago. Both Mr. Kim and Mr. Park are Korean-Americans. The company now makes only 3 products: tofu, soymilk, and soybean sprouts. It is a very small business that makes 1,500 to 1,700 lb/week of tofu.

911. Leviton, Richard. 1980. Soyfoods in Toronto. *Soyfoods* 1(3):14-19. Summer.
• ***Summary:*** Discusses Vital Eat, Pyung Hwa, Soy City Foods, and Victor Food Products. Victor Food products (102 Hymus Rd., Scarborough, Ontario, Canada M1L 2C9) was founded and is owned and managed by Mr. Stephen Yu. In the 3,600 square foot tofu factory, 13 workers (mostly Vietnamese refugees) produce 1,900 lb/day of tofu, 750 gallons/week of Nutrisoya soymilk, and about 200 quarts/day of kinugoshi soybean pudding. Mr. Yu, who was born in China and educated in California, came to Toronto in 1977 to make an initial market survey. He opened his plant in Feb. 1978, with an initial production of 900 lb/day. Mr. Yu now has accounts in all major Toronto supermarket chains. He reaches about 40% of the Oriental market and about 40% of the overall soyfoods market. He speaks fluent English and is "far more forward looking and market conscious than his Oriental competitors in the Toronto area." His production process and equipment are described in detail. Last summer he appeared on a 10-minute television feature that depicted the story of soybeans from field to shop to table. This was followed, in Jan. 1980, by a major article which profiled his company in the *Toronto Star.* This publicity ushered his tofu into the three big supermarket chains not yet carrying it and sales in the four chains that were rose 100%. Note: This is the earliest document seen (April 2001) that mentions Victor Food Products in Canada.

Soy City Foods, at 2847 Dundas St., is a new soy production site due to open in the spring. Pat Guardino is general manager and Leonard Bugyra is sales manager. The company is a subsidiary of Golden Age, Inc., a spiritual group which operates a successful vegetarian restaurant downtown and is currently installing a second one next door. The company will start by producing about 600 lb/day of tofu, as well as soymilk and soysage. They will supply their contiguous restaurant and sell bulk soyfoods from their own retail counter in the storefront. They will also produce tofu cheesecakes and okara cookies in the restaurant.

Photos show: (1) Soy City Foods and its owners (incl. Pat Guardino) under the storefront sign. (2) Pyung Hwa Tofu Shop, with cakes of tofu cooling in a bathtub. (3) Stephen Yu of Victor Food Products with Nutrisoya soymilk. Address: Colrain, Massachusetts.

912. Leviton, Richard. 1980. Effective soyfoods marketing: "We want to do for tofu what flavors did for yogurt." *Soyfoods* 1(3):46-51. Summer.
• ***Summary:*** Discusses the tofu marketing strategies of: (1) Steve Demos at White Wave Soyfoods (Boulder, Colorado); (2) John Paino of Nasoya Foods (Leominster, Massachusetts). Nasoya makes four tofu spreads and a tofu mayonnaise; (3) Luke Lukoskie of Island Spring, Inc. (Vashon, Washington). Each week the company produces 10,000 lb of tofu, five flavors of Soyfreeze (soymilk ice cream), soyloaf, tempeh, soymilk, and spicy Korean tofu; (4) Madeline Fox, director of Marketing at the New England Soy Dairy (Greenfield, Massachusetts).

Page 47-48: "White Wave Soyfoods of Boulder, Colorado, produces 7500 pounds of tofu and tofu products weekly and operates a bustling take-out soy deli in downtown Boulder. Company manager Steve Demos wants to penetrate the 25-45 year old market and to grab a share

© Copyright Soyinfo Center 2021

of the 2 million consumers in his immediate market area. In his view the natural foods market attracts only a minority of the real numbers of potential customers; if you reach only 1 percent of the clientele of a supermarket, you have still touched an enormous group, whereas a market penetration of 15 percent in the natural foods community represents a far smaller volume. One Denver supermarket, for example, currently moves 2000 pounds of White Wave tofu every week. White Wave's market goal is to reach 2 percent of the public in their market reach, a feat which would boost their sales, Mr. Demos estimates, to 20,000 pounds a week.

"Steve Demos emphasizes the need for a tight, coherent marketing package presentable to the supermarket purchasers, Soycraft companies should demonstrate their commitment to help the stores sell their soy products; they shouldn't just deliver tofu and leave quietly. White Wave provides recipe pads, point-of-purchase banners, in-store product demonstrations, and conducts local radio ads geared to supermarket sales. Mr. Demos cites an instance of working cooperatively with a supermarket in developing their market for tofu. King's Supermarket, the largest chain in Colorado, has a monthly Board of Directors meeting in which the food buyers present new foods for consideration. The produce buyer contacted White Wave for help; White Wave developed a product prospectus, provided heat-and-serve convenience soy-foods, and prompted the buyer in answering the expected questions. This worked nicely, and today King's 'plugs real hard and shows strong upward growth patterns,' Mr. Demos comments.

"White Wave works creatively to make tofu seem as if it were already familiar to their mainstream skeptical shoppers. Until recently, their tofu was not in the dairy section, but with the produce instead, mainly because the stores' profit mark-up on dairy is lower and, curiously, the familiarity of packaged tofu in the produce section has been established. As a remedy, White Wave has introduced two tofu packages, one graphic approach for each section. 'We want to make tofu look like it's been here for the last 15 years,' Mr. Demos remarks, 'as if it were an everyday product, like cheese or yogurt. We'll work on the familiarity of what's already there, such as vacuum sealing.' In conjunction with an ad agency and a freelance graphic artist (with experience in promoting herbal teas and yogurt), White Wave is striving to latch on to that 'uniformity in American packages, in color, shape, and phrasing. Then, people reading our tofu package will feel like they're reading the outside of a margarine package.'

"White Wave has taken their promotional campaign to the air waves, by trying to attract listeners and customers through humorous verbal vignettes. 'We want to show we are an established, professional company, one that people should know about. At a later stage we'll highlight the product advantages. We have to be practical in attracting Americans. They're convenience-oriented and often need 'spoon feeding.' We design our recipes around convenience and staple foods.' Radio ads, Mr. Demos admits, are expensive, and a company should monitor their results carefully. 'You should see immediate results, yet you need to develop an evolving program for the long run, as you develop the market. One 30-second spot can't create the whole market.' As a bottom-line measure of effectiveness, White Wave requires a 10 percent increase in sales for each ad campaign.

"Their soy deli, formerly called the Cow of China in recognition of the Oriental term for the soybean, has been renamed the Good Belly Deli. The soy deli is a wonderful showcase for the diversity of delicious soy products, ready-to-eat and take home, or 'real food, real fast,' as their slogan boasts. 'It's attracting coats-and-ties these days too,' Mr. Demos notes approvingly. 'The Cow concept appealed to too small a market. We redesigned our image and moved toward prepared soy-foods. So people can connect with this place, we're making it seem more familiar. If we give them what they want, a familiar dish, say, then they'll experiment and get a side dish of something unfamiliar and new to them. We have a very cautious and conservative public. We need to see insightfully what they are accustomed to, then match it. Maybe we have to use standard meat dishes with soy in them, as in hamburger or chicken extender recipes. It's a weaning process where we have to second-guess the public. The burden of our industry is to create the market. In four months I may have a different approach.'"

Photos show: (1) Tom Timmins (rear view) addressing a soyfoods press conference audience in Boston. (2) A waiter in a black bow tie setting up the tofu buffet at the Seventh Inn.

Note: This is an earliest document seen (June 2019) comparing the marketing of tofu to that of yogurt (the dairy product) in the title. Address: Colrain, Massachusetts.

913. Thalman, Margaret Morse. 1980. Re: William J. Morse, her father, and their trip to East Asia. Letter to William Shurtleff at Soyfoods Center, Sept. 23. 3 p. Handwritten.
• ***Summary:*** "Here is our itinerary after leaving Dairen [today's Dalian, Manchuria], Aug. 20, 1930.

Aug. 22–Arrive Heijo, Korea (Pyongyang).
Sept. 17–Leave Heijo for Seoul.
Sept. 21–Leave Seoul for Heijo.
Sept. 25–Leave Heijo.
Sept. 29–Arrive Mukden, Manchuria.
Oct. 1–Kungchuling.
Oct. 4–Arrive Dairen.
Oct. 19–Leave Dairen.
Oct. 20–Arrive Peiping, China.
Nov. 9–Leave Peiping.
Nov. 10–Arrive Dairen.
Dec. 18–Leave Dairen (by ship).
Dec. 21–Arrive Kobe, Japan.
Dec. 22–Nara & Kyoto.
Dec. 23–Leave Kyoto (8 a.m.). Arrive Tokyo (5 p.m.).

1931–Remained in Tokyo until...
Feb. 17–Left Tokyo.
Feb. 26–Arrive Honolulu, Hawaii.
March 4–Arrive San Francisco, USA.

"Discovered another small notebook that my father had kept from Feb. 18, 1929 to Oct. 6, 1929. On Feb. 23 he wrote:

"'In the afternoon went to Vitacolor Motion Picture Lab where we saw the new Vitacolor motion pictures which were excellent. Had a long talk with Mr. Dupont, the inventor.

"'Feb. 25–In the afternoon went to Vitacolor Lab to see colored movies taken by Mr. Dorsett. Obtained our colored motion stuff and bid goodbye to Mr. Dupont.'"

"In Tokyo, Hokkaido and Dairen they rented offices, set up darkrooms and developed their own still and motion picture films.

"Mr. Beattie was interested in chestnut blight. Mr. and Mrs. Beattie met us when we first arrived in Tokyo and were very helpful in showing us around the city.

"Mr. Dorsett's main interest was in persimmons." Address: 22 Interlaken Rd., Eastchester, New York 10709.

914. Weiss, Martin G. 1980. Re: Recollections of William Morse and work with soybeans. Letter to William Shurtleff at Soyfoods Center, Sept. 26. 3 p. Typed, with signature.
• ***Summary:*** "As I told you by phone, I discussed your need for information regarding Mr. W.J. Morse with Dr. E.E. Hartwig, Stoneville, Mississippi,... and he sent a series of papers on the history of soybean development and improvement in the U.S. over the past 50 years. Dr. Hartwig wrote the first paper.

"Dr. Hartwig states that W.J. Morse began his work with USDA in 1907. I can recall him describing some of his activities starting in about 1912... soybeans introduced to the U.S. in earlier times were mostly adapted to our southern states and were mostly grown for hay. But a few varieties were also good producers of beans, as proven in W.J.'s test plots at Arlington Farm (land on which the Pentagon is now standing [in Virginia]). After the seed of these varieties was increased adequately, W.J. told how he would take a few large bags and head for the Carolinas via train. Upon arrival he would go to a livery stable and rent a spring wagon and horses, and set forth across the countryside.

"When he observed a farmer in the fields planting corn or hay-type soybeans, he would tether his horses to a post, climb over the fence and visit with the farmer. If interested, he would give the farmer enough seed to plant a few rows to determine their productivity. That was the beginning of growing soybeans for beans rather than hay. At first, the soybeans were fed directly to livestock, as there were no oil-extraction plants adapted for soybeans. Troubles ensued. The high level of unsaturated oil in the beans was laid down in the fat of hogs and gave 'soft pork.' But cottonseed crushing and oil extraction was practiced in the South and soon adapted for soybeans as their production was increased.

"Hartwig mentions that testing of soybeans and some of the other seed legumes (cowpeas, mung beans, etc.) was conducted at Monetta, South Carolina. This was the result of W.J.'s finding the [Joseph M.] Johnson family very interested in these new crops and highly cooperative. The family consisted of a brother and two sisters, and a colored man who did most of the field work. By the time I succeeded W.J. (Jan. 1, 1950) the brother and colored man had passed away but I learned to know Bessie and Mae–a delightful pair of southern ladies who continued their interest and still wanted test plots on their farm. (Mae is now deceased but Bessie is still living although, I hear, in poor health). Our research workers stationed at Raleigh, North Carolina, continued for some time to use their farm as a test site. As the Hartwig article describes, Mr. Dorsett, a plant explorer, introduced a number of soybean types from the Orient. It became evident in the late 1920's that soybeans had distinct promise in the U.S. so in each of two years (1929 and 1930, I believe) a team–Mr. Dorsett and W.J. Morse (the soybean "expert") conducted extensive, systematic collection trips, particularly in northern China, known as Manchuria at that time. I'm sure W J. considered this the highlight of his career. He took many photos of fields, harvesting and processing operations. He described this collection effort to me as being a bonanza so far as obtaining a diversity of germ plasm.

"Each village they visited had three or four distinct varieties–one or two for oilseed production, a large seeded type to produce soybean sprouts, a mild flavored type for green vegetable production, etc. And, unlike American farmers, they didn't look across the fence and decide the adjacent village had a better variety and start growing it–that would be sacrilegious! The varieties they grew had been handed down by their honorable ancestors and they wouldn't dream of growing a variety handed down by some else's ancestors! And this practice had been followed for many generations. A true bonanza for a germ plasm collector. So more than four thousand collections were made and sent to the U.S. For the sake of completeness Dorsett and W.J. also collected in Japan and Korea, but these varieties were mostly of the vegetable types.

"The numerous collections were grown in 1932 at a branch station at Holgate, Ohio, by J.L. Cartter, W.J.'s only professional employee at that time, and a technician, Joe D. Vasvery (who is retired, lives near me, and is my fast friend). The varieties which showed agronomic promise were again grown in 1934. As the Hartwig article describes, the U.S. Regional Soybean Laboratory was founded in 1936 with headquarters at the University of Illinois. Fresh with an MS degree in genetics and plant breeding, I became its first full-time field employee, located at Iowa State University. Part-time employees stationed at the University of Illinois and Purdue [West Lafayette, Indiana] were made full-time upon completion of advanced degrees and somewhat later

© Copyright Soyinfo Center 2021

the Ohio employee became full-time. Mr. Cartter and Mr. Vasvery were transferred from Holgate to Urbana, Illinois. And they told us of the extensive collections, seed of which was stored in paper bags in the attic of a barn at Holgate. So, the samples were brought to Urbana.

"This part of my dialogue does not pertain particularly to W.J. I will insert it only as background of the early soybean development which was under W.J.'s direction. In early 1937 the assembled field representatives of the Laboratory pored through these collections and each took a sample of seed of those varieties he wished to grow. With my background in genetics, I had a mania for genetic diversity, so I took a sample of each one. But the seed was 5 years old and the high oil content of soybeans causes rapid deterioration of germination. So many of the 1932-grown samples germinated as little as l%, and a few gave no germination at all. But, after 2 years of increase I had over 3,000 types! Success story? But wait. Then came World War II and Uncle Sam decided my commission in the artillery reserves was needed more than my plant breeding skills. And labor was extremely scarce at the Agricultural Experiment Stations. So my seed aged. In 1946, I tried to revive the varieties, but could get germination of less than 1500. But those are in today's germ plasm bank. But how many genes giving resistance to new pests and diseases, which breeders are frantically searching for now, went down the drain? That's why, when I succeeded W.J., I initiated the soybean germ plasm bank!" Continued. Address: 11122 Emack Rd., Beltsville, Maryland 20705.

915. **Product Name:** Tofu.
**Manufacturer's Name:** Midwest Oriental Foods.
**Manufacturer's Address:** 8243 Hascall, Omaha, NE 68124. Phone: 402-391-7730.
**Date of Introduction:** 1980 September.
**How Stored:** Refrigerated.

916. *Soya Bluebook.* 1980-1994. Serial/periodical. St. Louis, Missouri: American Soybean Assoc.
• ***Summary:*** A directory and information book (general and statistical) for the soybean production and processing.

Titled *Soybean Blue Book* from 1947-1964; *Soybean Digest Blue Book Issue* from March 1965 to March 1972; *Soybean Digest Blue Book* from March 1973 to 1979; *Soya Bluebook* from 1980 to 1994.

In 1987 the *Soya Bluebook* contained seven major sections: Organizations (incl. Associations), Soy Directory (Crushers, Soyfoods, Industrial Products), Soybean Manufacturing Support Industries, Marketing and Auxiliary Services, Soy Statistics, Glossary, Standards and Specifications. Well indexed, with color maps. In the early 1980s the Bluebook started to include many more foreign soyfood manufacturers.

The book contains many tables, including: "World Soybean Production," which gives area and production in specified countries (1974-1980). In 1980 this included: North America: Canada, Mexico, United States. South America: Argentina, Brazil, Bolivia, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay. Europe: Bulgaria, France, Hungary, Romania, Spain, Yugoslavia. Soviet Union. Africa: Egypt, Ethiopia, Nigeria, South Africa, Tanzania, Uganda, Zaire. Asia: Burma, China (Mainland), Taiwan, India, Indonesia, Iran, Japan, Kampuchea [Cambodia], Korea (north), Korea (South), Philippines, Thailand, Turkey, Vietnam. Oceania: Australia. World total.

In early 1988 the American Soybean Association sold the *Soya Bluebook* to Soyatech, owned by Peter Golbitz. His first print run was 8,800 copies. Yellow pages were added. In Dec. 1989 Soyatech announced that in 1988 estimated readership was 10,265 in 55 countries. 33.6% of the buyers were soybean processors / manufacturers, 28.7% were importers, exporters, transporters or marketers, 15.0% were suppliers of soybean processing or handling equipment and manufacturing support services, 9.9% were consultants, booksellers, or periodicals, 8.7% were organization or government agencies, and 4.1% were colleges, universities, libraries, and information centers. By region, 64.3% were sold in North America, 15.2% in Europe, 9.1% in Asia / Pacific / Oceania, and 9.1% in Latin America.

The 1991 Soya Bluebook appeared in Aug. with a new larger (8½ by 11-inch) format and 264 pages. The indexing system is more complete and the pages are tabbed for easy access to each section. The "reference" section was expanded by adding nutritional information on soyfoods, a new chart of soyfoods products, and soybean oil trading standards.

*Health Foods Business.* 1992. Nov. p. 218. *Soya Bluebook* now reports its circulation to be 3,000.

Talk with Joy Froding of Soyatech. 1995. Jan. 12. The 1994 print run of Soya Bluebook was 2,300 copies. An estimated 4 people read each copy.

Price of the Soya Bluebook (1 book sent to USA, Canada, or Mexico): 1992 = $28 (if paid before June 1; $38 afterward). 1993 = Same price. 1994 = $38 (no prepayment discount; Available July 1994; this book has fold-out indexing tabs and 272 pages. The order form announcing the '94 Soya Bluebook states: "For 47 years Soya Bluebook has served as *the* noted information source for the world's soybean industry"). Starting in Jan. 1994 four issues of *Bluebook Update* are available free of charge to all who subscribe to or are listed in *Soya Bluebook.* 1995-96 = $38 ($48 after 1 June 1995; then in Nov. 1995 the price is raised to $58; incl. indexing tabs, 292 pages). This 1995-96 issue is titled "Soya Bluebook Plus: the annual directory of the world oilseed industry." Crops featured on the front cover

• ***Summary:*** This is the best book seen on soymilk in Japanese. For contents and details, see the enlarged 2nd edition (Dec. 1982). A portrait photo on the back cover shows the author, Kanji Tsuchiya, and gives a brief biography. Address: Technical consultant, Okazaki Marusan, Japan.

919. Yu, Ju-Hyun; Pyun, Yu Ryang. 1980. Korean fermented foods. In: Proceedings of the Oriental Fermented Foods. Food Industry Research and Development Institute, P.O. Box 246, Hsinchu, (300) Taiwan. iv + 229 p. See p. 46-57. Held 10-14 Dec. 1979 in Taipei, Taiwan. 7 tables. 4 figs.
• ***Summary:*** Fermented foods in Korea can be classified into alcoholic beverages, seasonings, kimchies (fermented vegetables), fermented milk (liquid type), and cakes and bread. Traditional Korean fermented foods made with soybeans are all seasonings: Ganjang is soy sauce, doenjang is soybean paste, and gochoojang is a red pepper paste containing rice and/or barley and soybeans. Sikcho (vinegar) is the only traditional Korean seasoning that contains no soybeans.

In Korea, production of soy sauce (ganjang) has increased from 93,355 kiloliters (kl) in 1975 to 97,830 kl in 1978. Production of soybean paste (doenjang, Korean miso) has decreased from 67,227 tonnes (metric tons) in 1975 to 51,237 tonnes in 1978. Production of red pepper paste (gochoojang) has increased from 29,000 tonnes in 1975 to 33,525 tonnes in 1978. A detailed description is given of the production process, and nutritional composition of gochoojang. The production of monosodium glutamate by fermentation was begun in 1963 by Miwon Co. and Chiel Sugar Co. Address: Dep. of Food Engineering, Yonsei Univ., Seoul, Korea.

920. Root, Waverley. 1981. A cordial bow to the byproducts of the soybean. *Los Angeles Times.* Jan. 15. p. J42.
• ***Summary:*** This article is indebted to: Simonds, Nina. 1979. "Chinese cuisine: Bean curd." *Gourmet.* Sept. p. 28-29, 84-91.

The soybean, which offers extraordinary versatility as a human food, can be transformed into soybean milk, "the soybean milk skin [yuba] derived from the milk, the bean sticks [dried yuba sticks] made from the milk skin, the also edible sediment given off by the milk [okara], untreated bean curd [regular tofu and perhaps silken tofu], pressed bean curd which produces bean curd noodles [pressed tofu noodles], more tightly compressed bean curd cakes, and frozen-and-thawed bean curd [dried frozen tofu]." Note: This is the earliest English-language document seen (April 2013) that uses the term "frozen-and-thawed bean curd" to refer to dried-frozen tofu.

In the process of making "pressed bean curd, another soybean food is created–bean curd skin [*pai yeh,* pressed tofu sheets], which should not be confused with soybean milk skin [yuba]. Dried bean curd skin," which needs no refrigeration and is often stuffed, for example with chopped meat, is sold by weight by Chinese specialty shops throughout the world; five or six sheets weigh one ounce.

"There is a whole family of foods made from fermented bean curd" [fermented tofu]. Bean curd can be fermented in various ways. Bean curd loaves, for example, can be stored for the winter in a cool dark place; micro-organisms from the air cause fermentation. "The loaves acquire a fungoid coating, which has to be scraped off, and as far as I know is not used for food,..." Fermented bean curd, which has been called "soybean cheese," is easier to digest than unfermented bean curd. Bean curd can also be marinated in rice wine, flavored with spices, and then allowed to ferment. A most unusual type of fermented tofu is stinky bean curd (*sh'ou tou fu*), a favorite Chinese snack. In Taipei [Taiwan], there are many street vendors who ply the streets with their portable deep fryers. This fermented tofu is usually deep-fried and usually eaten with one's choice of soy sauce, vinegar, mashed garlic, and chili paste.

Other fermented foods include miso, natto, hamanatto (which is of Korean origin), tempeh (of Indonesian origin), and shoyu (Soybean sauce, soy sauce).

"It is said that the best grades of soy sauce can take as much as six to seven years of aging to reach perfection, and that the making of a superb soy sauce requires 'as much art in its preparation as good French wines.'"

Flavorings are added to some Chinese soy sauce "various herbs, especially citronella; spices (ginger); aromatic vegetables (onions); and not only fermented fish, but even fermented chicken meat. To produce three liters (3.1 quarts) of sauce requires on kilogram (2.2 pounds) of beans.

"Fukien has the reputation of producing the best soy bean sauce in China and consequently stews many foods in it, giving them a color which has caused the culinary

© Copyright Soyinfo Center 2021

techniques of this region to be called 'red cooking.'"

Soybean sauce is "often an important ingredient in many more complicated sauces–for instance Hoisin sauce in China and Worcestershire sauce in England."

921. EMI Corporation. 1981. How do they say "soybean processing" in Jinhae? "EMI" of course (Ad). *J. of the American Oil Chemists' Society* 58(1):58. Jan.
• ***Summary:*** This full-page ad shows a Korean lady, holding a fan and smiling. The text:

"Dong Bang Oil and Flour Co. Ltd. [in Korea] processes 1250 metric tons of soybeans per day, to produce the highest quality hydro-winterized salad oil and meal for animal feed. How? With a system designed by EMI and built in record time.

"This speedy construction was accomplished by using equipment fabricated here in the Republic of Korea to EMI specifications. Dong Bang depended on EMI to do it, just as people around the world depend on EMI's versatile, creative capabilities in soybean processing, fatty acid processing, and much more." Address: 3166 Des Plaines Ave., Des Plaines, Illinois 60018.

922. Wang, H.L.; Hesseltine, C.W. 1981. Use of microbial cultures: Legume and cereal products. *Food Technology* 35(1):79-83. Jan. [38 ref]
• ***Summary:*** Contents: Introduction. Use of nontoxin-producing cultures. Safety of fermented foods: Several factors contribute to their safety: Soaking and cooking, salting, acid formation, antibiotic production, alcohol production, low surface moisture, decrease of aflatoxin by *Rhizopus* and *Neurospora.* Shelf life of fermented foods. Nutritive value of fermented foods: Complementary effect of mixed proteins, protein efficiency ratio and digestibility, vitamins. Future of fermented legume-cereal foods.

The following fermented soy-related foods are described briefly, including names, area of origin, organisms used, substrate, and nature and use: Soy sauce (chiang-yu, shoyu, toyo, kanjang, kecap, see-ieu). Miso (chiang, doenjang, soybean paste, tauco). Fermented bean (hamanatto, tou-shih, tao-si). Sufu (fu-ru, fu-ju, tou-fu-ju, bean cake, Chinese cheese). Tempeh (tempe kedelee). Natto. Ontjom (onchom). Address: Northern Regional Research Center, Peoria, Illinois.

923. Hesseltine, C.W. 1981. Aflatoxins in soyfoods (Interview). *SoyaScan Notes.* Feb. 18. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Concerning the 1969 *Time* magazine article on aflatoxins in homemade miso and soy sauce in Korea–There is a lot of incorrect information in the literature based on a problem with determining aflatoxins, since not all things that fluoresce are aflatoxins. A test for fluorescence needs to be followed by a chemical test. He found that one-third to one-half of all oats sampled in the USA contained fluorescent material that looked like aflatoxin–but was not. The oats were fed to animals and no problems resulted.

A study in Japan showed that when homemade miso was properly inoculated, it contained no aflatoxins, but when inoculated with natural spores, it did contain some aflatoxins. He has never seen any figures on the aflatoxin content of the latter miso. He has seen no evidence to indicate that there are problems with aflatoxins in naturally inoculated homemade misos. Good studies conducted in Japan have found aflatoxins in homemade miso but they were found only in a few samples and the levels were so low that there was no problem. No aflatoxins have ever been found in commercial misos as far as he knows. In short, he feels there is no risk is consuming any type of miso.

Dr. Hesseltine is now on a low-sodium diet and has therefore started eating a lot of tofu. In addition, he and Dr. Wang are conducting an interesting study on microbial spoilage of tofu. Address: Northern Regional Research Center, Peoria, Illinois.

924. Leviton, Richard. 1981. Tofu plant profiles: Soycrafters on the Island [Luke and Suni Lukoskie of Island Spring on Vashon Island, near Seattle, Washington]. *Soyfoods* 1(4):42-44. Winter.
• ***Summary:*** "From the back step of Island Spring's soyfoods plant on Vashon Island near Seattle, Washington, when you take a moment's break from making tofu and look out over the orchard and small plane airstrip, you enjoy a stunning view (when the sky is clear) of towering, snowcapped Mt. Rainier, rising 14,000 feet above sea level some 120 miles to the south. Island Spring, Inc., founded in 1977 by Luke Lukoskie and Suni Kim, his wife, shares space in a broad, squat building with Wax Cannery, a small-scale orchardist and fruit juice bottling company that constructed the Island Spring production space to their specifications. Outside the tofu plant, there's a miscellany of second-hand steam kettles and bulk holding tanks and Army surplus discards, that Mr. Lukoskie was quick to scrounge up and rejuvenate for his production needs.

"The Island Spring plant is tightly laid out with five long aisles of equipment, workspace, and production supplies, flanked by an overhead loft that runs along the back wall and houses dry materials, coagulants, labels, and boxes. Immediately outside the shop, a metal silo stores 50,000 pounds of dry bulk soybeans which are augured, when needed, into the shop for soaking in either steam kettles on wheels or in stainless steel twin compartment moveable tanks. The soaked beans are then scaled up in measures (the batch size is 140 pounds of beans and 30 gallons of water) on a large industrial scale wrapped in plastic against the ubiquitous moisture, placed in polyethylene tubs, and hoisted to the floor of their five-foot raised platform. The worker mounts the platform to dump the hydrated beans

© Copyright Soyinfo Center 2021

into the hopper of their soybean mill (a J.C. Ford Master wet corn grinder, which they bought for $2,850 in 1976; 548 Monterey Pass Road, Monterey Park, California).

"The worker tends two adjacent 60-gallon steam kettles that receive (alternately) the ground soybean puree from the mill; the foam is sprayed down with cold water, and when the cooking is finished, the slurry is pumped into their home-made, hand-hydraulic soymilk press. After extraction, the soymilk is pumped into one of three steam kettles that serve as curding barrels. Each barrel, which has a 120-pound capacity, produces three 40-pound batches of tofu curds, or enough for three forming boxes. The soymilk is coagulated using either nigari or calcium sulfate. The curds are then ladled into the three forming boxes, most of the whey is drained off before ladling, and buckets filled with water are hoisted on top of the lids for weight. The finished tofu is sliced on the lid which floats in the water in the cooling tank; it's sliced according to an imprinted grid that forms a cutting pattern on the tofu during pressing. The cooling tank, which is 25 feet long and was purchased for only $300, holds 1,800 pounds of tofu, has circulating cold water, and Freon coils for chilling the water (not presently used). Metal screens on four-inch risers are set on the tank bottom to facilitate packing and to prevent the tofu from making contact with the tank bottom. Almost all of the tofu (silken and regular) is packaged in 16-ounce tubs, then packed in cardboard boxes and cooled until delivery. In late October the daily tofu production was 15 batches (1,800 pounds) requiring four people working 6½ hour shifts. Mr. Lukoskie reports that 70 percent of their tofu sales are to Washington supermarkets.

"Island Spring produces both regular and silken tofu (calcium sulfate-based, made every 10 days in 120-pound batches) for a weekly total of 10,000 pounds. One thousand pounds are converted into Delicious Steamed Tofu, fresh griddled slabs of tofu packed in a soy sauce, 480 pounds of Soyloaf, 210 quarts of Soyfreeze [soy ice cream] (described in With Spoon in Hand, this issue), nine gallons of soymilk daily, and some 700 pounds of soy tempeh every week.

"Let's look briefly at the Island Spring tempeh process. For tempeh, the daily batch size is 80 pounds of dry soybeans that produces 260 eight-ounce units. They use a CeCoCo dehuller for bean dehulling, an item they purchased second-hand in 1976 for less than $1,000 (purchased originally in Japan in 1966); this removes most of the hulls and the rest are skimmed off when the beans are boiled. The dehulled beans are kept at a racing boil for 30 minutes in a portable steam kettle, followed by spin-drying in the centrifuge. This requires three or four loads to get the beans sufficiently dry. This stage is slow as each load handles only 25 pounds of beans.

"The inoculated beans are packed in shallow tofu tubs which have no bottom aeration or drainage; therefore excess moisture in the beans condenses on the top lid and "rains" down on the fermenting soybeans (rather than escaping as steam), sometimes causing spoilage or retardation of the Rhizopus. The beans and inoculant are blended thoroughly in a Leland rotary mixer and vinegar is added; then the inoculated beans are scooped out and placed in eight-ounce tubs to be stacked on trays on moveable bakery racks. The tubs are heat-sealed with film and holes are pricked in the film with a special nail punch. This punch has been sterilized for one hour in a special Sterilizing Hood that purifies and filters air with fans and ultraviolet light; the hood is also used as a sterile workspace for tempeh starter production. The tempeh is incubated in a 6 foot x 6 foot incubator at 85ºF for 12 to 18 hours. For the last step, they apply 'crack-and-peel' tempeh labels over the pin-pricked film, and refrigerate until delivery.

"As a soy plant, Island Spring is a model to emulate, impressive for its efficiency, economy and scale, thrift, ingenuity, and product wholesomeness. Specifically, here are 14 points of commendation: (1) their bulk soybean storage and auguring system, one of only a few such systems in the country; (2) the innovative use of steam kettles and the concept of 'kettles on wheels' which saves space; (3) the efficient but inexpensive dehuller and wet grinder, both not commonly known; (4) the trim production floor layout designed for compartmentalization of products, high-volume production, and efficiency; (5) the large cooling tank with inside raised mesh and Freon coils' that was still inexpensive; (6) the use of removable steam injection hoses for the 'kettles on wheels'; (7) the marvelous steaming bell that is lowered over the racks of Soyloaf to the floor with a steam hose injected in the side, then hoisted up out of the way when not in use;

"(8) iodine dip buckets for hand disinfecting, soaking tanks for production cloths, and the general high level of sanitation awareness; (9) the Sterilizing Hood used for tempeh starter production and purification of the nail punch; (10) the use of shallow broad sinks at the curding barrel stations for utensils used in coagulation; (11) the electric insect grill suspended from the ceiling; (12) the simple pumping system that moves the puree from the grinder to cooker, slurry from cooker to press, and soymilk from press to curding barrels; (13) the use of both nigari and calcium sulfate, unusual among Western shops; (14) their unique batch-piecework payment schedule that enables some production workers to earn over $7 an hour, including a health plan and flexible schedule, making Island Spring workers just about the highest paid soycrafters in the country.

"Island Spring has not only mastered the demands of engineering a smooth production system with low-technology, low-expense solutions, they have also introduced North America's pioneer Soycrafters Apprenticeship Program, an invaluable service where soycrafters are trained for three weeks in all aspects of soyfoods production and business management. Apprenticeship Program Director Steven Sloan reports they receive 50 inquiries a month, that

© Copyright Soyinfo Center 2021

they have graduated 15 students already, and that several of them have since inaugurated their own soy plants in places like Utah and Mexico. Other innovations continue. The tempeh makers are experimenting with producing preformed tempeh burgers by incubating the tempeh in round petri dishes; already they are selling 75 four-ounce patties weekly. To streamline tofu production, Mr. Lukoskie will install a new Okita three-compartment cooker and a Brown-Sweco soymilk extraction unit; and to simplify forming box tofu pressing, he will construct a series of overhead hydraulic beam presses with cement weights. With this new system he expects to increase his production capacity per hour by 25 percent. In addition, Island Spring is the first shop in America to install Bean Machine's brand new BMI Disintegrator for soybean grinding.

"As for new products, Younghee Kim, Suni Kim's sister, is developing a commercial *kim che* [*kimchi, kim chee, kimchee*] (fermented Chinese cabbage, very popular among Koreans) for the Western, rather than Oriental (which has suppliers) market in Seattle. Their label describes *kim che* as 'a spicy Korean pickled condiment in a piquant sauce,' and includes, in one-pint jars, 'napa cabbage, green onions, garlic, ginger, red pepper, water, salt.' *Kim che* contains no preservatives with a shelf life of at least 50 days, and requires refrigeration after opening."

925. Shurtleff, William. 1981. Dr. Harry Miller: Taking soymilk around the world (Continued–Document part II). *Soyfoods* 1(4):28-36. Winter.

• ***Summary:*** (Continued): "Pioneering Soymilk in China (1925-1939): In 1925 Miller accepted the church's invitation to return to Shanghai to develop a network of Adventist health care facilities, the first of which was the Shanghai Sanitarium and Hospital, which opened January 1, 1928, with Dr. Miller as medical director. Deeply touched by the high infant mortality rate caused by malnutrition, Dr. Miller began again in 1926 to turn his attention to soymilk, working on it steadily in his spare time at a small food plant located behind the hospital building. A growing number of orphaned infants began to appear at the hospital. Their only hope of finding food was to find a wet nurse or to be fed cow's milk, which was very expensive in China and which not all infants tolerated well.

"Dr. Miller was determined to develop a soymilk that had good flavor and digestibility, could be formulated to nutritional equivalency to mother's milk, was low in cost, and had a good storage life. Preparing his soymilk at the small soy plant in the typical Chinese way, with cold extraction of the soymilk from the okara, followed by cooking, he began to study ways to remove the beany flavor and make the soymilk more digestible.

"On his medical travels in other parts of China, and in Korea and Japan, he visited tofu shops and studied their methods. He believed that the beany flavor resulted from natural oils in the soybean; perhaps if the soymilk were spray dried and then reformulated with fresh soy oil, the flavor would improve.

"In the early 1930s, returning to America on furlough, he purchased the necessary equipment for a small soy dairy and had it shipped to China; a motorized stone mill, an American extractor, and a small homogenizer. Soon he was making improved formulated soymilk for the babies, patients, and staff at the Shanghai Sanitarium. The Chinese, too, liked the flavor. Some friends cajoled that it was 'undignified for a talented surgeon to be always playing around with beans.' Miller was undaunted, yet the beany flavor persisted.

"One day, in the mid 1930s, the breakthrough came as he was standing in the kitchen of the compound working with slurry from a tofu maker. He later wrote: 'I heard a divine voice behind me that said "why don't you cook it longer with live steam?" No one had ever thought of that before. Soon the staff and patients noticed the improved flavor and digestibility, and he added some soy oil or peanut oil during homogenization to make it even better. With new enthusiasm he began more baby feeding experiments. Soymilk was added to what was called the sanitarium's 'Universal Diet,' which also included whole wheat bread and half polished rice, plus other soyfoods. During a trip to the Philippines at this time he learned from refiners of coconut oil that steam distillation and flash pasteurization improved flavor of foods containing fats by driving off volatile oils and gases.

"So promising was the new product that Miller began to move forward on three fronts: controlled feeding studies on infants, establishment of a commercial soy, dairy, and application for a U.S. patent. In 1932 Dr. Miller had established the Vetose Nutritional Laboratory for furtherance of his research. For two years (1936-37) he fed formulated soymilk to several hundred small children at the Shanghai Clinic, running control tests with fresh cow's milk and various types of American and European prepared baby foods. The study turned out well and the results were published in the April 1936 issue of the prestigious *Chinese Medical Journal*, an English-language publication read widely in the U.S. and China. Here it was officially noted that babies could be nourished from birth fully as well with soymilk as with animal milks. This led to increased interest in the product. Dr. Miller later wrote: 'I regarded that work as of far greater importance than the building up of the sanitarium because it had to do with the preservation of thousands of lives that otherwise would be lost if they did not have a proper substitute for mother's breast milk, since cow' milk is beyond the economic level of the Chinese people and almost all Oriental races.' In later years follow-up infant

© Copyright Soyinfo Center 2021

feeding studies were done by other researchers using Dr. Miller's soymilk at the Indigent Hospital in the Philippines, at Tokyo University, and at Ohio State University at the Children's Hospital in Columbus, Ohio.

"In January 1936 Dr. Miller and his oldest son, Willis (who did much of the plant design and equipment construction and was the production manager), opened a full-scale soy dairy, the first of its kind in the world, on Pingliang Road in Shanghai, not far from the Shanghai clinic. The milk was cooked with live steam in open-top kettles. Soon a fresh liquid beverage, called Vetose Soya Milk, was available in natural, chocolate, and acidophilus flavors, in half-pint and quart bottles. The tangy acidophilus, cultured, bottled (but not sterilized) and delivered chilled was a real favorite. Ice cream was sold to institutions and meat analogs were under development. Production skyrocketed, doubling each month. Eventually the entire city of Shanghai had a soymilk route with thousands of families receiving door to door deliveries (by three-wheel pedicycles with carts behind them) of 3,000 quarts and 4,000 half-pints a day. The commercial product sold for less than dairy milks and cost less than one-fourth as much to produce. The soymilk proved so successful that it was soon included in rations for the Chinese army. A system for making dehydrated soymilk was also set up using a locally made Grey Jensen spray dryer; the government planned to use the dehydrated soymilk in rations that were lighter in weight and could be stored longer.

"But the Japanese were now invading China and on August 13, 1937, just eight months after the plant opened, it was totally destroyed by Japanese crossfire and bombs. (At the same time another soy dairy was being run by Julean Arnold of California and Nellie Lee, a Chinese, both of the China Nutritional Aid Council, in Dr. Fu's Children's Hospital in Shanghai. They provided their soymilk to 25,000 to 37,000 refugee children a day and distributed millions of biscuits containing 40 percent okara from their soy dairy.) The Japanese occupied Shanghai in November, 1937, and soon thereafter the Shanghai Sanitarium was closed, to become a refugee center. The political situation forced Miller to leave Shanghai.

On May 4, 1937, while his Shanghai soy dairy was still in full swing, Dr. Miller was awarded U.S. Patent No. 2,078,962. He introduced methods for eliminating beany flavor, and for the use of a centrifuge, and an homogenizer. In the patent he referred to his product as 'vegetable milk;' however subsequent pressure from the powerful dairy industry and the USDA convinced him to Latinize the name to Soya-Lac. This term was first used in late 1939 for Miller's first American soymilk; the spelling had been changed to the present one-word Soyalac by September 1941.

"Miller's patented process was as follows: Soak 1 part by weight of soybeans in 8 parts of water at 60 to 75ºF for 6 to 10 hours. Grind well in a burr mill, adding a little water while grinding, to produce a mixture of 20 gallons water and 25 pounds ground beans. Extract the soymilk through a fine cloth in a centrifuge at 2,500 RPM in either of two ways: (1) before heating; or (2) after bringing to a boil, stirring constantly, in a caldron and simmering briefly. Now to the simmering soymilk add 7 pounds each grain sugar (dextrose, maltose) and oil plus 3 ounces salt. Return to the boil and simmer, stirring constantly, for 30 to 60 minutes, or until the flavor changes from 'beany' to 'nutty.' Homogenize in a colloid mill or homogenizer to give a milk containing 3.5 to 4 percent protein and 5 percent fat. Cool, bottle, and refrigerate, or dehydrate.

"From late 1937, Dr. Miller was in Hankow-Wuhan establishing the Wuhan Sanitarium Hospital, where he also had a small soy dairy. Eventually over 15,000 Chinese refugees, escaping the Japanese troops in the north, filled the hospital compound. Finally in January 1939, as the war got too hot, Dr. Miller left China and returned to America in April of that year" (Continued). Address: Lafayette, California.

926. Hymowitz, T.; Kaizuma, Norihiko. 1981. Soybean seed protein electrophoresis profiles from 15 Asian countries or regions: Hypotheses on paths of dissemination of soybeans from China. *Economic Botany* 35(1):10-23. March. [30 ref]
• ***Summary:*** This is a remarkable, pioneering paper that presents new evidence, based on seed protein electrophoresis, concerning the paths of dissemination of the soybean from its place of origin in northeast China.

Soybean seed protein extracts from 1,603 accessions obtained from 15 Asian countries or regions (not including Japan) were analyzed for the presence of alleles of 2 proteins. The countries were: Northeast China [Manchuria] (661 accessions), Korea (417), India (219), south and central China (142), Thailand (34), Indonesia (33), Philippines (20), Taiwan (18) USSR (16), Nepal (14), Malaysia (13), Vietnam (5), Afghanistan (5), Pakistan (4), and Burma (2). Three alleles of the Kunitz trypsin inhibitor, designated as Ti-a, Ti-b, and Ti-c, are electrophoretically distinguishable from one another by their Rf values. The seed protein beta-amylase has 2 alleles, designated as Sp1-a and Sp1-b, which are electrophoretically distinguishable from one another by their Rf values.

About 94% of all accessions had a Ti-a allele. "Only the Korean and Central Indian soybean populations have a high frequency for the Ti-b allele. Within Korea, the soybeans from those districts that lie closes to Korea have a high frequency for the Ti-b allele whereas the soybeans from those districts that lie closest to China have a low frequency for the Ti-b allele. The Ti-b allele is not present in soybeans from the Philippines, Vietnam, Thailand, Malaysia, Burma, Nepal, Pakistan, and Afghanistan. Only 1 accession each from Taiwan and Indonesia have the Ti-b allele.

"The Sp1-a allele is not present in soybeans from

© Copyright Soyinfo Center 2021

Taiwan, Vietnam, Thailand, Malaysia, Indonesia, Burma, Pakistan, and Afghanistan. The highest frequency of the Sp1-a allele occurs in soybean germ plasm from northern India and Nepal.

Soybean germ plasm pools: "At present we recognize 7 soybean [germ plasm] pools (SGP) in Asia which are as follows: (1) northeast China and the USSR; (2) central and south China; (3) Korea; (4) Japan; (5) Taiwan and southeast Asia; (6) north India and Nepal; and (7) central India. The eastern half of north China, where the soybean emerged as a domesticate around the 11th century B.C. is considered the most probable center for dissemination of germ plasm...

"The soybeans from Asia (including Japan) were divided into 3 gene centers... The primary soybean germ plasm pool, or in Vavilov's terminology the primary gene center, is China... From the first century A.D. to the Age of Discovery, soybeans were introduced and land races were established in Japan, southeast Asia and southcentral Asia. These regions comprise the secondary gene center for soybeans... Japan should be considered a very active microcenter and northern India a passive microcenter within the secondary gene center.

"Central India may be considered a recent or tertiary soybean gene center. Another tertiary soybean gene center lies within the U.S., while incipient tertiary centers are being established in South America and Europe. The concept of primary, secondary and tertiary gene centers unifies time and space relationships with regard to the establishment of new genetic combinations within the species *Glycine max.* Another feature of this concept is that it establishes the foundation upon which future soybean germ plasm collection activities can be built."

Maps show: (Fig. 2) Korean peninsula divided into 9 districts showing geographical distribution of the Ti and Sp1 alleles. (Fig. 3) India, with 5 states outlined, showing geographical distribution of the Ti and Sp1 alleles. One of these states is Assam, which includes the Brahmaputra valley; soybeans analyzed from Assam contain no Ti or Sp1 alleles.

Paths of dissemination: Fig. 4 is a map on which an oval shows the primary gene center of the soybean in China (in the region about 200 miles southeast of Beijing, in the moist, low plain near the mouth of the Yellow River (*Huang Ho*), largely in Hopei and Shantung provinces) and on which arrows show the paths of dissemination of the soybean from China to Korea, Japan, Taiwan, Malaysia, Indonesia, and northern India. "By combining seed protein banding data with available historical, agronomic and biogeographical literature, we have developed an hypothesis concerning the dissemination of the soybean from China to other countries or regions in Asia. Our ideas are based partly upon the pioneering studies of Nagata (1960) who primarily used physiological and morphological data to point out possible paths of dissemination of the soybean from China to the rest of the world.

"In developing our hypothesis, we identified 2 major restraints concerning the movement of the soybean. One restraint is physiological and the other historical. Due to the fact that soybeans are day-length sensitive, they spread much easier between east and west than between north and south. Hence, in the dissemination process quantum latitudinal movement of soybeans was rare. Secondly, according to Ho (1975) the movement of the soybean out of its home area did not take place until the seventh century B.C. Therefore, the trial and error period for the adaptation, establishment and dissemination of the soybean from region to region within China, after the seventh century B.C., proceeded at a very rapid rate. As part of the dissemination process, the soybean was moved back and forth across geographical areas as a consequence of wars, famine, emigration, immigration, and trade.

"The suggested paths of dissemination of the soybean from the eastern half of north China to other regions in Asia are shown in Figure 4 and summarized below:

"1. The soybeans grown in the U.S.S.R. (Asia) came from northeast China.

"2. The soybeans grown in Korea are derived from 2 or 3 possible sources–northeast China, north China and the introduction of soybeans from Japan especially in the southern part of Korea.

"3. The soybeans grown in Japan were derived from the intermingling of 2 possible sources of germ plasm–Korea and central China. Most probably the first points of contact were in Kyushu and then the soybean slowly moved northward to Hokkaido. In addition the soybean moved southward from Kyushu to the Ryukyu Islands where they came in contact with the soybeans moving northward from Taiwan.

"4. The soybeans originally grown in Taiwan came from coastal China.

"5. The germ plasm source for the soybeans grown in southeast Asia is central and south China.

"6. The soybeans grown in the northern half of the Indo-Pakistan subcontinent came from central China.

"7. The soybeans grown in central India were introduced from Japan, south China and southeast Asia." Address: 1. Prof. of Plant Genetics, Dep. of Agronomy, Univ. of Illinois; 2. Assoc. Prof., Faculty of Agriculture, Iwate Univ., Morioka, Iwate, Japan.

20 panels. Each 9 x 22 cm. One large sheet folded.
• ***Summary:*** Peter J. Davies is president; he works at the New York office. Alfred C. Bartholomew, Ph.D., D.D., is chairperson, board of trustees. On the red, black and white cover is a photo of a boy. MFM's logo of a plant growing in an upturned bowl is on the cover.

Contents: Message from the president. Food and Nutrition Institute, Santa Monica. Overseas training courses: Sierra Leone and Antigua. Caribbean Community Food Technology Program. Nutrition education training program in Central America. Fiji community education workshop. Korea nutrition education program. Transfer of technology: Africa, India leaf protein fractionation project, India village texturizer project, Thailand. Information resource center. Kampuchea (Cambodia).

Multi-Purpose Food "is no longer being manufactured, therefore MFM / FFH will no longer be shipping it." The end of an era; a strange way to express it! Highlights of 1980. Financial highlights of 1980: Contributions from all sources amounted to $1.5 million in 1980, up 10% from the previous year. Where the money comes from: General public 33.4%, US AID 25.3%, churches 18.1%, foundations 16.9%, host governments 3.5%, etc. The many agencies that made generous grants are listed. Where the money goes: Applied nutrition programs 43%, food and nutrition institute 26%, fundraising 13%, management and administration 8%, etc. National Committee of Sponsors. Board of Trustees and executive committee. MFM officers.

As of 1980, MFM has largely discontinued its work with soy. Therefore, we will give less detailed summaries of annual reports from now on. Address: 1. 1800 Olympic Boulevard (P.O. Box 680), Santa Monica, California 90406; 2. 815 Second Ave., Suite 501, New York City, NY 10017. Phone: (213) 829-5337 or (212) 986-4170.

929. Shurtleff, William; Aoyagi, Akiko. 1981. The book of miso: Food for mankind. Revised. New York, NY: Ballantine Books. xx + 618 p. March. Illust. by Akiko Aoyagi Shurtleff. Index. 18 cm. [82 ref]
• ***Summary:*** Contents: What is miso? Preface. Acknowledgments. Part I. Miso: Savory, High Protein Seasoning. 1. Soybeans, protein and the world food crisis. 2. Miso as a food. 3. The miracle of fermentation. 4. The varieties of miso: Regular Miso: Rice miso (red / aka, light-yellow / shinshu, mellow red / amakuchi akamiso, mellow beige / amakuchi tanshoku, mellow white / shiro koji, sweet red / edo or edo ama-miso, sweet white / Kyoto shiro miso), barley miso (karakuchi mugi, mellow barley / amakuchi mugi), soybean miso / mamé miso (miso-dama, Hatcho miso, soybean miso / mame miso, tamari miso). Special Miso: Finger lickin' miso / Namemiso (Kinzanji miso, moromi miso, hishio, namémiso, natto miso, goto miso), sweet simmered miso / nerimiso. Modern Miso: Akadashi miso, dehydrated or freeze-dried miso, low-salt / high-protein miso.

Part II. Cooking with Miso (400 recipes). 5. Getting started. 6. Recipes from East and West. Part III. The Preparation of Miso. 7. Making miso at home and in communities. 8. Japanese farmhouse miso. 9. Traditional and modern miso production.

Appendixes: A. A history of chiang, soy nuggets [fermented black soybeans], miso, tamari, and shoyu. B. Other East Asian misos: Chiang, jang, taucho, and tausi. C. The microbiology and chemistry of miso fermentation. D. People and institutions connected with miso. E. Miso additives. F. Miso with seafoods, chicken, and meat. G. Measures, weights, and equivalents. H. So you want to study miso in Japan? Bibliography. Glossary.

Note: This is the earliest English-language document seen (Nov. 2011) that uses the term "fermented black soybeans" to refer to Fermented black soybeans. Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549.

930. Lukoskie, Suni Kim. 1981. Re: Korean natto and miso. Letter to William Shurtleff at Soyfoods Center, April 20–in reply to inquiry of March 5. 1 p. Typed, with signature on letterhead.
• ***Summary:*** "About Joenkuk-jang and Damsue-jang. I always call them Chungkuk-jang and Dambuk-jang.

"To eat and serve them, we make pretty thick Miso type soup with Tofu and Vegetables in it. This is the miso that we can make very easily and quickly in the winter time.

"I can't explain what they look and taste like, but I'm sure you could buy them at Korean grocery stores in California.

"I don't know when or where they originated in Korea.

"Chungkuk-jang and Dambuk-jang are made by almost the same process.

"Chingkuk-jang: Wash soybeans then soak for 10-12 hours. Cook for 5-6 hours until they are very tender so that when you touch them they crumble. Put them in a bowl and leave it in the room with a blanket over it; no culture is added. After 2-3 days the surface will be white and sticky, and it smells rotten. Then add **salt,** garlic and cayenne, and pound it until coarse. This is the traditional method. As you may know, the Korean floor is very warm in the winter time.

"Another method is to make it more like making tempeh. My text-book says that after cooking the beans add the culture then incubate them 30-35 hours at 40ºC.

"Dambuk-jang: Same as above but no spices.

"The Korean word for okara is BéGé [piji].

"People in Korea don't eat whole soybeans much, except that sometimes we roast them.

"I have never eaten green vegetable soybeans in Korea. I don't think we even have word for them in Korean. But the general name for soybean is *Mayjekwong.*

932. FIND/SVP. 1981. The tofu market: Overview of a high-potential industry. New York, NY: FIND/SVP. 140 p. May. No index. 28 cm. [34 ref]
• ***Summary:*** This report, largely plagiarized from Soyfoods Center documents without permission or credit, predicted that "tofu may be the next yogurt." The tofu market shows many parallels to the growth of the yogurt market. Tofu must break away from its bland image, like yogurt before flavors were introduced. Sales of tofu in the U.S. are predicted to grow from their present $50 million level to $200 million by 1986.

Contents: Preface. 1. Executive summary. 2. Tofu: History, background and definition. 3. Methods of production. 4. U.S. soybean supply. 5. Tofu products currently on the market. 6. Current market trends. 7. Institutional markets: School lunch programs. 8. Tofu and the consumer. 9. Major producers of tofu: Hinode Tofu Company, Inc., Azumaya, Inc., Quong Hop, Island Spring, Nasoya, New England Soy Dairy, Swan Gardens (Miami Beach, Florida), White Wave, Tofu Inc. (Roseville, Minnesota), The Soy Plant Co-op Inc., Northern Soy Inc., American Tofu Inc. (Brooklyn Park, Minnesota), Soy Shop, Lecanto Tofu, Traditional Tofu, Chicago Tofu Company, Hashizume Food Products Co.

10. Tofu imports. 11. Packaging. 12. Distribution. 13. Pricing and margins. 14. Advertising and promotion. 15. Market outlook and forecasts. Appendices: A. Names and addresses of major tofu producers in the U.S. B. List of tofu consultants. C. Bibliography of tofu literature. D. Tofu consumer survey questionnaire. E. Notes on the growth of the yogurt market in the U.S.

An advertisement is shown in Soyfoods magazine. 1981. Summer. p. 11. This study sells for $695 and its companion on Tofu Consumer Awareness sells for $650.

Concerning the growth of the dairy yogurt market in the U.S.: Though yogurt has been sold in the U.S. since about the 1930s, it did not enter the mainstream of American food consciousness until the late 1960s and early 1970s. They key event was the introduction of flavored yogurt varieties in 1968. Yogurt sales grew from 17 million lb in 1955 to approximately 580 million lb in 1978. In the ten years between 1968 and 1978, per capita sales of yogurt grew 325%–remarkable for a product that was so slow to catch on. In 1970, according to one survey, yogurt was perceived as a "new product" with 43% of consumers having eaten the product for less than one year. Yogurt's popularity has been attributed to changes in the American lifestyle: more health and weight conscious, faster paced, and more interested in natural foods. Yet yogurt is eaten mainly for its taste. Yogurt's protein is digested twice as fast as that of plain cow's milk. Only about 30% of Americans consume yogurt, and of those that do, 26.4% consume 76.2% of all the yogurt sold. The average American consumes about 3 lb of yogurt per year. U.S. sales of yogurt in the USA in 1980 were about $500 million; the market is highly decentralized, with about 100 manufacturers. Today yogurt, the "glamour of the dairy case," is the fastest growing dairy product in America.

Note: This is the earliest document seen (Feb. 1999) which compares the potential market for tofu with the current market for yogurt. Address: The Information Clearinghouse, 500 Fifth Ave., New York NY 10110.

• ***Summary:*** Discusses shoyu, miso, natto, and tempeh in Korea, the USA, and Japan. There are nine factors that favor the increased use of fermented foods. Address: Northern Regional Research Center, Peoria, Illinois.

934. Hildebrand, D.F.; Hymowitz, T. 1981. Two soybean genotypes lacking lipoxygenase-1. *J. of the American Oil Chemists' Society* 58(5):583-86. May. [32 ref]
• ***Summary:*** The USDA soybean germplasm collection was screened for genotypes lacking lipoxygenase-1. Two varieties or plant introductions (PI) were found: 133226 from Indonesia and PI 408251 from Korea.

Lipoxygenase [linoleate: $O_2$ autoreductase, EC 1.13.11.12] is widely considered to be the principal cause of the undesirable flavors in soy products, especially soymilk. Moreover, the lipid hydroperoxides resulting from lipoxygenase action can lead to loss of nutritive value by the destruction of certain vitamins and protein. In addition, lipid hydroperoxides and their breakdown products may have toxic effects.

Soybean seeds contain at least three lipoxygenase isozymes, each having a molecular weight (MW) of about 100,000. With linoleic acid the substrate, lipoxygenase-1 (L-1) has a pH optimum at 9.5, L-2 has a pH optimum at 6.5, and L-3 has a broad pH optimum from 4.5 to 9.0. The isoelectric points of the three isoenzymes are also different.

© Copyright Soyinfo Center 2021

L-1 is the most acidic. L-1 is the most reactive with free linoleic acid, whereas L-2 and L-3 are most reactive with methyllinoleate or trilinolein. On an equal protein basis, L-1 is 2.5 times as active as L-2 at its optimum pH, and L-2 is 2.5 times as active as L-3 or L-3b. L-1 is at least 36 rimes more stable than L-2 at 69ºC. Address: Dep. of Agronomy, Univ. of Illinois at Urbana-Champaign, Urbana, Illinois 61801.

935. Sugiyama, Mieko; Griffis, Gil. 1981. Japan–Soybean market extraordinary. *Soyworld* (*American Soybean Association, St. Louis, Missouri*) 3(2):1, 4-5. Spring.
• ***Summary:*** "When George Strayer, then the Secretary of ASA, announced in a 1956 edition of Soybean Digest that 'In Japan, soybeans are food!' he was not only expressing one difference in the cultures of the U.S. and Japan, he was defining the state of the market.

"During that year, Japan imported only 717,000 tonnes (26 million bushels) of food soybeans, of which only 80 percent came from the United States. The domestic market for these beans was limited. Human consumption preferences were for carbohydrates and animal feed protein was supplied from fish meal. Rapeseed oil was the standard cooking medium.

"Considering the conditions, leadership of ASA and the Foreign Agricultural Service (FAS), showed great foresight in establishing the first international office in Japan. Born the Japanese-American Soybean Institute (JASI) it was made up of the five leading soybean user organizations: the crushers, manufacturers of soy sauce, miso and tofu and the oil and fat importer/exporters.

"The initial program of JASI was to check the arrival of cargoes and indentify which American varieties best met the strict requirements of Japan's soy-food industry. Our competition was China and the poor quality of U.S. beans which were high in foreign matter and did not meet Japan's exacting requirements. Our primary objective was to develop a food bean market.

"In 1956 Mr. Shizuka Hayashi was appointed managing director. With the assistance of Ersel Walley, a past president of ASA, Marion Hartz of Jacob Hartz Seed Co. and Howard Akers, Assistant Agricultural Attache, he developed JASI's first activity–a soybean exhibit at the Osaka Fair. In his review of the market potential for soybeans following the fair, Mr. Walley noted that the Japanese may have difficult problems because of insufficient foreign exchange.

"Vision of an Industry: In spite of this not totally optimistic appraisal, JASI proceeded with arrangements to host its first study team to the U.S. The eight man team represented the leadership of oil importers and manufacturers and the food bean processors. Among them was Yukio Sakaguchi, then President of the Nisshin Oil Co. During his tour of U.S. crushing plants he and other leaders developed a vision of a similar industry for Japan. Six years later he presided over the opening of a new plant. Other crushers followed.

"To increase consumption of food soybeans in Japan, JASI sent two senior scientists to work at the USDA's Northern Region Research Lab in Peoria [Illinois] in 1958. They conducted production research on tofu and miso to determine which U.S. varieties of soybeans could best be used in Japan. Partially as a result of their work, U.S. exports of variety soybeans totaled over 750,000 tonnes in 1979. Even today, Japan continues to be the world's largest consumer of food quality soybeans.

"In 1959 JASI conducted a survey of soy oil consumption in the Tokyo area. The study clearly showed the need for dietary improvements and the potential for soy oil as a nutritious substitute for the popular animal fats. Promotional activities and nutrition-education campaigns that came about from this modest research effort resulted in soy oil gaining a 47 percent share of the total vegetable oil market in Japan.

"Lessons in Promotion: In 1961 JASI hosted a series of seminars on public relations and sales promotion. Many senior officials of the industry participated in the study of these marketing concepts. They learned the lesson well–last year one oil processing company alone spent over $12 million for sales promotion.

"Also in 1961 JASI hosted the first team of nutritionists to visit the U.S. Escorted by Ms. Yoshiko Kojima, team members had their first sample of vegetable oil based margarine. Their enthusiasm resulted only three years later in the production of Japan's own 100 percent soy oil margarine, Uni Soya.

"During the year we had another special success. Based on many discussions with the government and the increase in demand for soybeans, import duty on soybeans was no longer collected. In 1980, soybeans became zero bound. In 1964, when another new margarine was introduced to the market, the amount of soy oil used by the margarine and shortening industry was about one metric tonne per day. Today the industry uses over 148 metric tons every day of the year and ASA is continuing efforts to increase usage levels.

"By 1970 the one-year-at-a-time program of JASI was finally recognized as a major contributing force to the marketing of U.S. soybeans in Japan. One result was that our name was officially changed to correspond to that of our parent organization–the Japan office of the American Soybean Association.

"Embargo Shock Waves: The close relationships which we worked so hard to establish were tested in 1973 when the soybean embargo sent shock waves through the industry. Although Japan had record soybean imports that year, the memories of that event remain strong.

"Utilizing the marketing experience gained in Japan, the Tokyo office assumed responsibility for developing new and

© Copyright Soyinfo Center 2021

promising markets elsewhere in Asia. In 1975, we initiated market development activities in Korea; in 1977 we began work in Southeast Asia. Programs in both areas matured to the point that independent offices and staff were established in 1979. In 1979 we opened the new office of ASA/Japan. Our new offices, the pride of the commodity marketing community, far better reflect the one billion dollar value of America's soybean exports to Japan, the professional pride of American farmers and the Japanese staff which maintains their markets.

"America's Largest Customers: As we enter 1981, the 25th year of our program, we note with pride that Japan today represents America's single largest consumer of soybeans. This amounted to 4.4 million metric tons in 1980 alone, 97 percent of which were of U.S. origin. To sustain this market it is interesting to note that FAS and ASA funds expended in 1979-80 represented less than one percent of the value of soybeans sold to Japan during the same period. In addition, the ratio of funds provided by the Japanese with whom we work was $3.55 for each $1 invested by ASA and FAS.

"Regardless where funds originate–from grower support, from FAS or from Japanese industry–their expenditure over the last 25 years has paid very attractive dividends to farmers. In the 1956-57 crop year, the value of soybean exports to Japan was $5.4 million. Today exports to Japan represent a market in excess of one billion dollars.

"Success Brings Competition: While we are pleased with the success of our first 25 years, we are also aware of the envy these successes have created among our competitors. China maintains its traditional interest in this market for her food-quality soybeans; Brazil continually seeks opportunities. Most important, Canada, with her new Canola variety of rapeseed is making a significant marketing effort.

"To counter these competitive initiatives, and to assure a growth market of not less than three percent or 4.7 million bushels of U.S. soybeans per year will require our best effort. We must be assured of adequate program funds to maintain our strong market thrust in human and animal nutrition and to expand our work in the increasingly sensitive vegetable oil market. We cannot afford the mentality that defines our market as developed with accompanying budget reductions.

"It is with those whom we serve–the U.S. soybean farmer–and with those whom we work–the Japanese soybean industry–that we seek continued success. It is from this critical support that we have developed our anniversary theme and program philosophy of 'Together Toward the 21st Century.'"

Photos, each with a long caption, show: Gil Griffis. Shizuko Hayashi. Kitchen on wheels, which took soy nutrition to the people in the early days of soybean market development. Facilities for unloading soybeans from a ship in 1956. ASA Asian Regional Office staff. Yoshiko Kojima. Karl Sera.

936. Lee, Hyun Ja; Suh, Jung Sook. 1981. [Effect of Bacillus strains on Chungkook-jang processing. I. Changes of the components and enzyme activities during Chungkook-jang-koji preparation]. *Korean J. of Nutrition* 14(2):97-104. June. [22 ref. Kor; eng]

• ***Summary:*** Various types of koji were prepared using *Bacillus natto, Bacillus subtilis,* and the traditional method. During koji preparation, its temperature was very different depending on the microorganism used–as was the content of ethyl alcohol, reducing sugar, amino nitrogen, and water soluble nitrogen. Address: 1. National An Seoung Agricultural Junior College; 2. Seoul Junior Health College.

937. Yang, Cha-Bum. 1981. [Changes in nitrogen compounds and nutritional evaluation of soybean sprout. III. Changes of free amino acid composition]. *J. of the Korean Agricultural Chemical Society* 24(2):101-04. June. [9 ref. Kor; eng]

• ***Summary:*** Changes in free amino acid composition in the cotyledon and axis were investigated during sprouting. Free amino acids increased, especially in the axis. Arginine, proline, and methionine did not appear in the axis throughout. Free amino acids constituted 1.1% of total amino acids in soybeans but 8.8% in 8-day sprouts. Changes in amino acids during sprouting was as follows: Aspartic acid > histidine > valine > isoleucine > threonine > serine > lysine > tyrosine > phenylalanine > leucine > alanine > glycine > proline > arginine > glutamic acid > methionine. The amino acids most prevalent in 4-day soy sprouts were: Aspartic acid, serine, valine, isoleucine, lysine, and threonine. Address: Dep. of Food and Nutrition, Hanyang Univ., Seoul, South Korea.

938. Yang, Cha-Bum. 1981. [Changes of nitrogen compounds and nutritional evaluation of soybean sprout. II. Changes of amino acid composition]. *J. of the Korean Agricultural Chemical Society* 24(2):94-100. June. [17 ref. Kor; eng]

• ***Summary:*** Changes in the amino acid composition of soy sprouts were measured in the cotyledon and axis during sprouting. Total amino acid content per sprout did not change for 2 days, and thereafter decreased. It decreased in the cotyledon but increased in the axis. The ratio of essential amino acids to total amino acids decreased rapidly after 4 days, especially in the axis. Aspartic acid increased significantly while glutamic acid decreased. The limiting amino acid was methionine. Chemical score, a measure of protein quality, and essential amino acids decreased during sprouting. Address: Dep. of Food and Nutrition, Hanyang Univ., Seoul, South Korea.

939. Bader, Kenneth. 1981. Re: History of the American

© Copyright Soyinfo Center 2021

Soybean Association. Letter to William Shurtleff at Soyfoods Center, July 25–in reply to inquiry. 1 p. Handwritten, without signature.

• ***Summary:*** Dr. Bader and staff answered six questions: (1) In what years were each of the ASA overseas offices opened? Tokyo, Japan 1956. Hamburg, Germany 1969, and again in 1969. Taipei, Taiwan 1970. Brussels, Belgium 1970. Mexico City, Mexico 1971. Vienna, Austria 1974. Madrid, Spain 1976. Seoul, Korea 1979. Singapore 1979.

(2) What is the present size of the ASA overseas staff? 50. St. Louis staff? 110. Total American staff? 134.

(3) What was ASA membership in 1955? 5,400. In 1960? 5,900. In 1970? 12,368. What is present ASA membership? 20,028.

(3) How many soybean growers does the ASA represent in the 24 states having checkoff programs? 510,000.

(4) What is meant by the term "Third Party Services" in your annual budget? It is your main source of income! "It is the value of funds and services in joint projects provided by soybean and related trade organizations, private firms, institutes, and other parties. In other words, if ASA invests $10,000 in a soy oil promotion project and it is matched by $20,000 in the same project by a manufacturer, we count the $20,000 a 'third party funds.'"

(5) When was the Human Nutrition Center opened in Mexico? Early 1980. What are a few of its main activities related to soyfoods? "Identify and introduce acceptable soy food dishes in Latin America. Train nutritionists on soy products. Work with governments and institutions on soy nutrition." Address: CEO, American Soybean Assoc., St. Louis, Missouri.

940. Shurtleff, William. 1981. Low-cost extrusion cookers: revolutionary way to bring soy to the Third World. *Soyfoods* No. 5. p. 14-16. Summer.

• ***Summary:*** "The problem is familiar: how to use relatively simple technology to produce large quantities of low-cost nutritious foods that are readily acceptable to people in Third World countries; are quick and easy to use; and can play a significant role in upgrading the diets of those in greatest need such as infants, pregnant and nursing mothers, school children, and the poor. An exciting new answer has emerged during the last decade which is a combination of two factors: the low-cost extrusion cooker (LEC) and locally grown soybeans. The pioneering work with extrusion cookers has been done by researchers at Colorado State University, while that with soybeans suited to tropical and semitropical climates has been done by the INTSOY program at the University of Illinois. A number of successful programs are now underway around the world preparing precooked blended, foods, usually from combinations of locally grown cereal grains (corn, wheat, rice, sorghum etc.) and a protein source such as soybeans. These blends contain typically 16 to 20 percent protein with a quality approximately equal to that of milk (casein), and cost, on average, only $0.16 a pound total to produce and package in 1979 (less than ½ cent a pound of this is processing costs such as labor, utilities, and maintenance).

"Extruded soybeans can be made into an array of nutritious foods, of which weaning foods (baby foods) are predicted to be the most important, but which also include high-protein snacks, soy flour, textured soy protein, and the like. Extrusion cooking these foods in bulk in advance saves the homemaker time and fuel at home, allows the ingredients to be purchased at bulk discounts, and allows dehulling of grains and beans when necessary. The two main products produced on low-cost extrusion cookers are corn-soy blend (CSB) and full-fat soy flour; both are used in feeding programs and sold on the commercial market. Soybeans play a key role in these foods for several reasons: (1) they are the least expensive form of protein in most developing countries; (2) they provide both protein and food energy (calories) from their 20 percent oil; and (3) adding soy to grains makes the grains easier to extrude.

What is an extrusion cooker? Basically it is a machine constructed like a cannon with a hopper at the input end, a screw in the barrel, and a die perforated with many small holes (something like that on a meat grinder) at the muzzle end of the barrel. The screw, turned by a large diesel or electric motor at roughly 500 to 1000 RPM, forces the foods to be cooked against and through the die; the friction and pressure of the process heats the foods to roughly 143º to 163ºC (290º to 330ºF) which both cooks them and inactivates enzymes such as trypsin inhibitors. As the food bursts out of the die into the room, moisture flashes off and it dries automatically as it cools.

"Let's take a more detailed look at the types of foods produced on low-cost extrusion cookers:

"Blended Foods: The most popular blended food is corn-soy blend (CSB), which typically consists of 70 percent corn, 30 percent whole (full-fat) soybeans, and a vitamin-mineral premix. Blended foods are an excellent vehicle for introducing key vitamins and minerals into diets where they are generally deficient. It is important not to reduce the soy component to below 30 percent, as much for the food energy component from the soy oil as for the protein. There is controversy over whether soybeans should be dehulled prior to using them in weaning foods; some feel that fiber in the hull can irritate an infant's delicate digestive system, reduce the bioavailability of important minerals such as calcium, iron, and zinc, and reduce the nutrient density by adding bulk; others have found that using whole soybeans seems to cause no such nutritional problems. Hulls, however, probably cause wear on the extrusion cooker and they tend to settle in beverages, so dehulling is usually recommended.

"The protein quality of CSB is higher than that of milk (PER 2.91 v. 2.50 for milk). Valued for its high nutrition, its convenience, and its good flavor, CSB is most widely used as

© Copyright Soyinfo Center 2021

a baby food, and marketed with the image of happy bouncing babies, health, and well-being. Corn soy blend is remarkably versatile; it can be fed to babies in a bottle or spoon-fed as a soft porridge, or served to adults as a healthful cornmeal mush-type breakfast cereal, a lightly sweetened pudding or dry snack, a refreshing drink, or the key ingredient in tortillas or atoles (corn meal-and-soy mush). Another blended food, often made in the U.S. and shipped to Third World countries as part of the Food For Peace program, is wheat-soy blend (WSB). Protein-enriched pastas such as noodles and spaghetti can be made from 50 percent corn flour and 25 percent each soy flour and wheat semolina.

"Full-Fat Soy Flour (FFSF): Since most Third World countries do not have their own oil extraction plants that produce defatted soy meal or flour and since the full-fat or whole flour contains much more food energy, it is generally considered a better food ingredient. Soy flour must be precooked before it is consumed to inactivate trypsin inhibitors and to improve the flavor. It can be added uncooked to baked goods before baking, or it can be precooked by either extrusion cooking, roasting, or drum drying. While FFSF can be extrusion cooked, oil coats the surfaces during cooking and makes it necessary to use an expensive pin mill to grind it to the fineness required to pass through a 100-mesh screen. Soybeans roasted in sand or salt, since they are not sheared during cooking, can be ground to the required fineness with a simpler and less expensive hammermill. A roaster also has a greater 'throughput' and inactivates a larger percentage of the trypsin inhibitors, but it uses more energy.

"Textured and Shaped Foods: If a product such as soy flour or a soy-grain blend is extrusion cooked with a moisture content of 30 percent or more at high temperature and pressure, as it leaves the extruder die and bursts out into the room, which is at relatively low pressure and temperature, it expands greatly and can be shaped by the die into forms such as curls, twists, puffs, and granules, which can be sold as snacks or meat analogs. An extruded snack food made in Thailand, for example, contains 80 percent rice flour, 20 percent full-fat soy flour, one percent salt, and small amounts of ground chilies and other seasonings. Ten percent sesame flour can be substituted for part of the rice flour. Only the larger LECs can produce textured and shaped products.

"Low-cost extrusion cookers are now being used or installed in at least 10 Third World countries: Sri Lanka, Tanzania, Costa Rica, Bolivia, Guyana, Mexico, India, Indonesia, Korea, and Thailand. There are LEC demonstration projects in the first three countries mentioned. Sri Lanka uses a Brady extrusion cooker to make a corn-soy blend weaning food called Thriposha which is distributed by CARE and will soon be sold commercially; 14 million pounds were produced in 1978. Tanzania uses a Brady extruder to make a corn-soy-milk weaning food called Lisha. It is produced by the National Milling Corporation and distributed through the Ministry of Health Maternal-Child Health Centers. The Nutrinal company in Bolivia makes a corn-soy blend sold as Maisoy flour and flakes (like Corn Flakes); most of their sales are to the government, but their commercial Maisoy flakes sell for half the price of the imported Kelloggs brand" (Continued). Address: Soyfoods Center, Lafayette, California.

941. Shurtleff, William. 1981. William Morse: The father of soybeans in America (Continued–Part II). *Soyfoods* No. 5. p. 56-60. Summer.

• ***Summary:*** Continued: "It is truly remarkable that the authors were able to write such a complete and detailed book when neither of them had been to East Asia. (Morse would later spend two years there; 1929-1931.) Most of the book was actually written by Morse who, nevertheless, kindly listed Piper as the senior author. He gathered his information and photographs by extensive correspondence with researchers throughout East Asia and apparently drew heavily on a large collection of books on Chinese agriculture called the Swingle Collection, named after Walter T. Swingle of the Office of Crop Physiology, who spoke Chinese, had traveled extensively in the Orient collecting plants and the books, and had housed them at the USDA library, where Morse did much of his research. Decades ahead of its time, *The Soybean* soon became the standard work on the subject and was referred to by many as 'the soybean bible.' Dr. Piper died in February 1926 at the age of 69.

"Morse's fine work was already starting to give real substance to Piper's dream. In 1920, Morse helped to found the American Soybean Association (ASA) and thereafter helped to unify and direct an ongoing program of research and experimentation. Morse distributed seed from new introductions to anyone interested in soybeans. Among his closest contacts at the State Agricultural Experiment Stations were W.L. Burlison in Illinois and C.B. Williams in North Carolina. As late as 1927, most soybean agronomy research was still done on plots in Washington, D.C. outside the USDA south building. Morse sent out seeds to the states but farmers had problems; they shattered at maturity, were hard to harvest, and were abrasive on the binder canvas in those days before combines. Thus in the early years the tide of interest in soybeans ebbed and flowed. Doubters were always ready to laugh at anyone who talked of the soybean becoming a major U.S. farm crop. But this only served to spur Morse on to greater efforts. He was a very effective extension worker with many contacts, a deep knowledge of his subject, and good intuition. His desk at the USDA soon became the clearing house for information about the soybean. In 1927 he wrote: 'We may keep this work going and place the soybean where it belongs–in the King row with King Corn and King Cotton.'

"The Dorsett-Morse Expedition to East Asia (1929-1931): In the late 1920s it became evident to the USDA

© Copyright Soyinfo Center 2021

that the soybean had definite promise as a crop in America and it was decided to send W.J. Morse and P.H. Dorsett to East Asia for two years on what was officially known as the Oriental Agricultural Exploration Expedition (but which people interested in soy usually call the Dorsett-Morse Expedition) to 'make investigations regarding the utilization of the soybean in Oriental countries and the securing of varieties that might be of value to widespread American conditions' (Morse, 1929). In 1929 when the expedition left, Morse was age 45 and had worked on soybeans with the USDA for 22 years. Dorsett (1862-1943), now age 67, was a plant explorer from the USDA Office of Plant Introduction; he was described by a fellow agricultural explorer, David Fairchild, as one of the most ingenious and indefatigable workers he had ever known. Whereas Morse was a specialist, interested in soybeans, Dorsett was a generalist, interested mainly in persimmons, but also in grasses, forages, and other plants.

"During the expedition, Morse and Dorsett kept detailed daily journal notebooks, which were typewritten after the trip and bound in 17 hardback volumes. These volumes, primarily the work of Dorsett, also contain correspondence plus thousands of black-and-white photographs taken by both men. In the bound volumes there are several references to a 'special report on the soybean and its products' that Morse intended to write. Apparently he never completed it, although he did complete detailed chapters on tofu and soymilk. The only original copy of the documents described above is in the archives of the American Soybean Association in St. Louis, Missouri. [Note: As of 2011, it is in Rare and Special Collections, at the National Agricultural Library, Beltsville, Maryland].

"The group arrived in Tokyo on March 18, 1929, and set up headquarters. In August they traveled to Hokkaido, the northernmost island of Japan and center of soybean production, where they studied both soybean cultivation and food uses. In December 1929 they returned to Tokyo and spent full time until March 1930 collecting soyfoods and studying their production and use. On April 1, 1930, they arrived in Dairen, Manchuria, to study soybean cultivation and oil extraction. Dorsett left Morse in the summer of 1930 and went to Peking. He did not rejoin Morse on the trip, although he wrote regularly. Morse went to Korea on August 22, to Mukden in Manchuria on September 29, back to Dairen, the oil-processing capital of East Asia, and then to Peking on October 20; Morse apparently spent only 20 days in China on the entire trip. In late December they took a ship from Dairen back to Kyoto and then Tokyo. On February 17, after several more months of soyfoods research in Tokyo, they sailed for America, arriving in San Francisco on March 4, 1931. Morse's collection efforts–months of tramping through the fields of East Asia–were a bonanza. He discovered that almost every village in the Orient had its own distinctive soybean varieties, developed during thousands of years of close cultivation and inbreeding. Unlike their Western counterparts, Chinese farmers didn't think of looking for improved varieties in nearby villages and then growing these in their own village. They loyally grew the varieties that had been handed down by their honorable ancestors, and wouldn't dream of growing a variety handed down by someone else's ancestors. Morse's major accomplishments on the expedition were: (1) he collected approximately 4,600 distinct soybean seed samples representing roughly 2,000 soybean varieties and including 150 large-seeded vegetable type varieties collected mostly in Korea and Japan; all of these were introduced into the U.S. germplasm collection; (2) he realized for the first time the superiority and potential of the vegetable-type soybeans for food use and later played the leading role in propagating them and teaching others of their value; (3) he developed a much better understanding of soybean growing methods and technology; and (4) he collected more than 250 [commercial] food products made from soybeans, which he took back to America, and did by far the most extensive studies on soyfood production of any Westerner up to that time.

"In his journals and letters, Morse wrote more than once that he was 'amazed at the extent to which the soybean was used for food in Japan.' He was intrigued by the techniques for making tofu, miso, shoyu, natto, and other soyfoods, spent many days in small shops with producers, and described their processes in great detail, taking hundreds of pages of typed text with hundreds of photographs.

"The two-year trip was a tremendous adventure for both Morse and Dorsett. Morse later remarked that he considered it the highlight of his career. He was finally able to fully grasp the great potential of the soybean, which he had only been able to glimpse through his years of reading and work in America." Continued. Address: Soyfoods Center, P.O. Box 234, Lafayette, California.

People and institutions connected with tofu worldwide (Incl. directory of tofu manufacturers). D. Sources of supply for tofu production. Bibliography. Glossary. Favorite tofu recipes. About the authors and their work (autobiographical). Tofu–An opportunity for poor and rich lands. The tofu kit (from Sojaquelle in West Germany and Oekullus in Switzerland).

Note 1. This is the earliest publication seen (April 2013) that uses term "Tofurei" to refer to tofu shops / manufacturers. The term was coined by Gabriele Furth-Kuby of Ahorn Verlag.

Note 2. "Sojaquark" is used to refer to soymilk curds rather than to tofu. Published in a hardcover edition only.

Note. This is the earliest German-language document seen (Sept. 2013) that mentions soy cream cheese (p. 104), which it calls *Tofu-Käsecreme*. Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549. Phone: 415-283-2991.

943. Wagner, Martha. 1981. Soy down under. *Soyfoods* No. 5. p. 11-12. Summer.

• ***Summary:*** First discusses the work of Marcea Weber and Debbie Schmetzer in Australia. Marcea Weber owns The Soybean Factory located just outside of Sydney, Australia. Debbie, formerly a tofu maker at Surata Soyfoods in Eugene, Oregon, is now living in New Zealand, where she plans to start a soyfoods business. "Marcea, originally from New York, began her tofu business three years ago, about a year after arriving in Australia from England where she operated a small natural foods bakery. Koreans and Chinese were already producing large volumes of tofu in Australia but her business was the first to produce a nigari tofu. After three years, tofu is still quite foreign to Australians, Marcea says...

"The Soybean Factory sells to natural food stores, restaurants, and juice bars. It produces only 600 half-pound blocks a week. Using simple Takai machinery with a 45-gallon Australian pressure cooker, only 30 pounds are produced in each batch so the selling cost is high, about double U.S. prices, and much higher than Korean and Chinese tofu sold in Australia." "The factory employs three production workers and a manager. Marcea does the promotion. She also spends much of her time teaching cooking and nutrition classes at the East-West (Macrobiotic) Center, which she and her husband, Daniel, an acupuncturist, established when they arrived in Australia."

In New Zealand, "no one outside the Chinese community had even heard of tofu until an Auckland health food store, Harvest Whole Foods, began producing it in a backroom kitchen last October [1980]. The enthusiasm for tofu was shown by several restaurants doing an alternative lifestyle festival, which featured tofu burgers, has produced healthy sales for the shop. The three owners, Greg and Ricky Chalmers and Ricky's wife, Elizabeth, are producing about 170 to 299 kilos (374 to 440 pounds) of tofu a week. They expect sales to grow and are planning to expand production facilities."

Debbie Schmetzer arrived in New Zealand in Jan. 1981 with her husband, Peter (who was born in New Zealand) and their young son. She describes the process and ingredients used to make tofu at Harvest Health Foods, then notes that "Even in the Chinese community, only two Chinese restaurants are making tofu. Harvest's main customers are Indonesians, vegetarians, people switching from dairy to soy on the advice of naturopathic doctors, and spiritual seekers such as Hare Krishna and Divine Light people." On the Run is a fast food deli that makes excellent tofu dishes in Auckland, including tofu burgers, curried tofu salad in pita bread, and tofu tacos with locally made tortillas.

Letter from Martha Wagner. 1981. July 24. "Before this article went to press I learned that Debbie and her husband had become disillusioned with attitudes in New Zealand toward food and organic agriculture, red tape, and toward setting up business–especially concerning a mold to make tempeh. So they took off for greener pastures in Australia. They are now mulling over the scene in the Melbourne are and may well do a bagel business combined with a soy deli. She would be a good person for a soyfoods information center there. Address: 35 Flower Street, Essendon 3040 Victoria, Australia.

"For the addresses of the Koreans and Chinese making lots of tofu in Australia, contact Marcea Weber, 29 Belmore St., Rozelle 2039, NSW.

"Did you meet the Australian couple Fred and Radhika Koch at the SANA conference? They are planning to set up a good size tofu operation as a support for a 26-person community in the country." Address: USA.

944. Magida, Phylis. 1981. How to eat well and still kiss salt, sugar, and fat goodbye. *Chicago Tribune*. Aug. 10. p. A11.

• ***Summary:*** Many Chinese, Japanese and Korean dishes consist largely of vegetables. Instead of using meat, many use tofu (soy bean curd) as a protein source, since tofu contains no cholesterol and relatively little fat. When eaten with rice, the protein quality of tofu increases.

To decrease salt intake, use a low-salt soy sauce available from Yamasa soy sauce company. Or you can decrease the amount of salt or soy sauce by increasing the amount of garlic and/or ginger.

Chronology:

1904–Artificially frozen tofu was displayed at the Fourth Industrial Exhibition in Japan.

1923–The Matsuo Kori-dofu Union was established.

1925 Dec. 25–The Association of Kori-dofu Unions in Nagano prefecture was established.

1930–The Anonymous Asahimatsu Improved Kori-dofu Union was established.

1932–The Anonymous Asahimatsu Improved Kori-dofu Union was reorganized as Asahimatsu Improved Kori-dofu Company, Ltd.

1932–Misuzu-dofu Sales Union (predecessor of the present Misuzu Tofu, Inc.) was established.

1935–Responsibility-guaranteed Suwa Sales Union (the predecessor of the present Daiya Tofu, Inc.) was established.

1937–Kori-dofu Union of East Tsukuma County in Matsumoto City (the predecessor of Miyama Tofu, Inc.) was established.

1939–The All Japan Kori-dofu Association was founded.

1939–The factory for making artificially frozen tofu was built in Matsuo village by Asahimatsu Improved Kori-dofu Company, Ltd.

1940 May–The All Japan Kori-dofu Union Association was established in order to serve as an organization controlling the distribution of soybeans, the raw material.

1941–The Asahimatsu Improved Kori-dofu Company, Ltd. built a branch factory in Korea.

1943–The All Japan Kori-dofu Industry Union Association was established under an order given by the Ministry of Agriculture and Forestry.

1944–The All Japan Kori-dofu Industry Union Association was re-established as The All Japan Kori-dofu Industry Control Union.

1945–The Asahimatsu Improved Kori-dofu Company, Ltd. gave their factory to Fujikura Aircraft Industry Company, Ltd. to be used as a munitions factory.

1945 Aug. 15–The Korean branch factory of Asahimatsu Improved Kori-dofu Company, Ltd. was closed due to the termination of World War II.

1945–The All Japan Kori-dofu Industry Control Union was dissolved.

1947 March–The All Japan Kori-dofu Industry Association was established and joined the Japan Soybean Association.

1950 Dec. 19–The Asahimatsu Kori-dofu Company, Ltd. was established having a total capital of 3,750,000 yen.

1950–The naturally frozen tofu industries were struck by the unusually warm winter.

1951 Jan. 19–The factory of the former Asahimatsu Improved Kori-dofu Company, Ltd. (4873 Matsuo village) was purchased from the Fujikura Aircraft Industry Co., Ltd. and reconstruction of the factory began.

1951 April–The Soybean Control Order was abolished.

1951 May 15–The Asahimatsu Improved Kori-dofu factory started operation. The average daily production was 30 sacks (1 sack = 60 kg = 132 lb) of soybeans. Labor productivity per unit was 13.90 hours/1,000 cuts.

1952–The products of Kansai (the Kyoto-Osaka area) and the natural products from all areas in Japan declined steeply.

1953 Feb.–The All Japan Kori-dofu Industry Cooperative Union Association was founded.

1954 July 1–Asahimatsu's factory was designated by the Ministry of Labor as a model plant having safety and sanitation management.

1956 Aug.–The second construction of the SupeCo style dryer was completed. A current style thawing machine was installed which made the flow of operation continuously automatic.

1957 Nov.–The third construction of a freezing process and boiler was completed. A combustion machine for coal powder was introduced. A new chimney for the boiler was built. The average daily productivity was 112 sacks.

1958 Oct.–'Asahi-dofu' was used as food by the observation party of Showa base at the South Pole.

1958–Competitive sale of kori-dofu began.

1959 March–The first TV commercials for the Kori-dofu industry began in the Osaka area.

1959 Jan. 1–The 'meter' rule was put into practice.

1959–A specialized dryer for cubes was newly installed. Sprinkler-type thawing equipment was completed. The complete continuous operation by exchanging labor made

© Copyright Soyinfo Center 2021

the increase in productivity possible after the completion of the third construction.

1960–The average daily productivity: 154 sacks. Productivity of labor per unit: 7.50 hours/1000 cuts.

1962 July–Began sales of soft tofu.

1962–Began refrigeration of products.

1963 Feb.–Frequent occurrence of browned and hardened products.

1963 July–Tenryû plant began full-scale operation.

1963 Oct. 24–Success in making the products soft. Became number one in both quality and productivity among the industries.

1963 Nov. 1–Awarded by the Japan Food Sanitation Association an official commendation for having a well controlled sanitary plant. Began to use heavy oil as boiler fuel at Iida plant. The average daily productivity: At Iida plan, 97 sacks; at Tenryû plant, 136 sacks. Productivity of labor per unit: 6.50 hours/1000 cuts (at both Iida plant and Tenryû plants).

1964 July 7–Awarded by the Nagano Labor Standards Bureau of Ministry of Labor an official commendation for having a well controlled and safe plant. Stabilization of quality of 'soft' products.

1966 Oct.–Shinshu Tofu Co. Ltd. was entirely destroyed by fire.

1966 Nov. 1–Awarded by the Minister of Health and Welfare an official commendation for having a sanitary plant.

1966 Nov.–Misuzu-tofu Co. Ltd. expanded its plants and began to make 'soft' products.

1967 July 1–Asahi-dofu Sales Co. Ltd. was founded.

1967 July–Development at Iida plant of a forming box which does not require removal of whey.

1967 Dec.–Daiya Tofu Co. Ltd. began a plant to work in concert with Asahimatsu Kori-dofu Co. Ltd.

1968 April–Daiya Tofu Co. Ltd. tied up with Asahimatsu Kori-dofu Co. Ltd. Asahimatsu has 53% of the Japanese market.

1968 June 22–Asahi Dofu Sales Co. Ltd. was dissolved. Shinshû-dofu Sales Co. Ltd. was established. Ginseki Kori-dofu Co. Ltd. consigned production to Misuzu Kori-dofu Co. Ltd. Established a sales company entering into partnership with Misuzu Kori-dofu Co. Ltd.

1969 March–Decision to install a test plant which treats liquid effluent waste by the lagoon method inside Asahimatsu Kori-dofu Company's plant.

1969 July 21–'New Asahi-dofu' began to be sold.

1970–Wrapping and boxing machines were introduced at the Iida plant. Specialized dryer for cubes was completed. Percentage of good products at Iida plant is 96% and that of Tenryû plant is 95.3%. The average daily productivity at the Iida plant: 232 sacks, and at the Tenryû plant: 224 sacks. Productivity of labor per unit at the Iida plant: 3.97 hours/1000 cuts, and at the Tenryû plant: 3.28 hours/1000 cuts.

1970 Jan. 1–Genichi Akaba became the new president of Asahimatsu Kori-dofu Co. Ltd.

1970 May–Genichi Akaba, the president of Asahimatsu Kori-dofu Co. Ltd. took office as the chief director of the Kori-dofu Industry Association Union of Nagano prefecture.

1971 Aug. 17–An overseas training program was established. The first trainee was sent to the University of Illinois. A liquid waste management facility was completed.

1972–Operations began in January in the Iida plant and in August in the Tenryû plant. 'Asahikoya with Seasoning' was developed and began its sales with a test market.

1972 Aug. 17–A second trainee was sent to the University of Illinois.

1973–'Asahikoya with Seasoning' was introduced to the public in the Tokyo market. Misuzu Tofu Co. Ltd. began to sell Koya-dofu with seasoning.

1975 Jan.–Tie-up with Mitsubishi Shoji in sales. President Fukui of the National Nutrition Research Institute and the nutritionist Kozu reported the results of an experiment using kori-dofu for preventing anemia.

1976 July–The machine for dehydrating okara at the Tenryû plant began operation.

1976 Oct. 23–The 30th anniversary of Asahimatsu Company was celebrated and a party was held. The percentage of good products at the Iida plant was 96.0%; at the Tenryû plant was 96.4%. The average daily productivity at the Iida plant was 244 sacks (1 sack = 60 kg of soybeans); at the Tenryû plant was 251 sacks. The productivity of labor per unit at the Iida plant was 1.99 hours/1000 cuts; at the Tenryû plant was 1.80 hours/1000 cuts. Address: 1008 Dashina, Iida-shi, Nagano-ken 399-25, Japan.

947. Hartwig, Edgar E. 1981. Re: History of soybeans in North Carolina. Letter to William Shurtleff at Soyfoods Center, Nov. 2. 4 p. Typed, with signature on letterhead.
• ***Summary:*** "In my early years working with soybeans in North Carolina, I traveled with Mr. W.J. Morse on several occasions and he gave me some of the early history of soybeans. One of the men that he mentioned as having an active interest in soybeans in North Carolina was Mr. Fred P. Latham of Belhaven, North Carolina. I wonder if you have the proceedings of the American Soybean Association Volume 1 covering the years 1925-1925. Mr. Latham was active in the early years of the American Soybean Association. In a report he made in 1924, he indicated that he had been growing soybeans for 16 years. He credited W.J. Morse with activating his interest in soybeans. I believe that it was in the fall of 1950, the last years before Mr. Morse retired, we visited Mr. Latham on his farm in eastern North Carolina. He also had retired from active farming. They enjoyed their visit discussing some of the early years with soybeans. I believe members of the Latham family are still farming and growing soybeans in eastern North Carolina.

"C.B. Williams was head of the Agronomy Department

© Copyright Soyinfo Center 2021

at North Carolina State for many years. He had retired at the time I began my work in 1943, but I did have an opportunity to visit with him. He also had worked closely with Mr. Morse in getting soybeans established in North Carolina. Mr. Williams recognized the importance of nodulation on soybeans for successful production and developed a system of collecting soil from fields that had grown well-nodulated soybeans to distribute to areas where soybeans were to be planted the first time.

"As to why soybeans became established in North Carolina more successfully than other areas is a matter of several assumptions. I have assumed that some of the early ships bringing material from Japan had used soybean material for ballast in their ships, and in docking at ports such as Norfolk, Virginia or Elizabeth City, North Carolina had thrown out some of the soybeans that were in excess, and types such as Mammoth Yellow were at a maturity that they were well adapted for northeastern North Carolina and fit into their agricultural practices. I could furnish you a picture of some of the early harvesters should you desire this. As to other pioneers in the field, I do not have any other names to suggest.

"Fertility studies were conducted with soybeans in North Carolina in the late 1920's. Dr. S.G. Lehman, who I have discussed somewhat in the plant pathology work, was a pioneer in the identification and describing of the diseases of soybeans. It seems that in introducing soybeans from the Orient, they introduced most of the diseases attacking the crop in China and Japan. Although soybeans were a relatively unimportant crop in the state, Dr. Lehman and some of his co-workers described many of the diseases that we now recognize as important problems in the production of soybeans. He gave me considerable assistance in learning to identify diseases and recognizing the type of injury which they caused.

"There was no active breeding program concerning soybeans in the area until I began my work in 1943. The varieties Mammoth Yellow, Tokyo, Haberlandt, and Woods Yellow were major varieties. I am assuming that Mammoth Yellow was distributed as coming from ballast material on ships. Tokyo was introduced from Japan in the early 1900's, and Haberlandt was from Korea. I assume that Mr. Morse distributed seed of these to people like Mr. Latham. Woods Yellow was selected as a somewhat later maturing type out of the Mammoth Yellow variety. Later such black seeded types as Laredo and Otootan were introduced for hay production. It was the enthusiasm of people like W.J. Morse, C.B. Williams, and Fred Latham, who, in their contacts with farmers, suggested to them that they might try this crop. There was little attention from extension agronomists or research projects to stimulate the interest in the crop.

"In 1979 the Soybean Processors Association in their annual meeting recognized the 50 years of existence as an organization. The Soybean Crop Advisory Committee in their meeting recognized some of the achievements and activities over the period. I am enclosing a copy of the report which was prepared from this meeting.

"I assume that you have read my chapter on varietal development, but I am enclosing a reprint. I am returning the copies you sent with some modifications and additions.

"I would not classify Mr. W.J. Morse as a soybean breeder, but rather as an agriculturist. He began working for the Department of Agriculture in 1907. Research was at a different level from what it is now. His job was to become familiar with the crop and see where it might fit into the U.S. Agricultural system. In the early years, the crop was considered as a forage crop and also a crop that might be grown and turned under for soil improvement. But I believe it was in the mid-1920's that Piper and Morse stated that the future of soybeans was not as a forage crop, but as a seed crop for producing protein and oil. Since this was a crop in which very few were interested, the early introductions from Asia were grown and looked at and if they did not appear to fit an immediate purpose there was no need or really no system to retain them. You may have mentioned it, but I might repeat that it was not until 1941 that as many acres of soybeans in the U.S. were harvested for seed as were grown for forage. With regard to introductions, we received a large number from Japan after World War II when the U.S. Army of Occupation took over. I believe that essentially all soybean introductions received into the U.S. since 1948 are in our collection and many of their characteristics described and many have been utilized in the breeding program.

"From a machinery standpoint, the development of the combine harvester was a very important aspect in the development of soybean production. The grain binder and stationary thresher was used for small grains and was not as satisfactory for harvesting soybeans. The early beaters developed for harvesting in North Carolina were rather unsatisfactory. This was pulled through the field by a pair of mules and the beaters hit the soybean plants and a portion of the beans went into the box behind the beaters and many of the beans flew into the air in all directions. These beaters, to be moderately successful, required varieties that shattered rather readily. Thus, the beans had to be harvested at a very short time after they were ready to be harvested. If they were not harvested at this time, then seed would be lost to shattering. The Asiatic farmer usually grew only a very small area with soybeans. He cut these by hand and tramped them out. This system was certainly not satisfactory for American agriculture.

"In South Carolina Mr. John Wannamaker became interested in soybean production in the early 1930's. I visited his farm in 1943. He was growing some material that traced to introductions from Nanking, China that were distributed by W.J. Morse. Mr. Wannamaker was very enthusiastic about soybeans and made selections from the original seed lots that he received and distributed them to farmers in his area. His

© Copyright Soyinfo Center 2021

activities and enthusiasm helped get soybeans started in the coastal plains area of South Carolina.

"W.J. Morse seemed to have an ability to hear of anyone that was interested somewhat in soybeans. Professor Tracy had retired as director of the Mississippi Agricultural Experiment Station and had a home on the Mississippi Gulf Coast. Mr. Morse regularly sent him new introductions that were received from parts of Asia that he thought might be suitable for that latitude. One of the introductions that Professor Tracy thought well suited for the area, he gave the name Biloxi. For many years the variety Biloxi was widely grown for interplanting with corn in the southeast, and then grazed after corn was harvested by turning hogs or cattle into the fields. One of the major interests with regard to the variety Biloxi is that this variety was used by Garner and Allard in their studies in describing photoperiodism in plants. Plant physiologists all over the world still request seed of Biloxi from us when they are conducting photoperiod experiments.

"I trust these comments will be of help to you. Should you have further questions which you think I might be able to give you assistance, feel free to contact me at any time.

"Sincerely,..." Address: Research Agronomist, Soybean Production Research, Delta Station, P.O. Box 196, Stoneville, Mississippi 38776.

948. Judy, W.H.; Jackobs, J.A.; Engelbrecht-Wiggans, E.A. 1981. International soybean variety experiment: Sixth report of results, 1978. *INTSOY Series* No. 21. Nov. xi + 305 p. (College of Agric., Univ. of Illinois at Urbana-Champaign).
• ***Summary:*** In the ISVEX trials, soybeans were tested in the following regions and countries: Africa: Algeria, Botswana, Cameroon, Egypt, Ethiopia, Gabon, Ghana, Malawi, Morocco, Rwanda, Senegal, Somalia, Sudan, Tanzania, Upper Volta, Zaire, Zambia, Zimbabwe.

Asia: Bangladesh, Taiwan, India, Indonesia, Korea, Malaysia, Nepal, Pakistan, Sri Lanka, Thailand.

Europe: Italy, Poland, Portugal.

Mesoamerica: Costa Rica, Dominican Republic, Guatemala, Honduras.

Middle East: Iran, Iraq, Saudi Arabia, Turkey.

North America: United States.

Oceania: Fiji, Tahiti.

South America: Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, French Guiana, Paraguay, Peru, Venezuela.

Results of the first ISVEX trials in Morocco are reported. Soybeans were grown at three sites: (1) Berkane. Date planted: 22 May 1978. Cooperator: M.A. Yacoubi. Best yield: Harcor 3,724 kg/ha. (2) Gharb. Date planted: 13 May 1978. Cooperator: M.A. Yacoubi. Best yield: Elf 3,046 kg/ha. (3) Tadla. Date planted: 12 June 1978. Cooperator: Nadah Driss. Best yield: Crawford 3,370 kg/ha. Address: Univ. of Illinois, Urbana.

949. Drake, Milan. 1981. Re: La Choy soy sauce. Letter to William Shurtleff at Soyfoods Center, Dec. 8. 1 p. + 2 p. of labels and recipes. Typed, with signature on letterhead. Preceded by an interview on Dec. 2.
• ***Summary:*** 1. Ed Neel says the first soy sauce bottled by La Choy was definitely hydrolyzed. He recalls that they bottled it pretty much as they received it.

2. Ed Neel recalls that Staley and Huron Milling were the original suppliers of HVP to La Choy.

3. La Choy did not manufacture a fermented soy sauce until after they purchased Oriental Show-You Co. in 1963– says Paul Sigo.

4. La Choy now distributes 2 types of soy sauce: La Choy Soy Sauce (made with HVP) and Oriental Soy Sauce (fermented). Of these two, the HVP product accounts for about 85-90% of all soy sauce sales. Labels for both products are enclosed. Ingredients in the HVP sauce are: Water, protein extracts from soy beans, salt, corn syrup, and caramel color. The fermented product also appears to contain some HVP.

Accompanying this typed letter from Milan Drake is a questionnaire from William Shurtleff on Soyfoods Center letterhead dated 2 Dec. 1981. It contains seven questions, with the answers written in by hand.

Milan does not know when La Choy first began making or marketing soy sauce. Ed Neel thinks it was 1922 or maybe 1923. A document indicates that by 1922 they were importing a soy sauce from China. In Sept. 1944 La Choy soy sauce was advertised in *Soybean Digest.*

La Choy started as follows: Ilhan New (a Korean man) and Charles Smith attended the University of Michigan together. Both felt there was a market for Oriental foods in the area, so they started the company in 1927 in Detroit, but soon expanded. They hired Ed Neel and expanded more. During World War II they were unable to obtain cans, so they moved the company to Archbold, Ohio, then after the war went back to Oriental Foods. Smith bought out Mr. New, then Smith was killed by lightning. Beatrice bought the company in 1943. Address: Director, Research & Development, La Choy Food Products, 901 Stryker Rd., Archbold, Ohio 43502. Phone: 419-445-8015.

950. Kim, Gai W. 1981. Re: Introducing tofu to Sri Lanka. Letter to William Shurtleff at Soyfoods Center, Dec. 18–in reply to inquiry of Nov. 18. 1 p. Typed, with signature.
• ***Summary:*** "I sincerely hope that you and your wife will come to Sri Lanka in the near future to teach me how to make aburaage [deep-fried tofu pouches], which I simply fail to make although I tried all the instructions written in your *The Book of Tofu.*

"As for my project, at present, Tofu, which I named Boncheese here because 'bean' in Sinhalese is Bonchi and the method of making tofu is just like making cheese. Soy

Bread are daily sold at the Cornel's, the only Super Market in Colombo. I managed to make Miso out of Tempeh within a week's time and you have to taste it to appreciate its beauty. The biggest breakthrough is to supply about 50 pounds of *soyamesh* [soybeans ground in water; soybase or soy puree] every morning to the Colombo General Hospitals and the Welikada Prison to be used in lieu of coconut milk for the daily curry cooked in their kitchen. The plant I helped to set up is using about 1.5 to 2 tons of de-hulled [soya] beans a month at the moment.

"I am enclosing a report from the Super Intendent [superintendent] of the Welikade Prison in Colombo for your perusal. If you are really interested in my project in can send you some correspondence and newspaper cutouts [clippings] upon request.

"I just finished writing a letter to BMI regarding an order of BMI 100 for the expansion of the project."

A handwritten note says that Kim is contacting the Navy and Air Force canteens for her soy project.

Attached are two letters which are cited separately: (1) From H.G. Dharmadasa, Superintendent of Welikada / Welikade Prison (Oct. 1981). (2) From Dr. W.S. Weerasooria, Secretary, Ministry of Plan Implementation (16. Oct. 1981). Address: c/o UNDP in Sri Lanka, P.O. Box 1505, Colombo, Sri Lanka.

951. Kiang, Y.T. 1981. Inheritance and variation of amylase in cultivated and wild soybeans and their wild relatives. *J. of Heredity* 72(6):382-86. Nov/Dec. [17 ref]
• ***Summary:*** The cultivated soybean is *Glycine max* and the wild soybean is *Glycine soja.* Eleven wild relatives include *Neonotonia wightii,* which is a perennial with long climbing vines. It is widely distributed in Africa, Southeastern Asia, and Taiwan, and is commonly called the perennial wild soybean. Seed of *Neonotonia wightii* showed no amylase activity except in two accessions from South Africa. Some enzymes of cultivated soybeans have been studied electrophoretically, but there is only one brief report of isozyme analysis of the wild soybean (*Glycine soja*). Address: Assoc. Prof. of Plant Science and Genetics, Univ. of New Hampshire, Durham, NH 03824.

952. Oh, Hea Sook; Lee, K.H.; Yoon, S. 1981. [Preparation of soymilk yogurt and related studies]. *Korean J. of Nutrition* 14(4):175-81. Dec. [39 ref. Kor; eng]
• ***Summary:*** Yogurt was made by fermenting soymilk using lactic acid bacteria: *Lactobacillus acidophilus, Streptococcus thermophilus,* and *L. bulgaricus.* Sucrose, the main carbohydrate in soymilk, was fermented by *L. acidophilus* and *S. thermophilus.* None of the bacteria tested was able to ferment melbiose or raffinose. L. acidophilus grew the fastest during the early stage. After 16 hours of incubation, however, all the cultures except L. bulgaricus grew at nearly equal rates. All cultures except L. bulgaricus formed acid rapidly during 16 hours of incubation, bringing titratable acidity to 0.6% and pH to 4.3, which was enough to cause coagulation of the soymilk.

Three yogurts were prepared using 100% soymilk, 100% cow's milk, and 50% of each, fermented by S. thermophilus, and evaluated by a taste panel. Soy yogurt had a better, custardy texture, however scores for texture, color, and flavor did not differ significantly among the three. Soy yogurt had a significantly lower mean odor score. Total mean scores were between good and fair. Address: Dep. of Food & Nutrition, College of Home Economics, Yonsei Univ., Seoul, South Korea.

958. Bernard, R.L.; Nelson, R.L. 1981. USDA Germplasm Collection Inventory–1900 to 1977. Urbana, Illinois: University of Illinois. 37 p. Typed Ms.
• ***Summary:*** "Information on the origins of introduced United States and Canadian named varieties and all strains identified by FC numbers and PI numbers introduced through 1977 (PI 420.388).

"This is a working paper. Please report any errors to R.L. Bernard, Turner Hall, Univ. of Illinois, Urbana, Illinois 61801. A final document will be issued later in 1981.

"Soybean Germplasm Manual 1."

Gives contact information for the Northern Collection (Maturity Groups 000 to IV, Richard Bernard and Randall Nelson) at the Univ. of Illinois, and the Southern Collection (Maturity Groups V to X, Edgar Hartwig and Calton Edwards) at Stoneville, Mississippi.

This detailed work consists of a 3-page introduction followed by many tables.

This "collection of soybean cultivars, herein referred to as strains, from throughout the world" is maintained by the USDA "in cooperation with the Illinois and Mississippi Experiment Stations. The collection is in two sections, the northern or early-maturing strains... at Urbana, Illinois, and the southern or late-maturing ones... at Stoneville, Mississippi. The collection was established in 1949 with the objective being to obtain and maintain all significantly different soybean strains from throughout the world with emphasis on land races of eastern Asia, where soybeans originated. It was initially assembled by L.F. Williams at Urbana and E.E. Hartwig at Stoneville under the supervision of M.G. Weiss, leader of USDA Soybean Investigation, and J.L. Cartter, director of the U.S. Regional Soybean Laboratory [at Urbana, Illinois].

"The strains of the collection may be divided into three parts corresponding to their designations: 1. United States and Canadian named varieties (cultivars)...

"2. FC strains consisting of foreign introduction and domestic strains identified by a series of numbers assigned by the former Forage and Crops section of the USDA. This series was used until about 1956.

"3. PI strains, consisting of foreign introductions identified by the system described in the following section.

"In addition to the soybean germplasm collection outlined above, collections of genetic types and isolines, wild soybeans (*Glycine soja*), and perennial *Glycine* species are maintained, and lists of this material are available from the curator at Urbana."

"In 1949 when this collection was established they were able to gather from the USDA and various state experiment stations 1,521 strains, which is *19%* of the original 7,873 introductions made through 1944."

"The last page of Table 1 [p. viii] shows the results of the two large Asian collecting expeditions, the first by USDA plant explorer P.H. Dorsett [and his son, Jim] in 1924 to 1927, and the second by Dorsett and USDA soybean specialist W.J. Morse in 1929-1931. The soybeans obtained by them (5,417 varieties) represent 69% of the total received from 1900 to 1944 and make up 82% of the pre-1945 strains in the present collection."

"The major additions in recent years have been the 861 from Japan in 1977 and the 1,823 from South Korea in 1976."

"Maturity Group 00 was split into 000 and 0 in 1981 with the earliest ones in 000."

"The varieties introduced up until about 1908 (36) are mostly hay-type varieties. Those from 1910 to 1927 (61) are mostly grain-type and include virtually all of the introductions ancestral to the present U.S. commercial varieties. Those of 1929 and 1932 (41) were from the Dorsett and Morse expedition and are mostly vegetable types released for human food and home-garden use."

Tables: (1) PI numbers assigned by year, and number of strains in the USDA Soybean Germplasm Collection. The last page of Table 1 shows that from 1924 to 1927 Dorsett sent back 966 soybean PI numbers of which 260 (26.9%) are still in the collection. From 1929 to 1932 Dorsett and Morse sent back 4,451 soybean PI numbers of which 986 (22.2%) are still in the collection.

(2) A statistical history of soybean introduction.

(3A) Soybeans introduced from 1900 to 1944 by country and within country by year.

(3B) Soybeans introduced from 1945 to 1977 by country and within country by year.

(4) Number of strains in the Collection by country.

(5) Number of strains in the Collection by maturity group.

Origins of introduced soybeans which became U.S. and Canadian named varieties.

Origins of soybean strains identified by FC numbers.

Origins of soybean strains identified by PI numbers.

Note: This unpublished typescript was updated and published in two volumes in 1987 as INTSOY Series No. 30 and in 1989 as INTSOY Series No. 31. Both are extremely useful and interesting. Address: Urbana, Illinois.

• ***Summary:*** The Indian woman author of this creative book presents 21 recipes for bean curd (tofu), 7 for tempeh, and some for yuba and miso. Green soy beans with sauce (p. 7). Cabbage with miso (p. 15). Eggplant slices with white miso (p. 22-23). Fresh soy beans, steamed (p. 57). Spinach with fermented bean curd (p. 59). Stuffed yellow squash (with yuba, p. 62-64). Pecel (Vegetable salad with spicy peanut sauce, plus tofu and tempeh; p. 73-74). Tempura (with tofu; p. 75-77). Soy bean sprouts (how to grow; p. 100). Soy-bean and mung-bean sprouts seasoned with sesame oil (p. 105). Tempeh, Fried tempeh, Fried, preseasoned tempeh, Sambal goreng tempeh kering (Sweet and sour tempeh), Tempeh cooked in coconut milk (p. 108-110). Thai fried rice (with Red Bean Curd or Nam Yee [red fermented tofu]; p. 150-51).

One chapter (p. 160-89) is titled "Soy milk, bean curd, and wheat gluten." Making your own soy milk. Making your own bean curd. Udofu (*Yudofu*, simmering bean curd with seasonings). Bean curd with watercress. Korean-style bean curd in a hot water bath. *Hiya-yakko* (Chilled bean curd). Bean curd with Chinese parsley. Bean curd with broccoli. Cabbage cooked with bean curd. Bean curd with a deliciously spicy sauce. Carrots and beans with bean curd dressing. Bean curd, mushrooms, and peanuts in hoisin sauce. Sautéed bean curd. Tofu dengaku (Toasted bean curd with a miso topping). Fried bean curd cubes, soy-bean sprouts sautéed with fried bean curd. Fried bean curd with a sweet-and-sour sauce. Fried bean curd cakes with a mustard surprise. Inari-zushi ("Bags" of fried bean curd stuffed with sushi rice). Pressed bean curd with cabbage. Salad of pressed bean curd, mung-bean sprouts, and agar-agar. How to make fried and baked wheat gluten balls (plus 5 gluten recipes). Buddha's delight (with yuba and fried bean curd).

Chawanmushi (Steamed savory custards, with tofu; p. 192-94). Omelette with bean curd (p. 198-99). Soy sauce eggs (p. 209). Paneer (milk cheese; p. 237-40). Hot or cold noodles with a soy-sauce dressing (p. 248). Noodles with a hot-and-sour bean sauce (p. 250). Vegetarian mee krob (Crisp noodles with pressed bean curd and eggs, from Thailand, p. 255-56). Noodles with quail eggs, mushrooms, spinach, and yuba (Japan; p. 256-57). Hoppers (yeast pancakes from Sri Lanka). Roti (Flat whole-wheat bread). Delicious stock made with soy-bean sprouts. Clear soup with enok mushrooms, bean curd skins [yuba], and spinach (p. 297). Clear soup with soft bean curd and celery cabbage (p. 298). Miso soup with bean curd (p. 307). Miso soup with carrots and mushrooms (p. 308). Fried, munchable soy beans [soynuts] (p. 321-22). Potato and tempeh patties (p. 339). Dipping sauces (with soy sauce; p. 357-59). Kombu relish (with soy sauce, p. 374). Shoyu daikon (White radish pickled in soy sauce). Ginger quick-pickled soy sauce (p. 375). Aomidaikon (Quick pickled small white radishes, with slightly sweet yellow miso; p. 377-78). Chinese-style jellied bean-curd sweetmeat with a peanut topping (p. 399-400).

General information (p. 418-36; lots on soyfoods, see: bean curd [regular, fried, fermented (Nam Yee), pressed, pressed seasoned], kochu chang [jang], miso, soy-, tempeh, yuba). Sources (of ingredients; p. 437-40). Address: New York City, NY.

Well known modern day soybean geneticist whose work is widely acclaimed (Continued–Document part II). In: Leo Windish. 1981. The Soybean Pioneers: Trailblazers, Crusaders, Missionaries. Galva, Illinois: Published by the author. viii + 239 p. See p. 155-60. Chap. 29.
• ***Summary:*** (Continued): "Another major disease, only recently widely found in the midwest, is soybean cyst-nematode. In 1966, although it was present in Illinois in only a few southern counties, Dr. Bernard began a breeding program for cyst-nematode resistance in cooperation with the Missouri Delta Center at Portageville, Missouri. Testing for cyst reaction is done in winter in the Delta Center's greenhouses under the direction of Dr. Grover Shannon, and agronomic evaluation is done in Illinois. Last year, Franklin was released from this program to replace the old variety Custer, the only other northern variety (maturity Group IV or earlier) with resistance to soybean cyst-nematode. Earlier varieties with resistance are now being tested. Some have advanced to the regional tests and will be released for commercial production as soon as the most satisfactory one or ones can be identified.

"Other pests that have received attention include leaf-spot diseases, brown stem rot, and the Mexican beetle. Clark 63 (developed cooperatively with Dr. Williams in Missouri), Wayne, Williams, Woodworth, Union, and Franklin were also selected as resistant to bacterial pustular leaf spot. They have become the major Group III and IV varieties in the southern part of the midwest, and that formerly prevalent disease has become a rarity. On the other hand, downy mildew leaf-spot has become very prevalent in the

© Copyright Soyinfo Center 2021

area because of the high susceptibility of Clark 63, Wayne, Williams, and Woodworth.

"Dr. Bernard has identified a gene for complete resistance to downy mildew leaf-spot and has incorporated it into the variety Union, giving some hope for complete control of this disease as additional resistant varieties are released. Brow stem-rot is one of the most prevalent soybean diseases and appears to increase with frequency of soybean growing. They have been successful in developing productive varieties with resistance to brown stem-rot, discovered by Dr. Chamberlain, at Urbana.

"An extensive program has also been launched for breeding resistance to Mexican bean beetle in cooperation with entomologists here, at Purdue University in Indiana, and at Beltsville Agricultural Research Center in Maryland. Mexican bean beetle has not heavily infested Illinois soybean fields yet, but with heavy infestations in nearby Indiana and Kentucky, as well as in Maryland, it seems wise to start this effort before the problem actually develops here, especially since it will take many years to produce a commercially accepted resistant variety.

"In addition to working on specific pests, Dr. Bernard has been breeding for improved seed quality, especially in varieties adapted to southern Illinois, where quality is so frequently a problem. The related varieties Williams, Woodworth, and Union have come out of this program. While there is room for much more improvement, they are superior in seed quality to the varieties they replaced, and are also more resistant to lodging and shattering. All three varieties have gained wide farmer acceptance. Williams is currently the most popular American variety and is grown on about 9,000,000 acres annually (1979-1980 figures). Dr. Bernard's efforts are now being turned toward selection for resistance to diaporthe, a fungus involved in the seed-quality problem, and for resistance to soybean mosaic and bean-pod mottle, two virus diseases Dr. Bernard also suspects contribute to the seed-quality problem.

"Germ-Plasm: Maintenance of the northern section of the USDA's soybean germ-plasm collection has been one of Dr. Bernard's major responsibilities. The USDA's collection was initiated in 1949, when soybeans had become an important enough crop to justify a permanent collection of all available varieties from throughout the world.

"Before then, many hundreds of soybean varieties had been introduced, especially from eastern Asia, the native homeland of the soybean, but most of them had been discarded if not found immediately useful. In 1949, at the instigation of Martin Weiss, head of the USDA soybean investigations, the USDA and the experiment stations were solicited and all varieties of soybean still in existence in this country were gathered together. They totaled about 2,000. The early-maturing ones were to be maintained at the University of Illinois by Leonard Williams of the U.S. Regional Soybean Laboratory, and the late ones (Group V and later) were to be maintained by Edgar Hartwig at the Delta Branch Station in Mississippi.

"Thus, when Dr. Bernard arrived in 1954, the collection was just about four or five years old and there was much cataloging, identification, and purifying of varieties to be done. In the next few years, performance tests were run for all 2,000 varieties and evaluation reports were circulated to soybean researchers throughout the world. Thousands of seed packets are sent each year to researchers and these have been the basis for successful searches for resistance to many pests and of other research requiring diverse germ-plasm.

"At first, the collection grew rather slowly. Foreign varieties were sent to the United States from time to time, but few active solicitations were made. In the past eight years, the collection has grown much more rapidly, partly because of trips Dr. Bernard made to Japan and South Korea in 1974. While in those countries Dr. Bernard collected specimens himself and made contact with researchers and institutions that had soybean collections. Subsequently we have received a large number of varieties from Korea and Japan. The Urbana collection, which totaled about 2,000 varieties when Dr. Bernard began working with it, now includes over 6,000 domestic and foreign varieties of cultivated soybeans. Just within the past year the Soviet Union sent us over 1,500 additional varieties, which are being added to our collection.

"During Dr. Bernard's trip to Japan, Korea, and China, he collected some samples of the wild soybean (*Glycine soja*), which had never received much attention here or in Asia. From seven accessions previous to 1968 the wild soybean collection has grown to include 558 strains, which provide an interesting subject of study for those interested in the evolution of the soybean, and are a diverse potentially new source of pest resistance and other traits desired by U.S. soybean breeders. In addition to the wild soybean, there are several other species in the genus 'glycine,' all of them perennial and native to Australia, with the range of some extending to southeast Asia and the nearby Pacific islands. When the collection was begun, most American soybean researchers were unaware of these near relatives of the soybean. One or two accessions of what was then known as *Glycine javanica*, the 'perennial soybean,' were in the initial collection at Urbana, and we have since obtained several dozen accessions. Although the taxonomists have now removed this species to the genus *Neonotonia* it still has some interest as a not-too-distantly related legume species and also is a forage crop in its own right in many tropical areas.

"The other species of the genus were completely unknown to American agronomists until Dr. Bernard obtained some seeds of *Glycine tabacina*, originating in Australia. These were planted in the agronomy greenhouse in January, 1958, and produced a small, delicate, viney plant with soybean-like flowers and very small pods and seeds. Seeds of several other species have been received

© Copyright Soyinfo Center 2021

and grown in the greenhouse in subsequent years, and this collection has stimulated the study of Glycine in this country. Theodore Hymowitz and Christine Newell of the Department of Agronomy, have been particularly active in taxonomic and cytological studies of perennial Glycine species. Their work has greatly enlarged the collection of these species and augmented our knowledge about them.

"Current and Future Plans: Today, as more and more researchers at both public institutions and private seed companies are getting into soybean breeding, Dr. Bernard is concentrating more on resistance to pests important to the Midwest, or of potential importance, and on basic genetic studies which he hopes will be useful to the many now engaged in soybean research. In addition, Dr. Bernard said, 'We are greatly increasing our efforts in germ-plasm collecting, documentation, evaluation, and utilization. Before any more germ-plasm is lost we need to obtain collections from those areas that have been insufficiently sampled in the past, such as southern and western China and North Korea. Available information on the collection is being compiled and will be made readily available to interested researchers.'

"With the recent additions of USDA pathologist S.M. Lim and geneticist R.L. Nelson to the staff at the University of Illinois, Dr. Bernard is hopeful that our program of germ-plasm evaluation will be greatly increased, and that the somewhat narrow germ-plasm base of American commercial soybean production can be effectively enlarged, resulting in more efficient and stable production." Address: 101 Exchange St., Galva, Illinois 61434.

962. Tchah, Kyun Hi. 1982. Re: Dr. Chung's Foods Co., the largest soymilk manufacturer in South Korea. Letter to Dr. Chevalier F. De Selliers de Moranville, Jan. 5. 1 p. Typed, with signature.

• ***Summary:*** "Dear Dr. Chevalier: I have learned from prof. John W. Santas of University of Illinois of U.S.A. that you have interest in knowing the firms which are producing Soybean milk.

"Our company is the largest producer of the said milk in Korea, and annual sales in 1981 was around $15 million.

"We like to hear from you the points of your interest and area we could cooperate each other for mutual benefit." Address: Advisor to the President, Dr. Chung's Food Co., Ltd. Head Office, Business Dep. Insong Bldg. 18G 194.15 I-Ka, Hoehyun-Dong, Choong-Ku, Seoul, Korea. Phone: 23-2151-4-28--1234-3158.

963. Selliers, Francois de. 1982. Re: Three new soymilk manufacturers in Asia. Letter to William Shurtleff at New-Age Foods Study Center, Jan. 27–in reply to inquiry of Dec. 22. 1 p. Typed, with signature. [Eng]

• ***Summary:*** They are: Kickapoo Co. Ltd. in Thailand, makers of Lactasoy. United Milk Co. Ltd. in Thailand; part of the Nestlé Group, they make Bonus brand soymilk. Dr. Chung's Foods Co. Ltd. of Korea. Address: Chairman, IIDC (International Investment & Development Corp.) Belgium, Belgium S.A., Rond-Point de l'Etoile 3, Boite 8, B-1050 Brussels, Belgium. Phone: (02) 640-68 00.

964. Wood, Brian J.B. 1982. Soy sauce and miso. *Economic Microbiology* 7:39-86. Jan. A.H. Rose, ed. Fermented Foods. [50 ref]

• ***Summary:*** Contents: 1. Introduction. 2. The preparation of soy sauce: Introduction, preparation of raw materials (the beans, wheat), mixing, koji, moromi. 3. Of beans, microbes, and miso: Beans, microbes, miso. 4. Trade in soy sauce: Introduction, statistics. Table 1 (p. 64-66) shows exports of soy sauce in 1978, in tonnes (metric tons) from Hong Kong, Korean Republic, Singapore, Japan, and total, to almost every country in the world (with each country's population in millions), grouped by region as follows:

1. North America: Canada, USA (#1)–Regional total imports: 6,052.3 tonnes.

2. South and Central America [and Caribbean]: Argentina (#3 in region), Bolivia, Brazil, Chile, Costa Rica, Ecuador, El Salvador, Guatemala, Guyana, Honduras, Mexico (#2), Nicaragua, Panama, Paraguay, Surinam, Venezuela (#1), Granada, Jamaica, Trinidad and Tobago, total. Former Dutch West Indies–Regional total imports: 1,046.4 tonnes.

3. Europe: Austria, Belgium, Czechoslovakia, Denmark, Finland, France (#4 in region), Germany (West #3), Greece, Italy, Netherlands (#2), Norway, Portugal, Spain, Sweden, Switzerland, UK (#1), USSR–Regional total imports: 3,017.7 tonnes.

4. Near and Middle East: Bahrain (#3), Egypt, India, Iran (#2), Iraq, Jordan, Kuwait, Oman, Qatar, Saudi Arabia (#1), United Arab Emirates, Yemen Arab Republic–Regional total imports: 1,193.5 tonnes.

5. Far East and Western Pacific: Brunei, Hong Kong (#3 in region), Indonesia, Japan, Korea (South), Macao, Malaysia (#2), Philippines, Sabah (#1; A state of Malaysia from 1963; Formerly British North Borneo), Sarawak (A state of Malaysia from 1963), Singapore, Taiwan, Thailand–

© Copyright Soyinfo Center 2021

Regional total imports: 3,139.4.

6. Pacific and Australasia: Australia (#1 in region), Cook Islands, Christmas Islands, Fiji, Guam (#2), Nauru, New Caledonia, New Hebrides, New Zealand, Oceania n.c.s. (#3), Papua New Guinea, Portuguese Timor, Samoa and Tonga, Solomon Islands, Tuvalu (Ellis Island), U.S. Oceania–Regional total imports: 1,647.5 tonnes.

Note: This is the earliest document seen (March 2010) concerning soybean products (soy sauce) in Kiribati (Christmas Islands), in Nauru, in Qatar, in Portuguese Timor (later renamed Timor-Leste [East Timor]) or in Tuvalu. This document contains the earliest date seen for soybean products in Kiribati (Christmas Islands), in Nauru, in Qatar, Portuguese Timor, or in Tuvalu (1978); soybeans as such have not yet been reported.

7. Africa: Algeria, Canary Islands, Ethiopia, Gambia, Ghana, Kenya, Libya, Malagasy, Malawi, Mauritius (#2 in region), Nigeria, South Africa (Republic of, #1), Sudan, Réunion Islands (#3), Tanzania, Zaire. Other African countries–Regional total imports: 365.7 tonnes. World total imports: 15,731.5 tonnes, of which 6,192.8 tonnes from Hong Kong, 1,233.5 tonnes from South Korea, 1,713.6 tonnes from Singapore, 6,591.6 tonnes from Japan. The value in pounds sterling and in pounds sterling per tons of soy sauce is given for each exporter.

Other tables show: (2) Soy sauce exports (in tonnes and value) each year from 1976 to 1976 from Hong Kong, South Korea, Singapore, and Japan. A large percentage of Hong Kong's exports are re-exports (probably from China). (3) Total soy sauce exports from Japan, 1976-1978, by container type, with amount and value. (4) Soy sauce and miso production in Japan every 5 years from 1965 to 1978 (in tonnes). (5) Soy sauce and miso production in Japan for export in 1976, 1977, and 1978. Miso production (in tonnes) averaged about 40% of soy sauce production, and miso exports (in tonnes) averaged about 13% of soy sauce exports. (6) Imports of soy sauce into Hong Kong, Singapore, and the USA from exporting countries in 1978 (with figures for exports from China in 1976 and 1977). (7) Re-exports of soy sauce (made in China) from Hong Kong and Singapore in 1978 to major importing countries worldwide, by region, by country. Small countries that are the destination of this soy sauce include: Honduras, Nicaragua, Panama, Venezuela, Trinidad and Tobago, Former Dutch West Indies [also called Netherlands Antilles; they are part of the Lesser Antilles and consist of two groups of islands in the Caribbean Sea: Curaçao and Bonaire, just off the Venezuelan coast, and Sint Eustatius, Saba and Sint Maarten, located southeast of the Virgin Islands. The islands form an autonomous part of the Kingdom of the Netherlands], Pakistan, Saudi Arabia, United Arab Emirates, Brunei, Sabah, Sarawak, Fiji, Nauru, Oceanea (non-U.S.), Oceanea (U.S.), Papua, Samoa and Tonga, Solomon Islands, Ghana, Malagasy Republic, Togo. Total from Hong Kong: 2,945.3 tonnes, and from Singapore 109.5 tonnes.

(8) Exports of miso (in tonnes) from South Korea and Japan in 1978 to major importing countries worldwide, by region, by country. The leading importers are: USA (622), Saudi Arabia (353), Singapore (66), Bahrain (64), Netherlands (38), Iran (29), Iraq (29) France (28), German Federal Republic (23), Smaller importers include: Chile, Guyana, Surinam, Bangladesh, Iran, Iraq, Jordan, Kuwait, Quatar, Saudi Arabia, United Arab Emirates, Yemen Arab Republic, Sabah, Fiji, Guam, New Hebrides, Papua New Guinea, Samoa, Solomon Islands, Algeria, Canary Islands, Ghana, Kenya, Libya, Mozambique, South Africa Republic, Zaire.

Note: This is the earliest document seen (June 2007) concerning soybean products (miso) in Quatar. This document contains the earliest date seen for soybean products in Quatar (1978); soybeans as such have not yet been reported.

(9) Exports of miso from South Korea and Japan in 1976, 1977, and 1978 (quantity and value each year; no importing country names are given).

5. Tour of South East Asia: Technical and scientific aspects, trade aspects. 6. Acknowledgments. References

The chapter on Trade states: Soy sauce and soy paste (miso) are traded between all countries of South East Asia. The Korean Republic's exports nearly quadrupled in tonnage. The Kikkoman Company's production facility in Wisconsin produced 21,6000 tonnes of soy sauce in 1978. This was equal to 3 times the total exports from Japan in the same year. Japan's total share of the world soy sauce market remains very healthy. Miso exports are still small in comparison with soy sauce. On a rising market Japan's exports still only represent 0.2% of its annual miso production; "clearly there is considerable room for expansion here."

Miso is of greater relative importance to Korea than it is to Japan. Among the European countries, Belgium and Holland import the greatest amount of miso on a per capita basis. Spain imports a fair amount of miso. The U.S.A. and Canada had total miso imports totaling about 10% of their soy sauce imports.

"In Thailand, there are about 50 soy sauce factories, the majority of which are small, producing less than 100 kilolitres per year, although it should be noted that most of them also produce soybean paste and soybean cheese [probably tofu]. The total annual consumption of soy sauce in Thailand is estimated at about 6,000 kilolitres (about 7,200 tonnes).

"In Malaysia, there are about 140 soy sauce factories producing in total an estimated 5.5 million gallons of soy sauce per year according to the proprietor of a leading brewery in Kuala Lumpur. This is about 21,000 tonnes per annum" (p. 84). Address: Dep. of Applied Microbiology, Univ., of Strathclyde, Glasgow [Scotland], U.K.

965. Alfa-Laval. 1982. Soy milk. Product and process. Lund, Sweden. 10 p. 30 cm.

• ***Summary:*** Contents: Soybeans–Background (a bar chart shows the protein content of common food products. The soybean is highest with 40%). Nutrition (a diagram shows the basic macro-nutrient composition of a soybean. A chart shows the essential amino acid content of common food products compared with the idea FAO/WHO pattern). Soy milk–The product (a table and an illustration show its composition). Cultivation and yield (of common food products' Beef has the lowest yield of food per acre, followed by cow's milk. Soybean is by far the highest, meaning the best way of making efficient use of land to produce food). Processing (a diagram shows a flow chart of the soymilk process). Process lines: Clarified low bean flavor soy milk line, suspended low bean flavor soy milk line.

Some soy milk plants built with Alfa-Laval soy milk processing components and equipment, or complete soy milk lines are:

"Hong Kong: Hong Kong Soy Bean Product Co Ltd
"Japan: Kibun
"Malaysia: Lam Soon Oil & Soap Co
"South Korea: Dong Bang Oil & Flour Mills Co Ltd
"Taiwan: President Enterprise Corp
"Thailand: Kickapoo
"Thailand: Siam Food Products Ltd

On the back cover we read that for a century, dairy and food engineering has been Alfa-Laval's foremost specialty.

On the cover is a color illustration of a soybean plant with a schematic drawing of an Alfa-Laval soy milk processing plant on a blue background behind it. Address: Lund, Sweden.

• ***Summary:*** Contents: Comments, by Peter H. Epp, Chairman. Japan: Home Shokuhin Tofu Manufacturing Co., Komatsuya Shokuhin (natto mfg. plant), Nihon Miso (manufacturing plant), Japan Miso Assoc., Japan Tofu Assoc., Federation of Japan Natto Manufacturers' Cooperative Society, Wako Shokuryo Co. (makes natto; Jacob Hartz in Arkansas supplies them with "936X" variety small-sized natto soybeans; Wako also supplies Nihon Miso Mfg. Plant), X-Can Far East Ltd. Korea: Seoul meeting at embassy, Chung's Food Ltd., Agriculture and Fisheries Development Corp., Korean Soybean Curd Cooperative Manufacturing Assoc. Singapore: Okura & Company Ltd., Eng Huat Pte. Ltd., Intraco. Malaysia: Yeo Hiap Seng Co. Ltd. (the largest manufacturer of soymilk in Malaysia and Singapore). Follow-up. Conclusion.

Each of the following members of the mission wrote a chapter in this book, discussing each visit mentioned in the contents: Peter H. Epp, Bernard Calhoun, Otis McGregor, Richard I. Buzzell, M.D. Pennell (General Manager, R&D, H.J. Heinz Company of Canada Ltd.), Michael Loh (Export Development Specialist, Ontario Ministry of Agriculture and Food).

Details are given on the soybean characteristics desired for each type of soyfood product, especially in the chapter by Dr. Buzzell. Popular soybean varieties include: For Miso: Enlei [Enrei], Fujimejiro, Harcor.

For natto: The main natto specifications are: 1. Seed size–small but fully developed, less than 5.0 mm diameter if possible. 2. Round seed. 3. Total sugar content < 22%. 4. Oil content > 19%. 5. White / yellow hilum. Best natto varieties: Jizuka (the smallest, from Ibaraki prefecture) and Suzuhime (small, from Hokkaido), "two domestic [Japanese] varieties used for superior quality natto, were priced at $100 U.S. for 60 kg. The U.S. varieties which have been, and are being used presently, are not satisfactory. Both Nattawa and Pioneer 1677 varieties should adapt well to the natto product." Jennett (H24) from the USA is good. (p. 5, "Natto specifications Japan, unnumbered page near rear).

For tofu: Amsoy, Coles, Harcor.

Letter from Fred Brandenburg of OSGMB. 1994. Nov. 9. "Regarding export promotion before 1982, any activities would have been part of larger government sponsored trade missions. For example, in 1979 Otis McGregor participated in a mission to Asia which was co-ordinated by Michael Loh. It included a number of marketing boards and associations from Canada."

Note: This is the earliest document seen (Dec. 1998) that (apparently) mentions the soybean variety Enrei. Address: P.O. Box 1199, Chatham, ONT N7M 5L8, Canada. Phone: 519-352-7730.

© Copyright Soyinfo Center 2021

confessed to last week was Korean *kochujang*, a spicy red pepper sauce... The others are top secret. So be it.)"

969. Meals for Millions / Freedom from Hunger Foundation. 1982. Annual report 1981: Self-help for a hungry world. Santa Monica, California: MFM Foundation. 16 p. 18 x 26 cm.

• ***Summary:*** Peter J. Davies is President; he works at the New York office. Alfred C. Bartholomew, Ph.D., D.D., is chairperson, board of trustees. On the orange, black and white cover is a photo of a two women hoeing. MFM's logo of a plant growing in an upturned bowl is on the back cover.

Ecuador (p. 5): "In 1981, a group of farmers asked for our help. Because of a four-year drought, they could no longer grow soy, a cash crop we helped to introduce on the peninsula in 1974." So they are raising other crops and chickens.

"The multiplier effect: Training families; training trainers" (p. 8). "The decision made in 1980 to carry Meals for Millions training overseas was a sound one. Our first full year in the field produced an accelerated training program and an unprecedented multiplier effect that is reflected in the food and nutrition projects established by participants in their own countries.

"In June, in Kenya, we convened 12 nutrition planners and supervisors to involve them actively in the design of the two-week training of field level workers scheduled for late 1981. This cooperative advance planning resulted in a November course for 25 field workers, all hand-picked by their supervisors and described by Meals for Millions' staff as 'the best group we ever had.'"

"Our food technology transfer program" (p. 10) shows a photo of a village texturizer being used in Lampang, Thailand.

"Connections," a "twice-a-year newsletter to establish communication links among our widely dispersed overseas training participants," is now being published. A photo shows the cover of two issues.

"1981 financial support" (list of major donors). 1981 financial highlights. Total income: $1.576 million. The entire last page (p. 15) lists: Executive staff. Regional directors (Africa, Latin America / Caribbean. Asia / South Pacific, U.S. Southwest). Technical staff. Field offices (Kenya, Sierra Leone, Antigua, Ecuador, Honduras, Korea, U.S. Southwest). Honorary trustees (Henry Borsook, M.D., PhD, Willard E. Baier, Dr. Gladys Emerson). Board of trustees. National committee of sponsors.

Photos show: (1) Nelda Clinton (with signature). (2) Peter J. Davies.

Note: Included with the annual report is MFM / FFH "Highlights of 1981: Self-help for a hungry world." It is one sheet folded into 8 panels. Address: 1. Western office: 1800 Olympic Boulevard, Santa Monica, California 90406; 2. Eastern office: 815 Second Ave., Suite 501, New York City, NY 10017. Phone: (213) 829-5337 or (212) 986-4170.

970. Senanayake, E.L. 1982. Soybeans as food through the ages. *INTSOY Series* No. 22. p. 3-4. J.B. Sinclair and J.A. Jackobs, eds. Soybean Seed Quality and Stand Improvement (College of Agric., Univ. of Illinois at Urbana-Champaign).

• ***Summary:*** "It is true that my country [Sri Lanka] goes back 2,523 years and has not suffered a great deal from famine. But in the recent past, in 1973, '74, and '75, there was an unprecedented drought, and I saw people eating things that normally the people of our country do not eat.

"The soybean, which is called a miracle bean, is fairly new to us. Prior to the Second World War, the late Mr. Walter Moragoda, Chief Propaganda Officer in the Agriculture Department, encouraged the growing of soybeans. But the crop was adopted only in the village home gardens. We owe a great debt of gratitude to the late Mr. Bill Golden, who, with his untiring efforts, interested the Agriculture Department and the people of Sri Lanka in the soybean. His efforts got us into INTSOY, which has benefited us greatly. Since 1975, through UNDP and FAO assistance, we have had the assistance of Dr. Carl Hittle and his team, who have developed soybeans to a great extent in this country. We must thank UNICEF and CARE for having sponsored the pilot factory at Gannoruwa...

"I am happy to see Mrs. Y.Y. Kim here in this hall. [Note: She is the wife of Gai W. Kim, of UNDP, Sri Lanka]. She, in her own silent way, has been propagating the use of soybeans at the village level... Mrs. Kim has taught housewives to use the ordinary grinding stone to reduce soybean seed to a powder that is edible... I think CARE, by introducing Thriposha, has introduced an infant milk food that I hope will catch on in the future and not only stop the drain of our foreign exchange in importing infant milk foods but also give our children a wholesome protein diet...

"We are experimenting with the possibility of using 10 percent soybean flour in baking our bread, which will save a tremendous amount of money spent in foreign exchange. Soya milk for infants is also being promoted by the new Soy Foods Research Centre (SFRC)." Address: Minister, Ministry of Agricultural Development and Research, Government of Sri Lanka.

973. Kim, Gai W. 1982. Re: Details of introducing tofu [Boncheese] to Sri Lanka. More on replacing coconut milk with soymilk. Letter to William Shurtleff at Soyfoods Center, April 23–in reply to inquiry of April 13. 2 p. Typed, with signature.

• ***Summary:*** "Thank you for your letter dated 13 April 1982 asking me for information about Sri Lanka's first tofu shop."

The name of the show was Boncheese, 128 Kitulwatte Rd., Colombo, Sri Lanka. Phone: 596-992. Owner: Mr. U.N. Gunasekera; he is one of the few big contractors in Sri Lanka.

Work on the factory was completed by March 1980. The product, Boncheese, was publicly retailed at a stall in Kolpetty Market, the largest market in Colombo. The factory had to be closed from December, 1980 to March, 1981 due to a shortage of soybeans in the local market. At the moment, Cornel's Super Market, which opened in early August, the only Super Market in Colombo, is the sole sales outlet for Boncheese; 60 lb per day is supplied.

Sri Lankans usually cut tofu into ½-inch cubes and deep fry them before adding them to curry in place of whole boiled eggs or beef. Foreigners and Sri Lankans who have lived abroad are the best customers. "I have already given quite a few demonstrations on how to use tofu but, I think, more efforts should be made.

"I named tofu as 'Boncheese' in order to give Sri Lankans a name that was more familiar to them. Locally any bean is called 'Bonchi.' I added 'Cheese' to make it 'Boncheese' because of its similarity in texture and in the way it is made like *farmer's cheese* which I used to replace with tofu when it as not available.

Sri Lankans use coconut milk to make their curries; it is not only very expensive but also very rich in cholesterol [high in saturated fats]. So far I succeeded in replacing coconut milk with diluted soya paste at the kitchens of Colombo General Hospital and Welikade Prison. The Boncheese factory delivers about 30 kg (dry weight) of soybeans wet ground every morning to those institutions 365 days a year. Since 500 gm of soybean replaces 10 coconuts, 600 coconuts are not used and that means 100% saving in cost to the institutions.

At my urging, the Nutrition section of the Ministry of Plan Implementation already ordered two grinding machines from Bean Machines, Inc. One machine will be given to the Welikade Prison kitchen so that it will not only be self-sufficient in making its own soy paste (at the moment only 30% of the coconut milk is replaced by soy paste) but will also be able to make tofu and soy bread. The prison farms are already growing their own soybeans! Address: c/o UNDP in Sri Lanka, P.O. Box 1505, Colombo, Sri Lanka.

974. Palucci, Jeno. 1982. Brief history of Chun King soy sauce (Interview). *SoyaScan Notes.* April 30. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** Jeno founded Chun King in 1945. The company first began selling ready-made soy sauce in about 1947.

Note: A search of the U.S. Patent and Trademark Office

© Copyright Soyinfo Center 2021

database shows that the "Chun King" trademark (more specifically a "Word Mark") was first used and first used in commerce on 1 Jan. 1948 and was first registered (by Chun King Corporation, Duluth, Minnesota) on 16 Sept. 1957. The trademark was to be used for "Various canned unitarily packed foods." A list of these foods is given, and includes "Soya Sauce." Actually Chun King registered two similar "Word Marks. Both have the word "Chun" written in rounded Oriental-looking letters above the word "King." Both words are the same height, the same width, and the same "typeface" or design. In one, the wards are written in outline letters and in the other in solid black letters.

Chun King never made fermented soy sauce. They bought their nonfermented soy sauce by the barrel from a plant in Toledo, Ohio, run by the Donofrio Brothers, then repackaged it under the Chun King label. He does not remember the company's name but their technician was a man (perhaps Lou Minor) who had worked for La Choy. This man first got Jeno interested in soy sauce before he started buying from A.E. Staley. In the late 1940s and 1950s Jeno was not aware of any fermented soy sauce being made in the USA; it was all made from HVP. Kikkoman introduced fermented soy sauce to the USA by importing it from Japan.

Jeno thinks Chun King may initially have bought its soy sauce from A.E. Staley Mfg. Co.–but he is not sure. It was shipped by the barrel. Starting in the late 1950s, Jeno bought HVP from Staley and started blended his own soy sauce; he recalls that Staley sold both HVP and blended soy sauce.

When Jeno started selling soy sauce, La Choy had about 60% of the U.S. market and the remaining 40% was divided up among Chinese-, Japanese-, and Korean-American manufacturers. One Polish fellow in Chicago, Illinois, named Ben Gee, was also in the business. In the 1950s it became a battle between La Choy and Chun King, and in the end, when Jeno sold out, Chun King was definitely the market leader. But now La Choy has again taken the lead. Chun King is trying to re-capture the lead with a big ad campaign and a catchy jingle.

Jeno is quite sure that all Chun King soy sauce is presently made in Cambridge, Maryland. The company's plant used to be in Duluth, Minnesota, but after he sold the company, the Duluth plant was closed, and he bought it back.

Jeno also grew mung bean sprouts; he tried sprouting soybeans but was not successful. Address: Jeno's Inc. (Pizza), 525 Lake Ave. South, Duluth, Minnesota 55802. Phone: 218-723-5555.

975. **Product Name:** Soybean Curd, and Soy Milk.
**Manufacturer's Name:** Dae Han and Company.
**Manufacturer's Address:** 18300 S.W. Boones Ferry Rd., Durham, OR 97223. Phone: 503-620-8983.
**Date of Introduction:** 1982 April.
**New Product–Documentation:** Form filled out by Yeun Mo Koo (Korean). The company started on 1 April 1982.

Talk with Paul Moss, who has worked with Dae Han for 7 years. 1990. May 28. The company name is now Dae Han, Inc., 737 S.E. Alder St., Portland, Oregon 97214. Phone: 503-233-8638. Paul plans to use their plant to make tempeh. Labels sent by Paul Moss. 1990. May 10. The soymilk is now called Fresh Wonder Soy (Plain Soy Beverage). The two types of tofu are Organic Regular Tofu (Japanese Style), and Organic Firm Tofu (Chinese Style). Both are certified kosher by Rabbi Yonah H. Geller.

soyinfocenter.com.
• ***Summary:*** www.soyinfocenter.com/HSS/roasted_soy_flour.php

A comprehensive history of the subject. Contents: Introduction. Etymology. Use of the term "roasted whole soy flour." In Korean, *konggaru* means "roasted soybean powder." Part I: History of roasted soy flour in East Asia. China. Japan. Other East Asia. Part II: History of roasted soy flour in Europe. Part III: History of roasted soy flour in the United States. Part IV: History of roasted soy flour in the Third World. Part V: History of soy coffee. Europe. USA. East Asia. Part VI: History of soy chocolate. Europe. USA. Part VII: History of roasted soynut butter. Part VIII: Outlook for roasted soy flour.

Etymology: In China as early as the third century BC, roasted soy flour was known as *tou hsieh* ("bean powder or shavings"). By the 1700s it was also called *tou fen* ("bean flour") and by the 20th century it was called *huang tou* in standard Chinese (Mandarin) and *wong-dow* in Cantonese. Both terms mean "yellow bean." It is not known when these terms originated.

In Japanese in olden times, roasted soy flour is said to have been called *mame-ko* ("bean flour," written with the same characters as tou fen in Chinese). Later (the date is unknown) it came to be called kinako ("yellow flour"). Roasted soy flour is called *bubuk kedele* in Indonesian and *konggomul* in Korean.

In English, most of the early references to roasted soy flour were descriptive / indirect, such as "roasted soybeans ground into a fine powder" (Piper and Morse 1923). It was also referred to as "roasted bean flour" (Horvath 1927), "kinako" (Smith 1958) and "roasted full-fat soy flour" (Harper and Lorenz 1974; Shurtleff and Aoyagi 1975). The shortened term "roasted soy flour" was first used in 1976 by Shurtleff and Aoyagi in their *Book of Miso.* On packaging, to emphasize the fact that the flour is not defatted, it may be labeled "Roasted Whole Soy Flour."

Roasted soy flour is called *gerostetes sojamehl* in German and *harina de soya tostada* in Spanish. No French name is known.

Note. This is the earliest English-language document seen (Nov. 2012) that contains the term "roasted whole soy flour." Address: Lafayette, California. Phone: 415-283-2991.

979. Kikkoman International. 1982. Market share of U.S. soy sauce market (including teriyaki sauce): Dollar base. San Francisco, California. 3 p. Unpublished manuscript. [1 ref]
• ***Summary:*** The SAMI (Selling Areas Marketing Inc.) report shows that for U.S. supermarkets in Dec. 1981 the market shares based on dollar sales were Kikkoman 49%, La Choy 32%, Chun King 13%, and Other 6%. In May 1982 these figures were 50%, 32%, 11%, and 7%. In 1979 these figures were 44%, 34%, 16%, and 6%. Thus Kikkoman's gains in market share were made largely at the expense of Chun King. Address: San Francisco, California.

980. Kim, Kyung-Ja; Ryu, M.K.; Kim, S.S. 1982. [*Chungkook-jang koji* fermentation with rice straw]. *Korean J. of Food Science and Technology* 14(4):301-08. May. [33 ref. Kor; eng]
• ***Summary:*** "Chungkook-jang koji was fermented with rice straw at 40ºC and 50ºC for 72 hours. The changes in proximate composition, pH, titratable acidity, nitrogen compounds, protease activity and free amino acids during the fermentation were investigated. Moisture, lipid and protein contents remained essentially unchanged during the fermentation."

"Based on these results, it seems that the optimum fermentation conditions for *Chungkook-jang* were 40ºC and 72 hours" [3 full days]. Address: 1&3. Dep. of Food Science and Nutrition, Sook Myung Woman's Univ., Seoul 140; 2. Lab. of Sampyo Food Indust. Co., Ltd., Seoul 131, South Korea.

Shurtleff & Aoyagi. 1984. Soymilk Industry & Market. p. 81-83. They produced an estimated 1,272 tonnes in 1983.

982. Re: Names of soyfoods around the world: Korean. 1982. Form filled out and returned to William Shurtleff at Soyfoods Center, May. 1 p. Handwritten. [Eng; kor]
• ***Summary:*** Soyfoods: Daedu skikpoom.

Green vegetable soybeans: largely unknown or poot-kong or sang kong?

Soybean: me ju kong.

Whole dry soybeans: hinkong or daedu

Soy sprouts: kongnamul

Roasted soy flour: konggomul

Soymilk: kongkuk or duyu, du-u, or du yu.

Tofu: dubu, du bu or tubu.

Soymilk curds (uncurded / uncurdled tofu): sundubu.

Deep-fried tofu cutlets: yubu (7 by 1 by 3/4 inch strips).

Okara or soy pulp: piji

Miso or Korean-Style Fermented Soybean Paste. Doenjang.

Soy sauce: kanjang

Tempeh: unknown

Natto: Chong kuk-jang or Joenkuk-jang

Soy oil: daedu yoo

Soy flour: daedu boon

© Copyright Soyinfo Center 2021

Whole soy flour: chunji daedu boon
Defatted soy flour: talji daedu boon
Soy flakes and grits: daedu appyon and daedu sa
Soy protein concentrate: nong-chook daedu danbaek
Soy protein isolate: boon-ri daudu danbaek
Textured soy protein products: cho-jik daedu danbaek jepoom
Textured soy flour: cho-jik daedu danbaek (Note that TVP is an ADM brand name and registered trademark).

983. Suh, Jeong-Sook; Lee, S.G.; Ryu, M.K. 1982. [Effect of *Bacillus* strains on *Chungkook-jang* processing. II. Changes of the components and enzyme activities during the storage of Chungkook-jang]. *Korean J. of Food Science and Technology* 14(4):309-14. May. [23 ref. Kor; eng]
• ***Summary:*** The growth process of Chungkook-jang that occurred by utilizing such traditional methods as *Bacillus natto* and *Bacillus subtilis* has been examined. The results of the experiment in which the changing process of elements during the storage period had been measured are as follows:
"1. During the growth period, concerning any change in pH, the storage period had been declined and after 18 days pH rose above 7.0. Salt content was between 5.28 and 6.40% and *Bacillus subtilis* bacteria showed the highest titratable acidity.
"2. Moisture content was between 50.94 and 56.74% and crude protein content range was 14.44-18.60% indicating irregularity in pattern resulting from the testing equipment groups, whereas crude fat and crude fiber tend to decrease in general.
"3. During the storage, total sugar and ethyl alcohol content in all of groups tended to decrease and after 18 days *Bacillus subtilis'* total sugar content was the lowest.
"4. Amino nitrogen and water soluble nitrogen content increased with days, but no difference was found between groups.
"5. Amylase and protease activity showed irregular pattern with time, but no significant difference between groups was found." Address: 1-2. Seoul Junior Health College, Seoul 100; 3. Lab. of Sampyo Food Indust. Co., Ltd., Seoul 132.

984. Foley, Terrence B. 1982. Soybeans and soyfoods in China (Interview). Conducted by William Shurtleff of Soyfoods Center, June 12. 2 p. typed manuscript.
• ***Summary:*** Terry is now in the USA, visiting American Soybean Assoc. headquarters. He has been an ASA employee for 1½ years. He is a specialist in East Asia, who studied Chinese history in college and worked in Massachusetts. He knows our work, has all our books on soyfoods, and hopes we can meet some time. There are no official statistics published by China on its agricultural production or area.
Terry's inquiries in Peking indicate that peanut oil is preferred for food use, followed by soybean oil, rapeseed oil, and lard–in that order. Sesame oil is not mentioned. He does not know what oils are preferred in southern China. He has read that Manchurians prefer soy oil. Like all basic foods, vegetable oil is rationed, to maybe a couple of cups per family per year; he has no figures on the exact amount. Vegetable oil is replacing lard. Koreans strongly prefer sesame oil; they drizzle it on foods.
About 85% of the oil made in China is obtained using traditional hand-turned screw presses; the remaining 15% comes from modern solvent extraction plants. He has visited such plants in Shanghai, and knows they are operating in Dairen and elsewhere in Manchuria such as Harbin and perhaps Shenyang. These large solvent plants probably refine their oil. He would guess that both refined and traditional unrefined soy oil are sold in China. When a consumer buys oil, she takes her own bottle to a distribution point in a store, then has it filled. He strongly suspects the quality would be very poor by Western standards.
The Chinese are moving to low-fat hogs, since the people want more meat and less fat. There are now two prices established by the government: fatty pork and lean pork.
The main area of soybean production in China is the northeast (Manchuria), followed by the North China Plain. There is now a big export push in China to raise money. Some soybeans have been exported to Japan; most soybean meal is spread on the fields.
Tofu is in especially short supply in China; housewives almost get into a fistfight waiting in long lines for it.
ASA's top priority in China is the livestock industry, including the formulation of modern livestock diets, confinement methods, disease prevention, and genetics (to get modern breeds of animals to China). Address: Director, China Office, American Soybean Assoc.

985. Lee, Sang-Hyo; Chung, Dong-Hyo. 1982. [Studies on the effects of plant growth regulator on growth and nutrient compositions in soybean sprout]. *J. of the Korean Agricultural Chemical Society* 25(2):75-82. June. [34 ref. Kor; eng]
• ***Summary:*** Soybean sprouts treated with plant growth regulators (IAA and BA) had considerably shorter roots than the control. Weight and diameter of treated sprouts were increased by 10-20% and 40% respectively. Crude protein and fat contents of the treated soy sprouts were higher by 5-10% and 10% respectively than the control. Ascorbic acid increased by 70% to 38 mg%. Soy sprouts contained 16 amino acids and the treated sprouts contained more arginine, histidine, lysine, and methionine than the control. The ratio of unsaturated:saturated fatty acids was about 4.4. Address: Dep. of Food Technology, College of Agriculture, Chung-ang Univ., Seoul, 151, South Korea.

natto and its relatives. Soyfoods Center, P.O. Box 234, Lafayette, CA 94549. 39 p. July 17. Unpublished typescript. Available online at www.soyinfocenter.com.
• ***Summary:*** www.soyinfocenter.com/HSS/natto1.php

A comprehensive history of the subject. Contents: Introduction. Etymology. Part I: History of natto in Japan. Sources of information. Theories of origin. Heian period (794-1185). Kamakura period (1185-1333). Muromachi period (1338-1600). Edo (Tokugawa) period (1600-1868). Meiji period (1868-1911). Taisho period (1912-1925). Showa period (1926-1981 and beyond). Popular types of Japanese natto. Natto in the prefectures. Pictures of natto containers. Part II: History of relatives of natto in East Asia. Unsalted / bland fermented black soybeans in China. Joenkuk-jang in Korea. Thua-nao in Thailand. Kinema in Nepal. Sere in Bali, Indonesia. Part III: History of natto in Europe. Part IV: History of natto in the United States.

Note: This is the earliest English-language document seen (Jan. 2012) that uses the word "Joenkuk-jang" to refer to Korean-style natto. Address: Lafayette, California. Phone: 415-283-2991.

987. Tally, Gene. 1982. The Coca-Cola Company's work with soymilk in Asia (Interview). Conducted by William Shurtleff of Soyfoods Center, July 29. 1 p. transcript.
• ***Summary:*** Coca-Cola Co. (CCC) does not have a soymilk on the market in Thailand; they are still at the talking stage.

CCC has introduced soymilk, named H-C, in Hong Kong. They use their franchise Coca-Cola bottler there. They just bottle soymilk like any other soft drink by using soy protein isolates. So no need for a soymilk plant or buying soybeans etc. This is the way soft drink companies can easily get into soymilk.

In the Philippines, CCC is not presently involved with soymilk. The Magnolia Dairy Co. is owned by the same group that owns the Coke business in the Philippines. They have made it in the past, are not doing it now, but will resume soon, after they develop a new formulation. In the future they will probably not use Coke's soymilk formulations. Probably get from Dong Bang in Korea, or a group in Belgium, which has technology. Not the same as the Singapore company. This is a split-off of the Singapore company.

CCC has not yet introduced soymilk in USA, but they are looking at it. They are now in a feasibility study. They have Tetra Brik lines in the U.S. making Hi-C juices. The company's decision to go or no-go is imminent. We'll be the first to know.

Lots of talk with Vitasoy in the past about a joint venture in Hong Kong.

Thailand. CCC would probably contract with one of the local dairy companies there to co-pack for them. Probably Siam Foods. Its a bit early; only in the talk stage. Originally did a lot of exploratory work concerning Thailand with Vitasoy but it took a long time and the Los wanted to use their own formula, so they went different ways. CCC may not get a product on the market for Thailand in less than 1-1½% years.

Talley would like to be marketing manager for Morinaga's tofu products in the US. Address: Coca-Cola Co., Atlanta, Georgia.

988. *Toyo Shinpo* (*Soyfoods News*). 1982. Yoshikawa Shoji [Yoshikawa Shoji has opened a branch office in Seoul, Korea]. Aug. 11. [Jap]

• ***Summary:*** www.soyinfocenter.com/HSS/new_third_world.php

A comprehensive history of the subject. Contents: Introduction: Third World countries in which soy is "new." History and potential in "new" Third World countries: When introduced to each region, active history started in 1960 (protein gap) and 1970's: International Soybean Program (INTSOY), American Soybean Association (ASA), high prices, international conferences, call for further research, the potential: population and hunger. Basic approaches to introducing soybeans and soyfoods: Can't introduce like rice or wheat, need utilization training, how to get it, whole dry soybeans in Brazil and India, the traditional trickle-down approach (Japan–all village centered, Korea, Indonesia), the national integrated approach (examples of it–Sri Lanka, basic components: Cooperative funding, training center, well educated and inspired teachers, a publication, farm extension workers and farmers, soyfoods extension workers and resident students, soyfoods users–food industry and institutional, the people/villagers), the single enterprise integrated approach (examples of it, Soya Production and Research Association, Uganda, CARE in Costa Rica, teach farmers, guarantee crop, make food, advertise it), the commune village integrated approach (examples–the Farm, teach farmers, establish communal business, all use the food), the free market-government aid/extension/research approach (examples–Egypt, Brazil, oil mills and exports), the soyfoods missionary/mass movement approach or village uplift (examples–Blanca Dominguez, soyfoods movement in America, show others, they teach others, encourage starting of small businesses, broad-based, teach all over via books, programs, later start schools). Soyfoods applications: Oil, flour, textured soy flour (TSF), as is, traditional vs. new countries. Production and marketing approaches: Soybean crushing plant (oil and defatted meal, meal to fortify or TSF), middle level low-cost extrusion or soy dairy, small decentralized village and cottage industries, all traditional countries took this approach. Address: Lafayette, California. Phone: 415-283-2991.

997. Tsuchiya, Kanji. 1982. Tônyû. Shinban [Soymilk. 2nd ed.]. Tokyo: Shoku no Joho-sha. 223 p. First edition was published in 1980. Illust. 17 cm. [Jap]

• ***Summary:*** This is the best book seen to date on soymilk in Japanese. A detailed chronology of tofu and soymilk is given on pages 173-76. Over 20 years ago, when Mr. Tsuchiya was plant manager of the *Kyôdo Nyûgyo* dairy milk plant at Matsumoto, he became interested in using soy protein to replace dairy protein. Although soybean crushers had investigated the use of defatted soybean meal, the techniques for removing the beany flavor and smell were not yet good enough to allow substitution of soy protein for milk solids. At that time there was a shortage of imported nonfat milk for use in ice cream bars. It was said that a small numbers of manufacturers of the inexpensive ice cream products were already using some soy protein to increase their over-run. "Discovering this, Nisshin Seiyu, after some research, found a method of removing the beany smell by fermentation with a yeast; they asked if Kyodo Nyugyo could make a test run of 10 kg of spray-dried soymilk in our plant. So they dissolved soy powder (*daizu-ko;* which had been defatted at a low temperature) in water, added yeast, waited until the reaction was finished, diluted it with some water, and put it in a spray dryer. Yet the spray drying caused some protein denaturation and an increase in the viscosity of the soy powder, which made it difficult to pump the solution to the top of the spray dryer. Glucose was used to replace half the soy powder. The spray-dried powder would not dissolve in water and the resulting mixture had a muddy brown color, a flavor that was too sweet, and a beany flavor. It was useless. They had discovered that defatted soybean meal and nonfat dried milk behave differently. Defatted soybean meal contains about 20% sugars, but less than 1/3 of these are water soluble and many have a very complicated structure and high viscosity."

Therefore they started to study the basic nature of

© Copyright Soyinfo Center 2021

defatted soybean powder (*dasshi daizu-ko*) and after much trial and error, in 1961 they applied for a Japanese patent on "The method of refining defatted soybean powder" (*Dasshi daizu-ko no seisei hôhô*). They were issued the patent (#16,658) in 1962. The key to the success of this patent was the use of meta potassium bisulfite (*meta jûaryusan karium*), which lowers the viscosity, bleaches it and increases the amount of soluble nitrogen. Not enough of the beany flavor had been removed, yet at that time it was an excellent product, which could be used in place up to 30% of nonfat dried milk to make an ice cream product without a beany flavor. Mr. Masaharu Sato (who is presently head of the soybean department of Kyodo Nyugyo's central research lab) was the person who contributed most to the discovery. He is now conducting research on tofu and soymilk. "I still see him often since we are both members of Soyfoods Development Study Group (*Daizu Shokuhin Kaihatsu Kenkyû-kai*). He recently told me, 'After that incident, I became captivated by soy protein.'"

"After about 2 years of research, during the summer we received an order from Nisshin Seiyu for 200 tons of soy protein. Our plant had been losing money for a long time, and this discovery helped to make some profit during my time of work there. I will never forget it. I feel real gratitude to Nisshin Seiyu for helping us to become captivated by soybeans."

At about that time dairy farmers throughout Japan began to compete with one another in a price war which lowered milk prices. The battle between them and the owners of dairy milk companies got worse and worse. Among the leaders of this struggle were progressive dairy farmers in Matsumoto. "Although we made soy powder very secretly, one of the plant workers, who was the son of a dairy farmer, leaked the secret. This caused an uproar (we were using soy powder instead of dairy milk) and the local farmers asked us to stop immediately. However we decided to continue making soy powder for various reasons: (1) We had to fulfill the order that we had accepted; (2) Since we simply processed soy and sold it to another company, this had no effect on our plant's use of unprocessed dairy milk; (3) The soy business allowed out plant to operate profitably and this allowed us to return some money on the dairy farmers' investment." For a variety of complex reasons related to this conflict, Mr. Tsuchiya was fired as plant manager for Kyodo Nyugyo's Matsumoto dairy milk plant. Though his retirement was very near, he left the dairy industry without regret to continue his research on soy powder (p. 14-19).

"Meeting with Dr. Miller: During the period 1965-1969 I was involved in the founding of Taiwan Ryokusô Kogyô Kôshi, and I took a leadership role in constructing modern plants to make powdered soymilk and chlorella. One of the leaders in the chlorella industry, the late Dr. Yoshio Takechi, was in charge of the chlorella cultivation department and I was in charge of chlorella product development and of powdered soymilk production. In 1966 Dr. W.A. [sic, Harry W.] Miller (who was a founder of Loma Linda Foods) and his son visited our company, under the guidance of Dr. Taisei of Taikei University. At that time Dr. Miller stood on the platform atop our spray dryer, which was 20 meters tall and had 500 liters/hour capacity. Admiring it, he said: 'I've never seen a soymilk plant which has this much facilities!' He also tasted the soymilk (from which the beany flavor had been removed) and said 'I wonder if you have to refine soymilk to this degree for Chinese people.' His words left a strong impression in my memory. Sure enough, when the factory was completed and we launched our canned soymilk powder, we heard Chinese saying, 'This is not real soymilk. It's an imitation.' But we did a good marketing campaign and soon the soymilk started selling. When my 2-year contract ended, I returned to Japan. After that, the products produced in this plant were used as food for the Taiwanese army and were not sold to the public. Moreover, because of the chlorella boom in Japan, the spray dryer was used for chlorella and soymilk production stopped. Since I had great expectations for this plant, I was greatly disappointed.

"Right after I returned to Japan in 1970, I was asked to provide technical assistance to Keijô Shison Shokuhin Kenkyusho, a research lab in Korea headed by pediatrician Son Zaien. I visited there several times and even drafted a floor plan, then suddenly the Japanese government told me that the money which had been available for helping Koreans was no longer available, so I could do no more" (p. 18-21; see p. 53 for more on soymilk in Korea). Continued. Address: Technical consultant, Okazaki Marusan, Japan.

998. Tsuchiya, Kanji. 1982. Tônyû. Shinban [Soymilk. 2nd ed.] (Continued–Document part II). Tokyo: Shoku no Joho-sha. 223 p. First edition was published in 1980. Illust. 17 cm. [Jap]

• ***Summary:*** (Continued): Pages 31-32. In the literature of Japan's Muromachi period it is written that after eating confections (*tenshin* such as okashi, oyatsu) they ate light and simple food (*tanpaku na tabemono*). One of the latter was called *tofu no uwamono*, which means yuba.

A flow diagram (p. 35-36) gives Chinese names of soymilk, yuba, fermented tofu, etc.

Part III (p. 39-64) titled "Soymilk around the world," has chapters on the USA, Korea, Hong Kong, China, Taiwan, Southeast Asia, and Europe. Soymilk in America (p. 47-52) includes a 1975 table showing major manufacturers of soymilk and soy-based infant formula, their location, and the names of their products. Soymilk in Korea (p. 53-54): In 1968 the Keijo Shison Shokuhin Kenkyujo made soymilk using the regular tofu making equipment adjusted to make a product as similar as possible to dairy milk, then bottled it in cider bottles, pasteurized it, and sold it. They made 500 to 800 bottles a day and sold it nationwide. It was brownish in color and tasted like soybean cooking liquid; there was no

© Copyright Soyinfo Center 2021

comparison between that and today's soymilk in quality. The head of this research lab was Dr. Son Zaien, who also ran the children's hospital and was a professor of pediatrics at Seoul Medical University. As a pediatrician his concern was that the soymilk promote the growth and health of children; he was not concerned about its acceptance among adults. The children accepted it within 2-3 days. Later, in May 1982, Tsuchiya visited Korea again. They had developed their own method of making soymilk and the soymilk plant had been expanded. Now they produced 500,000 bottles a day (180 cc each, retort sterilized); they call it Vegemil / Vegemeal. It contains added fat and sugar to make it closer to dairy milk, but the sugar content is 10%, which is sweeter than Japanese soymilk. The plant is built on a lot of 4-5,000 tsubo and has 24 retort sterilizers; each machine has 2,500 bottles capacity. Tôhô Yuryô, as part of a Korean technical joint venture with Kibun in Japan, is going to make 120-130,000 Tetra Brik cartons (each 200 cc). Also other dairy milk makers (Sojû and Sangan) are going to have some sort of equipment to start making soymilk. Also, I heard that Tôa Shokuhin (K.K.), a pharmaceutical company, is planning a joint venture with Meiji in Japan to make soymilk.

Also, Lotte Chilsung Beverage Co. is planning to use Marusan's (Japan) technology to make soymilk. They are constructing a plant to start to making soymilk in Feb. 1983.–The population of Korea is about 40 million and the GNP 24,000 million won (unit of currency) a year; it is the largest in Asia. But it is a tough war for market share among these fine companies.

Soymilk in Taiwan (p. 57-61): People who were born in Taiwan [the former Japanese colony of Formosa (1895-1945)] have Japanese food habits and don't like soymilk as much as the Chinese. Also, Taiwanese young people don't like soymilk much. In mainland China people only drink water that has been boiled and cooled–just as they do with tea. The same with soymilk. They boil soymilk in a flat pan (*hira-nabe*) for 20-30 minutes before selling it. The buyers don't buy it without seeing that it has been properly boiled. If you cook soymilk in a flat pan for a long time, you can eliminate much of the beany smell and flavor, the antidigestion substances, and harmful bacteria. They don't care about a little burned flavor, bitterness, or beany flavor. But this is ancient wisdom. There they continue to drink soymilk up to this day and it is still very popular. It is said that the annual sale of soymilk in Taiwan is about 5,000 million yen.

In China, sellers of ice candy (like ice Popsicles) call out loudly *kaishui bingo. Kaishui* means boiled and cooled water. *Bingo* means Popsicle.

In the Philippines, about 10 years ago, the University of the Philippines developed soymilk and a blend of soymilk and coconut milk for American children. It was test marketed among the students and teachers of elementary schools, junior and senior high schools, and universities. It was acceptable only to comparatively well educated people. A 200 ml bottle (about 7 ounces) sold for 15 cents, making it more expensive than most other drinks. The taste was plain but the bean smell was not completely removed. In October 1982 Dr. William G. Padorina and other economically influential people came to Japan at the request of President Ferdinand Marcos and studied Marusan's soymilk plant. They are planning a Food Development Symposium in Feb. 1983 and they would like to have nutritious soy products that contain coconut oil (they account for 70% of the world's production). They have asked Marusan to cooperate in the effort.

In Denmark, a company named Starna [Nutana?] makes various soyfoods such as textured soy flour (*daizu nikku*), defatted soymilk, and soymilk. They are selling these products in Denmark and neighboring countries. *The Book of Tofu* by Shurtleff and Aoyagi is mentioned on pages 46 and 117.

Okazaki Marusan makes a soy yogurt named *Tôgurt / Tôguruto* in Japanese. The character *tô,* which means bean, is also the first character in the word *tôfu* (p. 71). Address: Technical consultant, Okazaki Marusan, Japan.

999. **Product Name:** [Hae Pyo (Haepyo) Soy Flour, and Textured Soy Protein; Dongbang Soy Flour, and Textured Soy Protein].
**Manufacturer's Name:** Dong Bang Oil and Flour Mills Ltd.
**Manufacturer's Address:** No. 2 Yangpyong-dong 4-ka, Yungdungpo-ku, Seoul, South Korea.
**Date of Introduction:** 1982.
**New Product–Documentation:** Soya Bluebook. 1982. p. 62, 67; 1985. p. 89. Address is now 2-4 Ka, Yangpyong-dong, Yungdungpo-ku, C.P.O. Box 3031, Seoul 150, S. Korea. Product is Haepyo Soy Flour; 1986. p. 87.

1000. Kim, Kwang Soo; Kim, S.D.; Kim, J.K.; Kim, J.N.; Kim, K.J. 1982. [Effect of blue light on the major components of soybean sprouts]. *Korean Journal of Food and Nutrition* 11(4):7-12. [30 ref. Kor; eng]
• ***Summary:*** Soybean sprouts germinated under blue light (120 lux, 3 hours/day) after 5 days underwent chemical changes. They had a significantly higher chlorophyll content (6.74 mg% fresh weight) in the cotyledons than its value when germinated in the dark (1.43 mg%). Vitamin C contents under blue light was also higher (22% and 30% in the cotyledon and hypocotyl respectively) compared to germination in the dark. Exposure to blue light caused a slight increase in root growth and some changes in protein pattern of disc gel electrophoresis. Address: Dep. of Food & Nutrition, Yeungnam Univ., Gyeongsan, South Korea.

[Meju] (Korean fermented soybean cake) [Korean soybean koji], aflatoxin B1 and N-methyl-N-nitro'-N-nitrosoguanidine. *J. of the Korean Medical Association* 25:149-60. [24 ref]*
Address: Korea Research Inst. of Bioscience and Biotechnology (KRIBB).

1002. Song, Puju; Wishnok, J.S.; Tannenbaum, S.R. 1982. [Determination of volatile nitrosamines in soy sauce]. *Zhonghua Yufangyixue Zazhi* (*Chung-hua Yu Fang I Hsueh Tsa Chih; Chinese J. of Preventive Medicine*) 16(3):147-49. (Chem. Abst. 97:108644e). [Chi]*
• ***Summary:*** Nine commercial soy sauces. purchased at U.S. retail stores, and including representative samples from Hong Kong, China, Thailand, Japan, and Korea, were examined for the possible presence of volatile N-nitroso compounds. All samples contained substances which gave positive responses on a nitrosamine-selective detector (Thermal Energy Analyzer; TEA). These signals, in addition, disappeared or were reduced following ultraviolet irradiation; this behavior is characteristic of nitrosamines. Two of the TEA-positive substances had gas chromatogram retention times and gas-chromatogram-mass spectrometer behavior suggestive of *N-nitrosodimethylamine* and *N-nitrosomorpholine,* respectively. Address: Beijing Medical College, Beijing, China.

• ***Summary:*** Kinako (Yayoi period): Also called "mametsuki" in Japanese, kinako is written with characters that mean "yellow soy flour." In the *Wamyosho*, it is called "Daizu-iri" or "Mametsuki." From these expressions we can learn that since ancient times, people have pounded soybeans in a mortar (*usu*). Stone mortars came to Japan during the Nara period (A.D. 710-784) and finally became popular among the people in about the middle of the Edo/Tokugawa period. Kinako was brought to Japan from China through Korea. Kinako is probably mentioned in the *Engi Shiki*. At a certain festival the people served at the altar 5 measures each of magarimochiki and mametsuki, and 10 measures of daizumochiki. These may have been the early names for kinako-mochi and/or azuki mochi.

Tamari: The original form of shoyu was tamari. The by-product of tamari was miso. And the original form of miso was *kuki* [fermented black soybeans], which was a seasoning developed in China. More on the history of kuki is given under "miso." The government office (yakusho) for miso was built at the imperial court (kyutei) in A.D. 701 (Taiho 1). Therefore tamari started there at the same time. In the book *Yamato Honso* (Japanese materia medica) by Ekiken Kaibara, tamari (written with the characters for bean + oil) was mentioned. But on the sign board (kanban) of Yuasa Shoyu (which was started in the Tenshô period, 1573-1592), Tamari Shoyu was written (and "tamari" was written with the single character for "tamaru"). In the *Vocabulary of the language of Japan* (1603; Nippo Jisho) tamari was defined in Portuguese: "Tamari, a very delicious liquid taken from miso which can be used as a seasoning when cooking foods." Furthermore, in the *Oshufushi* (1684) it is written that "The liquid from shoyu is tamari." During the Middle Ages (chûsei) in Japan, shoyu was written with the characters for bean + oil, but during the Tenshô period (1573-1592) it came to be written with the single character for "tamaru." Tamari and shoyu were first distinguished during the Kyôhô period (1716-1735). In the Chubu region of central Japan (Chûbu-Chiho; Toyama, Ishikawa, Fukui, Yamanashi, Nagano, Gifu, Shizuoka, and Aichi prefectures) one special kind of miso, which is a by-product of shoyu, is called "tamari-miso."

1004. American Soybean Assoc. 1982. Increasing pork demand to boost Korean soybean market. *Checkoff Successfile.* Korea #802. 2 p.
• ***Summary:*** "The Korean economy has been growing and with it consumer demand for meat products. Traditionally the Korean preference has been for beef but pork is gaining in popularity. Now, thanks to educational efforts by the American Soybean Association, consumer resistance to pork is declining. By developing recipes and presenting cooking demonstrations ASA is showing consumers tasty and attractive new ways to prepare pork. Today Koreans eat nearly twice as much pork as six years ago. That translates to increased demand for soybean meal to feed a growing hog population on Korean farms."

A graph shows that Korean soybean meal use increased from a low of about 25,000 metric tons in 1974-75 to a peak of about 325,000 metric tons in 1978-79. Address: St. Louis, Missouri.

1005. American Soybean Assoc. 1982. Korean farmers turn to soybean meal. *Checkoff Successfile.* Korea #803. 2 p.
• ***Summary:*** A photo shows Dr. Kyung Lee. Address: St. Louis, Missouri.

1006. American Soybean Assoc. 1982. Awareness is key in Korean soybean sales. *Checkoff Successfile.* Korea #801. 1 p.
• ***Summary:*** Contents: Summary. Problem. Program and execution. Results.

"Summary: Korea is a relatively new market for U.S. soybeans. Consequently, many Korean buyers are not aware that the U.S. offers a quality product that can fit their needs. With the opening of an office in Seoul, Korea, the American Soybean Association has concentrated on contacting Korean buyers to make them aware of the availability of U.S. soybeans and to inform them of procedures to obtain U.S. soybeans of the quality desired. The effort has resulted in a significant increase in Korean imports of U.S. food quality

soybeans."

ASA's office in Seoul, Korea, is headed by Kyung Lee, a U.S. citizen and native of Korea. The office was opened in 1980. A portrait photo shows Kyung Lee.

"Results: As a result of increased effort in working with food bean processors, the Koreans purchased over a million bushels of food grade soybeans for tofu from the U.S. last year. In addition, over 200,000 bushels of soybeans were purchased for sprouting in 1980." Address: St. Louis, Missouri.

1007. Asian Vegetable Research & Development Center (AVRDC). 1982. Soybean. *AVRDC Progress Report Summaries* (*Shanhua, Taiwan*) No. 83-195. p. 2, 27-36. [16 ref. Eng]

• ***Summary:*** Contents: Director's foreword, by G.W. Selleck (p. 2). The chapter titled "Soybean" (p. 27-36) discusses: Plant breeding: Evaluation of soybean germplasm, evaluation of vegetable soybeans, preliminary and intermediate trials, advanced yield tests, mutation breeding in soybean, selection for soybean rust tolerance, genotypic responses for minimum and maximum input in soybean, continuous cropping of soybeans, techniques to hasten soybean maturity for generation advance, techniques for determining soybean seed storability, evaluation of Korean soybeans, optimum management input for maximum economic yield in soybean. Pathology: Mycorrhizal population dynamics in soybean-rice-rice and soybean-soybean-rice cropping systems, survey of mycorrhizal fungi and Pingtung County, the effect of cropping systems on vesicular-arbuscular mycorrhizae inoculum potential under greenhouse conditions, identification of soybean rust races at AVRDC, resistance to development of soybean rust, yield of soybean cultivars under stress from a rust epidemic, the effects of vesicular-arbuscular mycorrhizae on soybean mosaic virus infected soybeans, isolation and characterization of viruses on soybean in Taiwan, preliminary yield trial of soybean lines resistant to soybean mosaic virus. Entomology: Study of beanfly resistance inheritance in soybean, screening soybean germplasm for resistance to beanfly, evaluation of insecticides for beanfly control, host range of beanfly species on common legumes, beet armyworm resistance in selected soybean accessions, the effect of defoliation on yield and yield components of soybean, chemical control of beet armyworm on soybean, confirmation of stinkbug resistance in PI 227687. Physiology: Effect of weathering on maturing soybean and mungbean seeds, effect of storage conditions on germination and vigor of soybean, seed emergence under anoxia [oxygen free] conditions.

Evaluation: Eight of 42 vegetable soybean accessions were selected for the first AVRDC Vegetable Soybean Evaluation Trial (AVSET), to be conducted at multiple locations in the spring and summer of 1983. In summer preliminary yield trials (PYTs), five accessions gave yields of 1.6 to 1.9 tonnes/ha, and 55% of the accessions had the preferred grey pubescence.

1008. Dunn, John R.; Reynolds, B.J.; Eversull, E.E.; Skinner, R.A.; Thurston, S.K. 1982. Cooperative involvement and opportunities in oilseeds. *ACS Research Report* No. 13. v + 47 p. 28 cm. [28 ref]

• ***Summary:*** A very important and original report showing the relationship between all aspects of soybeans and other oilseed crops in the USA, and between cooperative and noncooperative soybean processors. Contents: Highlights and recommendations. Oilseed crop production: Soybeans, cottonseed, peanuts, flaxseed, sunflowerseed. Overview of cooperative oilseed system: Cooperative oilseed flows, cooperative organizational approaches, vertical integration by individual cooperatives, horizontal coordination by groups of cooperatives, vertical coordination by groups of cooperatives. Oilseed crushing: Soybeans, cottonseed, sunflowerseed / flaxseed, peanuts, potential new locations for cooperative crushing, parts inventory for processing cooperatives. Processing plant output: Soybean plant output, cottonseed mill output. Processing plant costs: Soybean plant costs, cottonseed plant costs, economies of scale. Raw product marketing. Oilseed pricing mechanisms. Transportation of oilseeds and oilseed products: Cooperative control of transportation modes, transportation by cooperative soybean processors. Refining, product manufacturing, and marketing: Demand for vegetable oil products, vegetable oil refining, increasing cooperative refining activity, marketing of vegetable oil products, manufacturing and marketing meal products, cooperative brand name oilseed products, retail product quality assurance association. The export markets for U.S. oilseeds: Global demand for oilseeds, global oilseed processing, world oilseed trade flows. Cooperative involvement in oilseed exporting: cooperative export flows, level of cooperative involvement, considerations for expansion of cooperative exporting, advantages and risks for cooperatives in oilseed exporting, the need for unified cooperative export efforts. Challenges for oilseed cooperatives: Rail transportation, energy, growth, competitive pressures and the need for coordination. Selected oilseeds references. Appendix tables.

Tables related to soy: (1) Regional shares of U.S. regional soybean production; Averages for 1959-69, 1970-79, 1976-79. (6) Soybean crushing capacity; total cooperative and noncooperative. Cooperative share of crushing capacity, 1971-1979 crop years. (7) Number of soybean crushing mills, U.S. total, co-op, and non-coop. Average mill capacity; U.S., co-op and non-co-op, 1971-1979 crop years. (8) Soybean crushed, U.S. total, cooperative crush, nonco-op crush, cooperative share of total crush, 1971-1979 crop years. (9) Utilization of soybean crushing capacity; U.S. overall average, noncooperative average, 1971-1979 crop years.

(10) Soybean crushing capacity shares and cooperative shares of crushing capacity, by region, 1979. (11) Soybean crushing capacity and proportion of soybean production which may be crushed within each region, 1979. (12) Structural characteristics of the domestic soybean processing industry in terms of plant numbers and capacities, 1979. (16) Production of soybean oil and oil products by cooperatives, 1971-1979 crop years (Million pounds and percentage; Crude oil, degummed oil, lecithin and by-products, refined oil, hydrogenated oil). (17) Soybean meal production by cooperatives, 1971-1979 marketing years (Thousand tons and percentage; Total, high protein meal, low protein meal, mill feed production).

(20) Processing costs for cooperative soybean processing plants, 1971-1979, alternative years. (24) Soybean receiving methods by cooperative plants, 1971-1979 crop years (by rail, cooperative owned truck, other truck). (25) Soybean meal shipment methods by cooperative plants, 1971-1979 (by rail, co-op truck, other truck, barge). (26) Soybean oil shipment methods by cooperative plants, 1971-1979 (by rail, truck, barge). (27) U.S. utilization of soybean oil, by products, by crop years, 1964-1979 (million lb): Shortening, salad and cooking oil, margarine, other edible, total food, total non-food, total domestic disappearance.

(30) Total and per capita consumption of fats and oils, food and industrial products, USA, 1963-1979 (million lb and per capita) (butter, lard, margarine, shortening, edible oils, all [oleaginous] food products, all industrial products, all products). (31) Margarine: Fats and oils used in manufacture, United States, 1965-1979 (incl. soybean, cottonseed, peanut, corn, coconut, safflower, other vegetable, lard, beef tallow). (32) Shortening: Fats and oils used in manufacture, United States, 1965-1979 (incl. soybean, cottonseed, peanut, etc.). (34) Selected oilseeds, vegetable oils, and oilseed cakes and meals: value of U.S. exports, annual 1973-1979. (35) Major U.S. oilseed and products exports, 1973-1979 (Soybeans, sunflowerseed, cottonseed, peanut). (36) Global soybean annual crushing capacities of major markets, 1979 (Soybean importing countries: Belgium & Luxembourg, Denmark, France, Italy, Netherlands, UK, West Germany, Spain, Poland, Yugoslavia, Soviet Union, Japan, Korea {Rep. of = South}, China {PRC}, Taiwan, Mexico, subtotal 42%. Soybean exporting countries: USA, Brazil, Argentina, subtotal 58%). (37) U.S. soybean exports by region or country of destination, 1973-1979.

(40) Volumes of soybeans handled by regional and interregional cooperatives and regional cooperative share of total farm soybean sales, 1972-1979 marketing years. (41) Soybean shipments to cooperative and noncooperative port elevators, 1973-1979. (42) Soybean shipments to ports by port area, by regional cooperatives, 1973-1979 (Atlantic, Gulf, Great Lakes, Pacific, total). (43) Percent of regional cooperatives' soybean sales shipped to port areas 1972-1979. (44) Cooperative port elevator capacities and share of total capacity, by port area, 1980.

Figures: (1) Bar chart: Oilseed production by commodity for selected years, 1959, 1969, 1979. (2) Map of oilseed production areas, USA, 1979. (3) Cooperative export channels for raw oilseeds. (4) Cooperative channels for oilseed products. (5) Cooperative coordination paths (Complete integration, vertical integration, single activity, intercooperative coordination). (6) Bar chart: Oilseed crush shares by commodity for selected years (1959, 1969, 1979). (7) Bar chart: Oilseed production percentage crushed domestically by commodity for selected years. (8) Map: Cooperative oilseed processing plants, 1979. (9) Soybean products. (10) Flow chart: Vegetable oil refining process. 1009. Grain legumes production in Asia. 1982. Tokyo: Asian Productivity Organization. i + 550 p. Illust. No index. 22 cm. [10+ ref]

• ***Summary:*** This book is based on a symposium held in Chiang Mai, Thailand in November, 1980.

Section V, "Country reports on the status of grain legumes production," includes the following chapters:

12. China, Republic of [Taiwan], by Chih-Kang Chao.
13. India, by Tejwant Bolaria.
14. Indonesia, by Justika S. Raharsjah.
15. Japan, by Y. Tanaka and S. Konno.
16. Korea, Republic of [South Korea], by Young-Hyun Hwang. Contents: Introduction (Soybean is by far the leading grain legume in South Korea, followed by azuki bean). Trends in demand and supply of grain legumes: Demand-supply situation, production and productivity. Agronomic aspects of grain legume farming. Economic aspects of grain legume production. Government participation and support. Prospects of grain legumes production.

Tables for Korea: (1) Per calorie intake per day of calories and protein from food and grain sources, 1968-1977. (2) Comparative protein content and prices of major food items (Soybean is by far the least expensive source of protein, and beef is by far the most expensive). (3) Food demand and supply trends for soybeans, 1971-1980 (Supply: Production grew from 232,000 metric tons (mt) in 1971 to a peak of 319,000 mt in 1975 and 1978, then fell to 257,000 mt in 1980. Imports rose dramatically from 61,000 mt in 1971 to 576,000 mt in 1980. Demand grew rapidly: For animal feeds grew by far the fastest, from 27,000 mt in 1971 to 449 mt in 1980. For food use stayed constant, from 143,000 mt in 1971 to 140,000 mt in 1980). Source: KMAF (Korean Ministry of Agriculture and Fisheries).

(4) Distribution of area planted to major food crops, 1969-1978. (5) Area planted, production and yield of grain

*(Unit: 1,000 mt)*

| Item | 1971 | 1975 | 1976 | 1977 | 1978 | 1979 | 1980 |
|---|---|---|---|---|---|---|---|
| *Supply* | | | | | | | |
| Total | 229 | 410 | 468 | 496 | 601 | 778 | 936 |
| Carried forward | 6 | 30 | 38 | 50 | 59 | 63 | 103 |
| Production | 232 | 319 | 311 | 295 | 319 | 293 | 257 |
| Import | 61 | 61 | 119 | 151 | 223 | 422 | 576 |
| *Demand* | | | | | | | |
| Total | 281 | 372 | 418 | 437 | 538 | 676 | 850 |
| Animal feeds | 27 | 46 | 91 | 119 | 173 | 291 | 449 |
| Industrial use | 111 | 176 | 187 | 179 | 221 | 237 | 261 |
| Foods | 143 | 150 | 140 | 139 | 144 | 147 | 140 |
| Carried forward | 18 | 38 | 50 | 59 | 63 | 103 | 86 |
| Self-sufficiency | 83 | 86 | 74 | 68 | 59 | 43 | 30 |

*Source:* All figures for 1980 are KMAF projections.

legumes (In 1978, azuki bean production was only 9.2% of soybean production). (6) Distribution of grain legume production areas, 1978 (Gyeongbug-do is the leading South Korean province for soybean production). (7) Characteristics of major grain legume varieties. (8) Recommended fertilizer and herbicide doses for major grain legumes. (9) Costs and returns of soybean crop, 1979. (10) Comparative costs and returns of major grain legumes and competing crops, 1979. (11) Commercialization ratios of soybean, azuki bean and mungbean, 1970-1975. (12) Comparative farmgate and wholesale prices for major grain legumes. (13) Wholesale price indices, by month, for major grain legumes. (14) Long-term plan for increasing soybean area, yield and production, 1981-1986.

Figures for Korea: (1) Marketing channels for soybean. (2) Marketing channels for azuki bean. (3) Marketing channels for mungbean [sprouts]. (4) Marketing channels for groundnut. (5) Flow chart of grain legumes research and extension service [under the Korean Office of Rural Development].

17. Nepal, by M.P. Bhartai.

18. Pakistan, by M. Mumtaz Ali.

19. Philippines, by Federico B. Ballon.

20. Sri Lanka, by A.S. Kunasingham. Address: Tokyo, Japan.

1010. Hirayama, Takeshi. 1982. Relationship of soybean paste soup [miso soup] intake to gastric cancer risk. *Nutrition and Cancer* 3(4):223-33. [15 ref. Eng]

• ***Summary:*** Consumption of miso soup was found to protect against stomach cancer, as long as the soup's salt concentration was kept to a minimum. "Daily intake of soybean paste soup was found to significantly reduce standardized mortality rates for gastric cancer in an ongoing large-scale prospective study of 122,261 males and 142,857 females aged 40 and above in 29 Japanese health center districts, 1966-1978. The gastric cancer standardized mortality rates were 171.9, 210.2, 240.0, and 255.9 per 100,000 males, and 77.8, 85.3, 97.5, and 113.6 per 100,000 females in daily, occasional, rare, and noningesters, respectively... The risk-reducing effect has also been observed in case-control studies in the past, for both males and females and in urban and rural areas. This beneficial effect could arise from selected compounds such as protease inhibitors and/or other nutritious substances included in the soybean, but it is also possible that it merely reflects the effect of some frequent accompaniment to soybean paste soup, such as green-yellow vegetables...

"According to the national nutritional survey conducted by the Ministry of Health and Welfare in 1979 for 6,000 randomly selected households (21,000 persons), 40.5% of Japanese ingest soybean paste soup daily at breakfast. Another 6.7% ingest it at their evening meal."

In both men and women smokers, frequent consumption of miso soup was found to protect against stomach cancer (Table 3).

"Recently, an animal experiment bearing on the present issue was conducted in Korea [Kim, J.P.: Personal Communication, Oct. 1981]. Rats were fed various gastric carcinogens, and incidence of gastric cancer was reported to be significantly lower in those animals also fed soybean paste soup." Address: Epidemiology Div., National Cancer Center Research Inst., Tsukiji 5-1-1, Chuo-ku, Tokyo, Japan 104.

1011. Ko Swan Djien. 1982. Indigenous fermented foods. *Economic Microbiology* 7:15-38. A.H. Rose, ed. Fermented Foods. [67 ref]

• ***Summary:*** Contents: 1. Introduction. 2. Foods fermented by moulds: Roles of the moulds. 3. Foods fermented by bacteria: Fermented vegetable products, fermented fish products, fermented seeds (natto, thua-nao, dagé), fermented starch-rich raw materials (fermented maize products, fermented rice products, fermented cassava), fermented plant juice.

4. Foods fermented by a mixture of moulds and yeasts: Ragi, micro-organisms, fermented starch-rich raw materials.

5. Foods firstly fermented by moulds [as in making koji], followed by a fermentation with a mixture of bacteria and yeasts (the salt-tolerant yeasts are species of *Saccharomyces* and *Torulopsis;* the bacteria are species of *Pediococcus* and *Streptococcus*): Tane koji, soy sauce, other fermented soybean products (tauco {porridge or dry consistency}, miso, hamanatto {which is soft and has a high

© Copyright Soyinfo Center 2021

moisture content}, tou-shih {which has a much lower water content than hamanatto and is therefore not so soft}. These "fermented soybean products are also used as flavouring agents in cooking as well as table condiments or as a side dish").

6. Specific aspects of fermented foods: Mould species, lactic-acid bacteria, yeasts, salt. 7. Acknowledgement. References.

Concerning soy sauce (p. 30-31): "Japanese *shoyu* is made from equal amounts of soybeans and wheat." The "raw materials are inoculated with tane koji which contains spores of selected strains of *Aspergillus oryzae* and *A. soyae*. In less sophisticated soysauce factories throughout South East Asia, mould species grow spontaneously on the soybeans by natural contamination from the air and from the bamboo trays on which soybeans of former batches were incubated (Bhumiratana et al., 1980). The moulds involved are species of *Aspergillus, Rhizopus*, or *Mucor.* Some Indonesian *kecap* manufacturers inoculated the cooked soybeans with tempe [tempeh] inoculum which contains spores of *Rhizopus oligosporus."*

Tables: (1) Conferences discussing aspects of indigenous fermented foods (1977-1981, chronological). (a) Symposium / Workshop on Indigenous Fermented Foods, Nov. 21-26, 1977, Bangkok, Thailand. (b) World Conference on Vegetable Food Proteins, Oct. 29–Nov. 3, 1978, Amsterdam, The Netherlands, (c) Symposium on Fermented Foods, Nov. 22, 1978, London, England. (d) International Symposium on Oriental Fermented Foods, Dec. 10-14, 1979, Taipei, Taiwan. (e) United Nations University Workshop on Research and Development Needs in the Field of Fermented Foods, Dec. 14-15, 1979, Bogor, Indonesia. (f) VIth International Fermentation Symposium, July 20-25, 1980, London, Ontario, Canada. (g) Eighth Conference of Association for Science Cooperation in Asia (ASCA), Feb. 9-15, 1981, Medan, Indonesia.

(2) Origins of various fish sauces. (3) Origins of various fish pastes. (4) Names given in various countries to an inoculum used to manufacture food products. (5) Names given in various countries to fermented glutinous rice (*Oryza sativa glutinosa*). (6) Names given in various countries to rice wine. (7) Names given to soy sauce in different countries (*Chiang-yu* in China, *Kan jang* in Korea, *Kecap* in Indonesia, *Shoyu* in Japan).

Note: This is the earliest English-language document seen (April 2012) that uses the term "Kan jang" to refer to Korean soy sauce. (8) Soybean foods produced by a two-stage fermentation (*Hamanatto and miso* in Japan, Soy sauce in the Orient, *Taoco* in Indonesia, *Tao-si* in the Philippines, and *Tou-shih* in China). Address: Dep. of Food Science, Agricultural Univ., Wageningen, Netherlands.

1012. Lee, Cherl-Ho; Jul, Mogens. 1982. The effect of Korean soysauce fermentation on the protein quality of soybean. In: S. Saono, F.G. Winarno, and D. Karjadi, eds. 1982. Traditional Food Fermentation as Industrial Resources in ASCA Countries. xvii + 259 p. See p. 209-20. Proceedings of a technical seminar, held 9-11 Feb. 1981 at Medan, Indonesia. [11 ref]

• ***Summary:*** Contents: Introduction. Changes in the composition of N-compounds during fermentation. Changes in the protein quality by the fermentation methods. Discussion.

Tables: (1) Per capita daily consumption of fermented foods in Korea in 1970 was as follows: Kimchi (all kinds) 43.7 gm, soybean sauce 23.3 gm, red pepper soybean sauce 13.9, soybean paste 10.4 gm, fermented marine foods 0.6 gm.

(2) Production of fermented soybean foods in Korea, 1971 (in 1,000 metric tons): Soybean sauce: industrial 107, home-made 116, total 223. Soybean paste: industrial 56, home-made 168, total 224. Red pepper soybean paste: industrial 23, home-made 89, total 112.

(3) Retention of the nutrients in soybean during the traditional meju making (%). (4) Chemical score and essential amino acid index (EAAI) of soybean and meju-brine mixtures ripened for 8 months.

(5) The lysine availability of soybean and meju-brine mixtures ripened for 8 months. (6) Effect of 20% protein supplementation with the fermented soybean products on the protein value of the rice diet in the rat feeding. (7) Comparison of protein conversion rates of soybean fermentation and animal production: Beef 5% (BV {biological value} 74). Milk 23% (BV 85). Egg 24% (BV 99). Home-made meju products 74% (BV 67*). Improved meju products 85% (BV 73*). Asterisk (*) = "Rice protein added with 20% of the product protein.

Figures: (1) Cartoon diagram of the process for making Korean soysauce and miso. (2) Flowsheet [flow sheet] of improved method of making meju. (3) Graph of Changes in the content of soluble nitrogen, free amino nitrogen, and amino nitrogen in the total nitrogen of soybean during meju making. (4) Changes in the content (%) of methionine and cystine during cooking, 3-month meju fermentation, and ripening. (5) Changes in the concentration (%) of basic amino acids during cooking, 3-month meju fermentation, and ripening. (6) Changes in the concentration (%) of total amino acid in the crude protein of soybean during the ripening of different types of meju-brine mixture. Address: 1. Dep. of Food Technology, Korea Univ., Seoul, Korea; 2. Dep. of Food Preservation, the Royal Veterinary and Agricultural Univ., Copenhagen, Denmark.

seminar, held 9-11 Feb. 1981 at Medan, Indonesia. [13 ref]
• ***Summary:*** Discusses and gives a flow sheet and nutritional analysis for the following fermented soybean products: Meju, kochujang (soybean paste with red pepper added), doenjang, kochujang. "According to the available old literatures, the history of soybean cultivation for food uses in the Orient dates back to 4,000–5,000 years ago in China, 2,000 years ago in Korea, and 1,000 years ago in Japan (KIST, 1970; Watanabe et al. 1971)." Address: 1-2. Korea Inst. of Science and Technology, Seoul, Korea; 3. Korea Univ., Seoul, Korea.

1014. Shanmugasundaram, S. 1982. Role of AVRDC in soybean and mungbean improvement [for the developing tropical countries]. In: 1982. Grain Legumes Production in Asia. Tokyo: Asian Productivity Organization. 550 p. See p. 137-50. [28 ref]
• ***Summary:*** Contents: Introduction. Soybean. Importance of soybean in the Asian region. Important changes in agronomic practices. Breakthroughs in varietal development.

Tables: (1) Soybean area, production, yield, imports and exports for selected Asian countries: Taiwan (ROC; 19,000 ha; 1,644 kg/ha), India, Indonesia (755,000 ha; 795 kg/ha), Iran (70,000 ha; 150,000 metric tons; 2,143 kg/ha), Japan (100,000 ha; 2,000 kg/ha), Korea (Rep. of = South; 260,000 ha; 1,350 kg/ha), Nepal (19,000 ha; 650 kg/ha), Philippines, Sri Lanka, Thailand (160,000 ha; 783 kg/ha), China (PRC; 14,430,000 ha; 925 kg/ha) [1979 & 1980]. (2) Yield response of post-rice soybean crop to irrigation and tillage. (3) Effects of different soybean sowing methods on plant stand and yield. (4) Soybean responses to *Rhizobium japonicum* inoculum. (5) Effect of fungicide seed treatment on soybean plant stand when grown in rice stubble culture with excessive soil moisture after sowing. (6) Soybean germplasm collections available in Asian countries. (7) Soybean varieties and their characteristics identified as moderately resistant to soybean rust. (8) Soybean varieties immune to soybean mosaic virus. (9) Soybean varieties susceptible to soybean mosaic virus but are symptomless. (10) Wild soybean, (G. soya Sieb and Zucc.) accessions least affected by beanflies, (*Melanagromyza sojae* and *Ophiomyia centrocematis*) at AVRDC. (11) Soybean varieties less affected by pod borer, *Etiella zinckenella* at AVRDC. (12) Major soybean varieties grown by farmers in different countries until 1972. (13) Major soybean varieties developed after 1972 and grown by farmers until 1980. (14) Performance of AVRDC selection compared to local cultivars in Indonesia. (15) Yield of six soybean cultivars in four locations during summer in a district trial experiment. Address: AVRDC, Shanhua, Taiwan.

1015. Yokotsuka, Tamotsu. 1982. Industrial application of proteinous fermented foods. In: S. Saono, F.G. Winarno, and D. Karjadi, eds. 1982. • ***Summary:*** Contents: Introduction. Japanese shoyu: Koikuchi, usukuchi, tamari, shiro, saishikomi, fish-soy, JAS grades. The soysauce produced in other Oriental countries (Korea, Taiwan, Singapore, southern China; Inyu, tamari-style). Miso. Manufacture: Koikuchi shoyu (treatment of raw materials, koji making, mash making and aging, pressing of the mash, refining), tamari shoyu, miso. Some recent research and technological progress in shoyu and miso manufacturing: Whole and defatted soybeans as raw materials, treatment of raw materials, koji molds, koji making, control of mash, refining (pressing of the mash, pasteurization), product (colour, flavour, flavour components).

Tables: (1) Annual production of 5 different kinds of shoyu in Japan, and total, 1979. (2) Typical composition of 6 different kinds of shoyu (analyzed by Kikkoman Shoyu Co., Ltd., 1978). For each gives: Be (Baume), NaCl, total nitrogen, formol nitrogen, reducing sugars, alcohol %, and pH. (3) Composition of 7 types of typical Japanese miso (Ebine, 1980). (4) NK cooking method of soybeans as compared to the conventional method (Tateno and Umeda, 1955). (5) Chemical analyses of shoyu fermented from soybeans denatured by methanol and by conventional cooking (Yamaguchi, 1954). (6) Analysis of liquid part of shoyu mash after 40 days prepared from defatted soybean meal denatured by ethanol, isopropanol, or NK cooking (Fukushima and Mogi, 1955, 1957). (7) Effect of cooking conditions of soybeans on the enzymatic digestibility of protein (Yokotsuka et al., 1966). (8) Cooling speed and digestibility of protein. (9) Fraction of proteases produced by *Aspergillus sojae* through Sephadex G-100 (Nakadai, 1977). (10) Changes of viable counts of yeast in shoyu mash (Mogi Keitaro et al., 1968).

Figures: (1) Flow sheet–Koikuchi shoyu fermentation. (2) Flow sheet–Miso fermentation. (3) Cross-sectional illustration–Continuous soybean cooker: Screw type and net conveyor type. (4) Temperature change of materials during koji cultivation by the conventional method using wooden trays (Shibuya, 1969). (5) Koji cultivation at 25ºC (Haga et al., 1967). (6) Preferable temperature change of the materials during 3-day koji cultivation (Haga et al., 1967). (7) Temperature change of the materials during mechanical koji cultivation with a through-flow system of aeration during 3 days (Shibuya, 1969). (8) Temperature change of the materials during mechanical koji cultivation with a through-flow system of aeration during 4 days (Shibuya, 1969). (9) Koji culturing machines with a through-flow system of aeration: Rectangular type, circular type (batch), circular type (continuous). Address: Kikkoman Corp., Noda-shi, Chiba-ken, Japan.

1016. **Product Name:** Morning Calm brand Organic Tofu (Soy Bean Cake).
**Manufacturer's Name:** Tofu, Inc.
**Manufacturer's Address:** 1900 Oak Crest, Roseville, MN 55113.
**Date of Introduction:** 1982?
**Ingredients:** Organic soybean, water, natural nigari.
**Wt/Vol., Packaging, Price:** 15 oz packed in water in molded plastic tray with heat-sealed, peel-off plastic film lid. Retails for $1.10.
**How Stored:** Refrigerated.
**New Product–Documentation:** Label (undated) sent by Bruce Rose of Rosewood Products. 2000. Oct. 15. Black and yellow on white film. "Tofu (Vegetable protein). Tofu is a versatile, easily digestible source of vegetable protein." Contains six serving suggestions.

1017. Marter, Marilynn. 1983. Taste of the East added to U.S. 'melting pot.' *Philadelphia Inquirer* (*The*) (*Pennsylvania*). Feb. 1. p. 23, 34 (1C, 12C).
• ***Summary:*** "Korean dishes are simpler in form, although often stronger in taste, than other Asian styles. The basic flavors of Korean food are garlic, ginger, black pepper, scallion, sesame and soy. These are accented with cayenne pepper, chili powder, *gochujang* (a salty chili paste), bean paste and rice wine."

1018. Shurtleff, William; Aoyagi, Akiko. 1983. History of miso and soybean jiang. Soyfoods Center, P.O. Box 234, Lafayette, CA 94549. 82 p. Feb. 21. Unpublished typescript. Available online at www.soyinfocenter.com.
• ***Summary:*** http://www.soyinfocenter.com/HSS/miso1.php
A comprehensive history of the subject. Contents: Introduction. Etymology. Part I: History of soybean jiang in China. Early Chinese non-soybean jiang. Early Chinese soybean jiang (100 B.C. to 599 A.D.). 600 to 1899. The Twentieth Century. Part II: History of soybean jiang/jang in Korea and Southeast Asia. Dissemination of jiang from China. Korea. Indonesia. Vietnam. Malaysia. Part III: History of miso in Japan. Introduction; origins not clear. Early non-soybean hishios (before 700 A.D.). The Nara period (710-784 A.D.); Ganjin 754. The Heian period (794-1160 A.D.). The Kamakura period (1185-1333). The Muromachi period (1336-1568). The Edo or Tokugawa period (1603-1867). The Meiji and pre-war periods (1867-1940). The postwar period, modern times (1941-1982). Part IV: History of miso in Europe. Early European references (1597-1899). 1900-1949. 1950-1982. Part V: History of miso in the United States and Canada. Early developments (1896-1929). 1930-1959. Growth of interest in miso (1960-1982). Part VI: History of miso in other countries. India. Israel. Latin America. Address: Lafayette, California. Phone: 415-283-2991.

in Japanese characters.

1021. Meals for Millions / Freedom from Hunger Foundation. 1983. Annual report for 1982. Davis, California: MFM/Freedom from Hunger Foundation. 16 p. Back to back. Each panel 22 x 9.5 cm.

• ***Summary:*** Printed with black and green ink on white paper. Philip E. Barton is chairperson, board of trustees. On the cover is a photo of African children holding foods. Across the bottom: Self-help for a hungry world.

Contents: Board of Trustees' Annual Meeting held in Davis, California on March 20-21, 1982 ("Alfred C. Bartholomew, D.D. [Doctor of Divinity] retired as Chairman of the Board and of the Executive Committee after six years of outstanding leadership. His portrait photo and excerpts from his final address are given. Meals for Millions has "moved naturally from relief to development"). President's message, by Peter J. Davies ("1982 was a watershed year for your Foundation. MFM launched Applied Nutrition Programs in Antigua, Sierra Leone, and Thailand." "On March 20, 1983, the Board, Staff, Nutritional Committee of Sponsors, the University and Davis communities jointly dedicated (releasing a cluster of balloons) our new international center at Davis, California. To pay for this greatly needed, new functional headquarters, the Board commenced a capital campaign to raise $1.2 million over a three year pledge period").

Meals for Millions philosophy (800 million men, women and children worldwide suffer from malnutrition and nutrition-related diseases. "Freedom from Hunger... means attacking the root causes of hunger and malnutrition–poverty, poor sanitation, low levels of productivity, inadequate knowledge about good nutrition, minimum education and overpopulation–to create lasting change"). Ecuador (on the Santa Elena Peninsula; the fields "bloomed once more with corn and soy"). Honduras (ANP program now in its 5th year). Sierra Leone. Kenya.

Korea ("In 1979 MFM, in partnership with Wonseong County, built a plant to produce nutritious snack foods for distribution to schools and day care centers, and for commercial sale. In 1982, 90 metric tons of this low-cost soy, corn and wheat flour product were produced in the plant").

Thailand (In Lampang Province of northern Thailand, projects include growing of nutritious soya beans). Antigua. U.S. Southwest (native Americans). Papago Applied Nutrition Program (now in its 4th year). Solutions through appropriate technology. MFM Resource Center in Davis, California. Financials: For the year ended December 31, public support and revenue increased by 16.6% to $1.837 million. Pie charts show: Sources of support. Distribution of funds. People: Executive staff, regional directors, field officers, honorary trustees, Board of trustees, National committee of sponsors (headed by Mrs. John Steinbeck).

Note: What happened to the training center at 1800 Olympic Blvd., Santa Monica and its training programs which, until quite recently, were at the heart of MFM's activities? Address: 1. 815 Second Ave., New York, NY 10017; 2. P.O. Box 2000, Davis, California 95617. Phone: (212) 986-417 or (916) 758-62000.

1022. *Soyanews* (*Sri Lanka*). 1983. Raja Rata Food Grain introduces DSM [Dried Soya Milk]. 5(7):1, 3. March.

• ***Summary:*** Raja Rata Food Grain Processing Company introduced its main product, Dried Soya Milk powder, at a soya cookery exhibition / demonstration held last month at the YWCA, Rotunda Gardens, Colombo."

This event was also held to say farewell to Mrs. Kai Kim who, in her spare time and working independently, has helped to make soyafoods popular among Sri Lankans. Mrs. Kim is the wife of the Resident Representative of the UNDP, Mr. Y.Y. Kim.

"Mrs. Kim brought her Korean knowledge and experience in helping to introduce soyafoods to the public. She was instrumental in introducing soya milk to the Colombo Hospital and Prisons, for use in the form of a slurry, as a substitute for coconut milk." The Chairman of Raja Rata, Mr. R.S. Wijesekara, "thanked Mrs. Kim for her tireless and dedicated services to helping to add a highly nutritive food to the diet of the Sri Lankans."

A large photo shows Mrs. Gai Kim, Mr. R.S. Wijesekara, and others at the event.

Note: Dried Soya Milk powder will be on sale by about the middle of this year (p. 3).

1023. Giles, Wesley R. 1983. IPT, Vitasoy, and Shurtleff's trip to China as a consultant for STS (Interview). Conducted by William Shurtleff of Soyfoods Center, May 2. 3 p. transcript. Handwritten.

• ***Summary:*** IPT is an engineering and contracting company. They are specialists in designing and building manufacturing plants, and installing the equipment–especially plants that make dairy-type products. Vitasoy is talking with IPT about building a soymilk plant for them in America. IPT and STS could work as either competitors or cooperators. STS could be the major contractor and hire IPT.

There is a Kibun-Alfa Laval joint venture to sell soymilk plants worldwide.

STS was established by DTD and Dong Bang in Korea. Anders Lindner does not own any of it; he is just an employee of DTD.

DTD would like William Shurtleff to serve as a consultant for STS in China. He would go there with a team of two other STS men for 17 days and make presentations in numerous cities to groups and companies interested in starting soymilk plants. The rate would be about $6,000 plus expenses. Address: President, Intereps, P.O. Box 966, Orinda, California 94563-0956. Phone: (415) 253-1065.

• ***Summary:*** Includes:
"Be Beam Bop–$4.75"
"Doen Jang Ji Gye–$4.95"
"Bul-Go-Gi–$5.50." Address: Between ITC Bldg, and Avis Rent-a-Car, Tamuning.

1025. Loh, Eleanor. 1983. Re: Production of soya bean milk in Tetra Pak cartons in seven Asian countries, 1978-1982. Letter to Anders Lindner at STS in Singapore, May 9–in reply to inquiry. 1 p. Typed.
• ***Summary:*** These statistics refer only to the amount of soymilk (in million packages) packed in Tetra Pak Aseptic cartons.
(1) Taiwan increased from 15.9 in 1978 to 79.2 in 1982
(2) Hong Kong increased from 28.1 in 1978 to 55.0 in 1982.
(3) Malaysia increased from 28.1 in 1978 to 44.3 in 1982.
(4) Korea increased from 5.2 in 1979 to 33.0 in 1982.
(5) Thailand increased from 13.9 in 1981 to 16.7 in 1982.
(6) Singapore increased from 1.9 in 1978 to 9.6 in 1982.
(7) Philippines was 0.7 in 1982.
The total increased from 62.9 (15.7 million liters) in 1978 to a peak of 268.4 (67.2 million liters) in 1981, decreasing to 238.2 (59.6 million liters) in 1983. Address: Brik Pak Inc., Singapore. Phone: 662266.

1026. Shurtleff, William. 1983. Fly from California to Hong Kong: First impressions, May 26 (Document part). In: William Shurtleff. 1983. Log of Soyfoods Research Trip to China and Japan: 29 May to 10 July. Lafayette, California: Soyfoods Center. 117 p. See p. 1. Unpublished manuscript.
• ***Summary:*** May 24. I leave by jet for China, from Lafayette, California, my trip paid for by Danish Turnkey Dairies (DTD/STS).
May 25. In Hong Kong with jet lag. Stay at Sheraton Kowloon, meet John Davies and Asger Somer Hansen of DTD.
Singapore soymilk regulations: The protein content must be greater than 2% to label / call it "soymilk"; if less, it must be labeled "soy drink."
When soymilk in a Tetra Pak carton stands for 6-8 months, there is: (1) Physical oil separation. (2) Graying of the color. (3) Some of the enzymes, which are not inactivated by UHT (Ultra-High Temperature) processing, can coagulate the soy protein.
I buy and taste Coca-Cola's soymilk in Hong Kong. The flavor is mediocre, a little watery and cereal-like, but not bad. A 250 ml carton retails for $HK 1.5, about US$0.22.
Ma Po Doufu (Japanese: Mabo-dofu) is a popular Chinese dish from Sichuan (W.-G. Szechuan) province. It is of fairly recent origin.
Note: It is a combination of tofu (bean curd) set in a spicy chili- and bean-based sauce, typically a thin, oily, and bright red suspension, and often cooked with minced meat, usually pork or beef. The character "ma" stands for "mazi," which refers to a person whose face is disfigured by pockmarks. "Po" translates as "old woman." Thus "Ma Po" is an old woman whose face is pockmarked. According to a Chinese legend, the pock-marked old woman lived in the Chinese city of Chengdu (Chengtu)–the capital of Sichuan province in southwest China.
Due to her condition, her home was placed on the outskirts of the city. By coincidence, it was near a road where traders often passed. Although the rich merchants could afford to stay within the numerous inns of the prosperous city while waiting for their goods to sell, poor farmers would stay in cheaper inns scattered along the sides of roads on the outskirts of the ancient city.
According to *Mrs. Chiang's Szechwan Cookbook:* "Eugene Wu, the Librarian of the Harvard Yenching Library, grew up in Chengtu and claims that as a schoolboy he used to eat Pock-Marked Ma's Bean Curd or mapo doufu, at a restaurant run by the original Pock-Marked Ma herself. You ordered by weight, so many grams of bean curd and so many grams of meat, and your serving would be weighed out and cooked as you watched. It arrived at the table fresh, fragrant, and so spicy hot, or la, that it actually caused sweat to break out."
Nowadays there are several Mapo Dofu restaurants in Chengdu. (Source: Wikipedia, at Mapo doufu, retrieved 26 June 2011).
"Dim Sum" literally means "dot heart." Lo Han Tsai ("Monk's Food") is a vegetarian recipe served at Chinese New Year. When tofu is a prominent ingredient it is called "Lo Han Tsai Doufu."
There are two words for deep-fried tofu: (1) *You doufu* (literally "Oil doufu"). (2) *Zha doufu* ("Deep-Fried Doufu"). The first has bigger holes in it.
Note: This is the earliest English-language document seen (April 2013) that contains the term *You doufu.*
Since the 1930s, affluent city people have consumed cow's milk in China.
The soymilk label of Dong Bang (from Korea) is similar to that of Kibun from Japan. An illustration (line drawing) shows the Dong Bang label. Address: P.O. Box 234, Lafayette, California 94549. Phone: 415-283-2991.

• ***Summary:*** This book is based upon the literature and papers submitted to the Symposium on Indigenous Fermented Foods (SIFF), which was held in conjunction with the Fifth International Conference Global Impacts of Applied Microbiology (GIAM V) in Bangkok, Thailand, November 21-27, 1977.

Contents: Foreword by E.J. Da Silva. Preface. 1. Indonesian tempeh and related fermentations: Protein-rich vegetarian meat substitutes. 2. Indigenous fermented foods involving an acid fermentation: Preserving and enhancing organoleptic and nutritional qualities of fresh foods.

3. Indigenous fermented foods in which ethanol is a major product: Types and nutritional significance of primitive wines and beers and related alcoholic foods.

4. Indigenous fermented amino acid / peptide sauces and pastes with meatlike flavors (p. 433-571): Introduction.

(A) Soy sauces: Japanese shoyu: Koikuchi, usukuchi, and tamari; Chinese chiang-yu, by Tamotsu Yokotsuka (p. 437-51). Taiwanese soy sauce, by Liu (p. 451-56). Malaysian soy sauce: Kicap, by Ong, Mercian, Poesponegoro and Tanuwidja (p. 456-61). Indonesian soy sauce: Kecap, by Saono, Poesponegoro and Tanuwidja (p. 461-65). Korean soy sauce, by Chang (incl. homemade kanjang and meju, p. 465-66). Taiwanese black bean sauce: Inyu, by Jan et al. (p. 466-67). Philippine taosi [fermented black soybeans], by Steinkraus (p. 467).

(B) Fermented soybean pastes: Japanese miso, by Ebine, Shurtleff and Aoyagi (p. 468-79). Indonesian tauco, by Saono et al. and Winarno (p. 479-82). Korean Doenjang and kochujang, by Chang, Shurtleff and Aoyagi (p. 482-87).

(C) Fermented fish-shrimp sauces and pastes (p. 487-526).

(D) Fish-soy sauce and fish-soy paste, by Ismail (p. 526-30).

(E) Miscellaneous Oriental fermentations. Japanese natto (itohiki natto), by Hayashi and Ota (p. 530-45). Japanese Hama-natto (hamanatto) and related products (incl. yukiwari natto, p. 545-47). Chinese red rice: Anka (Ang-kah [ang-kak, angkak]), by Lin, Su and Wang, Sooksan and Gongsakdi, and Pichyangkura (p. 547-53). Chinese sufu, by Su and L.-P. Lin (incl. nyufu, p. 553-61). Note: Chapter 4 contains about 195 references.

5. Mushrooms: Producing single cell (microbial) protein on ligno-cellulosic or other food and agricultural wastes.

6. General papers related to indigenous fermented foods: Contributions of the western world to knowledge of indigenous fermented foods of the orient, the importance of microbial genetics in indigenous food fermentations, new uses for traditional food fermentations, mycotoxin problems in indigenous fermented foods and new methods for mycotoxin analysis.

Less widely known fermented foods include: Idli, dosa (dosai, puda), dhokla, khaman (with soy, 131-35), enjera (162), tef/teff (164), wot (165), hopper (173), kishra (175), lambic (179), ogi (with soy, 189-98), mahewu (203), gari (208), dahi (249-57), srikhand and lassi (256-57), laban rayeb, laban zeer, yogurt (257-59; cultured soy yogurt is mentioned on p. 616), liban, mast, mass, taw (260), tairu (with soy, 260-65), kishk or kushuk (267), Metchnikoff (266), trahanas or tarhanas (271-76), rabdi, jalebi (275), koumiss (276), kefir (277-80).

Alcoholic beverages and foods: Honey wine, mead, metheglin (305), tej (306), sugar cane wines, basi, bubod, binubudan (307), palm wine or toddy (315-28), pulque (328-37), kaffir (344), tesguino (352), bouza (357), pito (358), busaa (365) sake (373-79), yakju and takju (379), tape = tapeh (381-400), ragi (381), tapuy (400), lao-chao (402), madhu (406), brem (408), tropical vinegar (410-14), nata (414-20), tea fungus (421), nuoc-mam (516-21).

Reviewed in Scientific American (Nov. 1983, p. 37), and in Bio/Technology (1984. p. 364). Address: Inst. of Food Science, Cornell Univ., Geneva, New York.

1030. **Product Name:** Tofu.
**Manufacturer's Name:** Wah Chong Co.
**Manufacturer's Address:** 80 Ossington Ave., Toronto, ONT, M5T 2R4, Canada. Phone: 416-532-0841.
**Date of Introduction:** 1983 June.

Jin-ling, eds. Soybean Research in China and the United States (College of Agric., Univ. of Illinois at Urbana-Champaign). [16 ref]

• ***Summary:*** "As a commercially significant crop in this country, soybeans have a short history and have been important in the north-central states only since 1922. They were grown earlier in the southeast, especially North Carolina, as a forage crop. Breeding in those early years consisted of field trials of cultivars introduced from Asia and choosing those best adapted and most productive for the local farmers.

"Soybeans were experimented with in small plantings and occasionally grown on a commercial scale during the 1800's. According to Piper and Morse (1923) no more than eight cultivars were grown in the U.S. prior to 1898. In that year the U.S. Department of Agriculture (USDA) began a program of recording introduced cultivars of crop plants under 'PI' designations. Through this system, large numbers of soybeans were introduced and grown in experimental plots. The better ones were sent out to various state experiment stations for further testing.

"From 1898 to 1923 more than 1,000 cultivars were introduced, most sent by research stations or grain merchants in Asia, or brought in by agricultural explorers, diplomats, missionaries, or other travelers to Asia (Table 1). Some of the most successful cultivars were introduced into the U.S. during this period. As a result of the increasing success of soybeans, the USDA sent plant explorers to Asia (notably P.H. Dorsett and later W.J. Morse) and from 1924 to 1932, 6,651 soybean accessions were introduced. During the next 40 years little effort was made and only a few soybeans were introduced each year. With renewed interest since 1975, more than 5,000 strains have been introduced.

"During the early periods of introduction no attempt was made to save all the strains introduced and a majority of them were discarded. Only the best were kept along with some of the unusual types. In 1949, in recognition of the need to preserve the germplasm of this important crop and make it readily available, the USDA established a soybean germplasm collection. The early strains (Group IV and earlier) are maintained at the University of Illinois at Urbana-Champaign and the later ones (Group V and later) at the Delta Branch Experiment Station, Stoneville, Mississippi. The collection was initiated by M.G. Weiss, head of USDA's soybean production research, and J.L. Cartter, head of the U.S. Regional Soybean Laboratory at Urbana. The original curators were E.E. Hartwig at Stoneville and L.F. Williams at Urbana. Hartwig is still curator of the southern collection. R.D. Osler succeeded Williams in 1951, and I became curator of the northern collection in 1954.

"The guiding principle has been to maintain the basic genetic diversity of the soybean and its wild relatives by maintaining all cultivars and introductions representing different germplasm, regardless of their apparent economic worth, and to make them readily available for research purposes. In 1949 and 1950, the USDA and state agricultural experiment stations were requested to submit samples of all introduced strains and old U.S. cultivars. From the 7,873 PI strains introduced before 1945, 1,659 strains were obtained, including 138 old U.S. cultivars that originated from introductions (Table 1).

"Introduced strains plus American-developed cultivars have been added to the collection since then, until today the number of soybean entries totals over 9,500, about 70% are in the northern collection and 30% in the southern one. They were drawn from 60 countries, but the majority came from eastern Asia and especially from China (1,202 strains), Japan (1,721), Korea (3,041), and the Soviet Union (1,847) (Table 2). Soybeans from these four countries comprise 83% of the collection and many of the strains received from other countries originated from these four. At Urbana, in addition, there is a genetic collection (mutations, oddities, isolines, etc.) of several hundred lines of interest in qualitative genetic studies. We maintain also a collection of wild soybeans, *Glycine soja.* The wild soybean accessions range in maturity from Group 00 to X and were obtained in the USSR (34 accessions), China (28), China (Taiwan) (2), Korea (313), and Japan (183). Because they can be crossed with cultivated soybeans, they are an interesting potential source of useful germplasm. We have also a collection of six perennial species of *Glycine.* These species are native to Australia and some range into the south Pacific islands and south China. Though not closely enough related for easy crossing with soybeans, these species are of interest in studies on the origin of soybeans and botanical relationships within the genus. If the crossing barrier can be overcome, they may supply the soybean breeder and geneticist with some interesting and diverse material.

"The soybean germplasm collection is used actively by researchers throughout the U.S. and from many other countries. In 1982, from the collection at Urbana, we expect to send out over 40,000 seed lots.

"We hope to obtain as much of the world's wild soybean germplasm as possible, and to complete our collections from Europe, the USSR, southern Asia, South Korea, and Japan. Our greatest need is for further collections from North Korea and China, especially southern and western China, since most Chinese strains in the present collection have come from northeastern and north-central China.

"Of the 7,000 soybean cultivars introduced before 1945, more than 200 were named and promoted for commercial use in this country. References listing or describing these old cultivars appear at the end of this paper. Some of the older cultivars had small black and brown seeds with bushy or viny-type plants suited for hay production, which was a major use of soybeans in this country until the 1940's. Some of them were large-seeded vegetable types grown for direct human consumption in home gardens and occasionally

© Copyright Soyinfo Center 2021

on a small commercial scale. Most of them were grain-type soybeans. It was with these cultivars selected from introductions from eastern Asia that the U.S. soybean industry was built, since it was not until the 1940's that soybeans were developed from artificial hybridization for specific adaptation to this country.

"Virtually all of the successful cultivars for oil-seed production in the north-central states were from northeast China, which has similar climate and where large scale commercial soybean production had already been under way for several decades. Thus the successful establishment of the U.S. soybean industry was based on the successful development of a similar industry of soybean production and oil extraction in northeast China. We owe a debt of gratitude to the unknown Chinese plant breeders or farmer-selectors who developed these basic commercial-type soybeans. Beginning in the late 1930's and 1940's, soybean breeders in the USDA-state experiment station breeding programs, through hybridization and selection, developed improved cultivars with higher yielding ability and resistance to lodging and shattering and to prevalent diseases. By the 1950's virtually all hectarage was planted to these products of the scientific breeders' art, yet even down to the present day these American cultivars trace their ancestry to a small group of successful introductions, largely from northeast China.

"Mandarin was introduced from Sui Hua in Heilongjiang Province in 1911. It or a selection named Mandarin (Ottawa) is present in the ancestry of all major northern cultivars. Manchu, introduced in 1911 from Ning'an in Heilongjiang Province, is in the parentage of most northern cultivars. From AK [A.K.], introduced in 1912 from an unknown place in northeast China, two apparently identical selections named AK (Harrow) [A.K. (Harrow)] and Illini were made (in Ontario, Canada, and Illinois, respectively) and used in producing nearly every northern and southern cultivar. Dunfield from Fanjiatun, Jilin Province, in 1913, is in the ancestry of many northern and southern cultivars. Mukden, introduced from Shenyang in Liaoning Province in 1920 and Richland from Changling, Jilin Province, in 1926, are important also in the pedigrees of northern cultivars.

"These six, which were widely grown in the 1930's and early 1940's and which are preserved in the germplasm collection, along with five others (one from Japan, one from Jiangsu, China, and three from northeast China including PI 54610 from Changchun, Jilin, in 1921) have produced all of the widely grown cultivars in the north (Table 3).

"In the south, three of the above cultivars from northeast China, AK (through the late selection, S100), PI 54610, and Dunfield, appear in the ancestral parentage, but there also are important introductions from further south (Table 4). Tokio, introduced from Japan in 1901, is in the pedigree of every major southern cultivar and some of the northern. Arksoy and Haberlandt from Pyongyang, Korea, in 1914 and 1221, respectively, are in a majority of southern cultivars. CNS, which is in the ancestry of all southern and several northern cultivars, Roanoke, and Palmetto all were obtained from the University of Nanjing in 1927. (Roanoke is a reselection, possibly from an outcross.)" (Continued). Address: Univ. of Illinois, Urbana.

• ***Summary:*** Although chemically hydrolyzed soy sauce is widely consumed, fermented soy sauce has an annual growth rate of 15%. La Choy and Chun King, the two largest producers of chemical soy sauce, are assumed to have a combined annual production of 20,000 kiloliters. Most of the fermented soy sauce is produced by Kikkoman Foods, Inc. and annual production has reached 19,000 kiloliters.

Soy sauce manufacturing consists of three main processes: koji making, brine fermentation, and refining. Major improvements in the soy sauce process are (1) high temperature short time cooking of the soybean flakes to increase the yield, (2) use of an artificial mutant of *Aspergillus sojae* which produces twice as much proteolytic enzyme, (3) use of automatic koji making equipment, and (4) use of *Pediococcus halophilus* and *Saccharomyces rouxii*, and proper temperature control during brine fermentation. Address: Kikkoman Foods, Inc., Walworth, Wisconsin.

• ***Summary:*** In the ISVEX trials, soybeans were tested in the following countries: Afghanistan, Algeria, Argentina, Bangladesh, Bolivia, Burma, Chile, China (Taiwan, ROC), Colombia, Cuba, Czechoslovakia, Ecuador, Egypt, Ethiopia, Fiji, French Guiana, Gambia, Ghana, Guatemala, Guinea, Iraq, Korea, Malawi, Malaysia, Mexico, Morocco, Nepal, Pakistan, Paraguay, Peru, Philippines, Portugal, Puerto Rico, Rwanda, Somalia, Sri Lanka, Sudan, Syria, Tahiti, Thailand, Turkey, United States, Zaire, Zambia, Zimbabwe.

Note: This document contains the 2nd earliest clear date seen for soybeans in Guinea, and the cultivation of soybeans in Guinea (1979, probably in May). Sixteen varieties were tested at Foulaya. CH-3 gave the highest yield, 2,690 kg/ha. The source of these soybeans was INTSOY (at the University of Illinois, USA) for ISVEX trials. Address: College of Agriculture, Univ. of Illinois, Urbana-Champaign.

No. 25. p. 180-83. B.J. Irwin, J.B. Sinclair, and Wang Jin-ling, eds. Soybean Research in China and the United States (College of Agric., Univ. of Illinois at Urbana-Champaign). • ***Summary:*** (Continued): "Cultural Controls: Cultural practices have a direct impact on insect pests and natural enemies. Research is under way to determine the long-term effects of changing cultural practices, such as minimum tillage, crop rotation, and intercropping, on the insect community. The technique known as trap cropping has been employed in certain areas. Traps are strips of attractive plants on which pests are concentrated and treated. A trap-cropping plan has been proposed for the control of soybean pod borers in Korea. Given the biological characteristics of the soybean pod borer, using strips of plants whose maturity coincides with the emergence of the pod borer would have a potential for use in IPM programs for this pest.

"Chemical Control: Any IPM system is not complete without a definition of the roles of insecticides in the program. This definition should be made on the basis of minimum effective rates to achieve control of the pest with the least impact on the beneficial parasites and predators. This is the key for integration of biological control with chemical control. Additional screening for new and more effective insecticides should be made not only on the target species but also on their natural enemies. As part of a chemical control program, potential shifts in the status of resistance in the natural pest populations should be monitored.

"Integrated Pest Management: When implemented, IPM programs should reduce the cost of application of insecticides and the undesirable side effects of programs that rely solely on insecticide use for pest control. I saw examples of successful IPM programs in China for the pod borer on soybeans. Integrated programs represent an area of interest to both China and the U.S., and this is the area in which much progress can be achieved by combining efforts and exchanging experiences and information.

"Exchange of Information:

"During the last 12 years Illinois has made a major effort to develop a comprehensive data base for information on soybean entomology through SIRIC, the Soybean Insect Research Information Center, and ISIC, the International Soybean Insect Collection. SIRIC is devoted to the search and retrieval of the published literature on soybean entomology and ISIC to identification of arthropods associated with soybeans in the world. Both data bases are computerized and represent a resource available to cooperators throughout the world. SIRIC made one of the first overtures to establish contact with soybean researchers in the People's Republic of China soon after the reestablishment of relations between the two countries in 1976. A letter was sent to the major institutions in China to identify sources of literature. As a result we now receive and exchange publications with several major research institutions in China.

"Through the exchange of visiting scholars, graduate students, and scientific delegations, we hope to maintain an active program in soybean entomology with the People's Republic of China. If we are to credit several estimates that have been made in many parts of the world, a yearly loss of 10% to 30% is due to the impact of insect pests. By developing sound IPM programs one may expect to substantially reduce the economic impact of these pests.

"Discussion: Wang Jin-ling stated that approximately $4,000,000 was spent in Heilongjiang Province to control a borer which is normally not destructive. Lights were turned on in one village during the night, apparently in an attempt to attract the insects.

"Zhang Zi-jin stated that there are ten major insect pests of soybeans and soybean aphids are the most important. Soybean pod borers also are important. Control is effected with resistant cultivars such as Jilin 3, 4, 33, and 13. Chemical control and biological control also are practiced.

"R.L. Bernard asked what control methods are used for soybean aphids and if there are resistant cultivars.

"Zhang Zi-jin replied that there are resistant cultivars. An example is Big White Eyebrows, which has a high level of resistance to aphids. A discussion concerning the mechanism of resistance then took place. Resistance to aphids may be due to the leaves being coarse and rough with more pubescence. This cultivar is indeterminate. There is also a determinate cultivar which is resistant and has a thick leaf.

"S.E. Halbert noticed two species of aphids colonizing soybeans during her visit to PRC and wondered if Zhang was breeding for resistance to those two species.

"Zhang Zi-jin replied that they are just beginning their research and do not fully understand the biology of these aphids.

"G. Kampmeier asked how often aphid-resistant cultivars are planted in the PRC. Again, the reply was that they are just beginning to work. The question was asked about how often alates [having wings or winglike appendages] are formed on PRC cultivars. The answer was that there may be 15 generations of nonalate aphids formed during the season. Alates may be formed only on winter hosts.

"However, S.E. Halbert stated that she saw alates during July.

"R.L. Bernard asked if chemical control is used for aphids.

"Wang Jin-ling replied that at the moment the most efficient method of control is chemical control, and the Chinese use Cygon (*dimethoate*) with low-volume applications." Address: Univ. of Illinois, Urbana.

Soyfoods Center, P.O. Box 234, Lafayette, CA 94549. 19 p. Aug. Unpublished typescript. Available online at www.soyinfocenter.com/HSS/China1.php.

• ***Summary:*** (Continued): 9. Hakka Cuisine, which uses fresh crisp vegetables, is famous for its jiang doufu, which is firm tofu cut into pockets and stuffed with the same mince.

10. Yunnan Cuisine, a Moslem cuisine from southwest China, makes extensive use of dairy products and pork, but very little soyfoods (Anderson and Anderson 1977; Foreign Language Press 1983).

Soyfoods Recipes in Cookbooks. Since soyfoods are an integral part of the Chinese diet, extensive information on their use in cooking as well as descriptions of types of products can be found in better Chinese cookbooks, especially those with a good glossary. The People's Republic of China has produced a fine collection of the favorite recipes of China's great chefs, in various editions (1949-58, 1963, 1958-65) and various sizes (10-13 volumes), each titled *Famous Dishes of China* (*Chung-kuo Ming-tsai-p'u*). Of the works written in English since 1949 with good treatment of soyfoods, the following highly recommended and authentic ones are listed in chronological order. *How to Cook and Eat in Chinese* (*B.Y. Chao*, 1963; delightful), *The Thousand Recipe Chinese Cookbook* (Gloria Bley Miller 1966; excellent glossary), *Chinese Gastronomy* (H-J Lin and Lin 1969; refined, literate, and poetic with many vegetarian recipes), *Chinese Food* (K. Lo 1972), *Mrs. Chiang's Szechwan Cookbook* (Schrecker 1976; good glossary, excellent recipes), *Florence Lin's Chinese Vegetarian Cookbook* (Lin 1976; the best glossary and most extensive treatment of soyfoods), *The People's Republic of China Cookbook* (Sakamoto 1977; based on the 11-volume Chinese work of 1958-65), *The Key to Chinese Cooking* (I. Kuo 1977; good technique and recipes, but you should cut salt and soy sauce in half), *Chinese Regional Cooking* (Hsuing 1979; fine recipes and superb color photos), *The Modern Art of Chinese Cooking* (Tropp 1982; elegantly written and designed).

Overview of the Chinese Soyfoods Industry. Many of the following observations are based on a 3-week trip to China by W. Shurtleff in June 1983 to study soyfoods in four provinces: Guangzhou, Shenang, Beijing, and Heilongjiang. In 1983 China's most popular soyfoods in terms of the amount produced and consumed (not counting soy oil), in approximate estimated order of importance were: tofu (all nonfermented types), soybean jiang (a sort of Chinese miso but with the texture of applesauce), soy sauce, and soymilk. These were the "big four." Other lesser soyfoods included fermented tofu, yuba, fermented black soybeans (these three were found mostly in south China), green vegetable soybeans, okara, soy sprouts, and whole dry/mature soybeans. Small amounts of modern soy protein products (especially soy flour and textured soy flour) had started to be made experimentally in larger cities. Except for the modern products, this ranking has probably not changed much since 1949–or since 1900.

It is not known exactly what percent of the soybeans used in China are crushed to extract the oil. In 1983 the USDA Economic Research Service estimated 45%. Directors of the Soybean Research Institute at Heilongjiang estimated somewhat more than 50% (and they estimated that the percentage was dropping as the standard of living rose and the demand for soyfoods, such as tofu, increased). Lepley (*Soybean Update*, April 1981) and Terrence Foley, ASA Director in China (1983, personal communication), estimated that 93-95% of the soybeans in China were used to make (traditional) soyfoods, one of the highest percentages in the world; only 5-7% were used for livestock feeds.

Despite increases in soybean production and imports since 1965, per capita annual soybean availability (approximately equal to consumption) dropped sharply from 16.9 kg in 1953 to 14.0 kg in 1975, down to 7.13 kg (the lowest point) in 1965, then up a little to 7.7 kg in 1978 and 8.3 kg in 1980. Note that the latter figure is less than half the 1953 per capita availability / consumption. Nevertheless, according to FAO Food Balance Sheets, this was probably the highest per capita use of soybeans as food in the world; following China (in 1971; FAO 1965 = 6.7 kg) were Japan 5.1 kg, Korea (5.0 kg), Singapore (4.3 kg), and Indonesia (2.8 kg).

Although soybeans are consumed throughout China, far more are consumed in the north and northeast (where the most are grown) than in the south.

Within this broad context of Chinese diet and soybean utilization, there were a number of distinct features that characterized the Chinese soyfoods situation in 1983 and sharply distinguished it from that in other major soybean producing and/or using countries such as Japan, Indonesia, or Korea in East Asia, and the USA or Brazil in the West.

Information on Soyfoods. By far the most important fact noted by one wishing to study soyfoods in China since 1949 is how little information is available on the subject (relative to the importance of soyfoods in China), especially in Western languages, and how difficult it is to get the limited information that is available. There are no official statistics on any aspects of the production of any soyfoods (amount produced, number of manufacturers, etc.), no publications (scientific or popular) devoted specifically to soyfoods or to any soyfood, few books or articles (all in Chinese) on soyfoods, few people with an interest in or doing research on the subject, few conferences or university classes, and no history. It is a shame that a history of soybeans and soyfoods in China has not yet been written by an insider. By contrast, in Japan, there is abundant information in all these areas, in Indonesia there is quite a bit, but in Taiwan and Korea there is relatively little.

Various theories can be proposed to explain this (on the surface) surprising lack of information. (1) Traditional

© Copyright Soyinfo Center 2021

soyfoods are taken for granted since they are so common and widespread. It would be very difficult to gather statistics on so many, widely dispersed cottage industries. (2) The ongoing disruptions from 1958 to 1976 and decentralization of statistics gathering groups made collection of information virtually impossible. (3) Emphasis is on crop production (especially grains before 1976), not on food processing since what is produced will automatically be consumed. (4) Socialist methodology and the general lack of a Western scientific viewpoint, combined with lack of management and organizational skills, the lack of soyfoods trade associations, and a general secrecy about information, all mitigate against good statistics and information. (5) There are no private companies and, with jobs being assigned by the state, few individuals with a strong personal interest in soyfoods, their history and culture. (6) Few Westerners have access to or can read the various Chinese publications in which articles on soyfoods have been written, and few Westerners have been allowed to travel in China since 1949 to study soyfoods directly. All of these reasons have lead to the present shortage of information.

The only article we know of about soyfoods by a Chinese from the PRC published since 1949 in a Western language is Guo's brief 1983 description of 11 Chinese soyfoods, all of which have been described elsewhere in greater depth. Publications in Chinese in which articles on soyfoods occasionally appear include *Food and Fermentation Science, Science of Chinese Seasonings* (soy sauce, jiang, fermented black soybeans), and *Food Science and Technology* (a popular magazine with 300,000 circulation, written in easy-to-understand Chinese). China needs a Soyfoods magazine!

Likewise, relatively few books on soyfoods have been written since 1949. In 1958 the Shanghai Bureau of Cereals published *Integrated Application of Soybeans* (*Dadou Te Zhung He Liyun*)*;* it contains information on soyfoods. In 1982, Zhang, son of a cook in Sichuan wrote a book of tofu. Feng Teh-yi, associate professor at Heilongjiang Commercial College has written books on Soy Sauce and Vinegar Production Technology (1983) and Soyfoods Production Technology (1983). The latter work is the best one in Chinese on the subject to date. In Japan, Nakayama's *Encyclopedia of Chinese Foods* (1970) and *Chinese Cuisine: Famous Recipes* (1973, both in Japanese), contain good information and glossaries on soyfoods. (Continued). • ***Summary:*** www.soyinfocenter.com/HSS/morse_and_piper.php

A comprehensive history of the subject. Contents: Introduction: Transformation of soybean from curiosity to main crop, Morse key man. Early years (1884-1929): Birth and university, early breeding work under Piper at USDA, joint writings with Piper, *The Soybean* in 1923, tribute to Piper. The Dorsett-Morse expedition to East Asia: Purpose of expedition, 2 main objectives and minor objectives, participants and Washington, DC, contact (Ryerson), previous expeditions, departure, gear, Japan March-Oct. 1929, periodic writing, photos, collections, seasonal cycle, 2 trips to Hokkaido, 6 weeks in Korea, back to Japan until April 1930, Manchuria (Dairen) April-Oct. 1930, Dorsett ill, Morse's first trip to Korea, Morse letter to Burlison and American Soybean Growers Association, little soyfood in Manchuria, Dorsett to Peking, Morse's last trip to Korea, Morse's hectic 19-day trip to China, Morse back to Dairen, Morse to Japan Dec. 1930–Feb. 1931, Morse's return to USA Feb. 17, 1931, Dorsett's return March 27, trip a great adventure, strong friendship, 2 letters from Dorsett to Morse, logs, photos, and notebooks, special reports (*Soybeans in Manchuria* and articles for *Soybean Digest*), 4 major accomplishments of expedition, conclusion (a landmark). Later years in America (1931-1959): Return to USA, descriptions of his character, work in USA with soyfoods, continued breeding work, long-term results of collecting efforts not what they might have been, supporter of American Soybean Association, writing career, retirement, growth history of soybean crop, death at age 75 in 1959, tribute. Address: Lafayette, California. Phone: 415-283-2991.

1037. Hattori, Terumitsu. 1983. The soy sauce market in the USA (Interview). Conducted by William Shurtleff of Soyfoods Center, Sept. 19. ½ p. transcript.

• ***Summary:*** His rough estimate of market shares, including imports, is as follows: Kikkoman 40%. LaChoy 30%. Chunking 12%. Imports from Hong Kong, China, Taiwan, and Korea 9%. Imports from Japan 8%. Other USA HVP soy sauce 1-2%.

The products imported from Taiwan, Korea, and China are about 90% Shinshiki shoyu [a mixture of HVP and fermentation], as judged by levulinic acid assays. He does no know when this started. If levulinic acid is in the shoyu, it contains HVP.

Three types of Pearl River Bridge soy sauce are now being imported to the USA: Light, dark, and mushroom. Only one (the light?) has little or no levulinic acid. In a month, he'll have more accurate data. Address: Kikkoman Marketing & Planning Inc., 50 California St., Suite 3600, San Francisco, CA 94111.

1038. Leviton, Richard. 1983. Report on soyfoods research trip across America, September 1983. Colrain, Massachusetts. 8 p. Unpublished typescript.

© Copyright Soyinfo Center 2021

• ***Summary:*** Visited or discusses: Grainaissance (makes amazake and mochi), Brightsong (Dik / Richard Rose), Sonoma Specialty Foods (California), Northern Soy (Rochester, New York), Southwest Soyfoods (Richard Jennings), White Wave (Steve Demos, Boulder, Colorado), Quong Hop & Co. (South San Francisco, California), Modern Fare (Loveland, Ohio), Soyfoods Unlimited (Valerie, Gary and John Robertson, San Leandro, California). Soyfoods Center (Lafayette, California), Soyfoods of America (Doug Fiske and Ken Lee, Los Angeles), Real Foods (Polk St., San Francisco), Tumaros (Los Angeles), Unicorn (Terry Dalton, Florida), Japantown and Rainbow Grocery (San Francisco), Berkeley Natural Grocer and Berkeley Co-op (Bob Gerner, California), Hinode Tofu Co., Edensoy, Farm Foods, New England Soy Dairy, and Nasoya (Leominster, Massachusetts). Legume (Gary & Chandri Barat, New York City), Lotos / Lotus Cafe (Greg Weaver, Rochester, New York).

NRRL (Hesseltine and Wang, Peoria, Illinois): Their work is in mixed starter culture fermentation, vitamin B-12 work. Japanese man from Tokyo to work one year on natto at NRRL, paid by Japanese government. B-12 can withstand some heat during cooking and the percentage of B-12 lost depends on the initial percentage present. Natto research: examine all Japanese publications for review article. Experiment using U.S. soybeans to make natto since the Japanese buy Chinese beans for their thinner seed coat. See what happens to the oil to protein ratio during fermentation. Natto as such has no possibilities in the U.S. as it is a slimy food with a rotten smell; hard to tolerate. There might be vitamin B-12 in natto produced by *Bacillus subtilis.* Koreans have done lots of B-12 research with kimchee and other pickled vegetables. Earl Swain died this summer of a heart attack at age 36. Natto research will help U.S. soybean exports. USDA bureaucrats are making it difficult for Dr. Hesseltine to do natto research. They have 65 objectives, but Dr. Wang's projects don't fit any of them clearly, so they won't mention "food" in their research outlines, just fermentation methods. Secretary of Agriculture John Block [served 1981-86 under President Ronald Regan] says the U.S. needs more ag exports and more basic information about crops uses, so he is in support of this natto research.

Out of business: Michiana Soyfoods, St. Ignatius shop, Sunshine Soy, Heartsong, probably Joy of Soy and a Korean shop in Salt Lake City, Utah.

Concerning soymilk: 10. In Oak Park, Illinois, a natural foods retailer says Edensoy outsells San-J by two to one. (Note: San-J imports "To-Neu Natural Soy Beverage" made in Japan by Kibun). Teenagers buy the carob Edensoy along with popcorn in the store, and use it as a soft drink. But most retailers say the Eden package [stand-up foil retort pouch] is a disaster; it is impossible to open without scissors, then if you squeeze, it sometimes spills out. San-J [in a Tetra Brik carton] is convenient but the taste is poor and the front graphics are confusing–too many words and images. According to Shurtleff, both are inferior products compared to Japan's best.

22. Concerning Edensoy at the NNFA show in Denver, Colorado: Mike Potter says "it went over great." He sold two container loads right away. People liked the package and the taste. About 4,000 people sampled it and were "generally amazed." The results were as good as they could want; it generated interest and excitement. Now they are setting up the distribution system. Address: 100 Heath Rd., Colrain, Massachusetts 01340. Phone: 413-624-5591.

1039. Shurtleff, William; Aoyagi, Akiko. 1983. The book of miso. 2nd ed. Berkeley, California: Ten Speed Press. 278 p. Illust. by Akiko Aoyagi Shurtleff. Index. Sept. 28 cm. [223 ref]

• ***Summary:*** Contents: What is miso? Preface to the second edition. Preface to the first edition. Acknowledgments. Part I. Miso: Savory, High Protein Seasoning. 1. Soybeans, protein and world hunger. 2. Miso as a food. 3. The miracle of fermentation. 4. The varieties of miso: Regular Miso: Rice miso (red / aka, light-yellow / shinshu, mellow red / amakuchi akamiso, mellow beige / amakuchi tanshoku, mellow white / shiro koji, sweet red / edo or edo ama-miso, sweet white / Kyoto shiro miso), barley miso (karakuchi mugi, mellow barley / amakuchi mugi), soybean miso / mamé miso (Hatcho miso, soybean miso / mame miso, tamari miso). Special Miso: Finger lickin' miso / Namemiso (Kinzanji miso, moromi miso, hishio, namémiso, natto miso, goto miso), sweet simmered miso / nerimiso. Modern Miso: Akadashi miso, dehydrated or freeze-dried miso, low-salt / high-protein miso.

Part II. Cooking with Miso (400 recipes). 5. Getting started. 6. Recipes from East and West. Part III. The Preparation of Miso. 7. Making miso at home and in communities (incl. Homemade natural shoyu, and Homemade namémiso, p. 184). 8. Japanese farmhouse miso (how to make miso at home). 9. The traditional miso shop. 10. The modern miso factory. Appendixes: A. A history of miso and soybean chiang. B. Other East Asian misos: Chinese chiang, Korean jang and Indonesian Taucho. C. The microbiology and biochemistry of miso fermentation. D. Miso manufacturers in the West. E. People and institutions connected with miso. F. Miso with seafoods, chicken, and meat. G. Measures, weights, and equivalents. H. So you want to study miso in Japan? I. Miso additives. Bibliography [223 references]. Glossary. About the authors (autobiographical). The Soyfoods Center.

In May 1993 a new printing of this book appeared, containing many small changes made by the authors. Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549. Phone: 415-283-2991.

A: A history of miso and soybean chiang [jiang] (Document part). In: W. Shurtleff and A. Aoyagi. 1976. The Book of Miso. Hayama-shi, Kanagawa-ken, Japan, Soquel, California, and Brookline, Massachusetts: Autumn Press. 278 p. See p. 214-41. Illust. by Akiko Aoyagi. [223 ref]
• ***Summary:*** Contents: Introduction: Etymology. Soybean chiang in China: Early Chinese non-soybean chiang, 600-1899. Soybean chiang in Korea and Southeast Asia: Dissemination of chiang from China, Korea, Indonesia, Vietnam, other Southeast Asia.

History of miso in Japan: Introduction, early non-soybean hishios (before AD 700), the Nara period (AD 710-784), the Heian period (AD 794-1160), the Kamakura period (1185-1333). The Muromachi period (1336-1568), the Edo or Tokugawa period (1603-1867). A brief overview of origins. the Meiji and pre-war periods (1867-1939), World War II and the postwar period: Modern times (1940-1983).

History of miso in Europe: Early European references, 1900-1949, 1950-1982.

History of miso in the United States and Canada: Early developments (1896-1929), 1930-1959, growth of interest in miso (1960-1982; Shibasaki and Hesseltine at the NRRC, Peoria, Illinois, Ichiro Ouchi, the macrobiotic movement, Herman Aihara, George Ohsawa, Miso and Aveline Kushi in Boston, Massachusetts, Noboru Muramoto, George Gearhart, Thom Leonard, Allen Ginsburg and Gary Snyder, Mt. Tamalpias, Tassajara Zen Mountain Center, Miyako Oriental Foods, Kanemasa Miso Co., Ohio Miso Co., Shin-Mei-Do, American Miso Inc., South River Miso Co., Joel Dee and Miso-Cup), miso's future in the West.

Miso in other countries: Israel, India, Latin America (Brazil, Mexico), Africa.

Illustrations: Evolution of Chinese characters. Hideyoshi Toyotomi and a robber on the bridge (Hatcho miso history, p. 219). Making miso-damari (p. 220). Graph of the miso market in Japan (1880-1980) (p. 226). Ohio Miso letterhead and logo (p. 238). U.S. miso imports, production and consumption (1970-1983) (p. 240). Page 219: "The origins of modern shoyu can be traced more clearly to the mid 1200s when the Japanese priest Kakushin returned from China, having learned there the technique for preparing Kinzanji miso. Establishing himself at Kokoku-ji temple near the town of Yuasa..." Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549. Phone: 415-283-2991.

1041. IBPGR. 1983. Genetic resources of soyabean. Rome, Italy: International Board for Plant Genetic Resources, Secretariat. 19 p. 30 x 21 cm. Oct. IBPGR Working Group on the Genetic Resources of Glycine Species, held at the International Soybean Program (INTSOY) at the University of Illinois, Urbana, 9-11 Aug. 1982. [2 ref]
• ***Summary:*** This report, distributed free to developing countries but with restricted distribution to developed countries, was written after an ad hoc Working Group on the Genetic Resources of *Glycine* was held. A minimum list of descriptors is included. Address: Crop Genetic Resources Centre, Plant Production & Protection Div., FAO, Via delle Terme di Caracalla, 00100, Italy.

1042. Lee, Kyung. 1983. Re: The soymilk industry and market in Korea. Letter to William Shurtleff at Soyfoods Center, Nov. 23–in reply to inquiry. 3 p. Typed, with signature on letterhead.
• ***Summary:*** See next page. "Unfortunately, there is no book or publication either in English or Korean about the history of soybeans or soyfoods in Korea. I am enclosing a book 'Science of soybean, tofu and soybean sprout,' written by Dr. K.H. Kim. This book discusses the technical procedure to make different soy foods such as tofu and soybean sprout. I hope you can make a good use of this book.

"As far as soy milk industry is concerned, it can be said that soy milk industry is one of the fastest growing food industries in Korea.

"The leading soy milk maker is Chung's Food, which markets Vegimil (brand). Chung's Food began soy milk business in 1973 and observed the 1Oth anniversary in October.

"The second largest maker is Dong Bang, which markets Green Milk and Hae Pyo Doo Yoo (brands). Dong Bang entered the soy milk market in September 1979.

"The third largest maker is Seo Ju Industry, which markets Seo Ju Mill. It entered the market in October 1982.

"As of March this year, there were 9 makers, out of which three companies went bankrupt. Later during the year, Lotte Chilsung entered the market in May. Currently there are 7 makers.

"Their status is as shown on the attached paper. On The average, one kg of soybeans produces 6 kg of soy milk. The usage of soybeans as allocated by the National Agricultural Corporation was as follows in 1983;

"Chung's Food 7,500 MT (metric tons)
"Dong Bang 2,000
"Lotte Chilsung 800
"Dong A 700
"Dae Won 200
"Kwang Ju 200
"Seo Ju * Not using soybeans, but rather soy protein concentrate.

On the last page of the letter is a table of Korea's "Soy Milk Status (Nov. 1983)."

All soymilk in Korea is sold in 180 cc cartons.

Dong Bang's sales volume includes soymilk sold to ice cream makers in bulk. Out of the total of 170,000 cartons per day, about 70% is sold in consumer packages and the rest is sold in bulk, which is then converted to consumer package equivalent. Address: Country Director, American Soybean Assoc., P.O. Box 1704, USIS Bldg., 63 Eul Ji Ro 1Ka, Chung Ku, Seoul, Korea. Phone: 722-2601 X-4368.

Soy Milk Status

Nov. 1983

| Company | Brand | Sales Volume 1/ container/day | Year of Establishment |
|---|---|---|---|
| Chung's Food | Vegimil | 1,000,000 | 1973 |
| Dong Bang | Green Milk<br>Hae Pyo Doo Yoo | 170,000 2/ | 1979 |
| Seo Ju | Seo Ju Mill | 130,000 | 1982 |
| Dong A | Sun Dew | 130,000 | 1983, March |
| Lotte Chilsung | Lotte Doo Yoo | 130,000 | 1983, May |
| Dae Won | Eggmil | 20,000 | 1982, August |
| Kwang Ju | Supermil | 20,000 | 1982, May |

1/ Sales Volume is estimated by ASA/Seoul. There is some seasonal variation. The figure reflect the best month figure in Summer. The size of container is 180 cc.

2/ Dong Bang's sales volume includes soymilk sold to ice cream maker in bulk. Out of 170,000 containers about 70 % is sold in consumer package and the rest of them is sold in bulk, which is converted to consumer package equivalent.

1043. Yasuda, Masaaki. 1983. Tôfuyô to beni kôji [Okinawan fermented tofu (tofuyo) and red koji]. *Nippon Jozo Kyokai Zasshi* (*J. of the Brewing Society of Japan*) 78(11):839-42. Nov.; 78(12):912-15. Dec. [72 ref. Jap; eng+]
• ***Summary:*** How to eat tofuyo (p. 839): In the *Gyozen Honzo* (*Food Herbal*) (1832, a book about food and medicine) the physician TOKASHIKI Tsûkan Peichin wrote: Tofuyo has a delicious flavor and is good for the stomach. It makes eating a pleasure and is good for various types of sickness" (Ref. #9; Note: This book contains the earliest direct reference seen (May 2021) to tofuyo. Peichin refers to a high-ranking officer). It seems that tofuyo was consumed by the upper classes during the Ryukyu Ocho period in Okinawa and it was also used as a food for recovering after a sickness, and as a side dish. According to old people in Okinawa, Tofuyo was popular among upper class people in Shuri or Naha, during the Taisho period (1912-1926) and at the beginning of the Showa period (1926+). It was eaten with tea by ladies or with millet brandy (*awamori*) by men. But it was too expensive for the regular people to afford. The best way to eat tofuyo is to place one cube of it (2-3 cm on a side)

© Copyright Soyinfo Center 2021

on a small dish and eat it with chopsticks or a toothpick a little bit at a time.

Note on the geography and history of the Ryukyu Islands (also called Luchu or Loochoo Islands): This chain of islands extends in a 600-mile long arc southward from the southern tip of Kyushu (Japan's southernmost main island) down to Taiwan. It includes Okinawa, Sakishima, and the Amami island groups. The population in 1970 was 945,000. The chief town is Naha on Okinawa. History: In 1372 these islands came under the political influence of China. In 1451 they became a tributary to Japan as well as China, and 1609 a Japanese protectorate (part of Satsuma-Han). Thus the islands have long had cultural ties with both Japan and China. During Japan's Edo period (1600 to 1868) the kingdom of Ryukyu formally belonged to China, but in fact it was more closely tied with the Satsuma Han, a powerful domain in southern Kyushu. Like China and Japan, Ryukyu had its own emperors and dynasties. The imperial palace was on the island of Okinawa, in the southern city of Shuri. Imperial messengers (*sakuho-shi*) were frequently sent to Okinawa from China and there were cultural exchanges between the two countries. In 1871 the Meiji government in Japan made Ryukyu part of Kagoshima prefecture. In 1872 they made it Ryukyu-Han. After this change, Shôtai (lived 1845-1901) became king of the Ryukyu-Han. In 1879 Ryukyu became an integral part of Japan. Under the Japanese, the Amami group belonged to Kagoshima prefecture and the Okinawa and Sakishima groups constituted Okinawa prefecture. In 1945, after World War II, it was placed under a U.S. military government. In 1966 it received local self-government, and in 1972 was returned to Japan.

History of tofuyo in Okinawa (p. 839-40). The earliest document seen concerning soybeans in Okinawa appeared in 1534 in the *Record of the Messengers to Ryukyu* (*Shi Ryukyu Roku;* Ref. #16). Thereafter soybeans became a widely grown crop (Ref. #17). The *History of Ryukyu* by Ryukyu Opu (1713, Ref. #19) noted that it was not clear at the time when and how tofu came to the country. Although this uncertainty still remains, tofu is thought to have arrived in Ryukyu in the mid-1600s. According to the *Various Records of the Messengers to Ryukyu* written by Osho? (Wang-shu?, Ref. #18) in 1683, tofu was widely available at that time in Okinawan market places, being produced by many companies. It was an important food not only for the local people, but also for the Chinese imperial messengers (Refs. #20-22). Okinawa's tofu was a firm tofu, made in the Chinese way by pressing the soymilk out of the okara before cooking it. This method was also traditionally used in Korea and southern Japan (in Kumamoto–Itsugi-mura, Yamaguchi, Ishikawa, and Koichi prefectures). The method was probably introduced to Okinawa by Chinese imperial messengers or by exchange students, although it could have been brought from Japan by Buddhist monks, who served it in their temple cuisine.

Note: For much more detail about the history of tofu-ru in the Ryukyu islands, please see "History of Fermented Tofu" on Google Books and on the Soyinfo Center website. Address: Dep. of Agricultural Chemistry, University of the Ryukyus.

1044. Widner, Patrick T. 1983. Meals for Millions Foundation (Interview). Conducted by William Shurtleff of Soyfoods Center, Dec. 19. 1 p. transcript.

• ***Summary:*** Mark Sterner left in 1976. He is now in Oregon. Phone: 503-672-2047.

In Davis they have a library and resource center, incl. some old logs of MPF shipments. Their documents on their history are in boxes and closets. They have quite a few statistics and a large log book of shipments. One good history paper is by Patti Butzer Larsen. For more historical information call Mrs. Clinton in Los Angeles at 213-663-3838. Mark Sterner might know the history best. Or try Borsook: 805-682-1006.

MFM / FFHF moved to Davis in Sept. 1982, then moved into a new million dollar building in Feb. 1983. They chose Davis primarily for its university which had an interest in nutrition, food science and technology, and agriculture. They have a mutual exchange with the university. They help foreign students prepare for work overseas; it is an innovative community.

They no longer distribute MPF (multi-purpose food); CSM (Corn-Soy-Milk), introduced in Sept. 1966 by USDA's Food for Peace Program (P.L. 480) made it unnecessary.

They moved away from Santa Monica since they were no longer as heavily involved with food technology. The Santa Monica facility was set up for food processing and teaching–mostly foreign students.

Their main work now is "applied nutrition" abroad–a wholistic program including nutrition education. They started their first applied nutrition program in Honduras in 1978–at one stage they were making foods outside the USA. Much of this work was based on the work of Michael Latham at Cornell and on FAO; in the 1960s they defined "applied nutrition." They do integrated rural development programs, community development, etc. Nutrition is their primary interest and focus, and they have applied this to Honduras.

They are no longer doing much work with soy, although they planted a little in Ecuador. Lou Ziskin is Latin American director. Talk with him. MFM's push to grow soybeans was in the early 1970s.

Peter Davies, who is now president of the Foundation, came in May 1976. The main countries where they now work are described in the recent MFM annual report. The work with soy is most active in Korea.

The budget is now close to $2 million. Most of it (36%) is from the general public, generated through mailings. 25.7% of their income is from USAID; most of the rest

© Copyright Soyinfo Center 2021

(27%) is from foundations and corporations. Churches give 9%. MFM is now also doing radio ads. The New York office does mailings. Address: Director of Public Education, Western Office: 1644 DaVinci Court, P.O. Box 2000, Davis, California 95617. Phone: (916) 758-6200.

1045. Sterner, Mark H. 1983. Work with Meals for Millions Foundation, 1966-1973 (Interview). Conducted by William Shurtleff of Soyfoods Center, Dec. 20. 2 p. typed transcript.
• ***Summary:*** Mark Sterner joined MFM in 1966. He initiated technology transfer, moving away from distribution of MPF. He was executive director in 1972 and 1973. Florence Rose was the executive director of MFM for roughly 20 years, from the inception until just before Sterner arrived–when she retired. In 1965 the Board decided to wind down distribution and to focus on technology transfer.

The first MPF was made by Gentry Foods, a food dehydrating company. General Foods began to make and market multi-purpose food on 1 Dec. 1959; before that it had been made by Gentry Foods in the Los Angeles area. The formula was changed when General Foods started making MPF. The peak year for MPF distribution was about 1965; roughly 60 to 100 tons were made and distributed each year at that time. It was never an impressive amount when measured by weight. 2,000 tons would be 100 tons a year for 20 years. The U.S. government said the amount of MPF distributed was "fairly small." After about 1955, most of it was sent to missionaries and the like who operated soup kitchens, hospitals, etc. They used it properly and it was well accepted as a protein fortifier. Virtually all of it was sent in sealed #10 cans. General Mills continued to make MPF until it stopped being distributed in about 1980.

Florence Rose tried to get USAID to distribute MPF but they were not interested.

Incaparina was the first cereal-soy blend.

Mark's most significant accomplishment was the development of an extruder or extrusion cooker that could be built and used in less developed countries. Most such countries could not afford to purchase one of these from the USA. He made design changes, such as interrupting the flights. Later a number of these changes he made were adopted by other manufacturers of extruders. About six of the MFM extruders designed by Mark went into the field, two in Korea and 1 each in Thailand, Puerto Rico, and Africa. Mark will be with Hank Sterner until about May; he would love to look over the draft manuscript on the history of MFM.

Mark left MFM in a situation he was not happy with; he has not kept track of it afterwards. It's a "heritage room" history.

Before he arrived, MFM had a certain air about it (little credibility) that it was run by "that woman who was in menopause." The same woman was executive director for the first 20 years; she had no endowment funds. Clifford Clinton apparently funded it for the first two years and provided it with office space above one of his restaurants. It was a private foundation, publicly funded. Then the Board disowned Clinton, but amends were made in about 1972.

"Florence Rose was kind of laughed at. She trotted around the world with a carpet bag full of Meals for Millions literature, elbowed her way in to see heads of governments and top officials, and encouraged them to work with her" (and MFM). She had much the same presentation and reputation in Washington, DC. People hated to see her come around. So MPF and MFM, primarily because of her personality, found little favor with the government. She died in 1969.

When Mark Sterner came in to MFM it took on a whole new tone. It became reputable internationally, professional, listened to, welcomed by cereal chemists and with credibility in Washington, DC, as with Rod Crowley's office and with USAID. MFM was getting $1.3 million a year for a few years (1972-1973) before he left. This funding indicated real confidence and it made a big difference in operations. Plus, MFM got additional money to construct a laboratory and classrooms in Santa Monica. Address: Formerly technical advisor and executive director, Meals for Millions Foundation, Norco, California 91760.

Part VII: History of soy flour, grits, and cereal-soy blends in Africa. Introduction. Ethiopia. Ghana. Kenya. Nigeria. Rwanda and Burundi. South Africa. Tanzania. Uganda. Zimbabwe.

Part VIII: History of soy flour, grits and cereal-soy blends in the Middle East.

Note: This is the earliest English-language document seen (Jan. 2019) with the term "cereal-soy blends" in the title. Address: Lafayette, California. Phone: 415-283-2991.

1048. Rhee, Sook-Hee; Kim, S.K.; Cheigh, H.S. 1983. [Studies on the lipids in Korean soybean fermented foods. I. Changes in lipids composition during Chungkookjang fermentation]. *Korean J. of Food Science and Technology* 15(4):399-403. Dec. [23 ref. Kor; eng]

• ***Summary:*** "Chungkookjang, a traditional Korean fermented soybean food, was prepared by a commercial process. Cooked soybeans were fermented with *Bacillus natto* for 3 days and ripened with addition of 7% salt for 20 days."

Note: This is the earliest document seen (May 2021) that uses the word "Chungkookjang" to refer to Korean-style natto. Address: 1. Dep. of Food and Nutrition, Busan National Univ., Busan; 2-3. Food Chem. & Technol. Lab., Korea Advanced Inst. of Science & Technol., Seoul, South Korea.

1049. Suh, Jeong-Sook; Ryu, M.K.; Hur, Y.H. 1983. [Effect of bacillus strains on Chungkook-jang processing. III. Changes of free amino acid contents and nitrogen compounds during Chungkook-jang koji preparation]. *Korean J. of Food Science and Technology* 15(4):385-91. Dec. [31 ref. Kor; eng]

• ***Summary:*** "The change of free amino acid contents and nitrogen compounds in the course of the *Chungkookjang* fermentation that occurred by utilizing *Bacillus natto* and *Bacillus subtilis* are to the following effects. pH, during the growth period, that is 6.35 in pH at the first stage of fermentation, were turned into 8.2 after 72 hours. Crude protein content increased irregularly from 16.82%-18% and total sugar decreased. Increasing with the progress of fermentation time, protease activity showed the maximum value between 48-60 hours, but *Bacillus natto* activated a little than *Bacillus subtilis.* Amino nitrogen and water soluble nitrogen content increased but difference was found that is, *Bacillus natto* increased more than *Bacillus subtilis.* Glutamic acid content was the highest among the contents of free amino acid between both *Bacillus* sp. and the order of the next contents showed as leucine, phenylalanine, histidine alanine. arginine, but difference was found between *Bacillus* sp., that is, *Bacillus natto* was higher than *Bacillus subtilis.* In view of the results as above, *Bacillus natto* was excellent than *Bacillus subtilis* as *Bacillus strains* of *Chungkookjang koji* production." Address: 1. Dep. of Food Science & Nutrition, Seoul College of Health; 2. Lab. of Sampyo Food Indust. Co., Ltd., Seoul; 2. Dep. of Food Processing Technology, Seoul College of Health.

1050. Wee, Jae-Joon; Lee, Hyong-Joo. 1983. [Characteristics of amino acid fortified tofu manufactured by coprecipitation of whey and soybean proteins]. *J. of the Korean Agricultural Chemical Society* 26(4):205-10. Dec. [11 ref. Kor; eng]

• ***Summary:*** "The contents of total solids and protein of traditional tofu were about 19% and 13%, respectively, while those of the whey-soybean tofus were 17.3%-18.1% and 10.9%-11.3%, respectively. The 5-15% of lactose in whey-soymilk mixture was transferred into the tofus. The content of sulfur-bearing amino acids in the fortified tofu from 3:1 mixture of whey and soymilk was 3.8g/100g protein which indicated about 50% fortification of the amino acids as compared to the traditional tofu which contained 2.54g/100g protein of the sulfur-bearing amino acids." Address: Dep. of Food Science and Technology, College of Agriculture, Seoul National Univ., Suwon, South Korea.

1051. Wee, Jae-Joon; Lee, Hyong-Joo. 1983. [Coprecipitation characteristics of cheese whey and soybean proteins]. *J. of the Korean Agricultural Chemical Society* 26(4):199-204. Dec. [24 ref. Kor; eng]

• ***Summary:*** "As a way of utilizing cheese whey to fortify sulfur-bearing amino acids to soybean protein, whey-soybean coagulum was made from whey-soy milk mixture and optimum conditions for coprecipitation of the two proteins were determined." Address: Dep. of Food Science and Technology, College of Agriculture, Seoul National Univ., Suwon, South Korea.

1052. **Product Name:** [White Snow Lecithin].
**Manufacturer's Name:** Cheil Sugar Co. Ltd.
**Manufacturer's Address:** 23rd Floor, Samsung Main Building 250, 2-KA, Taepyung-Ro, Chung-Ku, Seoul, South Korea.
**Date of Introduction:** 1983.
**New Product–Documentation:** Soya Bluebook. 1983. p. 58.

1053. Cuh, J.O.; Rhee, C.O.; Lee, Y.M. 1983. [Basic studies on the native colored-soybean cultivars. III. Variations and performances in chemical composition and textural property

in seeds of collected colored-soybean cultivars]. *Korean J. of Crop Science* 28(3):345-50. [21 ref. Kor; eng]
• ***Summary:*** "Collected 38 varieties of colored-soybean seed cultivated under a given cultural conditions were tested in the various chemical compositions and rheological properties in seeds. As it were, protein, fat, carbohydrate, ash and water contents as a chemical contents were studied not only on their statistical variations, but also on interrelationships with their collaborated rheological characteristics; hardness, cohesiveness, elasticity, gumminess and chewiness. For the rheological analysis of the materials, the General Foods Texturometer and typical texturometer curve were used." Address: College of Agriculture, Chonnam National Univ., Chonnam 500, Korea.

1054. Ghu, J.O.; Ha, K.Y.; Hong, E.H. 1983. [Basic studies on the native colored-soybean cultivars. IV. Sensory analysis and interpretation of component in seeds of collected colored-soybean cultivars]. *Korean J. of Crop Science* 28(4):462-68. [12 ref. Kor; eng]
• ***Summary:*** "Collected 38 colored soybeans, which was cultivated under the conventional field conditions, Were investigated about their organoleptic parameters and correlations among factors such as organoleptic score, texturometer parameters and chemical components of seeds. Most of the organoleptic parameters were affected much more by the characteristics of each cultivar than by grain weight, and then showed significant differences with the effect of interaction between grain weight and cultivar, too. Also among contribution degrees of texturometer scores to overall acceptance, cohesiveness was higher in small, medium and super grains, however in large grains, hardness. And among sensory attributes, suitable toughness was contribute most positively to acceptance." Address: College of Agriculture, Chonmam National Univ., Kwangju 300, Korea.

1055. **Product Name:** Soft Tofu, and Firm Tofu.
**Manufacturer's Name:** Obok Foods.
**Manufacturer's Address:** 7215 Garden Grove Blvd. Suite M, Garden Grove, CA 92641. Phone: 714-898-9120.
**Date of Introduction:** 1983.
**New Product–Documentation:** Talk with Shoan Yamauchi. 1988. Oct. 23. This is a small Korean-run company in Orange County. Talk with Mr. Park, the founder, a Korean-American. 1988. Oct. 24. He started the company in 1983 with soft and firm tofu. In 1987 he added Kinugoshi. He also runs Obok Bakery on the same street. As of May 1991 he consumes 27 tons/month of soybeans. He may move to Riverside.

1056. **Product Name:** Silken Tofu (Kinugoshi Style).
**Manufacturer's Name:** Obok Foods.
**Manufacturer's Address:** 7215 Garden Grove Blvd. Suite M, Garden Grove, CA 92641. Phone: 714-898-9120.
**Date of Introduction:** 1983.
**New Product–Documentation:** Talk with Mr. Park, the founder, a Korean. 1988. Oct. 24. He started the company in 1983 with soft and firm tofu. In 1987 he added Kinugoshi. He also runs Obok Bakery on the same street.

Address: Kikkoman Corp., Noda-shi, Japan.

1058. American Soybean Assoc. 1983. ASA helps quench Asian thirst for soymilk. *Checkoff Successfile*. Asia #804. 2 p.
• ***Summary:*** Problem: Soymilk has been a staple in China for centuries. "But the 'beany' taste limited its appeal. Also, in many areas soymilk was made and sold by roadside vendors, and production was inefficient or unsanitary.

"Program: ASA promoted soymilk in Japan, Taiwan, Korea and Singapore. ASA staff worked with food companies to stimulate large scale soymilk production. ASA technicians helped develop new, appealing soymilk flavors. ASA participated in food shows, gave demonstrations and sent out educational pamphlets depicting soymilk's health benefits and good taste.

"Results: Asian soymilk consumption has soared. Consumption in Japan is expected to jump over 200 percent from 1981 to 1982, using almost 1 million bushels of soybeans. Korean soymilk consumption has doubled, requiring over 1 million bushels of beans. Taiwan consumers are drinking over 180,000 gallons of soymilk daily, using over 950,000 bushels of soybeans annually."

A bar chart shows "Growth of soy milk sales in Japan" from 1975 to 1981, with 1982 estimated. The growth has been exponential.

1059. Chang, Te-Tzu. 1983. The origins and early cultures of cereal grains and food legumes. In: David N. Keightley, ed. 1983. The Origins of Chinese Civilization. Berkeley, California: Univ. of California Press. xxxi + 617 p. See p. 65-94. [133 ref]
• ***Summary:*** An excellent overview. Prehistoric civilization in China began to bloom and spread when crop production progress was made "in the central plain, in areas bordering the southern banks of the Yangtze Chiang basin, and probably in the adjoining areas. *Shu* (1 Chinese character given) (millet), *chi* (1 Cc) (millet), *tao* (1 Cc) (rice), *mai* (1 Cc) (barley and wheat), and *shu* (1 Cc) (soybeans)–the five cereals mentioned in mythological writings–provided the basic necessities for the eventual expansion and development of Chinese civilization."

A map (p. 67) shows "Geographic distribution of the

© Copyright Soyinfo Center 2021

cereals and soybeans in nine *chou* (districts) during the Chou dynasty." A dark broken line shows the western and northern limit of rice cultivation ca. 450 BC, and a lighter broken line shows the western and northern limit of rice cultivation ca. 100 BC; the shifted eastward and southward.

"From the Spring and Autumn to the Warring States periods (722-256 B.C.) millets and soybeans were the staples of the north (Liu 1960 [in Chinese]).

Both millets "are adapted to semi-arid climates and infertile soils." They are also adapted to alkali soils. "The millets require less intensive care than other cereals..." (p. 69).

"From the beginning of the Warring States period, *shu* (the soybean) began to overtake the millets in predominance, as indicated by various writings. Between the Ch'in and Western Han, however, *mai* and *ho* (millets) still dominated *shu* (soybeans) (Liu 1960).

Pages 80 and 81 are about "The soybeans and other legumes," including: The origin and domestication of the soybean. Antiquity of the soybean. Impact of the soybean. "The *shu* pictograph can be traced back to approximately the eleventh century B.C. (Hu Tao-ching 1963). Both *shu* and *jung-shu* (2 Cc) appear in the odes [Book of Odes, Shih-ching] several times (Ho 1975, p. 78).

"The soybean probably emerged as a domesticate during the Chou dynasty (Ho 1969a: 168; Hymowitz 1970: 416). The proto-Tungusic people in the northeast plains could have brought the seeds to the early Chou court. It became widely disseminated in the Chou culture area only after 664 B.C., following the expedition of Lord Huan of Ch'i, who brought seed from the Mountain Jung tribe (Ho 1975: 77-79). As the Ch'in dynasty expanded and trade increased, the legume spread to the south (Li Ch'ang-nien 1958), to Korea, Japan, and southeast China. The northeastern provinces became a center of diversity (Hymowitz 1970). The soybean thrives better in mesophytic regions than in arid zones (see King 1966: 180 for comparative data on efficiency of transpiration).

"Millet and soybeans became important crops grown in rotation in about the fourth century B.C. The long lapse between the first domestication of millet and that of the soybean indicates a prolonged process of trial and error by people who were probably of different tribes (Ho 1975: 80).

"Impact of the Soybean: Soon after domestication and dissemination during the Chou dynasty, the soybean became an important source of plant protein. Because its root nodules fix nitrogen, it entered into the widely practiced millet and soybean rotation system (this is mentioned in the Kuan-tzu {2 Cc} of the fifth to third century B.C.; Li Chang-nien 1958). Within three centuries, millet and soybeans became the major crops in areas north of the Huai river." Address: Geneticist and Leader, Genetic Resources Program, The International Rice Research Inst., P.O. Box 933, Manila, Philippines.

1060. Fruin, W. Mark. 1983. Kikkoman: Company, clan and community. Cambridge, Massachusetts: Harvard University Press. xiv + 358 p. Illust. Index. 24 cm. [230 ref. Eng]
• ***Summary:*** A superb business history and No. 35 in the series Harvard Studies on Business History. Contains 8 illustrations, 16 figures. and 30 tables. All Japanese names are written, Japanese style, with the family name first, followed by the given name.

Contents: Editor's introduction, by Alfred D. Chandler, Jr. Acknowledgments. Introduction (author's. The company began brewing shoyu in 1661 in the town of Noda, 90 minutes by modern train northwest of Tokyo. Phase I: 17th century to 1887. Phase II: 1887 to 1917. Phase III: 1918 to 1946. Phase IV: Postwar democracy.

1. Factories in the fields: Rural-centered industrialization, the origins of shoyu, Noda soy sauce (In 1661 Takanashi Hyozaemon XIX began brewing shoyu in Noda), Mogi domination of the market, fermentation technology (preparation of wheat for koji, preparation of brine solution, culturing of the wheat and soybeans to make koji, process of fermentation), extraction or pressing (At the end of the Tokugawa period {1867} the standard wooden keg held 9 *shô*, 4.33 gallons, which was said to be the amount of shoyu consumed in one year), production and scheduling, the dual employment system (organization of work, work rules, 1909 wage agreement, hierarchies of work {in front office and factory}), industry and community, farms and factories in 19th century Japan.

2. Clan and cartel in Meiji Japan: Clan and cartel in the Meiji period, government-regulated markets, Noda brewers assert themselves (registration and promotion of the brand-name Kikkoman by Mogi Saheiji, in Japan, Amsterdam, Austria and California), the Noda Shoyu Manufacturers' Association (*Noda Shôyu Jôzô Kumiai;* a cartel formed in 1887 to stabilize price, control supply, and guarantee markets, cartel and costs, the challenge of Suzuki Tôsaburô / Tosaburo), research and development, distribution: the railroad (opened in late April 1911), social change and the cartel (the cost of charity, noneconomic motivation, from philanthropy to paternalism), the transformation of shoyu manufacture in the countryside.

3. From cartel to corporation and beyond ("A corporation requires a nucleus for centralization and coordination"): 1909 to 1918: period of preparation ("in 1914 three shoyu brewers from Choshi in Chiba prefecture had formed the Choshi Shoyu Company." The owners were Hamaguchi Yoshiuemon, Fukai Yoshibei, and Tanaka Genba) (remains of the cartel, the Noda Shoyu Company {began operations on 1 Jan. 1918}), 1918 to 1927: the first decade–process of incorporation (Jinsen Shoyu was a brand brewed in Inchon, Korea) (1918 to 1925: from committees to functional departments {sales committee, research committee}, 1925 to 1927: holding company reorganization),

© Copyright Soyinfo Center 2021

the making of a rural zaibatsu (1925 on).

4. A loyal retainer's farewell (translation of a small, privately published eulogy for Mogi Shichirouemon VI, of the Kashia clan, first president of the Noda Shoyu Co, written in 1929): Shinshima's views on Japanese management, the master as seen by the apprentice (preface, introduction, brief biography, the president's principles and policies, the president as businessman, the president's everyday life, an impressive personality, a man of unquestionable character, ancestor worship, a model of love, on being what you are, accepting fate, the president's personality as revealed in a game of go, people rather than things, the president and wine {"A proverb says 'a drinker resembles a cake of tofu: in the beginning it's square and has shape, but it ends up shapeless, formless"}, life as a spiritual exercise, three great men of Kashiwa, is Ito crazy?, called by God, everything is one), editor's postscript.

5. Prelude to turmoil: The murder (of Kimura Junichiro), union activities up to the homicide, traditional wage labor (problems associated with the employment system, "internal contracting"), internal contracting and the Noda Shoyu Company, from homicide to the 1923 strike, reorganization of work design and structure (Jan. 1923).

6. The Noda Strikes: 1923 and 1927-28: Worker discontent rises, the strike of 1923 (negotiation and compromise, memoranda), the 1927-28 dispute (it lasted 218 days; work environment, transportation issues: prelude to the strike, 1927-28: an overview), conclusion: Japanese industrial relations at a crossroad.

7. Corporate maturation: The new paternalism (membership in the new paternalism), paternalism and patriotism, two features of the Japanese employment system, the prewar employment system at the Noda Shoyu Company, the end of an era, the limits of a family firm, a corporate coming of age

8. Democratization and internationalization (In 1964 Noda Shoyu Co. was renamed Kikkoman Shoyu Co., and in 1980 the name was changed again to Kikkoman Corporation): The course of democratization, democratization of the family (the individual replaced the household / family as the locus of legal responsibility. Zaibatsu were dismembered), unionization–within and without the Noda factories (effect of unionization upon the company), company and community after 1962, antitrust and business strategy, background to marketing development), the growth of internationalization (effect of exogenous factors on Kikkoman, development of a new business strategy), internationalization (in June 1957 Kikkoman International Inc. was established), diversification (Manjo brand, Yomohoharu brand, Del Monte brand, Disney brand, Mann's brand, Higeta brand {marketed but not made by Kikkoman}, Ragu brand, Kikko brand, Monet brand). Conclusion. Appendix A. Ie [stem family lineage] and the shoyu industry. B. Scroll from Mogi Fusagoro with preface by Mogi Keizaburo on the founding of a Noda Shoyu brewery, 1872. C. Rules and Regulations of the Noda Shoyu Brewers' Association. D. Noda Shoyu Brewers' Association Income and Expenses, 1888-1918 (yen). E. Property held by Mogi-Takanashi families joining Noda Shoyu Co. Inventory taken November-December 1917. F. New wage and work proposal, Noda Shoyu Company, 1919. Notes. Glossary.

This book was very favorably reviewed by Masaru Udagawa in *Business History Review.* 1986. Spring. p. 169-70.

Concerning the Kikkoman brand (p. 59): In 1838, Mogi Saheji petitioned for and received registration for the brand name Kikkoman by the central government of Japan. Although this Mogi family has produced other shoyu brands, Kikkoman was the pride of the family, its private label. When written longhand in Japanese characters, the brand is composed of three characters: *ki*, for "tortoise," meaning good luck and longevity in Chinese and Japanese folklore; *ko* means "first-rate"; and *man* suggests "ten thousand" or forever. *Kikko* also means octagon, so the brand name is often written as an octagon with the character for "ten thousand" or *man* written inside the octagon.

"In 1872 and 1873, shortly after the Meiji Restoration of 1868, Mogi Saheiji entered Kikkoman in two world's fairs, the first held in Amsterdam and the second in Austria. Kikkoman was awarded a letter of commendation for excellence at the Austrian fair, and following this, Mogi Saheiji redoubled his efforts to promote the brand. In 1877 Kikkoman received a second-place medal at the All-Japan Industry Promotion Fair, and in 1879 it was registered in California as a legally recognized brand name, a move that predated the same legal protection in Japan by six years!"

Prof. Alfred D. Chandler, Jr. of the Harvard Business School worked closely with Fruin as he was researching and writing this book during nearly two years at Harvard. His scholarship, wisdom, friendship, and encouragement contributed greatly. Address: Prof. of History, California State Univ., Hayward.

1061. Hesseltine, C.W. 1983. Microbiology of Oriental fermented foods. *Annual Review of Microbiology* 37:575-601. [50 ref]

• ***Summary:*** Contents: Introduction. Historical account. Importance of mixed cultures. Microorganisms used.

"The Japanese Food Agency, Ministry of Agriculture, Forestry, and Fisheries (1979), gave the following figures for 1979: miso, 567,776 tons; shoyu, 1,252,431 kiloliters; and natto, 158,000 tons. In Korea, 35% of the 442,803 metric tons of soybeans produced is fermented. Indonesia uses about 75,600 tons of soybeans in making tempeh.

"There is considerable ancient writing in Chinese publications about foods made by fermentation, but the first scientific reports are only about 100 years old. From 1878 until the beginning of World War I, there was an explosion

© Copyright Soyinfo Center 2021

of papers and reports dealing with fermented foods and drinks... In general, studies between 1881 and 1914 were devoted to the description of the product and the local name and to the isolation and description of the microorganisms associated with the fermentation. A number of organisms new to science were described and illustrated. Additional information was given on the action of the fungus on the substrate, suggested uses of the fungus in processes that could be exploited in European technology, and a description of the substrate preparation, food use, and native methods of food preparation.

"This period of research ended abruptly with the advent of World War I, as the exchange of students and cooperation between Japan and Germany ceased. Food fermentation studies resumed in the 1950s and today considerable interest exists. This renewed interest stems from the concern with nutrition, the great enthusiasm for vegetarian and natural foods, the search for less expensive, high-protein foods, the influence of foreign students studying in the West, the need to expand export markets, the need to add products to convenience foods to add zest and flavor, and the interest in the activities of microorganisms used in fermented foods." Address: Northern Regional Research Center, Peoria, Illinois.

1062. Jaffrey, Madhur. 1983. Eastern vegetarian cookery. London: Jonathan Cape. xii + 531 p. Illust. by Susan Gaber. Index. 24 cm.

• ***Summary:*** This is an expanded version of *Madhur Jaffrey's World-of-the-East vegetarian cookery* (1981, New York). The author of this creative book, a woman, was born in British India on 13 Aug. 1933. She first became known as an actress in India, but later found fame as a food writer. She has lived in America for more than 20 years. She presents 21 recipes for bean curd (tofu), 7 for tempeh, and some for yuba and miso. Soy-related recipes include: Aubergine slices with white miso (Japan, p. 4-5). Green beans with soy sauce (Japan, p. 20), Cabbage with miso (Japan, p. 29). Lotus root with soy-sauce dressing (Korea / Japan / Hong Kong, p. 46-47). Yellow pumpkin cooked with soy sauce (Japan, p. 74-75). Fresh soy beans, steamed (China, p. 76, with "fresh green soy beans in their pods"). Yien Koo's Spinach with fermented bean curd (China, p. 78-79). Pecel (Vegetable salad with spicy peanut sauce, plus tofu and tempeh; Indonesia, p. 87). Tempura (with tofu; Japan, p. 89-92). Soy bean sprouts (how to grow, p. 119). Soy-bean and mung-bean sprouts seasoned with sesame oil (Korea, p. 123-24). Tempeh, Fried tempeh, Fried, pre-seasoned tempeh, Sambal goreng tempeh kering (Sweet and sour tempeh), Tempeh cooked in coconut milk (Indonesia, p. 127-30). Thai fried rice (with red fermented tofu, p. 176).

Chapter 4 (p. 187-221), titled "Soy milk, bean curd, and wheat gluten," contains the following: Introduction to each ingredient. Soy milk (making your own at home). Making your own bean curd. Udofu (Yudofu, simmering bean curd with seasonings, Japan). Bean curd with watercress (Singapore Chinese). Bean curd with fresh coriander (Taiwan). Korean-style bean curd in a hot water bath. *Hiya-yakko* (Chilled bean curd, Japan). Bean curd with broccoli (Hong Kong). Cabbage cooked with bean curd (Japan). Bean curd with a deliciously spicy sauce (China). Carrots and beans with a bean-curd dressing (Japan). Bean curd, mushrooms, and peanuts in hoisin sauce (Chinese style). Sautéed bean curd (Korea). Tofu dengaku (Toasted bean curd with a miso topping, Japan). Fried bean-curd cubes (Most of East Asia). Soy-bean sprouts sautéed with fried bean curd (China). Fried bean curd with a sweet-and-sour sauce (China). Fried bean curd cakes with a mustard surprise (Japan). Inari-zushi ("Bags" of fried bean curd stuffed with sushi rice, Japan). Pressed bean curd with cabbage (China). Salad of pressed bean curd, mung-bean sprouts, and agar-agar (China). How to make fried and baked wheat-gluten balls. Stew of baked wheat gluten, potato, turnip, carrot, and cabbage rolls (Japan, p. 215). Fried wheat gluten with broccoli, carrot, and mushrooms (China). Fried wheat gluten and potato stew (Indian style). Shredded wheat gluten and Cabbage with fennel seeds (Indian style). Buddha's delight (A mixed Chinese stew, Hong Kong; with yuba, fried tofu, and fried wheat gluten balls).

Chawanmushi (Steamed savory custards, with tofu; Japan, p. 223-26). Omelette with bean curd (Japan, p. 230-31). Soy-sauce eggs (Thailand / China, p. 245). Paneer (Fresh cheese from cow's milk; India, p. 277-78). Hot or cold noodles with a soy-sauce dressing (China, p. 288). Noodles with a hot-and-sour bean sauce (China, p. 290). Vegetarian mee krob (Crisp noodles with pressed bean curd and eggs; Thailand, p. 296-97). Noodles with quail eggs, mushrooms, spinach, and yuba (Japan; p. 298-99). Hoppers (yeast pancakes; Sri Lanka, p. 315). Roti (Flat whole-wheat bread; India, p. 320). Delicious stock made with soy-bean sprouts (p. 340). Clear soup with mushrooms, bean curd skins [yuba], and spinach (Japan, p. 346). Clear soup with soft bean curd and Chinese leaves (p. 346). Miso soup with bean curd (Japan, p. 357). Miso soup with carrots and mushrooms (Japan, p. 358). Fried, munchable soy beans [soynuts] (China, p. 373). Potato and tempeh patties (Indonesia, p. 394). Dipping sauces (with soy sauce, p. 414-17, incl. kochu chang–Korean soy sauce). Kombu relish (with soy sauce; Japan, p. 435). Shoyu daikon (White radish pickled in soy sauce; Japan, p. 436). Ginger quick-pickled soy sauce (China, p. 436). Aomidaikon (Quick pickled small white radishes, with slightly sweet yellow miso; Japan, p. 438-39). Chinese-style jellied bean-curd sweetmeat with a peanut topping (Singapore, p. 462-63).

General information [like a glossary] (p. 481-506): See: Bean curd (regular, fried, fermented {*fu-ju, nam-ye, tao-hoo-yee,* red bean curd}, pressed {*doufu kan*}, pressed seasoned {*pai doufu kan*}, dried bean-curd skin or yuba). Beans

(azuki, soy). Bean sauce (made from fermented soy beans). Chilli paste with soy bean (and garlic). Hoisin sauce. Miso. Nam yee (see Bean curd, fermented). Nigari. Soy beans, fresh. Soy-bean sprouts. Soy milk. Soy sauce (incl. Japanese, Chinese dark and light, Japanese usukuchi, Indonesian ketjap manis). Tao Hoo Yee (see Bean curd, fermented). Tempeh. Yuba. Sources (of ingredients; p. 507-10). Address: New York City, NY.

1063. McNamara, Dennis. 1983. Dependence and the grain trade: Japan and Korea, 1885-1904. Berkeley, California: Center for Korean Studies, Univ. of California. 30 p. [39 ref]
• ***Summary:*** See next page. Pages 1-2: Late 19th century Korea was an agrarian society with 84% of the households involved in agriculture. Korea's total agricultural trade with Japan was always greater than her trade with China. "There was little demand in China for Korean grains. Yet a strong market for Korean grains was developing in Japan in the 1880's, made possible by a network of Japanese merchants in Korea itself, supported by Japanese banks and shipping lines. Rice end soybeans accounted for better than 80% of Korean commodity exports to Japan in the years of strong exports, 1890-1892.

"Victory in the Sino-Japanese War (1894-1895) strengthened Japan's political influence in Seoul at the expense of the Chinese. Though temporarily checked by the Russians in 1896 and 1897, the Japanese were able to consolidate their political position in Korea, eventually establishing a Protectorate in 1905." From 1895 to 1904, the total value of Japanese-Korean trade increased more than 400%. This trade with Japan hastened the development of commercial or "cash cropping" in Korea across these two decades.

Page 7: "With the foreigners restricted to residence areas, the Korean Government had retained some control of foreign trade through the licensed Korean brokers and commission merchants. But from June of 1885, the Chinese and Japanese merchants could deal more directly with Korean producers, eroding government control of the market. With more immediate access to Korean grain markets, Japanese merchants began developing an extensive grain trade."

Page 8: Table 1–"Value of Japan's Grain Imports, 1885-1894." Column 3 is for Korean Soybeans and Column 5 is Total Soybeans imported to Japan. The value of Japan's imports of Korean soybeans grew from 54,000 yen in 1885 to a peak of 1,341,000 yen in 1890, dropping to 629,000 yen in 1894. From 1885 to 1890 these Korean soybeans represented from 58% to 99% of the value Japan's total soybean imports. The value of Japan's total soybean imports rose from 93,000 yen in 1885 to 1,856,000 yen in 1890 to a peak of 2,978,000 yen in 1894. "The Japanese had suddenly become major consumers of Korean grains" [soybeans and rice].

Page 11: "Japanese transport and finance networks in Korea made possible such developments in the grain trade. The Nihon Yubin Kaisha (Japan Mail Steamship Company abbreviated NYK) and the Osaka Shôsen Kaisha (Osaka Commercial Shipping Company, abbreviated OSK) operated lines that brought grains from Inchon and Pusan to Japanese trade centers such as Kobe, Osaka and Nagasaki. Branches of the Dai Ichi (The First National Bank of Japan) provided Japanese merchants in Korea with both credit for grain purchases and insurance for storage and transportation. There was also a strong Japanese consular presence in Korea, and a growing population of Japanese residents, numbering better than 4,500 in 1885, and 9,300 by 1894."

Page 16: "Foreign grains were important for the food supply in the rapid industrialization program of the Meiji Government. The discrepancy between the domestic supply of agricultural products in Japan and the domestic demand began to widen from 1888. Imports from Korea accounted annually for an average of 57% of total Japanese rice imports between 1888 and 1892, and 74% of total Japanese soybean imports."

Page 18: "Seventeen embargoes on the transport and/or sale of grains were imposed by various Korean provincial governors between 1884 and 1901, ostensibly to assure sufficient domestic grains in times of poor harvests, and to prevent excessive speculation and inflationary grain prices. The frequency of such embargoes, vigorous Japanese Government opposition, and the difficult indemnity negotiations suggest both Korean sensitivity to erosion of sovereignty in the grain trade, and Japan's commitment to developing the Korean grain trade."

"Grain Trade: 1895-1904: Table Two (p. 20) shows "Value and volume of Japan's grain imports, 1895-1904." Column 3 shows: Export of Korean soybeans grew from 36,000 tons in 1895 to a peak of 58,000 tons in 1900, decreasing slightly to 51,000 tons in 1904. Column 5 shows that imports of soybeans to Japan rose from 2.55 million yen in 1895 to 7.11 million yen in 1904.

Page 22: "As in the earlier decade, Japan continued as Korea's major export market, absorbing annually 85% of Korean imports between 1895 and 1904.

Page 23: "The Japanese had also begun extensive investment in Korean farmland by the end of this decade. Such direct control of Korean farmland provided an alternative to earlier methods of grain transactions."

Page 24: "Japan needed rice and soybeans to feed the growing population involved in industry." Address: Center for Korean Studies, Univ. of California, Berkeley.

1066. Lee, Kyung. 1984. Re: Names of soyfoods in Korean. Letter to William Shurtleff at Soyfoods Center, Jan. 13–in reply to inquiry. 1 p.

• ***Summary:*** The following are from an untitled, unpublished, undated document:

"Soybeans whole (2Kc = 2 Korean characters): hin kong or (3Kc) mae-chu-kong; contains all amino acids; protein powerhouse among foods; boil and eat whole, chopped, ground in casseroles, soups, stews, sauces; deep fry for soy nuts; make soy milk [kong-kuk].

"Soybean flour (3Kc), kong ka-roo, enrich all baking with 2 Tablespoons per cup of [wheat] flour; use special recipes for higher amounts; cheapest protein.

"Soybean sauce [soy sauce], 2Kc, kan-chang, seasoning, complementarity.

"Soybean paste, 2Kc, dwen-chang, season stews, soups, main dishes, complementarity.

"Soybean sprouts, 3Kc, kong na-mul, soups.

"Soybean curd, 2Kc, doo-boo, fry, soups, mash in with meat loaves or balls, the 'cheese' made from soy milk, use chunks in vegetable stews.

"Brown soybean, whole, 2Kc, bam kong, literally chestnut bean; cook with rice or use in casseroles, soups; available deep-fried at market for snack food.

"Black soybean, whole, 2Kc, nuk kong, season after cooking as side dish, soup.

"Fresh soybeans [no name given]: available in the fall before the pods have dried and seeds matured. Delicious cooked for use in salads, soups, or as vegetable side dish." Address: Country Director, American Soybean Assoc., P.O. Box 1704, USIS Bldg., 63 Eul Ji Ro 1Ka, Chung Ku, Seoul, Korea. Phone: 722-2601 X-4368.

1067. *SoyaScan Notes.* 1984. Korean names of soyfoods–non-fermented and fermented (Overview). Jan. 13. Compiled by William Shurtleff of Soyfoods Center.

• ***Summary:*** Unfermented:

Tubu: tofu

Suntubu: curds

Yubu: fried tofu

Kongkuk: soymilk

Kongnamul: soy sprouts

Doebiji: gô = fresh soy puree, used to make tofu. cook with vegetables, kimchi or meat.

Koggomul: roasted soy flour

Fermented:

Kanjang: soy sauce.

Doenjang: soybean paste

Kochujang: hot chili and soy paste = meju + chili powder + cooked glutinous rice.

Jeonkukjang (or cheonkukjang): Korean-style natto. The only Korean fermented food not made from meju. Diced with salt

Damsuejang (makjang): powdered meju. Add brine, ferment and ripen. A quick fermentation

Meju: Korean soybean koji

Per capita consumption in Korea:

Kanjang (soy sauce) 20 ml/day, 64% made at home

Doenjang (soy paste) 15 gm/day, 82% made at home

Kochujang (natto) 10 gm/day, 76% made at home.

All meju prepared at home.

• ***Summary:*** www.soyinfocenter.com/HSS/meals_for_millions.php

A comprehensive history of the subject. Contents: Early years (1900-39): Clifford Clinton's years in China, Clifton's Cafeteria in Los Angeles, California, to feed the needy during the Depression. A way to feed the world (1940-1965): Grant from Clintons to Dr. Henry Borsook to find food for postwar Europe, Mme. Berzceller's / Berczeller's Multi-Purpose Meal (primarily defatted soy flour) ready in late 1944, the initial formula, first use in Los Angeles, Clintons founded Meals for Millions Foundation in Los Angeles 1946, all-soy formula in 1950's (now called Multi-Purpose Food, MPF) made by General Mills until 1980, celebrities praise MPF (Eleanor Roosevelt, Albert Schweitzer, Pearl Buck–a director), Executive Director Florence Rose creates poor professional image, amount distributed, historical significance. 1966-76: From distribution to technology transfer, Mark Sterner new program head 1966, move to Santa Monica 1967, overseas manufacturers, early 1970's new self-help philosophy, phrase, and logo, USAID (U.S. Agency for International Development) funding in 1973 launched a new era, training center and classrooms in Santa Monica headquarters, developed own low-cost extrusion cookers, major work with soy done in Korea and Ecuador. 1976-1980's: Peter Davies replaced Sterner 1976, last MPF distributed 1980, first training overseas, applied nutrition programs, 1982 move to Davis, CA, 1982 budget of $2 million. Address: Lafayette, California. Phone: 415-283-2991.

1069. Bernard, R.L. 1984. The past and the future in soybean breeding. *Soybean News* (*NSCIC*) 35(1):2, 6. Jan.

• ***Summary:*** "As a commercially significant crop in this country, soybeans have a short history and have been important in the north-central states only since 1922.

© Copyright Soyinfo Center 2021

They were grown earlier in the southeast, especially North Carolina, as a forage crop. Breeding in those early years consisted of field trials of cultivars introduced from Asia and choosing those best adapted and most productive for the local farmers.

"Soybeans were experimented with in small plantings and occasionally grown on a commercial scale during the 1800's. According to Piper and Morse (1923) no more than eight cultivars were grown in the U.S. prior to 1898. In that year the U.S. Department of Agriculture (USDA) began a program of recording introduced cultivars of crop plants under "PI" designations. Through this system, large numbers of soybeans were introduced and grown in experimental plots. The better ones were sent out to various state experiment stations for further testing.

"From 1898 to 1923 more than 1,000 cultivars were introduced, most sent by research stations or grain merchants in Asia, or brought in by agricultural explorers, diplomats, missionaries, or other travelers to Asia (Table 1). Some of the most successful cultivars were introduced into the U.S. during this period. As a result of the increasing success of soybeans, the USDA sent plant explorers to Asia (notably P.H. Dorsett and later W.J. Morse) and from 1924 to 1932, 6,651 soybean accessions were introduced. During the next 40 years little effort was made and only a few soybeans were introduced each year. With renewed interest since 1975, more than 5,000 strains have been introduced.

"During the early periods of introduction no attempt was made to save all the strains introduced and a majority of them were discarded. Only the best were kept along with some of the unusual types. In 1949, in recognition of the need to preserve the germplasm of this important crop and make it readily available, the USDA established a soybean germplasm collection. The early strains (Group IV and earlier) are maintained at the University of Illinois at Urbana-Champaign and the later ones (Group V and later) at the Delta Branch Experiment Station, Stoneville, Mississippi. The collection was initiated by M.G. Weiss, head of USDA's soybean production research, and J.L. Cartter, head of the U.S. Regional Soybean Laboratory at Urbana. The original curators were E.E. Hartwig at Stoneville and L.F. Williams at Urbana. Hartwig is still curator of the southern collection. R.D. Osler succeeded Williams in 1951, and I became curator of the northern collection in 1954.

"The guiding principle has been to maintain the basic genetic diversity of the soybean and its wild relatives by maintaining all cultivars and introductions representing different germplasm, regardless of their apparent economic worth, and to make them readily available for research purposes.

"In 1949 and 1950, the USDA and state agricultural experiment stations were requested to submit samples of all introduced strains and old U.S. cultivars. From the 7,873 PI strains introduced before 1945, 1,659 strains were obtained, including 138 old U.S. cultivars that originated from introductions (Table 1).

"Introduced strains plus American-developed cultivars have been added to the collection since then, until today the number of soybean entries totals over 9,500 about 70% are in the northern collection and 30% in the southern one. They were drawn from 60 countries, but the majority came from eastern Asia and especially from China (1,202 strains), Japan (1,721), Korea (3,041), and the Soviet Union (1,847). Soybeans from these four countries comprise 83% of the collection and many of the strains received from other countries originated from these four. At Urbana, in addition, there is a genetic collection (mutations, oddities, isolines, etc.) of several hundred lines of interest in qualitative genetic studies. We maintain also a collection of wild soybeans, *Glycine soja.* The wild soybean accessions range in maturity from Group 00 to X and were obtained in the USSR (34 accessions), China (28), China (Taiwan, 2), Korea (313), and Japan (183). Because they can be crossed with cultivated soybeans, they are an interesting potential source of useful germplasm. We have also a collection of six perennial species of Glycine. These species are native to Australia and some range into the south Pacific islands and south China. Though not closely enough related for easy crossing with soybeans, these species are of interest in studies on the origin of soybeans and botanical relationships within the genus. If the crossing barrier can be overcome, they may supply the soybean breeder and geneticist with some interesting and diverse material.

"The soybean germplasm collection is used actively by researchers throughout the U.S. and from many other countries. In 1982, from the collection at Urbana, we sent out over 40,000 seed lots.

"We hope to obtain as much of the world's wild soybean germplasm as possible, and to complete our collections from Europe, the USSR, southern Asia, South Korea, and Japan. Our greatest need is for further collections from North Korea and China, especially southern and western China, since most Chinese strains in the present collection have come from northeastern and north-central China.

"Beginning in the late 1930's and 1940's, soybean breeders in the USDA-state experiment station breeding programs, through hybridization and selection, developed improved cultivars with higher yielding ability and resistance to lodging and shattering and to prevalent diseases.

"In the future, soybean pests and diseases will likely be an even more important factor in soybean production. Soybean breeders will be putting more emphasis on increased cultivar resistance and will be selecting for multiple resistance to different races and types of diseases.

"Breeders constantly are looking for the traits that contribute to improve yield. Because of the low heritability of yield, selecting for component traits rather than directly for yield might improve breeding efficiency. Unfortunately,

© Copyright Soyinfo Center 2021

except for pest and disease resistance, no helpful physiological or morphological traits have been found.

"Improvement in yield through improved soybean cultivars has been slow but steady over the past 50 years. No slowdown has yet occurred and presumably further improvement is possible working with the rather narrow base of just 20 ancestral cultivars. A major problem for the breeder is how to effectively use the large number of germplasm lines and find sources for further improvement.

"Today over half the acreage in the north central states is planted to varieties developed by private seed companies. However, the varieties trace their pedigrees directly to some of the recently widely grown public varieties. Thus they represent not a change in direction but the latest round in the process of variety improvement. It has continued steadily for the past 50 years.

"Advances in the future will be more difficult than in the past, but with the large number of specialists working on the problem, the prospects are bright." Address: Research Geneticist, ARS-USDA and Agronomy Dep., Univ., of Illinois.

1070. Jackobs, Joseph A.; Smyth, C.A.; Erickson, D.R. 1984. International soybean variety experiment: Eighth report of results, 1980-1981. *INTSOY Series* No. 26. xi + 234 p. Feb. (College of Agric., Univ. of Illinois at Urbana-Champaign).
• ***Summary:*** In the ISVEX trials, soybeans were tested in the following regions and countries: (For the years 1980/1981): Algeria, Argentina, Azores, Bangladesh, Bhutan, Bolivia, Brazil, Brunei, Burundi, Cameroon, Chile, China [actually AVRDC, Shanhua, Taiwan], Colombia, Costa Rica, Czechoslovakia, Ecuador, Egypt, Ethiopia, Fiji Islands, French Guiana, Gabon, Ghana, Guatemala, Guinea-Bissau, India, Indonesia, Iraq, Korea, Lesotho, Liberia, Libya, Madagascar, Malaysia, Mali, Mauritius, Mexico, Morocco, Mozambique, Nepal, New Caledonia, Pakistan, Panama, Paraguay, Peru, Philippines, Portugal, Puerto Rico, Rwanda, Saudi Arabia, Somalia, Sri Lanka, Sudan, Surinam, Tanzania, Thailand, Turkey, United States, Upper Volta, Uruguay, Vietnam, Zaire, Zambia, Zimbabwe.

(For the year 1979): Belize, Pakistan, Turkey, Vietnam.

Note 1. This is the earliest document seen (March 2021) concerning soybeans in Guinea-Bissau, or the cultivation of soybeans in Guinea-Bissau.

This document contains the earliest date seen for soybeans in Guinea-Bissau, or the cultivation of soybeans in Guinea-Bissau (21 May 1981). Sixteen varieties were tested at Granja Prabis, Bissau. ICA Tunia gave the highest yield, 1,225 kg/ha.

Note 2. This document contains the 2nd earliest date seen (May 2010) for the cultivation of soybeans in Brunei (19 May 1981). Sixteen varieties were tested at Biray Research Station by cooperator W.T.H. Peregrine. UFV-1 gave the highest yield, 2,577 kg/ha.

Note 3. This is the earliest document seen (Feb. 2006) that describes soybean variety trials in Bhutan. On 30 April 1980 sixteen varieties were planted under the supervision of Mr. Heinz Burgin at the Rural Development Project Demonstration Farm, Bumthang, Bhutan. DeSoto gave the highest yield, 729 kg/ha. The source of all these soybeans was INTSOY for ISVEX trials.

1071. Shim, Chung-shil. 1984. Korean recipes. Seoul, Korea: Seoul International Tourist Publishing Co. 79 p. Feb. Illust. (color photos by Edward B. Adams). Index. 26 cm.
• ***Summary:*** Recipes include: Five grain rice (-*kok pap*, with ½ cup each red [azuki] beans and black [soy] beans). Rice with soy bean sprouts (*Kong namul pap*). Mixed vegetables on rice (*Pibim pap*, with 100 gm soy bean sprouts, soy sauce, and red pepper paste). Dumplings (*Mandu kuk*, with 150 gm beancurd [tofu]). Seaweed soup (*Miyok kuk*, with 50 gm brown seaweed {*Miyok*} and 2 tablespoons soy sauce). Soy bean sprout soup (*Kong namul kuk*). Soy bean paste stew (*Toinchang ch'igye* [*doenjang*], with 2 tablespoons soy bean paste and 200 gm beancurd). Beancurd with beef (*Tubu chorim*, plus 3 tablespoons soy sauce). Curd with vegetables (*T'angp'yong Ch'ae*, with 250 gm mung bean curd, 200 gm soy bean sprouts, and 2 tablespoons soy sauce). Bean pancake (*Pindae tok*, with 50 gm soy bean sprouts and 4 tablespoons soy sauce).

Each recipe is accompanied by a large color photo. About the author: She is a publisher, artist, and wife of Edward B. Adams, Headmaster of Seoul International School. She has developed a keen interest in Korean cooking, and has chosen here the simple dishes that are most popular among foreigners. She was educated in California, where she married. A color photo shows Shim Chung-shil. Address: Founder, Seoul International Publishing House.

Danish Turnkey Dairies–DTD and Soya Technology Systems (STS), Alpro / Vandemoortele in Belgium, Nestle, F. de Selliers in Belgium, Dansk Sojakagefabrik in Denmark, Lima Andiran in France, Galactina in Belp, Switzerland, and Semper A.B. in Sweden).

20. Latin America. 21. Africa. 22. History of Vitasoy in Hong Kong. 23. Two modern soymilk manufacturing processes: Marusan and Alfa-Laval. 24. Etymology of the word "soymilk" worldwide. 25. Analysis of ingredients in 49 popular Japanese soymilk products. 26. Bibliography. 27. About the Soyfoods Center. A table on p. 12 gives an overview of world soymilk production in 1983 ranked in descending order of annual per capita consumption. These statistics do not include China (PRC) or soy-based infant formulas, usually made from soy protein isolate. 1. Taiwan, 210 million liters, 11.1 liters / capita, growing at 30% per year. 2. Hong Kong, 39.1 million liters, 7.5 liters / capita, growing at 10% per year. 3. Singapore, 11.2 million liters, 4.7 liters / capita, growing at 15% per year. 4. South Korea, 67.0 million liters, 1.60 liters / capita, growing at 60% per year. 5. Malaysia, 21.4 million liters, 1.53 liters / capita. 6. Japan, 131.8 million liters, 1,10 liters / capita, growing at 101% per year. 7. Thailand, 50.0 million liters, 1.00 liters / capita. 8. USA, 9.6 million liters, 0.04 liters / capita. Total world production: 548.3 million liters.

Page 36 gives an overview of the U.S. market for soy-based infant formulas and adult soymilk. Production of soy-based infant formulas (on a ready to serve basis) in 1983 was as follows: Ross Laboratories made 14,720,000 gallons of Isomil (i). Mead Johnson made 14,080,000 gallons of Prosobee. Loma Linda made 2,240,000 gallons of Soyalac. And Wyeth Labs made 960,000 gallons of Nursoy. Thus 32,000,000 gallons of soy-based infant formula were made in the USA in 1983.

Also in 1983, consumption of soymilk by adults in the USA was as follows: 1,743,000 gallons were made by specialized soymilk manufacturers in the USA (Loma Linda Soyagen 1,000,000 gallons; Worthington Soyamel 670,000 gallons, Miller's Soy (private label) 73,000 gallons). 690,000 gallons were imported (328,000 gallons of Vitasoy by Vitasoy USA, 254,000 gallons of Yeo's by YHS, 50,000 gallons of Edensoy by Eden Foods, 25,000 gallons of President by President, 25,000 gallons of Kibun by Kibun, 8,000 gallons of To-Neu by San-J International). 250,000 gallons were made fresh by tofu companies (45,000 gallons by Mighty Soy, 41,000 gallons by Victor Foods [Scarborough, Ontario, Canada], 39,000 gallons by Quong Hop & Co., 35,000 gallons by Wy Ky, and 90,000 gallons by others).

Yield. 1 ton of raw soybeans yields approximately 4,320 gallons of soymilk. Conversion: 3.785 liters = 1 gallon.

On page 56 is a table of "Large natural food distributors in the US" with the dollar figure being estimated annual sales in millions of dollars."

1. Rainbow Distributing (Denver, Colorado) $13.
2. Arrowhead Mills (Hereford, Texas) $12.
3. Eden Foods (Clinton, Michigan) $10.
4. Rock Island Foods (Ignacio, California) $10.
5. Westbrae Natural Foods (Emeryville, California) $9.
6. Pacific Rim (Seattle, Washington) $7.
7. Cornucopia Natural Foods (Coventry, Rhode Island) $7.

Total estimated sales for the top 7 distributors: $68 million a year.

• ***Summary:*** Continued. An overview of HKSBP's market position in the early 1980s showed the following. By 1980 sales (by number of cartons or bottles) of the many and varied non-soy Vita products had passed sales of Vitasoy. Sales of Vitasoy were growing steadily, from 130 million Tetra Brik cartons and bottles (converted to 250-ml equivalents) in 1980 to 150 million in 1983, for a 5% compound annual growth rate in a mature market. In 1983 all products made by HKSBP's accounted for 35% of the Hong Kong Beverage market, second only to the Swire/Coca-Cola Company's products with 42%. Vitasoy, which had had no competition from brand-named soymilks since 1961, suddenly had to worry about competitors again. Nestle's Bonus (launched in 1978), President's soymilk (launched in 1980), and Coca-Cola's Hi-C soymilk (launched June 1982) took away some of Vitasoy's market monopoly. Yet in 1983, according to Hong Kong Beverage Association statistics, Vitasoy had a commanding 96% of the fast-paced Hong Kong soymilk market, versus only 4% for Hi-C. Bonus and President had insignificant shares. Hong Kong had the world's second highest per capita consumption of soymilk (after Taiwan), about 8.2 liters a year. In 1983 Vitasoy was given a new slogan which proclaimed: "Taste the Feeling."

In 1980-81 Vitasoy prices in Hong Kong dollars were as follows: Bottles, 60 cents for 7 oz. and 80 cents for 10 oz. of plain Vitasoy and 80 cents for 8 oz. of malted Vitasoy; Tetra Brik (250 ml or 8.45 oz.), 90 cents for plain and $1.00 for malted. Ingredients in the plain (sweetened) Vitasoy sold in Hong Kong were water, soybean solids, soy oil, cane sugar (5.5%), and salt, plus vitamins A, B-1, B-2, and niacinimide [niacinamide]. The exported Vitasoy contained no added vitamins. A typical 250-ml carton of Vitasoy for export

© Copyright Soyinfo Center 2021

contained 100 calories, 16 grams (6.1%) carbohydrates, 5 grams (2.0%) protein, and 3 grams (1.1%) soy oil. In 1981 the company had sold more Vitasoy in bottles than in Tetra Pack, but sales of the latter had increased by 50% a year since 1978. In 1983 sales in Tetra Pak led bottles 6 to 4.

For HKSBP China represented the great untapped market of the future, but also the great unknown. In 1983 HKSBP made two small but important new moves into China, building on experience from the Kwong Ming Dairy Farm. First, the company began to export Vitasoy to China's new Special Economic Zones. And second, they worked with the Chinese on a venture in Shanghai called Jing Jiang United Food Processing Co. Ltd. Initially HKSBP worked as a technical consultant on the project, but negotiations were underway for a joint venture. In August 1983 the plant's first product, Vita orange drink, was produced for a national sports meet. It is hoped that soymilk, perhaps called Vitasoy, will be the company's next product.

Vitasoy in North America. Vitasoy was the first Asian soymilk to be imported to North America. This venture was pioneered by K.S. Lo's two entrepreneurial daughters, Yvonne and Irene. Yvonne, who actually ran the operation, had graduated from a Canadian university then worked for 6 years as a city planner in Toronto, before realizing that her heart was really in business and marketing. In January 1979 Yvonne and Irene incorporated The Soya Bean Products Co., N.A. Inc. (SBPC) as a marketing company for HKSBP's products in North America. They opened headquarters that month on Bush Street in San Francisco, then began immediately to market and distribute plain and malted Vitasoy in Canada, in 8.4-oz. (250-ml) Tetra Brik cartons. In February 1981 they introduced the same products to the USA, immediately after the FDA lifted its ban on Tetra Pak (because of a disproven concern over hydrogen peroxide residues from sterilization). By 1982 some 3.2 million cartons of Vitasoy a year were being sold in the US and Canada.

The venture was so successful that in April 1982, to raise capital and facilitate long-term operations with Hong Kong, Yvonne and Irene sold their company to HKSBP, which renamed the US affiliate Vitasoy USA, Inc. The parent company now took a serious interest in the US market. In 1983 sales of Vitasoy increased to 5 million cartons, up a whopping 60% from the previous year. The 1983 figure equaled 328,125 gallons or 1.24 million liters. An estimated 90% of this soymilk was sold to the Oriental market; of this, 80% was sold to Chinese, and the rest to Vietnamese, Filipinos, and other ethnic groups. Roughly 45% of all Vitasoy was sold in the three western coastal states. Vitasoy distributed its own products in the San Francisco Bay Area (the single area of greatest sales), northern California, Oregon, and Washington [state]. Other companies, appointed by Vitasoy, sold the product in southern California, and elsewhere in the US and Canada, in 10 market areas designated as having a high concentration of Oriental Americans.

In 1983 Vitasoy was by far America's leading imported soymilk, accounting for just under 50% of total soymilk imports. Heady with success, Vitasoy USA announced in late 1983 that it would launch two American-style products in March 1984 at the big natural foods trade show in Anaheim, California. These would be called Vitasoy Original and Vitasoy Coconut. Each would bear the subtitle: "Natural Soy Drink, Sweetened with Maple Syrup." They would be marketed to the natural and health food trades as a healthful and nutritious beverage, under the slogan "Taste the Goodness." Marketing to mainstream consumers was also planned. Prices in the two markets were expected to be $0.65 and $0.55 respectively (maple syrup was a major part of the product cost), as compared with $0.35 for Vitasoy with a higher water content, sweetened with sugar, sold in the Asian-American market.

In developing these products Vitasoy USA did extensive and thorough, original research on American attitudes to and taste preferences for soymilk. Working with American marketing and product development professionals, they ran "focus group" and "intercept" studies. In September 1982 Yvonne Lo and Hilton Tsui issued a 59-page in-house report titled Market Study of Soymilk Beverage, packed with original information, plus an overview of the US beverage industry and a marketing plan.

Most important, the company announced in late 1983 (after an unsuccessful attempt to acquire majority ownership of the New England Soy Dairy) that it had purchased land in Brisbane, California (just south of San Francisco) and had signed a contract to build a large soymilk plant there. This plant, scheduled to open in 1985, would clearly introduce a new stage in the history of soymilk in America, for HKSBP would be the first major Asian soymilk manufacturer to start a plant in the West.

The Present and Future. The year 1984 saw the Hong Kong Soya Bean Products Co., Ltd. as the world's third largest manufacturer of soymilk (after Kibun in Japan and Chung's Food in Korea), and one of the largest exporters. The tiny size of the Hong Kong market (only 5.2 million people, compared with 120 million in Japan and 42 million in Korea) had been a major factor limiting the company's growth. But now HKSBP was poised on the edge of an era of great potential growth in a world market. The challenges of internationalization, diversification, public versus family ownership, exports versus local manufacture, marketing Asian products in the West, company name changes with diversification, etc. all bear striking resemblance to those faced by Kikkoman, as discussed in Chapter 79 of our book *History of Soybeans and Soyfoods.* We expect that HKSBP, though much smaller than Kikkoman, will follow many of the same patterns; hopefully it will be as successful as Kikkoman has been.

© Copyright Soyinfo Center 2021

The relatively small Hong Kong market will play a smaller and smaller role in the company's future. The greatest potential for growth may well lie in China. Efforts to introduce Vitasoy into school lunch programs in Third World countries and to help such countries make better use of domestic soybeans for human nutrition could bear great fruit in countries such as Mexico, India, Argentina, Brazil, Paraguay, and Indonesia. In these areas, domestic joint-venture plants probably hold greater promise than imports, since they help rather than hurt foreign exchange balances.

A table shows HKSBP growth pattern from 1941-1983 every 5 years with paid up capital, sales in bottles/packs. and sales in dollars.

A graph shows "Sales of Vitasoy" from 1945-1983 in million bottles and packs sold. Sales fell substantially from 1972-1975 but rose dramatically thereafter. A table shows "Sales of Vitasoy: Millions of bottles or packs (250 ml equivalents), 1970-1983.

Note: Three updates:

1990 Aug. 31–Vitasoy acquires Nasoya Foods (Leominster, Massachusetts).

1990 Sept. 24–Company name changed to Vitasoy International Holdings from Hong Kong Soya Bean Products Co. Ltd.

1993 May 27–Vitasoy acquires Azumaya Inc. (South San Francisco, California). Azumaya (Originally Azumaya Tofu Seizo-sho) had been making tofu in San Francisco since at least 1930. Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549.

1074. Shurtleff, William; Aoyagi, Akiko. 1984. South Korea: Soymilk industry and market (Document part). In: Shurtleff and Aoyagi. 1984. Soymilk Industry and Market: Worldwide and Country by Country Analysis. Vol. 1. 177 p. See p. 81-83.

• ***Summary:*** Historical: Like China and Japan, Korea was not traditionally a dairying country, and cow's milk did not begin to be fairly widely consumed until about the 1960s. It is not known when soymilk (*kongkuk*) was introduced to Korea, but it was probably brought from China at least several hundred years ago, and perhaps more than 1,000 years ago. Wang (1978) reported that soymilk is mainly prepared on a household scale during the hot months and consumed directly or with cooked noodles. Sometimes ground roasted sesame seeds may be added to flavor and nutritionally fortify the soymilk.

Large scale production of soymilk in South Korea began in October 1973, when Dr. Chung's Foods Co. Ltd. started to make Vegimil bottled soymilk in Seoul; in 1981 their output was estimated at 432 metric tons. In 1979 Dong Bang Oil and Flour Mills, the biggest oilseed crusher in Korea, established a subsidiary, Green Milk Co., in Seoul, to make Green Milk brand soymilk. In 1981 they made an estimated 3,000 tons of soymilk in four flavors, packaged in cartons. Alfa-Laval provided a UHT soymilk system to Dong bang. In October 1982 Seo Ju Industry, which operates Seo Ju Mill, entered the soymilk market. Other entrance dates are shown in Table 1 below. Most of the soymilk in Korea was sold in Tetra Brik cartons.

As of late 1983, Korea's soymilk industry was growing at an estimated 60% a year, making it one of the country's fastest growing food industries, and one of the world's fastest growing soymilk industries.

Major Soymilk Manufacturers and Their Market Share. As of late 1983 there were seven major soymilk manufacturers in Korea. They were allocated soybeans by the National Agricultural Cooperative Federation. Their 1983 allocation and the amount of soymilk made (1 kg of soybeans yields 6 kg of soymilk) is shown in Table 1 below:

In 1983 South Korea had a population of about 42 million. Therefore that year the per capita consumption of soymilk in Korea was about 1,595 ml a year or 9.4 cartons of 180 ml each. One rough index of the growth of soymilk consumption Korea is found in the number of Tetra Brik cartons used for soymilk, as shown in Table 2 below. We can convert this into an approximate volume figure by assuming that each pack is 180 ml. It is not known what percentage of all soymilk was sold in Tetra Brik cartons, but quite a lot was. Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549.

1075. Tsumura, Takashi; Tsuruta, Shizuka; Inoue, Mamehiko. 1984. Kenko-shoku tôfu [Tofu, the health food]. Tokyo: Nobunkyo (Nosan Gyoson Bunka Kyokai). 236 p. Illust. No index. 19 cm. Tezukuri Nihonshoku Shirizu (Handmade Japanese Foods Series). [27 ref. Jap]

• ***Summary:*** The third author, Mr. Inoue, opened his tofu shop in 1981 and is making tofu coagulated with natural nigari. The second author, Ms. Tsuruta, translated *The Farm Vegetarian Cookbook* into Japanese. This book is not vegetarian.

Contents: Part I. Japanese tofu cookery. Chinese and Korean tofu cookery. Futuristic tofu cookery. Part II. The real face of tofu. How tofu is made. How to make tofu by yourself. History of Japanese and Chinese tofu. Part III. One statement from a tofu maker. Aiming for traditional tofu production.

This book contains numerous old illustrations (line drawings) of tofu in Japan. Page 208 shows a tofu vendor carrying two tubs of tofu at the ends of a shoulder pole (*tenbin*). He is wearing a straw hat, Japanese kimono, and high wooden clogs (*geta*). It is from the book "Illustrated Edo Period Food Life Dictionary" (*Zusetsu Edo Jidai Shoku Seikatsu Jiten*), compiled by the Society for the Study of the History of Japanese Customs (*Nihon Fuzoku Shigaku-kai*).

Page 209 shows the interior of a tofu shop from the Edo period. It adjoins the family home. A woman with a child on her back is grinding the soybeans in a hand-turned stone

1076. Sterner, Mark H. 1984. More on work with Meals for Millions Foundation, 1966-1973 (Interview). Conducted by William Shurtleff of Soyfoods Center, March 13. 2 p. typed transcript.

• ***Summary:*** A major change in Meals for Millions took place on 14 Sept. 1964 when Florence Rose was replaced by Jerry Miller as executive director. In about 1965 the

© Copyright Soyinfo Center 2021

new officers at MFM began to lay plans for a new building. Clifford Clinton provided moral support from the wings. Funds for the Santa Monica building came from Morris Asimow, PhD (who was president of MFM at the time) and Jerry Miller; they co-signed a note with a Santa Monica bank, which was later converted to a mortgage. The mortgage was paid off over the years by contributions to MFM during Sterner's period there. There were no land grants. Construction started in 1965 and MFM moved into the new building in April 1966. They wanted a building of their own located outside of Los Angeles where they could have a pilot plant and offices.

In India, the original MPF-type food was developed at Mysore based on peanut meal and Bengal gram. It was later manufactured by Gopi Agarwal and his brothers in J.B. Protein Food Industries. They had a peanut pressing operation in northeast India. They started making it in about 1965 and called it Multi-Purpose Food; it did not contain soy. MFM, instead of sending MPF from the United States, sent money to India to help pay for distribution.

Bob Nave and SPRA of the Methodist Mission, sometime after that, put in a soy extrusion operation. At a later date, just before Mark left MFM, there was an effort with Nave to produce second generation foods. Nave's mission had received MPF from the USA then bought it from the Agarwals. Then Nave got an extruder and started to make a similar product. So MPF sparked Nave's interest; eventually he went into second generation foods. Also, someone in the south of India made a little MPF using peanut meal, but no soy. Lots of peanuts were available, but aflatoxins were a problem.

MFM was more involved in image building than in truth; it was a big problem in the early days. Everyone wanted to embellish the story to help raise funds. For example, the early newsletters said that one meal of MPF cost only 3 cents. No! That was the cost to manufacture it in Los Angeles, not the cost when it arrived for a hungry person in Europe.

Adine Laugh was a promotion person, employed by MFM to promote the organization. When Mark arrived he worked a lot to bring truth back into the picture. Clifford Clinton was a very dedicated man, but there were several years in about 1963-64 when he was alienated from MFM. He got involved with a chiropractic doctor or healer [Dr. Omar Fareed] who sort of mesmerized him. That doctor was flamboyant and lived in Beverly Hills. He threatened to take over MFM but the board would not allow it. Clinton resigned, but soon returned. After Clifford Clinton died, his wife and son were on the board.

The original MPF was based on uncooked soy grits, but early on it became available in both soy flour and soy grit form. This lasted until the 1970s, whereafter it was based entirely on toasted soy grits. Note: General Mills, Inc. began to make Multi-Purpose Food in Dec. 1959; it was based on toasted soy grits.

Mark visited the United Rescue Mission (URM) in Taiwan; they helped care for refugees from mainland China. They may well have received MPF.

In 1966 Mark was hired by MFM (not as new program head) to develop the protein food technologies that would use indigenous third world ingredients and to develop a technology transfer curriculum. That led to a more professional reputation for MFM. Mark worked in that position from 1966 to 1972, when he went to Korea. During that time, Jerry Miller was executive director, followed by Irvin Saunders, a retired colonel, followed by Mark.

In about 1973 USAID in Washington, DC, began to give MFM $1.3 million a year. Some of this money was earmarked for building a workshop, and for enlarging labs and classroom facilities and the program itself.

This month the Korean MFM project [based on extrusion cooking] is being turned over to a Korean MFM foundation to be funded by Koreans for work in Korea. When Mark was director of technology transfer, soymilk equipment was donated by Sam Tubin. A Chinese banker in Los Angeles wanted to set up a soymilk plant there. In 1967-68 he set it up to make soymilk to be bottled in soda pop bottles. He never got it off the ground, although he had all the equipment–which lay around unused for a year or so. Sam Tubin bought the equipment to produce a beverage from fish meal using the Viobin process for making fish meal. That didn't work out, so Sam donated the equipment, worth $250,000 to MFM.

While Mark was in Korea he made connections with the Sam Young Co., a large manufacturer or ramen (instant noodles). They wanted to start making soymilk, so Mark installed MFM's soymilk equipment at their plant outside Seoul and they paid MFM for it in installments in Korean money. Using that money, MFM set up a program in Korea with an in-country director. And they set up an extruder and project in Wanju funded by payments from the soymilk plant.

The soymilk plant began operating in about 1973. They did it in a big way, made 5,000 bottles a day, and soon expanded the plant. Mark thinks the soymilk product was named Super-D; it came in plain (sweetened) and chocolate flavors. MFM's Korean project became self-supporting when one province took on the program to provide infant and weaning foods, as well as commercial foods that were sold. On 20 March 1984 (in about a week) the project will be officially turned over to the Koreans. MFM has been putting a little money into the project. The extrusion project is also very alive. Now the provincial government is trying to persuade other provincial governments to build their own LEC (low cost extrusion cooker) plants.

Starting in about 1966, at the Santa Monica center they used to demonstrate all the state of the art methods of making soymilk including hot grind, whole raw bean, using soy protein isolates, etc. Mark does not know if any of that

© Copyright Soyinfo Center 2021

work took hold and was applied anywhere. It was all pretty academic. The tuition of most students was paid by MFM or by a commercial company.

MPF was an important, pioneering idea and food. History is partly the result of huge, impersonal forces, and partly the work of particular remarkable men and women, who are often pioneers. They have a vision and an idea and are willing to take a risk and to work hard to manifest that idea.

A good historian should be able to trace great movements and ideas back to the men and women whose ideas and vision started them, and then to give them life and to give them credit for what they have seen and done. Clifford Clinton was clearly one such man. Address: Former director, Meals for Millions Foundation.

1077. Gotoh, K. 1984. Historical review of soybean cultivation in Japan. *Tropical Agriculture Research Series* No. 17. p. 135-42. March. International Symposium on Soybean in the Tropics and Subtropics. [24 ref. Eng]

• ***Summary:*** Contents: Abstract. Before the Meiji era (-1866): Dissemination, instructions to farmers. Traditional cultivation (1867-1945): Characteristics of this period, special methods of cultivation. Scientific approaches (1946-1977): Characteristics of this period, genetic resources, cultivation practices recommended, physiological studies, planting density, differences between record yields and average yields. Recent situation (1978-): Take-off in yields, problems in the near future.

"The time when the soybean was introduced from the northern part of China to Japan is not precisely known. The earliest reference to soybean appeared in the Kojiki (completed in 712 AD) and Nihonsyoki [Nihonshoki] (in 720 AD). They referred also to rice, barley, Italian millet (*Setaria italica* Beauv.), Japanese millet (*Echinochloa frumentacea* Link), and adzuki beans (*Vigna angularis* (Willd.) Ohwi and Ohasi). Thus, it appears that soybeans were grown as one of the important crops in olden times."

Nagata (1959) proposed that soybeans first entered Japan in the northern part of the country, having been disseminated from Korea. Prior to that they had arrived in Korea from north China. "Nagata's assumption that soybean may have been introduced to the northern part of Japan seems plausible. In 1932 and 1933 at the Komoriyama ruins located in Senhata, Akita Prefecture, which date back to the Jyômon (Jômon) era (see Note) carbonized soybeans and hulled rice were found in an old house. The dating of this specimen of soybean was not performed since radio-carbon was not available at that time. As will be mentioned later, a large number of land races have been found in Tohoku, as a result of extensive surveys conducted in the early 1950s. Apart from the Nagata's hypothesis it is probable that soybeans may have been first introduced as an important medicinal herb and later as a food crop into the ports along the Japan Sea.

"Instructions to farmers: *Engishiki* (completed 927 AD) which described in detail the regulations on crop products (for example, exchange rates of soybeans with bundles of rice and barley for yearly tribute), stated that the Kinki, Chugoku, and Shikoku districts [all located in southwest Japan, from Kyoto in the northeast to just above Kyushu in the southwest] were the main soybean production areas, as shown in Fig. 1.

"*Seiryôki* (published around 1560) which is the oldest Japanese book of agronomy, identified two types of soybeans, namely summer and autumn types. *Aizu-nôsyo* (1684) and *Hyakusyô-denki* (around 1688) described in detail the characteristics of many cultivars, and various cultivation practices, namely ridging and intercropping with barley. *Nôgaku-zensyo* (1697) outlined the principles and practices of soybean management already widely applied, and mention was made of vegetable beans (Edamame) [green vegetable soybeans]. *Kôka-shunjyû* (1707) described special types of soybeans, such as boiled soybeans (Nimame). This book also described how to grow soybeans on dikes or levees between paddy fields. *Seikei-zusetsu* (1804) outlined the methods of soybean production as recent practices."

Note: According to Fairbank, Reischauer, and Craig's *East Asia: Tradition and Transformation* (1973, p. 327): "The earliest neolithic culture, named Jômon for its characteristic "cord-pattern" pottery, spread throughout Japan about 6,000 years ago. The Jômon people lived in sunken pit dwellings and subsisted by hunting, fishing, and gathering nuts, roots, and shellfish. They left behind extensive shell mounds and a wealth of pottery, unsurpassed in richness and imaginativeness of design by any other stone-age culture in the world." Note that they did not practice agriculture. In the third century B.C. Jômon culture was replaced by Yayoi culture in western Japan and by the end of the first century B.C. it had spread as far east as the Kantô plain. Address: Faculty of Agriculture, Hokkaido Univ., Nishi 9, Kita-ku, Sapporo, Japan.

1078. Hong, E.H.; Kim, S.D.; Hwang, Y.H. 1984. Production and use and research on soybeans in Korea. *Tropical Agriculture Research Series* No. 17. p. 81-93. March. International Symposium on Soybean in the Tropics and Subtropics.

• ***Summary:*** Abstract. Trends in soybean production: importance of soybeans, area planted, yield, production and import, regional distribution. Trends in supply and consumption: demand and supply, utilization. Methods of cultivation currently applied: cultural practices (planting time, land preparation and planting, fertilizer application, management, harvesting and processing, marketing and procurement, cropping patterns, competitive power), varieties and their distribution, major diseases and pests, problems in farm cultivation. Soybean research and

© Copyright Soyinfo Center 2021

extension service. Government participation in and support for soybean production. Future prospects of soybean production and main constraints. Discussion.

In Korea, soybeans rank third among all food grain crops, in both the area planted and in production, after rice and barley. Soybean "products such as soy paste [doenjang], soy sauce [kanjang], beancurd [tofu] and beansprouts are the primary side dishes in conventional daily Korean meals." The area planted to soybeans has steadily decreased from about 300,000 acres average in 1967-1971 to only 183,000 acres in 1982.

Tables: (1) Area planted and production of major food crops in Korea. (2) Production, yield and import of soybeans by year in Korea. (3) Regional distribution of soybean production in Korea. (4) Demand and supply of soybeans in Korea. (5) Utilization of soybean in Korea. (6) Regional distribution of soybean planting times in Korea. (7) Results of sample investigation for the application of herbicides on soybean in Korea. (8) change of cropping systems in the central part of Korea. (9) Farm income derived from major summer crops in Korea. (10) Characteristics of main soybean varieties currently recommended and their geographical distribution in Korea. (11) Research institutions, location and number researchers related to soybeans in Korea. (12) Amounts, area planted, and production for every class of soybean seeds in Korea in 1982. (11) research institutions, location and number of researchers related to soybeans in Korea. (12) Amounts, area planted, and production for every class of soybean seeds in Korea in 1982. (13) The amount and purchasing prices of soybean by the government and the prices of imported soybeans by year in Korea. Figures: (1) Marketing channels for soybean in Korea. (2) Flow chart of soybean research and extension services in Korea. Address: Crop Exp. Station, Office of Rural Development, Suwon 170, South Korea.

1079. Lee, Jung-Sook; Ko, Y.T.; Paik, J.K. 1984. [Studies on production of soy yogurt: Effects of defatted soy milk on the growth of *Lactobacillus acidophilus*]. *J. of the Korean Agricultural Chemical Society* 27(1):7-13. March. [20 ref. Kor; eng]

• ***Summary:*** Soymilk was made with soy flour, then fermented with *Lactobacillus acidophilus* to make a soy yoghurt. Addition of glucose and fructose greatly enhanced acid production by *L. acidophilus*, the optimum concentration of the 2 sugars in the medium being about 3% each. Among the growth stimulating agents tested, yeast extract stimulated acid production, the optimum concentration being about 0.5%. L-Methionine reduced acid production by *L. acidophilus*, while dried whey, and nonfat dried milk, and protein concentration had no significant effect on its growth or acid production. Address: Dep. of Foods and Nutrition, Duksung Women's College and Lotte-Chil Sung Beverage Co., Ltd. Both: Seoul, South Korea.

1080. Meals for Millions / Freedom from Hunger Foundation. 1984. Annual report 1983: Self-help for a hungry world. Davis, California: MFM / FFH Foundation. 16 p. 21.5 x 9.5 cm.

• ***Summary:*** Peter J. Davies is President. Philip E. Barton is chairperson, board of trustees. On the brownish-red, black and white cover is a photo of a mother smiling at her child. MFM's logo of a plant growing in an upturned bowl is on the front cover.

There is a 1-page message from Barton and a 2-page message from Davies. The latter notes: "In 1983 your foundation started two new Applied Nutrition Programs in Sierra Leone and Kenya."

"A milestone was achieved when our staff moved into our new International Center at Davis last March. And we were especially excited to receive a magnificent check for $225,000 from the Kresge Foundation in April; full payment of their challenge grant." Meals for Millions philosophy. MFM has "Applied Nutrition Programs" (ANPs) in Ecuador, Honduras, Sierra Leone, Kenya, Korea, Thailand, Antigua, U.S. Southwest, Papago Applied Nutrition Program (on the Papago Indian Reservation near Tucson, Arizona). Solutions through appropriate technology.

"Korea: At the end of 1983 MFM phased out its direct participation, turning over its programs to an independent local body;... MFM began to work in Korea just after the Korean War, helping a company to produce a high protein soy beverage for schoolchildren. In 1976 we began an Applied Nutrition Program in Wonseong County, which has grown tremendously."

Thailand: "Last July the men, women and children in 53 villages and 29 schools began planting the 753 kilograms of soybeans distributed by MFM. Villages which were previously quiet and listless, 'seem to have come alive.'"

Total income: $1.894 million. Address: P.O. Box 2000, Davis, California 95617. Phone: (916) 758-6200.

1081. Mogi, Ken. 1984. The history of shoyu (soy sauce) brewing in the United States. The story of the Oriental Show-You Company. San Francisco, California: Kikkoman. 3 p. March. Unpublished manuscript. Combined with a subsequent interview of Ken Mogi by W. Shurtleff on 20 April 1984.

• ***Summary:*** "Early in this century, Mr. Shinzaburo Mogi, one of the Mogi family's ancestors, tried to make shoyu in America. Mr. Mogi was born in 1872 and later came to America in about 1892. He studied at college in Maryland but had an eye problem so he gave up studying and returned to Japan. In 1904, the year his daughter Katsuko was born, he was in Toronto selling Japanese bicycles, involved in a trading business unconnected to Kikkoman. According to the memory of Mr. Tsuneo Tanba, who worked with Mr. Mogi very closely (and later told his story to Morio Ichiyama,

© Copyright Soyinfo Center 2021

Kikkoman historian), Mr. Mogi managed a shoyu plant in Denver, Colorado, in 1907; it was not successful. Later, he had some contact with a shoyu project in Toronto, Ontario, Canada. Though I traveled to Denver, I could not get any information on this."

Note: On 7 Feb. 2005 Ken Mogi wrote William Shurtleff at Soyfoods Center (in response to some questions about the existence of the Denver soy sauce plant): "I talked with Komiya. Mr. Shinzaburo Mogi had the New Testament reading meeting with 5-6 people during lunch break when Mr. S. Mogi was living in Noda [Japan] during World War II. Mr. Komiya told me that he remembered that Mr. S. Mogi mentioned the Denver story." However Ken Mogi is does not know (1) if S. Mogi ever wrote anything about a soy sauce plant in Denver, (2) when and where S. Mogi told this story to Mr. Tanba, and (3) when and where Mr. Tanba told Mr. Ichiyama about S. Mogi's supposed soy sauce plant in Denver. Ken Mogi encloses a photo of Mr. Shinzaburo Mogi at about age 30.

Mr. Mogi's daughter, Mrs. Katsuko Yoshida, who is living in Tokyo, does not remember anything about Denver or her father starting a soy sauce plant in Denver. However she did tell me the story about "Oriental Shoyu" in Indiana.

Katsuko lived in Chicago with her parents in the 1920's (maybe 1920-1926). Mr. Mogi worked for Yamato Shokai, selling Japanese silks. They found the product "Oriental Shoyu" in the market and were very much impressed. They visited the plant in Indiana and later Mr. Mogi became a stockholder in that company.

Mr. Esta Keirn started employment with the Oriental Show-You Co. on 28 Oct. 1932 as a [mung] bean sprout washer. He continued until 1 Nov. 1961, when the company was sold to Beatrice Foods Inc. and turned over to La Choy Food Products. Mr. Keirn worked for La Choy for 8 years. He never met Mr. Mogi but he heard several things about him from Mr. Ohki.

Shinzo Ohki, the founder of the company and one of 8 children, was born in 1884 in Kamakura, Japan. He immigrated to the USA in 1901, landing in Seattle, Washington. Eventually he ended up in Columbia City, Indiana, where he graduated from high school. He then graduated from college in New York City. Upon graduation he started in business as a tea merchant in Detroit. To expand his line, he imported soy sauce in small wooden kegs from Japan. This he bottled and sold along with his tea. He could not expand his tea business but the soy sauce business kept growing.

Wishing to expand by adding other products to his line, he returned to Columbia City, took in a partner to gain capital, and set up in a vacant canning plant (Vance Canning Co.). This is when he incorporated and took the name of Oriental Show-You Company, Inc. Then, in 1917, Mr. Ohki went to Japan to obtain the formula (and also a wife) and some instruction in making soy sauce so he could manufacture his own. Upon coming back to Columbia City, Indiana, he enlisted the help of someone from the USDA to work out the koji culture. Fermentation was set up in large wooden beer vats. Equal parts soybeans, wheat, and salt were aged for 24 months, then pressed and bottled. According to Mr. Keirn, the company produced as much as 30,000 gallons of shoyu in one year. The plant in Columbia City was vacant for some time and now most of it has been torn down, but the adjacent adobe and brick buildings are still standing.

Note 1. Much of this story was published in the Japanese-language newspaper *Rocky Mountain Jiho* (Denver, Colorado), 25 Jan. 1984. p. 4.

Kenzaburo's great grandfather was the first president of Noda Shoyu K.K. (today's Kikkoman). Shinzaburo Mogi was the latter's brother.

Note 2. The story was also written by Marilee Kreps in about 1984 under the title "Shoyu pride: Columbia City's soy sauce factory one of many in the United States." The name of the newspaper, which was published in Columbia City, Indiana, is now known–nor is the date or page. It states: "Until 1962 the company, located on Factory Avenue, was a thriving business in this town, and contrary to what some believe, it was [named] the 'Shoyu Company,' not the 'Show-You Company.'" The Oriental Shoyu Company was established in 1917 by Shinzo Ohki in Columbia City. The factory was closed in 1961.

Note 3. On 7 Feb. 2005 Kenzaburo Mogi IV of Kikkoman, Japan, sent William Shurtleff a hand-drawn map showing the location of the four buildings that were part of the Oriental Show-You Company in Columbia City, Indiana. They were located between the railroad track and Factory Avenue, near Line street. These photos show: (1) The office building. (2) The printing and boiler shop building. (3) The remains of the soy sauce plant, with hand-drawn arrows pointing the areas on the cement floor used for the moromi tank, koji making, and pressing. (4) Close-up of the cement base of the moromi tank. (5) Close-up of the space on the cement floor, between the moromi tank and outside wall, where the heater was. (6) Close-up of the area used for pressing (*assaku*) the soy sauce from the moromi. (7) Mr. Esta Keirn standing in a grassy field in front of the chow mein building, which once shared a wall with the soy sauce plant. (8) Granite tombstone of the founder, Shinzo Ohki (1883-1967) and his wife, Taka (1889-1963). (9) Mr. Esta Keirn. Address: Kikkoman Marketing and Planning Inc., P.O. Box 784, San Francisco, California 94101.

• ***Summary:*** Soybeans were first exported from Canada about 12 years ago when a Japanese house approached the Ontario Soybean Grower's Marketing Board for a trial shipment to Japan. The trial worked out very well and in a short time Ontario's soybean exports became a multi-million dollar business. Ontario soybeans are very clean, the quality is comparable to Japanese and Chinese soybeans, and the supply is consistent. However the price is high in relation to Chinese and U.S. soybeans. As a result, Ontario soybeans are sold in high-priced markets, as for making premium quality miso or soyamilk. The supply of Chinese soybeans is irregular. Address: Manager, Grain Trading Section, Okura & Co. America Ltd., New York, NY.

1085. Wang, Hwa L. 1984. Tofu and tempeh as potential protein sources in the Western diet. *J. of the American Oil Chemists' Society* 61(3):528-34. March. [22 ref]
• ***Summary:*** Contents: Abstract (uses the word "soybean foods" several times). Introduction. Traditional soybean foods. Trends in market growth for tofu and tempeh (based on statistics gathered by Shurtleff & Aoyagi of The Soyfoods Center in California, 1983). Tofu. Tempeh.

Traditional soybean foods can be classified as either nonfermented or fermented. Tables show: (1) Oriental nonfermented soybean foods (gives food name, local names, description, uses): Fresh green soybeans (local names: mao-tou, edamame). Soybean sprouts (huang-tou-ya, daizu no moyashi). Soybean milk (tou-chiang). Protein-lipid film (tou-fu-pi, yuba). Soybean curd (tofu, tou-fu, tubu, tahoo, touhu, tau-foo, dou-fu, dau-fu). Soybean flour (tou-fen, kinako) (Wang 1983).

(2) Oriental fermented soybean foods (gives food name, local names, microorganisms used, substrate, nature of product): Soy sauce (local names: chiang-yu, shoyu, toyo, kanjang, ketjap, see-iu). Miso (chiang, doenjang, soybean paste). Hamanatto [fermented black soybeans] (tou-shih, tao-si, tao-tjo [sic]). Sufu (fu-ru, fu-ju, tou-fu-ju, bean cake, Chinese cheese). Tempeh (tempe kedelee). Natto.

(3) Tofu industry in the United States (No. of manufacturers and annual production in 1975, 1979, 1981, 1982, and 1983).

(4) Soybean solids and proteins in soybean soak water as affected by soaking conditions (temperature vs. time; Lowry protein / Lowry's protein). (5) Ratio of protein to oil content of tofu and soy milk as affected by protein content of soybeans (for different soybean varieties; the highest ratios come from the varieties Wase-Kogane, Vinton, Toyosuzu, and Coles).

Figures: (1) Flow diagram for the preparation of tofu. (2) Graph: In vitro digestibility of soybean milk as affected by the duration of boiling. Best digestibility is 12-14 minutes. (3) Four graphs: Relationship of concentration and type of coagulant to the yield of tofu. Coagulants are calcium sulfate, calcium chloride, magnesium sulfate, and magnesium chloride. The 4 graphs are: Gross weight of tofu. Moisture content. Total solids recovery. Nitrogen recovery. Calcium sulfate gives the highest values on all four graphs. (4) Four graphs: Relationship of concentration and type of coagulant to the texture characteristics of tofu. Same coagulants. The four graphs are: Hardness. Brittleness. Cohesiveness. Elasticity. (5) Flow diagram for tempeh fermentation. Address: Northern Regional Research Center, ARS, USDA, Peoria, Illinois 61604.

1086. Wernham, Les. 1984. Exports–Problems and opportunities [for Canadian soybeans]. In: Ontario Soya-Bean Growers' Marketing Board. ed. 1984. Ontario Soybean Symposium. Chatham, Ontario, Canada: OSGMB. 319 p. See p. 246-53.
• ***Summary:*** Soybean exports from Ontario have expanded dramatically during the past 10 years; in 1982 they reached a high of 132,000 tonnes worth $44 million. The East Asian market including Japan, Korea, Hong Kong, and Malaysia accounted for 81% of Ontario's export soybean sales in 1983, with an additional 8% going to Europe. The main buyers in 1982 were: Japan 47,414 tonnes, Netherlands 19,545 tonnes, Singapore 18,039 tonnes, Indonesia 16,652 tonnes, Hong Kong 15,234 tonnes.

Most of these soybeans are sold for human consumption. "For example, one of Sweden's foremost pharmaceutical manufacturers has in the past years been that country's largest single importer of Canadian soybeans. Taking about 3,000 tons annually, this company produced a patented intravenous nourishment called Intralipid." Tiny soybeans (5 mm diameter or less) are used to make bean sprouts and natto. For soybean exports, freight constitutes an average 21% of the net delivered cost to the buyer in his country. They are shipped in bagged or bulk (20 or 40 foot) containers. The main focus of breeding should be to develop varieties that do not carry a common bitterness or beany flavor. Address: Grain Manager, King Grain, Chatham, ONT, Canada.

1087. Simpson, Rita J. 1984. Re: 1982 statistics on production of soybean-based products in Tetra Brik packages. Letter to William Shurtleff at Soyfoods Center, April 18. 1 p. Typed, with signature on letterhead.
• ***Summary:*** The products include plain and flavored soybean milk, plus tofu (million liters):

Japan 51.0
Hong Kong 15.0
Malaysia 11.5
Korea 7.0
Thailand 4.0
Singapore 2.5

"Our international office is aware of your need for the 1983 statistics and I will forward them when received." Address: Vice President, Information, Brik Pak Inc., P.O. Box 802605, Dallas, Texas 75380. Phone: 214 934-0338.

1088. *Soybean Update.* 1984. Korean meal demand strong. But oil needs improvement. May 28.
• ***Summary:*** "Korean imports of U.S. soybeans in 1984 are projected to reach 750,000 tonnes, up from 1983's 658,000 tonnes, says ASA's Kyung Lee, market development director for Korea.

"Meal usage in feed rations in 1983 reached a record level of 12.2 pct, helping to account for 1983's total meal usage of 714,000 tonnes. Feed demand will remain strong this year, says the country director.

"Soybean oil demand is the big problem area in Korea, says Lee. The demand for so oil continues to grow at a good rate–up to over 105,000 tonnes last year from only 29,000 in 1978–but soyoil consumption is still not growing as fast as meal usage." Address: American Soybean Assoc.

1089. Harvey, Gerald W. 1984. Market opportunities for U.S. soybean sales. *Foreign Agriculture* (*USDA Foreign Agricultural Service*). May. p. 19-21.
• ***Summary:*** From $482 million in 1960, the value of U.S. soy exports rose to $7,900 million in calendar 1983 and is expected to surpass $8,000 million this year. Discusses the outlook for Mexico, Venezuela, Ecuador, Peru, Brazil, Argentina, Paraguay, Korea, China, Malaysia, Philippines, Indonesia, Burma, Thailand, Nigeria, USSR, Yugoslavia, Poland, and Romania. 1090. Shurtleff, William; Aoyagi, Akiko. 1984. History of soy sauce, shoyu, and tamari. Soyfoods Center, P.O. Box 234, Lafayette, CA 94549. 118 p. June 6. Unpublished typescript. Available online at www.soyinfocenter.com.
• ***Summary:*** www.soyinfocenter.com/HSS/soy_sauce1.php

A comprehensive history of the subject. Contents: What is soy sauce? Etymology. World overview. Part I: History of soy sauce in China and Taiwan. Early Chinese soy sauces (shih-you and jiangyou). The 1800's. 1900-1948. 1949-1980's (People's Republic of China). Taiwan. Hong Kong. Part II: History of soy sauce in Southeast Asia and Korea. Dissemination and common characteristics. Association of Southeast Asian Nations (ASEAN)–general. Philippines (1912-). Thailand (1974-). Malaysia (1970-). Singapore. Indonesia. Vietnam. Korea. Part III: History of shoyu in Japan. Hishio (jiang), tamari, and other forerunners of shoyu (700-1600). The development of shoyu (1500-1700). Standardization of the shoyu formula (1716-1867). The rise of shoyu in Japan (1750-1867). Overview of origins. Shoyu during the Meiji period (1868-1911). Shoyu from 1912-1945. The postwar period and modern times (1945-1981). Part IV: History of soy sauce in Europe. Part V: History of soy sauce in Australasia and the Pacific. Part VI: History of soy sauce in the United States. Part VII: History of soy sauce in Latin America, Africa, the Indian Subcontinent, and the Middle East.

The period during World War I was one of consolidation for the shoyu industry. In 1914 three of the larger manufacturers at Choshi (Higeta, Jigamisa, and Kagidai) merged to become Choshi Shoyu Co. Ltd. In 1917 eight (later nine) major manufacturers in Noda, all related by descent or marriage, withdrew from the Noda cartel and joined to form a corporation, the Noda Shoyu Company, Ltd., which later became Kikkoman Inc. The company began operations on 1 January 1918, and quickly modernized its entire organization. In 1925 it restructured itself by amalgamating four related companies under the control of a holding company, thus greatly increasing its capital and scope. In 1918 Choshi Shoyu Co. changed from a limited partnership to a stock corporation and adopted a common trademark, Higeta. The Hamaguchi family, originally from Kishu, which ran Yamasa in Choshi, chose not to join the Choshi Shoyu Co. Rather, in 1928 they incorporated as the Yamasa Shoyu Co., Inc. Address: Lafayette, California. Phone: 415-283-2991.

1091. Yang, Cha-Bum; Park, S.K.; Yoon, S.K.; Park, H. 1984. [Changes of nitrogen compounds and nutritional evaluation of soybean sprout. VI. Changes in electrophoretic pattern of protein]. *J. of the Korean Agricultural Chemical Society* 27(2):129-34. June. [14 ref. Kor; eng]
• ***Summary:*** Changes in the protein composition of soy sprouts grown at 4 temperatures were investigated using polyacrylamide gel electrophoresis. 7S, 11S, and 2S globulins were identified in the cotyledon and the axis. High growing temperature accelerated decrease in protein in the cotyledons and increase in protein in the axis (especially 11S). Address: 1-2. Hanyang Univ.; 3. Dongduck Womans Univ.; 3. Seoul Korea Ginseng and Tobacco Research Inst.

eng]
• ***Summary:*** Soy milk (4.2% protein) was prepared from soy protein concentrate and various nutrients, inoculated with *Lactobacillus acidophilus,* and incubated at 37ºC for 24 hours. Growth of *L. acidophilus* was estimated from viable cell counts, titratable acidity, and pH. The growth curve obtained suggested that the log phase of growth (the phase of rapid logarithmic or exponential growth) ended after 6 hours and the stationary phase (when the number of microorganisms remains constant) after 30 hours. Addition of glucose and fructose greatly enhanced acid production by *L. acidophilus.* Optimum concentration of these sugars was approximately 3%. Yeast extract greatly stimulated acid production, optimum concentration being about 0.5%. A higher concentration of soy protein concentrate resulted in a slightly higher acidity in soy yoghurt. Address: Dep. of Foods & Nutrition, Duksung Women's College, Seoul, South Korea.

1093. Freckmann, James K. 1984. Korea: Surge in vegoil use favors U.S. soybean sales. *Foreign Agriculture* (*USDA Foreign Agricultural Service*). July. p. 21.
• ***Summary:*** Korea's vegetable oil consumption has been increasing 10 to 15% a year ever since 1975, largely led by soybean and palm oil. The U.S. supplies virtually all of Korea's imported soybeans. Address: Agricultural Counselor, Seoul.

1094. **Product Name:** Tofu Blend Dressing [Blue Cheese, Creamy Ranch, Creamy Italian, or Thousand Island].
**Manufacturer's Name:** Eastern Foods Corp.
**Manufacturer's Address:** 3225 E. Hennepin Ave., Minneapolis, MN 55413.
**Date of Introduction:** 1984 August.
**Wt/Vol., Packaging, Price:** 12 oz plastic cup.
**How Stored:** Refrigerated.
**New Product–Documentation:** Regulatory Letter from FDA. 1984. Aug. 27. Labels (lids) shown in color brochure titled "Eastern Foods." "Naturally Low Calorie. ½ the calories of regular dressing. Stir before using." Talk with Mr. Lee. 1987. Nov. 11. This product had excellent taste and 6 week shelf life. Discontinued because of shelf life problems. The products were made at his plant.

1095. Finley, David; Goldberg, Ray. 1984. Kikkoman Corporation. Unpublished Harvard Business School Report. 33 p. No. 9-585-102. [10 ref]
• ***Summary:*** A ten year update on the original 1974 Harvard Case Study of Kikkoman and one of the best insights available into Kikkoman's history and operations (although some of the data has been disguised for competitive reasons). Kikkoman sales in 1982 were about $547 million.

Contents: Early diversification–The wine industry. Company history. Soy sauce production. The soy sauce industry. Structural change. Kikkoman strategy. Expanding soy sauce sales in Japan. Diversifying into other food products (Kikko Foods was established in 1961). Development of the U.S. market. New businesses (Restaurant, health food, and leisure). Technological innovation. Final considerations.

Exhibits. 1. 30 top Japanese food companies in FY (Fiscal Year) 1982, with sales. (1) Kirin Brewery, (2) Suntory, (5) Yuki-jirishi / Snow Brand Milk Products, (6) Ajinomoto, (8) Meiji Milk Products, (9) Nisshin Flour Milling, (10) Morinaga Milk, (19) Showa Sangyo, (20) Nisshin Oil, (23) House Food, (25) Kikkoman.

3. Quantity of soy sauce produced and market share of major Japanese manufacturers. 1982 soy sauce market share was Kikkoman 30.4%, Yamasa 8.9%, Higashimaru 4.6%, Higeta 3.0%, and Marukin 2.5%. Thus the top 5 had 49.4% of the market. 5. Change in per capita food intake (1975-79). 6. Kikkoman financial data. 8. List of main products. 9. World per capita wine consumption by country. France is tops with 90 liters/person/year. 11. Growth through diversification. In 1964 soy sauce accounted for 87% of Kikkoman's sales, in 1983 for 59%. 12. 1980 Asian population of the U.S. by state. Total: California 1,253,987. Hawaii 583,660. New York 310,531. Illinois 159,551. Texas 120,306. New Jersey 103,842. Washington state 102,503.

Oriental immigrants to the USA 1972-81. Total. 1,794,682. From Philippines 375,517. Korea 290,322. Vietnam 233,274. China and Taiwan 213,908. Address: 1. Research Associate; Prof., Harvard Business School, Boston, Massachusetts 02163.

1096. Shurtleff, William. 1984. Soybeans and soyfoods in China: 1949-1983. *Soyfoods.* Summer. p. 24-25.
• ***Summary:*** "In mid-1983 I was invited to go to the People's Republic of China for three weeks to give four seminars in various provinces for government officials and technical professionals interested in modern soymilk production. Accepting the invitation enabled me to study soybeans and soyfoods in the land of their origin. I realized that this was a rare opportunity, for not since William Morse studied soybeans and soyfoods extensively in China during his trip to East Asia in 1929-31 and A.K. Smith studied them in 1949, almost 35 years ago, has a Westerner gone there for this express purpose.

"From ancient times to well into the twentieth century, China was by far the world's leading producer of soybeans. In 1910 China proper produced an estimated 71% of the world's soybeans, and Manchuria, then an independent nation, produced another 16%. As late as 1929 the two nations produced 87% of the world's soybeans, and in that year their combined production reached an all-time peak of 11.89 million tonnes (metric tons). The soybean was Manchuria's most important agricultural and export crop, and during the 1910s and 1920s huge amounts of soybeans,

© Copyright Soyinfo Center 2021

soy oil, and soybean meal were shipped from Manchurian ports to countries around the world [above all to Japan]. Starting in 1933, however, soybean production began a long decline, caused largely by stiff competition from soybean producers in the U.S., by the revolution, the civil war, and the anti-Japanese war in China.

"Soybean production rose following the founding of the People's Republic in 1949. After collectivization in the winter of 1955-56, Chinese rural management cadres were encouraged to concentrate on grain and cotton production. Area planted to soybeans (considered a grain) expanded dramatically, as did production, reaching 12.75 million hectares and 10.05 million tonnes in 1957, figures which have not been attained since.

"Soybean area fell from its peak of 12.75 million ha in 1957 to 9.55 million ha in 1958, a drop of 25%. It fell even further by 1965, to 8.59 million ha. Yields also fell, so that in 1965 soybean production, a mere 6.14 million tonnes, was at about the same level it had been in 1900. Soybean production, yields, and hectarage increased substantially after 1976. From 1976 to the peak year in 1981, production rose 41%, yields climbed 18%, and hectarage increased by 20%. In 1980 China produced a mere 9.3% of the world's soybeans, down from 44% in 1954 and 38% in 1957. China first imported soybeans from the USA in 1977. Imports peaked at 810,000 tonnes in fiscal year 1980, then decreased to zero after spring 1982.

"Following U.S. diplomatic recognition of China in 1978 and the first large imports of U.S. soybeans, the American Soybean Association began to wonder if China's one billion people and 200 million hogs might not be the next big market for American soybeans. After the ASA's first trip to China in mid-1979, Chief Executive Officer Bader announced that China seemed sincere in wanting to expand and improve its livestock industry (primarily swine and poultry), in part by feeding more soybean meal. In August 1982 the ASA opened an office in Beijing under the direction of Terrence Foley. Many teams of Chinese professionals in soybean crushing, soyfoods manufacturing, and livestock and human nutrition were sponsored by the ASA to visit the U.S. and Asian countries, and U.S. specialists were sent to China to teach. Foley saw great potential in the soyfoods area since there were five times as many people as hogs and most hogs were fed only scraps and waste inedible by people. In late 1983 the ASA hired a nutritionist, Beth Branthaver.

"Since the founding of the People's Republic of China soybean research has been conducted solely by public institutions, largely those under the national Ministry of Agriculture. Perhaps the most active and best-known center is the Soybean Research Institute at the Heilongjiang Academy of Agricultural Science, founded in 1975 near Harbin. By 1983 the Institute, with a staff of 71 professionals (building toward 100) and a yearly budget of $100,000, had developed several new soybean cultivars and created a package of practices that allowed farmers to get yields of up to 3,000 kg/ha. Between 1949 and 1982 Chinese researchers developed more than 200 new soybean cultivars that were used in production.

"To help improve soybean production and utilization in northeast China, the United Nations Food and Agricultural Organization (FAO) established a project to increase the competence of the Institute staff. With $525,000 in funding, the program runs from February 1982 to August 1984.

"By far the most important fact noted by one wishing to study soyfoods in post-revolutionary China is how little information is available, and how difficult it is to get what little exists. There are no official statistics on any aspects of the production of soyfoods, no publications devoted specifically to soyfoods, and few people with an interest in or doing research on the subject.

"Despite China's top-priority goal since 1976 of modernizing its agriculture and industry, no plans have been made to modernize the vast and important traditional soyfoods industry. As of 1983, a major debate was shaping up in China as to whether the country should modernize traditional industries or turn to making Western high-technology soy protein products, largely for export.

"Unlike most countries of the world where soybeans are widely produced or used, China has no soy-related trade associations. This is one major reason for China's shortage of information and slowness in modernizing its soybean production and processing industries. The most closely related trade group is the Chinese Food industry Association.

"In China there is little or no private enterprise or individual ownership of businesses. Soyfoods manufacturers work for the State, and all decisions on which soyfoods will be made, how, by whom, and in what amounts are made by government bureaus. Since 1979 the inertia and listlessness of China's bureaucracy and its lack of concern for the common people have become officially recognized and widely discussed problems. Various Chinese friends who work with soyfoods in America have reported to us, after returning to China, that soyfood production had dropped noticeably in both quantity and quality.

"In 1983 China's most popular soyfoods in terms of the amount produced and consumed (not counting soy oil), in approximate order of importance, were tofu (all nonfermented types), soybean jiang (a sort of miso), soy sauce, and soymilk. Small amounts of modern soy protein products (especially soy flour and textured soy flour) have started to be made experimentally in larger cities. Except for the modern products, this ranking has probably not changed much since 1949, or even since 1900.

"Lepley (*Soybean Update.* April 1981) and Terrence Foley of the ASA, estimated that 93% to 95% of the soybeans produced in China were used to make traditional soyfoods, one of the highest percentages in the world; only 5 to 7% was used for livestock feeds.

© Copyright Soyinfo Center 2021

"Despite increases in soybean production and imports since 1965 per capita annual soybean availability (approximately equal to consumption) has dropped sharply from 16.9 kg in 1953 to 7.13 kg (the lowest point) in 1965, then rose a little to 8.3 kg in 1980. Nevertheless, according to FAO food balance sheets. this was probably the highest per capita use of soybeans as food in the world. Following China (in 1971) were Japan (5.1 kg), Korea (5 kg). Singapore (4.3 kg). and Indonesia (2.8 kg).

"Availability of soyfoods in China varies widely by type of food, season. and region. Earlier overemphasis on heavy industry at the expense of agriculture and failure to check population growth led to a steady decline in per capita food production. To cope with potential shortages of basic foods, the Chinese government devised a complex rationing system. In Beijing in 1983. people had to carry as many as seven or eight different types of monthly coupons or ration booklets. Tofu and soy oil (along with all cooking oils) were the main soyfoods rationed. Grains, sugar, and, in some areas, meat were also rationed. Equal weights of wheat flour and tofu were interchangeable.

"On many days, particularly in the warm months due to the lack of refrigeration through the marketing chain, tofu and other foods simply were not available, or they sold out early, or people had to wait in long lines for up to an hour to buy them. Lines for meat and fish were the longest.

"Perishable soyfoods such as tofu become more available during the colder months. Seasonal soyfoods such as fresh green soybeans (*maodou*) in the fall, are enjoyed each season. Since inland transportation systems are rudimentary, soyfoods are most widely available in areas where the beans are grown."

A graph, based on the Statistical Yearbook of China, shows soybean production in China from 1910 to 1983. On this graph, production for Manchuria only from 1910 to 1949 is also shown; it peaked in 1930. Manchuria firmly became part of China in 1949. Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549.

1097. Chen, Steve. 1984. Soyfoods in the Far East and USA: Products, markets, trends. In: American Soybean Assoc., ed. 1984. First European Soyfoods Workshop, Proceedings. Brussels, Belgium: ASA. 36 p. See p. C1-C38. Held Sept. 27-28 at Amsterdam, Netherlands. [11 ref]

• ***Summary:*** Contents: Summary. 1. Introduction: Ten reasons why soybeans will be a key protein source for the future. 1. Soyfood products. A. Non-fermented soyfoods: Fresh green soybeans, soybean sprouts, soynuts, soymilk, soy flour, yuba or soy protein film, tofu. B. Fermented soyfoods: Soy sauce, miso, tempeh, natto, fermented tofu, fermented black soybeans (tou-shih, hamanatto). 3. Soyfoods markets and trends in the Far East: Taiwan, China, Japan, South Korea, Indonesia, Malaysia, Singapore, Thailand, Philippines. 4. Soyfoods markets and trends in the U.S. 5. References. Plus 15 tables and 8 figures.

"It is our [American Soybean Association's] strong intention that marketing and consumption of soy protein should not in any way deter the expansion of the production and sale of as much animal protein as the world can be expected to produce in the years ahead. Soy protein foods are being intentionally brought to the market to complement and not necessarily to replace animal protein products."

"Taiwan imported 1.41 million tonnes (metric tons) of soybeans in 1983 and used about 250,000 tonnes as soyfoods for direct human consumption, which made Taiwan one of the highest in per capita consumption of soyfoods (13.2 kg or 29 lb) in the world. In the past 10 years (1974-1983), the consumption of traditional soyfoods showed an average increase of 3% per year as compared to 12% and 8.1% for poultry and soy oil, respectively. The market for packaged soymilk, soy pudding and tofu has also been expanding rapidly in recent years in Taiwan." Table 7 shows the production of soymilk in Taiwan, which grew from 103,600 tonnes in 1974 to 210,000 tonnes in 1983, for an average growth rate of 8.2% a year.

China produces about 9 million tones of soybeans a year, and about half of these are consumed as soyfoods, giving a per capita consumption of 4.5 kg of soyfoods. "An improvement in the general economy and soyfood technology and equipment will bring a sharp increase in soybean demand and more soyfoods consumption."

In South Korea soymilk consumption has increased more than seven-fold in the last 4 years. Currently about 10,000 tonnes of soybeans are used to make 70,000 tonnes of soymilk. "It is projected that soymilk production in Korea will double in 1984 as compared to the previous year."

Indonesia continues to be Southeast Asia's largest consumer of soybeans as food. In 1982/83 soybean consumption was 6.7 kg per capita. Indonesia consumes about 1 million tonnes of soybeans annually, 60-65% of them in the form of tofu and 35 to 40% as tempeh.

Malaysia consumes only about 30,000 tonnes of soybeans per year as food. In Singapore, more than 75% of the population of 2.5 million are Chinese. Therefore tofu, soysauce, and soymilk are the predominant traditional soyfoods consumed.

Thailand consumes about 40,000 tonnes of soybeans a year as food, mainly in the form of tofu. The Philippines uses only 5,000 tonnes of soybeans annually for food, mainly as tofu.

To summarize (Table 6), annual per capita consumption of soybeans in various East Asian countries, in descending order of the amount consumed, is as follows: Taiwan 13.2 kg (population 19 million); Japan 8.3 kg (population 120 million); South Korea 7.5 kg (population 40 million); Indonesia 6.7 kg (population 150 million); Singapore 6.25 kg (population 2.4 million); China 4.5 kg (population 1,000 million); Malaysia 2.1 kg (population 14 million);

© Copyright Soyinfo Center 2021

Thailand 0.8 kg (population 50 million); Philippines 0.3 kg (population 15 million). Address: Director, American Soybean Assoc., Room 603, Kwang-Wu Building, No. 386, Tun Hua South Road, Taipei, Taiwan.

1098. Epp, Peter H. 1984. Growers' interest in supplying export markets. In: Ontario Ministry of Agriculture and Food, Market Development Branch. 1984. Workshop on Export Markets for Ontario Soybeans: Edited Proceedings. 45 p. See p. 42-45. Held 5 Sept. 1984 at Wheels Motor Inn, Chatham, ONT, Canada. 28 cm.
• ***Summary:*** In 1954 Ontario soybean growers began to seek export markets when the Ontario Soybean Growers' Marketing Board organized the first export of Canadian soybeans to the United Kingdom.

In the late 1960s, samples of Canadian soybeans were forwarded to Pacific Rim countries to try to determine whether Canadian varieties were acceptable to the tofu and miso markets of those countries.

The replies indicated that Japanese food manufacturers preferred U.S. varieties such as Kanrich, Amsoy, Corsoy, Ohio, and I.O.M. (Indiana, Ohio, Michigan) soybeans.

In 1970 an export promotion booklet titled "Cansoy" was introduced to 52 foreign countries promoting the story of Canadian soybeans.

"Ontario soybean samples continued to be forwarded annually but received no support or interest until the spring of 1972. At that time the C. Itoh people in Toronto indicated the Harwood variety, produced by the Harrow Research Station, possessed qualities favorable to the manufacture of tofu and miso. C. Itoh was willing to purchase a shipment of 750 tons for further testing by some of their customers. The soybean board made several important decisions: (1) To include a letter with the soybeans from the Canadian Grain Commission stating that the shipment consisted of 85-90% Harwood variety soybeans. In other words, the identity of the Harwood variety had been preserved or maintained, and not mixed with other varieties. This marks the start of Canada's identity preserved (IP) program and a strong commitment to providing the soybean characteristics that Asian food products wanted. (2) To pay $6,920 of the total freight and stevedoring costs to Japan.

In Feb. 1982 the OSGMB sponsored its first export mission to Asia–to Japan, South Korea, Hong Kong, Singapore, and Malaysia.

Since the Harwood variety, Dr. Buzzel of the Harrow Research Station has devoted a great deal of time breeding soybean varieties suitable for the edible market. Address: Chairman, Ontario Soya-Bean Growers' Marketing Board, Chatham, ONT, Canada.

1099. Ko, Young-Tae; Kim, Y.B.; Paik, J.K. 1984. [Studies on production of soy yogurt: Keeping quality of yogurt beverage prepared from defatted soy flour]. *J. of the Korean Agricultural Chemical Society* 27(3):163-68. Sept. [22 ref. Kor; eng]
• ***Summary:*** The flavor of this soy yoghurt beverage was rated significantly different from and slightly inferior to that of dairy yoghurt; the addition of flavorings improved the acceptability. There was considerable precipitation of the curd during the first 24 hours of storage, but sedimentation was reduced by addition of stabilizers: by 0.4% carboxymethyl cellulose, or 0.1% propylene glycol. The beverage could be stored for 48 days at 5ºC without significant change in lactic acid bacteria viable cell counts. After 48 days at 25ºC, the pH, titratable acidity, and viable counts of the beverage changed significantly. Some samples were contaminated by yeasts and molds. Address: 1. Dep. of Food & Nutrition, Duksung Women's College; 2. College of Agriculture, Korea Univ.; 3. Lotte-Chil Sung Beverage Co., Ltd. All: Seoul, South Korea.

1100. Lee, Taik-So; Chun, Myoung-Sook; Oh, Kyung-Hwan. 1984. [Effect of kojis on the component of kochujang]. *J. of the Korean Society of Food Science and Nutrition* 13(3):238-46. Sept. [26 ref. Kor; eng]
• ***Summary:*** "The objective of this experiment was to improve the quality of Kochujang and to shorten the aging time of it by using the Kojis of various *Aspergillus* strains. During the autumn season Kochujangs were mashed with koji of *Aspergillus oryzae*, *Aspergillus kawachii* and *Aspergillus shirousamii*... Thus it is presumed that *Aspergillus shirousamii* Koji can be used for the improvement of quality of Kochujang if a suitable method is applied to prevent the pH from decreasing." Address: Dep. of Food Science, Seoul Woman's Univ., Korea.

1101. Loh, Michael. 1984. An overview of export markets for edible soybeans. In: Ontario Ministry of Agriculture and Food, Market Development Branch. 1984. Workshop on Export Markets for Ontario Soybeans: Edited Proceedings. 45 p. See p. 1-9. Held 5 Sept. 1984 at Wheels Motor Inn, Chatham, ONT, Canada. 28 cm.
• ***Summary:*** "Ontario first exported edible soybeans in 1972 and over 12 years have built it into a $40 million business. 1981 was our best year when exports totalled $46 million... The bulk of Ontario's soybean exports are sold to the Far East [East Asia]–Japan ($8 million in 1983), Singapore ($6 million), Hong Kong ($3.5 million), Malaysia ($1 million), Indonesia, and Korea." In these countries soybeans are consumed in the daily diet of the people. In Japan, for example, they are made into miso, tofu, natto, soymilk and shoyu. Korea also makes soy sprouts, Indonesia makes tempeh, and Singapore, Malaysia, and Hong Kong make dried yuba. In addition, sales to the Netherlands, United Kingdom, and France are quite significant.

Concerning Ontario's market share of soybean imports for food use: Japan imports 877,300 tonnes, of which 27,000

© Copyright Soyinfo Center 2021

tonnes or 3.1% is from Ontario. Singapore and Malaysia import 36,000 tonnes, of which 20,000 tonnes or 55.0% is from Ontario. Hong Kong imports 20,000 tonnes, of which 10,000 tonnes or 50.0% is from Ontario.

Japan's sources of its 877,300 tonnes of imported soybeans are as follows: USA 570,000 tonnes (65%), China 280,000 (32%), Canada 27,000, South America 300.

Japan uses its 877,300 tonnes of imported soybeans as follows: tofu 485,000 tonnes (55.3%), miso 180,000, natto 185,000, soymilk 25,000, cooked soybeans 10,000, shoyu 6,500, other 85,800. Within these figures, Ontario's soybeans are used as follows: Miso 20,000 tonnes (11.1% of the total), natto 5,000 tonnes (5.9%), and tofu 2,000 tonnes (0.4%). Address: Export Development Specialist, Ontario Ministry of Agriculture and Food, Toronto, Canada.

1102. Sung, Nak-Ju; Ji, Y.A.; Chung, S.Y. 1984. [Changes in nitrogenous compounds of soybean during chungkookjang koji fermentation]. *Journal of the Korean Society of Food and Nutrition* 13(3):275-84. Sept. [19 ref. Kor; eng]
• ***Summary:*** "In order to study the flavor quality of Chungkookjang, the changes in nitrogenous compounds, nucleotides and their related compounds, free amino acids, amino acid composition and fatty acids were analysed during Chungkookjang Koji fermentation. Koji was prepared with *Bacillus natto* isolated from Japanese natto.

"Insoluble nitrogenous was rapidly decreased, whereas PAA (peptide, amino, ammonia) nitrogen were slightly increased during the fermentation of Chungkookjang Koji. The content of extracted nitrogen and free amino acid nitrogen were rapidly increased until 48 hours fermentation of Chungkookjang Koji and then decreased." Address: 1. Dep. of Food and Nutrition, Gyeongsang National Univ.

1103. Sung, Nak-Ju; Ji, Young-Ae; Chung, Seung-Yong. 1984. [Changes in nitrogenous compounds of soybean during chungkookjang koji fermentation]. *J. of the Korean Society of Food Science and Nutrition* 13(3):275-84. Sept. [19 ref. Kor; eng]
• ***Summary:*** "Eight kinds of fatty acids were detected from raw soybeans, but 10 kinds of fatty acids from Chungkookjang Koji. Palmitic, oleic and linoleic acids were identified as the major fatty acids of raw soybeans and Chungkookjang Koji, and amounts of these were estimated above 80% of the total fatty acids." Address: Dep. of Food and Nutrition, Gyeonsang National Univ., Korea.

1104. *Yomiuri Shinbun* (*Yomiuri Daily News, Tokyo*). 1984. Nattô sekai ni [Natto is marching into the world]. Oct. 24. [Jap]
• ***Summary:*** This article is about tempeh in general and about the world conference on Asian non-salted fermented foods in July 1985 in Tsukuba, Ibaragi prefecture, Japan.

Prof. Watanabe Tadao (Kyushu University) is the head of the conference. They are planning to invite specialists from Thailand, Indonesia, Nepal, China, Korea, USA, Holland, and Denmark.

The wife of Mr. Kawashima (of Tsukuba University) has been developing tempeh recipes suited to Japanese tastes. This subject was on HNK TV on the 6:30 p.m. "News Center 630," on Oct. 17, 1984. Mrs. Kawashima got interested in tempeh when she was living in Indonesia with her husband (a food researcher); they lived there for a long time.

Photos show: (1) A traditional Indonesian tempeh maker in his shop. (2) Mrs. Kawashima holding a plate of prepared tempeh.

1105. Schultz, Jack [John M.]. 1984. Re: History of the J.M. Schultz Seed Co. Letter to William Shurtleff at Soyfoods Center, Nov. 27–in reply to inquiry. 2 p. Typed, with signature on letterhead.
• ***Summary:*** "A brief history of our company is as follows: The J.M. Schultz seed company was started in 1903... The company began cleaning and selling soybean seed in the late 1920s and early 1930s. At that time, the principal use for the soybean was as a hay crop. It was in later years that the certified seed business developed and the J.M. Schultz Seed Company was one of the first companies to become involved in the certified seed business in Illinois.

"In the 1970's the company began development and marketing a proprietary soybean under the J.M. Schultz seed brand. Recently the company has returned to selling hay beans and this market has developed in the past two years. In the 1980's the company entered into the development of soybeans for the edible soybean market and has pursued development and production of these soybeans. We recently completed negotiations on a rather large order of soybeans to Korea for sprouting purposes."

Note: In a previous letter, dated 25 Oct. 1984, Jack Schultz sent William Shurtleff and original copy of his thesis about soybeans and Brazil as a competitive force, and also a recent article from a talk he gave on soybean seed production in Brazil. This letter is also typed with signature on letterhead. Address: P.O. Box 211, 105 Pine St., Dieterich, Illinois 62424. Phone: 217-925-5212.

1106. *Soybean Update.* 1984. Developing countries best growth markets for soybeans. Dec. 10.
• ***Summary:*** "The major export growth area for the U.S. bean complex is in the developing countries of Asia and South America," according to Rich McDonnell, Deputy Director of Analysis for the Foreign Agricultural Service (FAS). "McDonnell said the developing countries of Mexico, Taiwan, South Korea, Indonesia, Malaysia, and Venezuela have shown a significantly higher rate of import growth during the last few years than Western Europe, Japan and the Soviet Union.

"Soybean shipments into those 6 countries rose about

© Copyright Soyinfo Center 2021

400% in 1983/84 from 1.1 million tonnes imported in 1974/75, reported McDonnell. While the USDA analyst does not foresee a long continuation of this rate of growth, he stresses that 'per capita consumption of meal and oil in these countries is far from saturation levels.'"

1107. Hymowitz, Theodore. 1984. Dorsett-Morse soybean collection trip to East Asia: 50 year retrospective. *Economic Botany* 38(4):378-88. Dec. [38 ref]

• ***Summary:*** Contents: Introduction. The plant explorers–Dorsett and Morse (a biographical sketch of each member of the expedition. Palemon Howard Dorsett, a veteran plant explorer and senior member of the team, was age 67 at the time of the trip to East Asia. Dorsett's son, Jim, who had accompanied him on a plant exploration trip to Asia during 1924-1926, died of tuberculosis on 8 Oct. 1927. Dorsett's daughter-in-law, Ruth B. Dorsett, accompanied him on the Dorsett-Morse expedition. William Joseph Morse was the junior member of the team and the specialist in soybeans–age 45 when the team left for East Asia. He was accompanied by his wife, Edna, and their daughter, Margaret).

Oriental Agricultural Exploration Trip (gives all key dates, places, and events on the trip). Dorsett-Morse collection. Soybean collection (a detailed discussion, including history and varieties): "This paper is devoted to the analysis of the 4,451 soybean (*Glycine max*) accessions collected by P.H. Dorsett and W.J. Morse during their plant exploration trip to east Asia 1929-1931. Until about 1950 the collection was used primarily for the development of vegetable type soybean cultivars. During this period many of the accessions were lost. Today only 945 of the original 4,451 accessions are available in the United States soybean germplasm collection. From the 1950s to the 1980s, as soybean production increased in the United States, so did plant pathogen problems. The Dorsett-Morse soybean accessions have been extremely valuable to plant pathologists and breeders as sources of resistance to certain pathogens. Individual genotypes in the collection have been used for genetic studies on morphological, physiological and biochemical traits. Due to the development and distribution of higher-yielding soybean cultivars, farmers in East Asia are no longer growing lower-yielding landraces. Although these landraces are now extinct in east Asia, many were collected by Dorsett and Morse and are preserved in the United States soybean collection. Over the years, the Dorsett-Morse collection has increased in value and will be as useful to soybean scientists in the future as it has been in its first 50 years of existence."

"According to Piper and Morse (1923) no more than 8 soybean cultivars were grown in the United States prior to 1898. In 1898, the Office of Foreign Seed and Plant Introduction was established within the United States Department of Agriculture (USDA) to centralize introduction activities. Introduced plants were assigned permanent numbers under the Plant Introduction (P.I.) designation system. The first soybean listed in the P.I. system was P.I. 480 from South Ussurie, Siberia. The seeds were received from Professor N.E. Hansen in March, 1898 (Cook, 1898).

"Between 1898 and 1928, approximately 3,000 accessions of soybeans were introduced into the United States from China, Japan, Korea and India (Bernard, 1983). The collections were made principally by P.H. Dorsett, F.N. Meyer, and C.V. Piper. In the mid-1920s it was apparent to the USDA that the soybean was becoming a major American crop. Funds were allocated to send 2 plant scientists on a major expedition to Japan, Korea and northeast China, primarily to collect soybean germplasm and also to collect seed and propagating material of other crops of interest."

"Dorsett-Morse Collection: Dorsett and Morse sent back to Washington, DC, approximately 9,000 accessions of seed and propagating material (Ryerson, 1930). About half the accessions collected were soybeans (Table 1); the other half consisted of representatives from 230 genera. Individually or jointly, Dorsett and Morse collected germplasm from fruit and vegetable markets, food and flower shows, experiment stations, botanical gardens, seed companies, farms, factories making soybean and other food products, processing plants, and from the wild. In certain instances they contacted individuals to make collections of specific indigenous plants. In addition, they pressed 814 herbarium specimens, mostly 5 sheets each. They also brought back boxes containing butterfly, moth, wasp, spider and ant specimens.

"The explorers returned with 3,350 black-and-white still pictures, 6,700 ft of standard black-and-white motion picture negative and 2,400 ft of colored motion picture negative. Lastly, they brought back 210 publications, 341 different soybean food products and 236 bamboo-made articles (Dorsett and Morse, 1928-1931)."

"The Dorsett-Morse collection trip cost approximately $25,000. Even with today's inflated dollars the benefits gained by United States soybean farmers, processors, and consumers greatly exceed the original collection cost."

Talk with Ted Hymowitz. 1998. June 15. In fact, the value to American farmers of one soybean introduced by this expedition, P.I. 88788, which is a source of resistance to soybean-cyst nematode (SCN) races 3 and 4, is greater than the cost of the entire expedition–several times over. Interestingly, it was not until the late 1980s and 1990s, some 60 years after the expedition, that the resistance contained in this one soybean began to be utilized by U.S. soybean breeders. This is a good example of the importance of collecting and preserving germplasm, whose value may not be known until many years later.

Tables show: (1) Soybean accessions introduced into U.S. by Dorsett and Morse and currently available in the U.S. soybean collection: 1929–366 in original collection / 126 currently available. 1930–2,261 / 554. 1931–424 / 206. 1932–1,400 / 59. Total–4,451 / 945 (=21.2% currently

available).

Table 2. 41 of their soybean introductions that by simple selection became cultivars in the USA and Canada, with P.I. number, place of origin, and Maturity Group: Cultivar names: Agate, Aoda, Arisoy, Bansei, Bansei (Ames), Cherokee, Chusei, Delsoy, Emperor, Etum, Fuji, Goku, Green and Black, Hakote, Hidatsa, Higan, Hokkaido, Imperial, Jackson, Jefferson, Jogun, Jogun (Ames), Kanro, Kanum, Kura, Magnolia, Mendota, Nanda, Osaya, Rokusun, Sac, Sato, Seminole, Shiro, Sioux, Sousei, Tastee, Toku, Waseda, Willomi, Wolverine.

Table 3. Eight "vegetable-type soybean cultivars developed in the U.S. by hybridization and selection from germplasm introduced by Dorsett and Morse:" Disoy, Kanrich, Magna, Perry, Prize, Shore, Verde, and Yelnanda.

Table 4. Selected soybean introductions by Dorsett and Morse with resistance to certain pathogens: Column 1, organism (Fungal, bacterial, viral, and nematode pathogens). Col. 2, Disease. Col. 3, Source of resistance (PI numbers).

Table 5. Introductions by Dorsett and Morse listed in the soybean genetic type collection: Column 1, lines (11). Col. 2, P.I. number. Col. Description (Narrow leaflet, dense pubescence, black pod, etc.).

Note 1. This is the earliest English-language document seen (Oct. 2013) that uses the term "landraces" (or "landrace," spelled as one word) to refer to indigenous soybean varieties. Note 2. Before writing this article, Ted read the 17-volume log of the Dorsett-Morse Expedition, first for 2 days at the American Soybean Association headquarters in St. Louis, Missouri, and then using a microfilm of the log sent by ASA. Then he went through the published USDA Plant Inventory volumes compiled by the Office / Division of Foreign Plant Introduction. Finally he compared the latter list with the names and SPI numbers of varieties in the USDA germplasm collection. Address: Crop Evolution Lab., Dep. of Agronomy, Univ. of Illinois at Urbana-Champaign, Urbana, IL 61801.

1108. *J. of the American Oil Chemists' Society.* 1984. Soymilk: New processing, packaging expand markets. 61(12):1784-93. Dec.
• ***Summary:*** An excellent, comprehensive article prompted by a new book, *Soymilk Industry and Market*, by Shurtleff & Aoyagi.

In South Korea, Dr. Kyung Won Lee, ASA's country director says that soymilk is at the take-off stage; in late 1983 it was growing by 60% a year. Korean consumers favor soymilk over cow's milk; being very concerned about good health, Koreans prefer vegetable fat to animal fat. In 1983, Korea's seven major soymilk manufacturers made an estimated 67,000 metric tons of fluid soymilk. In descending order of size: (1) Dr Chung's, maker of Vegemil in 180 ml bottles. (2) Dong Bang Oil and Flour Mills, with its Green Milk.

1113. **Product Name:** Tofu.
**Manufacturer's Name:** Jeon's Natural Foods.
**Manufacturer's Address:** Springfield, Missouri. Phone: 417-NL.
**Date of Introduction:** 1984.
**New Product–Documentation:** Talk with John Kaiser. 1989. March 2. John has been making tofu for 7 years, starting at The Farm in Tennessee, and then in Cleveland. A company named Jeon's Natural Foods in Springfield, Missouri, has made tofu for 5 years and sprouts for 13 years but stopped 2 months ago. They have a pressure cooker system. The founder came from Korea and is now running a restaurant and leasing out the sprout operation. John wants to lease his tofu business.

1114. **Product Name:** Tofu.
**Manufacturer's Name:** Jeon's Natural Foods.
**Manufacturer's Address:** Route 1, Box 139, Republic, MO 65738. Phone: 417-732-2507.
**Date of Introduction:** 1984.
**New Product–Documentation:** Talk with John Kaiser. 1989. June 30. A Korean man named B.K. Jeon started this company near Springfield, and started making tofu and mung bean sprouts about 5 years ago. He sold it to a lady named Sadie. She is too busy with the sprouts to do tofu, so she wants John to come and make the tofu on a profit sharing arrangement.

1115. Keum, J.H.; Oh, M.J. 1984. [Changes in chemical composition during lactic acid fermentation of soymilk]. *Research Reports of Agricultural Science and Technology* 11(1):34-44. [33 ref. Kor; eng]*
• ***Summary:*** Soy yogurt was prepared from soybeans, defatted soybeans and sprouted soybeans inoculated with *Lactobacillus acidophilus* and *Bifidobacterium bifidum* as a starter. Soymilk made from sprouted soybeans showed the greatest growth of *L. acidophilus*, decreased levels of raffinose and stachyose, and when 10% nonfat dry milk was added, it was rated by a taste panel as having the best flavor. Address: Graduate School, Chungnam National Univ., Daejeon, South Korea.

• ***Summary:*** Note: Chinese characters are given for all romanized Chinese words or terms. Although legumes were among the earliest plants to be domesticated in West Asia and the Americas*, there is no solid evidence that legumes were cultivated in China in prehistoric times, even though several species were native to China, and even though legumes played a very important role in Chinese agriculture from the late Chou [ca. 722 B.C.] onwards.

* Footnote: In the Near East and Europe carbonised peas and lentils, assumed to be domesticated, have been identified at farming sites dating as far back as 7000 B.C. Various species of *Phaseolus* beans seem to have been domesticated in Peru and Mexico by the 6th millennium B.C. And groundnuts are believed to have been domesticated in the upper Amazon regions, in South Bolivia and North Argentina well before 3000 B.C.

"Though remains of leguminous species have been found in one or two Chinese Neolithic sites, they have been identified as broad beans (*Vicia faba*) and groundnuts (*Arachis hypogaea*); since the former is believed to have been introduced to China from Western Asia in Han times [220 B.C.–220 A.D.] and the latter is a native American species, the authenticity of these identifications is doubtful, to say the least" (Footnote: K.C. Chang. 1977. *The Archaeology of Ancient China*, 3rd revised ed.).

"There are apparently no references to legumes in the Shang oracle records, and the earliest uncontested evidence for the cultivation of leguminous plants in China is found in Chou bronze inscriptions and in the *Shih Ching*. Both these sources refer to a crop called *shu* (Chinese characters given), and the early form of the character clearly depicts the

© Copyright Soyinfo Center 2021

nodules on the roots of the plants (Fig. 237). The term *shu*, though also used to refer to legumes in general, is primarily associated with the soybean, *Glycine max* (L.) Merrill, and its presence in these writings is usually taken to signify the domestication of this crop" (Footnote: Hu Tao-Ching {1963} in fact postulates a much earlier domestication [it must have been domesticated and well known long before it appeared in inscriptions on bronze vessels in 1024 B.C.]; Ping-To Ho {1975, p. 70} believes that domestication occurred about 1000 B.C.)

"In later lexicographical texts the term *shu* is usually qualified when soybeans are referred to: *jung shu*, *jen shu*, and *ta shu* are mentioned (Footnote: In the *Erh Ya* and its commentary for example), and this does suggest that even in pre-Han times *shu* was used as a generic term for legumes rather than a specific term for soybeans. The modern term for soybean is *ta tou*, 'greater bean,' a term which first appears in the -1st century *Fan Sheng-Chih Shu.* In classical times the term *tou* was applied only to a type of 'wooden vessel or dish containing flesh sauces at sacrifices or feasts' (Bretschneider 1882, vol. II, p. 162), but by Han times it seems that it was also used as a general term for pulse crops, as it still is today.

"Whether or not the unqualified term *shu* in early texts and inscriptions should be understood to refer to soybeans or to legumes in general, there is no doubt that the soybean was domesticated in China some time around the beginning of the Chou, for texts describing -7th-century events refer to soybeans (*jung shu*) as novel introductions to the Central States, whereas by the time of Mencius [Meng tzu, c. 371-c. 289 B.C.] they had already become a staple food of the common people (Footnote: P.T. Ho 1975, p. 79).

"The presumed wild ancestor of the soybean, *Glycine ussuriensis* Regel & Maack or *G. soja* L. is native to northeast China and the adjacent areas of Manchuria, Korea, and Japan (Footnote: Hymowitz 1970, 1976), and it may be significant that the cultivated soybean was called *jung shu* for Jung was the name commonly given to the Tungusic tribes of Northeast China in Chou times. The *Kuan Tzu* states that in the -7th century Duke Huan of Ch'i (Footnote: Ch'i covered most of modern Shantung) led an expedition to the territory of the Mountain Jung and brought back 'winter onions and soybeans (*jung shu*) for dissemination throughout the various states' (P.T. Ho 1975, p. 78)."

An alternative interpretation of *jung* and of its (then) homophone *jen* is that it simply meant large and luxuriant (Bretschneider 1882, vol. 2, p. 164), for the soybean is a large, bushy plant which grows up to 6 feet tall. Its modern name of *ta tou* can be attributed to its growth habit, and not to the size of its beans which are only about as big as a lentil. Fig. 238 (*Shou Shih T'ung K'ao*, 1742) shows an illustration of a soy bean plant.

"The soybean's rapid conquest of Chou China is a tribute to its superior qualities, qualities so outstanding that they frequently provoke outbursts of surprising lyricism in modern writers: 'that miracle, that noblest of crops, that wondrous plant, the soybean' (Anderson & Anderson 1977, p. 346)."

The ancient Chinese were more moderate in their praise, perhaps because they were unaware of the benefits of modern nutritional analysis. The chief virtues of the soybean for the ancient Chinese "were that it produced good crops even on poor land, that it did not deplete the soil, and that it guaranteed yields even in poor years, so that it made a useful famine crop." (p. 514). It gave 3-4 times the yield of millet. The *Fan Sheng-Chih Shu* says that in former times (presumably the late Chou) it was customary for peasants to plant 5 *mu* per capita of soybeans to guard against famine. Soybeans were widely grown in China from Chou times on, "but they were not held in high esteem for their gastronomic qualities." The Chinese appreciated soybeans most when they were fermented to make sauces (*jiang*) or relishes (*shi*), or transformed into beancurd (*doufu*). These foods were generally made from yellow soybeans, although the *Qimin Yaoshu* (544 CE) recommends black soybeans. The various fermentation processes were discovered in early times; they improved the soybean's palatability and its nutritional properties (p. 514). Address: Research Fellow, East Asian History of Science Library, Cambridge, England.

1120. Brennan, Jennifer. 1984. The cuisines of Asia: nine great oriental cuisines by technique. New York, NY: St. Martin's Press. ix + 542 p. Illust. (line drawings). Index. 24 cm.

• ***Summary:*** The "Nine great Oriental cuisines" are those of "China, India, Indonesia, Japan, Korea, Malaysia, The Philippines, Thailand, Vietnam" (as stated on the book's cover). The book contains many recipes, yet it is largely organized into chapters by cooking techniques: barbecuing, steaming, stir-frying / using a wok, deep-frying, etc.

The chapter on "Japan" discusses soybeans, miso, tofu, and shoyu on pages 44-45. Soyfoods are said to be the 2nd largest source of protein in the Japanese diet.

The section on "Soybeans" (p. 97-104) includes a discussion of the names of various soyfoods in different Asian languages and countries. For example: "The basic bean curd is called *tau-fu* in Cantonese, *tau-hu* in Hokkien, and *tofu* in Japanese." Or consider this (p. 99): "During the basic process of making bean curd, at the stage where the bean and water mixture is boiled, a skin or residue forms on the top. This skin [yuba] is skimmed off and dried. It is commercially available in sheets... and in the form of sticks that bear the picturesque name of 'second bamboo' [dried yuba sticks] in Chinese, meaning that they are the second residue from the curd."

There follows a 3-page table titled "Soybean products" (p. 101-03) which has four columns: Description, Chinese name [Cantonese], Japanese name, comments.

Note: Before proceeding, we believe that the design of

© Copyright Soyinfo Center 2021

this table is fundamentally flawed. (1) Why are the names of the basic soyfoods not given in the other languages with which this book is concerned, including Mandarin Chinese, Korean, Indonesian, Vietnamese, Filipino, etc.? (3) Why is no English name given for each basic soyfood product? Sometimes the description is the English name, yet that name is rarely the name a person would use if they were selling the product in an English-speaking country. (3) Why are so many common "soybean products" omitted from this table, such as the various basic other types of Japanese miso and of Japanese shoyu (besides koikuchi shoyu), fermented black soybeans (douchi, dow see), soymilk, soy sprouts, roasted soy flour, whole soy flour, soybean oil, textured vegetable protein, etc. These problems are easily solved with alternate table designs. For example, have one table for each language, with the name of each soyfood product given first in English and then in the language of that country. Put the description and comments in a glossary to avoid repetition. Or, have a glossary entry for each soyfood, with the English name, description, comments.

The table is divided into four basic types of soybean products. After each, we will give the Cantonese name and then the Japanese name, and we will indicate disagreements using [sic]. NL = Not listed.

(1) Bean curd: Tau fu fu [sic] = kinugoshi tofu. Tau fu = momen tofu. NL = yaki tofu [sic, yaki-dofu]. NL = koya tofu or kori tofu [sic, koya-dofu or kori-dofu]. Tau fu pok = abura age. Fu chu = yuba [sic, fu chu is dried yuba sticks. Yuba in Mandarin is doufu pi]. fu joke [sic, fu jook] (bean curd sticks) = NL. Tim joke [sic, tiem jook] (sweet bean curd sticks) = NL. tau fu kon [Mandarin: doufu gan; pressed tofu].

(2) Soy sauce: Light = chan ch'an or sang chu = usu kuchi shoyu [sic, not the same]. Dark, medium = see yu chan yan = shoyu [sic, see yu is soy nugget sauce, not made in Japan. Japanese shoyu is not traditionally made in China]. Dark, heavy, sweet = chu yan = NL.

(3) Fermented bean pastes and cheeses. Black bean paste = dau see tau ch'ih = NL. Sweet, white bean paste = NL = shiro miso. White soy cheese [fermented tofu, should be classified under tofu] = pai doufu-ru or foo yee or foo yu = NL. Red soybean paste = NL = aka miso. Red soy cheese or spiced red bean curd = hung doufu-ru or nom yee or nam yu.

(3) Miscellaneous soybean productions. Soy jam = yun shi jeung = NL. Whole fermented soybeans = NL = nato [sic, natto]. Red bean sauce = saang see jeung = NL. Soybeans and malted rice = NL = moromi miso. Hoisin sauce = hoisin = NL.

In the "Basic recipes" section is a recipe for Indonesian dark sweet soy sauce (*ketjap manis*).

The Glossary (p. 499-515) contains the following soy-related entries: "Bean Curd (*tofu*, Japanese; *tao foo*, Chinese; *tahu*, Indonesian and Thai; *tokwa*, Philippines): A curdled, soft, cheeselike preparation made from soybean milk. Used as a source of protein in Asian cooking. Available loose or in packages."

Bean paste, red sweet [from azuki beans]. "Substitute Chinese sweet red bean paste, p. 132."

Bean paste, yellow (Chinese).

"Beans, black salted fermented. (Called dow see in Chinese) These are very salty soybeans, sold in cans in Chinese markets. Used with garlic as a flavoring for fish and pork dishes. substitute: Soybeans, cooked until soft and seasoned with plenty of soy sauce."

Bean sprouts: Usually refers to mung bean sprouts, "although alfalfa and soybean sprouts are also used."

Hoisin sauce: Soybeans are a major ingredient, along with garlic, chili peppers, and various other spices and ingredients.

Miso. Oyster sauce: "A Chinese sauce, made from oysters cooked in soy sauce and brine." Used as a seasoning with cooked foods and as a table sauce. See recipe p. 146.

Red bean sauce: "A strong table sauce made from mashed soybeans." Available in cans from Chinese stores.

Soy sauce

Also contains entries for: Kombu. Monosodium glutamate (MSG; "I do not use it nor do I recommend its use"). Mung beans.

The index contains 28 entries for soybean, 22 for soy sauce, 14 for miso, 6 for bean paste, oyster sauce, teriyaki, 4 for bean curd–deep fried, hoisin sauce, vegetarian dishes, 2 for ketjap, and 1 each for beans–black salted fermented, bean curd–fermented, jam–soy, jang (see miso), milk–soybean, ragi, shoyu (see soy sauce), soybean oil, sukiyaki, tahu, tau-fu or tau-hu (see bean curd), tempe [tempeh], textured vegetable protein (TVP), tofu (see bean curd), tou shih [fermented black soybeans],

About the author (from the back cover): "Jennifer Brennan grew up in Pakistan and India and has spent many years in Southeast Asia. She is the author of *The Original Thai Cookbook.*" She is "Winner of the IACP [International Association of Culinary Professionals] Award for the Best Literary Food Writing."

1121. *Korea Soybean Digest* (*Hankuk Kong Yeonguhoegi*). 1984--. Serial/periodical. Miryang, Korea: Korean Soybean Society. Vol. 1 Nov. 1940. Annual. Kor.

• ***Summary:*** Letter from Cheryl-Ho Lee (2017 Aug. 1): Concerning the *Hankuk Kong Yeonguhoeji* (Korean Soybean Digest) What organization publishes it? Korea Soybean Society (*Hankuk Kong Yeonguhoe*)

Where is it published? Miryang, Korea.

How often is it published? Once in a year.

How many pages in a typical issue this year? Around 100 pages.

When was the first issue published–year and month if possible? The Society was founded in March 1984. Last year issue was volume 33.

Are ALL of the articles in Korean? Yes, mostly.

© Copyright Soyinfo Center 2021

What is the main purpose of the magazine? It covers all areas including history, scientific findings, cultivation technologies and utilization of soybean.

Prof. Moon Gap-soon is representing the Korea Soybean Society. If you have further questions on the Society, please contact her (fdsmoon@inje.ac.kr).

1122. **Product Name:** Hard Tofu: Soy Bean Curd.
**Manufacturer's Name:** Mon Soon Food Products, Inc.
**Manufacturer's Address:** 154 Mott St., New York, NY 10013. Phone: (212) 226-7600.
**Date of Introduction:** 1984?
**Ingredients:** Soybeans, water, calcium sulfate.
**Wt/Vol., Packaging, Price:** 16 oz (1 lb) 454 gm.
**How Stored:** Refrigerated.
**New Product–Documentation:** Label. Undated. 5.25 by 4.25 inches. Printed red on clear film. Chinese and Korean characters also on label.

1123. Kim, Yong Kook; Roh, J.K. 1985. [Detection of aflatoxins in soybean food by HPLC]. *Korean J. of Food Science and Technology.* 17(4):295-303. Jan. [24 ref. Kor; eng]
• ***Summary:*** "HPLC was used in determining amount of aflatoxins in the commercially manufactured soybean food and home-made Meju. Aflatoxin producing abilities of strains used in the industrially fermented soybean food were also studied with the HPLC technique. Although aflatoxin-like substances were detected in a few samples on TLC, they were not identified with the HPLC retention times of standard aflatoxins. The commercial fungal strains used in Korea had no aflatoxin producing abilities." Address: Korea Research Inst. of Bioscience and Biotechnology (KRIBB).

1124. Kwon, S.H. 1985. [Origin of the soybean]. *Korea Soybean Digest* 2(1):4-8. Jan. [17 ref. Kor]
• ***Summary:*** Page 7: So far we have guessed that the history of Korean soybean cultivation was about 200-300 B.C. Also, Dr. Kwon, in 1972 thought the soybean was cultivated in about 5-4 B.C. However, with various other science developments, the history changed. Many historians thought the history of soybean cultivation began about 2000 to 1,500 B.C. At least 1,500 B.C. Dr. Kwon's opinion is that soybean cultivation began about 2000-1,500 B.C. with the beginning of Korean agriculture, which is based on China soybean cultivation history about 2500 B.C.

Note: The Korean name of this periodical is *Han'guk k'ong yon'gu hoeji.* The Univ. of Illinois at Urbana, Funk ACES library has it. Call# 633.3405 HA. Owns v.11(1994) to v.33(2017); some issues missing during 2000-2003. It is not at NAL (USDA's National Agricultural Library; Beltsville, Maryland). Address: Seoul, South Korea.

1125. Sri Lanka Soybean Project. International Soybean Project (INTSOY). 1985. Soybean Utilization Workshop: Summary report. Urbana, Illinois: INTSOY. 15 p. Held 14-16 Jan. 1985 at Soyfoods Research Center, Gannoruwa, Peradeniya, Sri Lanka.
• ***Summary:*** The workshop was organized by the Sri Lanka Dept. of Agriculture, and INTSOY. Contents: Background. Workshop objectives. Highlights. Nutrition. Sociology. Appendix I: Participants (directory of 28 people from 13 countries, including Bangladesh, Egypt, India, Indonesia, Korea, Nepal, Pakistan, Philippines, Sri Lanka, Thailand, Vietnam, and Zambia). Appendix II: Instructors (all from Sri Lanka or INTSOY). Appendix III: Course schedule. Address: Urbana, Illinois.

1126. Sri Lanka Soybean Project; International Soybean Project (INTSOY). 1985. Sri Lanka Soybean Utilization Training Program and Workshop: Proceedings. 2 vols. Gannoruwa, Peradeniya, Sri Lanka. 525 p. Held 14-25 Jan. 1985 at Gannoruwa, Sri Lanka. No index. 28 cm.
• ***Summary:*** The proceedings of this interesting workshop exist only as an unpublished manuscript. The program was divided into the following segments, each with its own convenor: Introduction and history. Soybean production (C.N. Hittle). Production and marketing (N. Ranaweera). Training and publicity (S. Wijeygoonewareena). Nutrition (P. Soysa). Utilization (A. Nelson). Laboratory practicals–Production of soy-based foods at SFRC. Dry Zone tour to Agriculture Research Station and Rajasoya in Maha Illuppallama, Anuradhapura District farmer's field, Pelwehera seed production farm. Hill country tour. Commercial processing (L.S. Wei, T.D.W. Siriwardena). Home level processing (Ellen Jayawardena). Field tours: CARE Thriposha plant, oils and fats corporation plant (Seeduwa), U.N. Gunasekara plant, Forbes and Walker plant, Glaxo Ltd.

Contains a directory of instructors (25) and participants: 24 students came from 12 countries–Bangladesh, Egypt, India (4), Indonesia, Korea, Nepal (2), Nigeria (3), Pakistan, Philippines, Thailand (3), Vietnam (2), Zambia (4). Address: Sri Lanka.

1127. Young, L. Steven. 1985. Work with soy protein products by ADM and Central Soya, including soy ice creams and soy protein isolates (Three interviews). Conducted by William Shurtleff of Soyfoods Center, Jan. 9 and 16, Feb. 14. 7 p. transcript.
• ***Summary:*** ADM and Ralston Purina have approximately equal shares of the market for isolated soy proteins; there are no other major manufacturers. In 1984 approximate total use of isolates, with Tofutti as a major user, was 200,000 to 400,000 lb as delivered. Since only 2% of the soy ice cream mix is isolates, this translates into 10 to 20 million lb of mix. To convert this to gallons, figure 40-50% overrun, leading to 3 to 3.5 million gallons of nondairy frozen desserts.

© Copyright Soyinfo Center 2021

Why did Central Soya get out of the soy protein isolate business at the very time when they were the world leader with their line of Promine products? Probably because it was not profitable. When they got out, they literally handed the market over to Ralston Purina. They told their former customers to buy from Purina, and even which products to buy. This move made Purina's isolate business profitable. Prior to that, Purina was within a year of getting out of isolates. Address: ADM, Manger of Product Applications, Food Research Div., 1825 N. Laramie, Chicago, Illinois, 60639.

1128. Shurtleff, William; Aoyagi, Akiko. 1985. Tofutti & other soy ice creams: Non-dairy frozen dessert industry and market. 2 vols. Lafayette, California: Soyfoods Center. Vol. 1, 144 p. Vol. 2, 214 p. Index. Feb. 28 cm. [129 ref]
• ***Summary:*** The first study of the rapidly emerging soy ice cream market, based on historical principles. Contents: Volume I. 1. Introduction. 2. What are non-dairy frozen desserts? Standards, terminology, and labeling laws. 3. History of non-dairy frozen desserts. United States and Canada (1918–present), History of Tofu Time Inc. and Tofutti, East Asia (1936-), Europe (1946-), Third World countries (1970-), Australasia and the Middle East.

Pages 75-92, titled "The Tofutti Era and Tofutti Clones, contain histories and descriptions of four categories of non-dairy ice cream companies. Within each category, the companies are listed in the sequence that their products appeared: (1) Small soyfoods companies: Penguino's Inc. (New York), Green World (Idaho), Garden of Eatin' (California), Soy City Foods (Ontario, Canada), The Soy Shop (Georgia), Metta Tofu Co. (British Columbia, Canada), Island Spring (Washington state), Evolutionary Foods (Arizona), Midwest Tofu & Sprouts Co. (Nebraska), Cream of the Bean (Illinois). (2) Soyfoods companies that used a mixture of tofu or soymilk and soy protein isolates to make Tofutti-type products: Brightsong Light Foods (California), Farm Foods (Tennessee), White Wave (Colorado). (3) Dairy companies (or non-soyfoods companies) that launched Tofutti-style products: Presto Food Products (California), Colombo, Inc. (Massachusetts), Honey Hill Farms (California), Continental Yogurt (California), Gloria Vanderbilt / Frusen Gladje Ltd. (New York), Barricini Foods Inc. (New York), Parvelle Corp. (New York), Carvel Corp. (New York), Tuscan Dairy Farm (New Jersey), Golden Seal Riviera Ice Cream Co. (New York). (4) Innovative makers of non-dairy frozen desserts that are not soy-based: Olympus Industries (Washington, Yodolo), and Imagine Foods (Arkansas, Rice Dream).

4. The soy ice cream industry and market in the U.S. and worldwide. 5. Nutritional value of soy ice cream. 6. Directory of people, organizations, and publications connected with non-dairy frozen desserts. 7. Tofu standards and soy ice cream. 8. Technical information on soy ice cream production. Ingredients and sample ingredient listings; Formulas and processing techniques. 9. How to calculate the amount of tofu in a tofu ice cream. 10. Bibliography (129 entries). 11. Index. About The Soyfoods Center.

Volume II. Documents and Graphics Related to Soy Ice Cream. This volume contains early historical and current popular articles, product labels, posters, graphics, and corporate brochures. A rich source of information for marketing and product development, these also document the rapid growth of soy ice creams worldwide. The publication is not paginated. Contents: 12. Early history (1918-1969). 13. Farm Foods and Ice Bean (1974-). 14. Tofu Time and Tofutti (1980-). 15. Other Soy Ice Creams and General (1976-). 16. Technical information on soy ice cream production. This last section lists ingredients and recipes, and discusses regulations, labeling, production processes, and quality of soy-based frozen desserts–largely ice cream, but also popsicles, sherbets, custards, etc. Fermented or cultured soymilks are also discussed briefly.

As of Jan. 1998, both volumes are bound as one.

Note 1. This is the earliest document seen (Oct. 2001) that contains industry or market statistics for soy ice cream by geographical region.

Note 2. This is the earliest English-language document seen (Sept. 2013) that discusses the etymology of soy ice creams and non-dairy frozen desserts.

Note: The story of "The man who introduced David Mintz to tofu and soy ice cream: Pesach Lazaroff," does not appear in this book. The story was not uncovered until Oct. 1986. Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549.

1129. Byrne, Maureen. 1985. The future for soyfoods. The first European Soyfoods Workshop was held in Amsterdam by the American Soybean Association, and papers covered subjects from marketing to microbiological standards. *Food Manufacture* (*London*) 60(3):49, 51, 53. March.
• ***Summary:*** This workshop was held on 27-28 Sept. 1984 at the Krasnapolski Hotel, Amsterdam, the Netherlands–organized by the American Soybean Association. Gives a brief summary of each paper presented.

Contains an interesting full-page table (p. 51) in which Oriental soyfoods are classified into two types: Non-fermented and fermented. For each non-fermented food is given the local names, description, and uses. The non-fermented soyfoods are: Fresh green soybeans, soybean sprouts (huang tou ya, Chinese), soynuts (hueh huang tou, Chinese; iri-mame, Japanese), soymilk (tou chiang or tounai, Chinese; tonyu, Japanese; kongkuk, Korean), [roasted] soy flour (huang tou fen, Chinese), soy protein-lipid film (yuba, tou-fu-pi), soybean curd (tofu).

For each fermented soyfood is given the local names, organisms used, description, and uses.

The fermented soyfoods are: Soy sauce, miso, tempeh,

© Copyright Soyinfo Center 2021

natto, fermented tofu, and fermented black soybeans.

Soy sauce includes chiang-yu from China, shoyu from Japan, ketjap from Indonesia, kanjang from Korea, toyo and see-ieu from Southeast Asia.

Fermented black soybeans include tau-shih from China, tao-si from the Philippines, tau-cheo from Malaysia, tauco from Indonesia, and Hamanatto from Japan.

1130. **Product Name:** [Sahm Yook Soymilk (Plain)].
**Foreign Name:** Sahm Yook Dou Ru.
**Manufacturer's Name:** Sahm Yook Korean Foods.
**Manufacturer's Address:** 320 Panjeong-ri, Jiksan-myun, Chunwon-gun, Choongchungnam-do 333-810, South Korea.
**Date of Introduction:** 1985 April.
**Ingredients:** Soy milk, high fructose corn syrup, corn oil, rapeseed oil, salt.
**Wt/Vol., Packaging, Price:** 200 ml foil retort pouch (Doypack). Retails for 230 Won (6/90).
**How Stored:** Shelf stable; refrigerate after opening.
**New Product–Documentation:** Talk with Eric C. Fehlberg. 1990. March 8. The Seventh-day Adventist food company in South Korea, Sahm Yook Foods, now makes soymilk (only plain, no flavors) packaged in Tetra Brik cartons and foil Doypack (Doynpack). The company was established in about 1978, and it began to make soymilk in May 1985. After launching soymilk, the company began to grow dramatically, as that product grew. Last year they built a very large, new soymilk plant (based on Adventist technology) and they are now about the 2nd or 3rd largest soymilk maker in Korea.

Label (Foil retort pouch). Sent by Eric Fehlberg. 1990. May 24. 4 by 6.75 inches Red, yellow, dark green, and light green on silver. Front panel says "Soy Milk" and an illustration shows 3 yellow soybeans in a green pod. The back panel shows the package being immersed in boiling water or heated in a microwave oven. So this package is probably sold during the cold months.

Form filled out and label sent by C.Y. Yoon, General Manager, Sahmyook Korean Foods. 1990. June 23. Note that on the envelope the company name is printed Sahmyook Korean Foods, but the brand name is typed 4 times on the form as Sahm Yook. The address on the envelope is 320 Panjung Jiksan Chunwon Choongnam, Korea. The soy milk in a foil retort pouch was introduced in April 1985. The same product with the same ingredients was launched in a Tetra Brik carton in July 1987. All four of the company's soymilk products contain no sugar (sucrose), chemical flavorings, or preservatives.

A brief company history. In 1981 they purchased a 31,313 square meter plant to make foods using wheat gluten. In 1984 they installed a soymilk processing plant, then began to sell soymilk starting in April 1985. Concerning prices, there are 720 Won to 1 U.S. dollar. Thus the Tetra Brik soymilk (200 ml) retails for the equivalent of US$0.31.

Leaflet for Sahm Yook soymilk products (7.5 by 10 inches, color photo). 1990. Shows 5 packages of soymilk and a glass of soymilk surrounded by fresh green vegetables and mikan oranges.

1131. Park, Kun-Young; Lee, K.B. 1985. [Aflatoxin production by *Aspergillus parasiticus* NRRL 2999 in various varieties of soybeans]. *J. of the Korean Society of Food and Nutrition* 14(2):177-81. May. [18 ref. Kor; eng]
• ***Summary:*** "Aflatoxin production by *Aspergillus parasiticus* NRRL 2999 with two different levels of inoculum sizes ($10^2$ and $10^6$ spores) was studied on such varieties of soybeans produced in Korea as Bongeui, Hwang Keum, Jangbaek, Danyeop, Jangyeop and Namcheon. With the inoculum size of $10^2$ spores per 10 gm of soybeans, there were statistically difference ($p<0.05$) on the production of aflatoxins in the varieties of soybeans. The variety of Namcheon produced 7 times higher amount of aflatoxin B1 than that of Bongeui. The variety of Jangyeop produced the highest level of aflatoxin G1 among the varieties employed." Address: Dep. of Food and Nutrition, Pusan National Univ.

1132. **Product Name:** [Sahm Yook Soyalac (Plain Soymilk)].
**Foreign Name:** Sahm Yook Soyalac.
**Manufacturer's Name:** Sahm Yook Korean Foods.
**Manufacturer's Address:** 320 Panjeong-ri, Jiksan-myun, Chunwon-gun, Choongchungnam-do 333-810, South Korea.
**Date of Introduction:** 1985 June.
**Ingredients:** Soy milk, vegetable oil, glucose, high fructose corn syrup, salt.
**Wt/Vol., Packaging, Price:** 200 ml foil retort pouch (Doypack). Retails for 300 Won (6/90).
**How Stored:** Shelf stable; refrigerate after opening.
**New Product–Documentation:** Form filled out and label sent by C.Y. Yoon, General Manager, Sahmyook Korean Foods. 1990. June 23. The product was introduced in June 1985. Ingredients are listed in English.

Label (Foil retort pouch). Sent by C.Y. Yoon. 1990. June 23. 4 by 6.75 inches Red, yellow, dark green, and light green on silver. Front panel says "Soyalac" and an illustration shows 3 yellow soybeans in a green pod. The back panel shows the package being immersed in boiling water or heated in a microwave oven. So this package is probably sold during the cold months.

1133. Staudt, Joe. 1985. La Choy. *Horizons* (*Beatrice Grocery Group*). Summer. p. 1-7.
• ***Summary:*** In 1920 Wally Smith and Ilhan New, two friends from the University of Michigan, founded La Choy Foods in Detroit. Their first product was [mung] bean sprouts. In 1922 the business was incorporated as La Choy Food Products. The first La Choy-owned plant was built in Detroit in 1937. The Archbold, Ohio plant was built on its present site in 1942. The Company's long association with Beatrice started

© Copyright Soyinfo Center 2021

in 1943, when La Choy was bought by the Chicago-based company and became Beatrice's first non-dairy operation. The article does not state when La Choy introduced soy sauce. But in 1945 it came off the bottling line at 30 bottles/minutes; today it is 250 bottles/minutes. La Choy, which translates to "good vegetables," is and has been for some time the world's undisputed leader in Oriental foods. Address: Fullerton, California.

1134. Ostman, Eleanor. 1985. Public acquires a taste for tofu. Soybeans give business more than just desserts [Lee L. Lee, Tofulicious, and Eastern Foods Corp.]. *Morning Pioneer News Dispatch* (*St. Paul, Minnesota*). Sept. 15. p. 1G, 3G.
• ***Summary:*** Korean-born Lee L. Lee graduated in physics from Seoul National University and came to the Univ. of Minnesota to study accounting. He stayed to work for 11 years at Control Data Corporation's international accounting division, the last 5 as its manager. "He was clearly ahead of demand in 1978 when he started producing tofu in a tiny rented warehouse in Roseville [Minnesota]." During his years at CDC "he was also making tofu for First Oriental Foods in St. Paul, ultimately buying that company in 1982. His Eastern Foods Corp. began producing tofu part time a year before he left Control Data, with the assistance of venture capital investment from his former employer." CDC owns 30% of Eastern Foods. In 1979 he built his current quarters at 3235 E. Hennepin Ave.

"Though he kept producing tofu over the years while two other local competitors started and folded, Lee says he knew that 'I couldn't live and die with just one product.' His company began manufacturing won ton skins and egg roll wrappers. 'Within 18 months, we dominated the entire Midwest market for the skins,' said Lee.

"'In tofu, we are the leader in Minnesota, Wisconsin, Iowa, Michigan and Illinois. Our sales were growing 10 to 15 percent annually, but the base was so small to being with. The Minnesota market uses 300 cases of tofu a week; that's under $10,000 a month.' Total production weekly of tofu, skins and related products is up to 36,000 pounds weekly...

"Steve Schellhaass, formerly with Safeway Stores, was hired last year as vice president of manufacturing and product development, with a directive to find 'value-added' uses for tofu and the skins. Tofulicious is one result and Tofruit, resembling yogurt with fruit, is another. Available in health food stores, it soon may be released to regular retail channels under a co-packing arrangement. The company also has tofu salad dressing ready...

"Lee plans to make Eastern Foods a national company in 1986 and perhaps to go public in 1987. To speed national distribution, his company has contracted with JFC International, the distribution arm of Kikkoman soy sauce and the largest Oriental specialty distributor in the country."

A photo shows Lee L. Lee, founder and president of Eastern Foods Corp., holding a pint of Tofulicious. Address: Minnesota.

1135. **Product Name:** Tofulicious (Soy Ice Cream) [Dutch Chocolate Almond, Vanilla Almond Supreme, Piña Colada Royale, Triple Berry Delight, or Creamy Peanut Butter].
**Manufacturer's Name:** Eastern Foods Corp.
**Manufacturer's Address:** 3225 E. Hennepin Ave., Minneapolis, MN 55413.
**Date of Introduction:** 1985 September.
**How Stored:** Frozen.
**Nutrition:** Chocolate-Almond. Per 4 fl oz: Calories 160, carbohydrates 24 gm, protein 3 gm, fat 6 gm, sodium 50 mg.
**New Product–Documentation:** Dairy Record. 1985. Nov. p. 43. "A Taste of the Orient." Product development was partially supported by the Minnesota Soybean Growers Association. *Soybean Digest.* 1987. July. p. 4. Leaflet. 1986, undated. Tofulicious. Good taste that's good for you. Haumann. 1987. JAOCS. Oct. p. 1378. The product was developed by research coordinated by Univ. of Minnesota food scientist William Breene and funded by the Minnesota Soybean Research and Promotion Council; Calhoun Herald (Hardin, Illinois). 1988. Sept. 15. "Tofulicious available at Taviners." Midwest Gourmet Ventures, a new distributorship established by John and Caroll Bonn, is the exclusive distributor for Tofulicious, which is a kosher product and has an approved diabetic exchange of one and one half starches and one fat per 4 oz. serving.

1136. Jackobs, Joseph A.; Smyth, C.A.; Erickson, D.R. 1985. International soybean variety experiment: Tenth report of results, 1983. *INTSOY Series* No. 28. xiv + 113 p. Sept. (College of Agric., Univ. of Illinois at Urbana-Champaign).
• ***Summary:*** In the ISVEX trials, soybeans were tested in the following regions and countries (For the year 1983): Algeria, Argentina, Bangladesh, Bolivia, Burma, Cameroon, Chile, Colombia, Costa Rica, Cuba, Dominica, Ecuador, Egypt, El Salvador, Gabon, Gambia, Ghana, Guatemala, Guinea-Bissau, Honduras, Indonesia, Korea, Laos, Madagascar, Mali, Mexico, Morocco, Nepal, Pakistan, Paraguay, Peru, Philippines, Portugal, Puerto Rico, Saint Lucia, Senegal, Somalia, South Africa, Sri Lanka, Sudan, Thailand, Turkey, United States, Upper Volta, Venezuela, Yugoslavia, Zaire, Zambia, Zimbabwe.

(For the year 1982): Brazil, Burma, Cuba, Italy, Peru, Turkey, Zaire.

In Dominica, on 19 Nov. 1983, with Plenty Canada serving as the cooperator, 16 varieties of soybeans were planted at the Royal Botanical Gardens, Roseau. Jupiter gave the highest yield, 676.8 kg/ha.

1137. *Daily Leader* (*Stuttgart, Arkansas*). 1985. Teamwork: Researchers, marketers join forces to make Hartz efforts successful. Oct. 2. p. 4C. Insert.
• ***Summary:*** Genetic research and development of plant

© Copyright Soyinfo Center 2021

varieties today requires teamwork. Dan Lamberth, chief operating officer, says that Hartz is involved in a never-ending quest for excellence. The Plant Variety Protection Act of 1971, which protects a breeder's patent on a new variety for 17 years, set the stage for Hartz's current efforts. Until then, a plant breeder had no protection for his work and there was little incentive for private industry to develop research programs. Most plant breeding was done by state and federal government programs.

Since 1971 Hartz has developed nine varieties. "The main emphasis of Hartz Seed Company has been and remains the Southern soybean market... Hartz has also developed a program of food bean production for the Far East, which is an important, but not dominating, percentage of its business. Hartz 936X soybeans, grown in the United States and shipped to Japan and Korea, have been subject to substantial increases in sales during the past six to seven years... Hartz 936X soybeans have captured the best-quality, higher-priced natto market." Hartz is also involved in both farm management and real estate. A photo shows Dan Lamberth seated at his desk.

1138. Kim, J-P; Park, J-G; Lee, M-D; Han, M-D; Park, S-T.; Lee, B.H.; Jung, S.E. 1985. Co-carcinogenic effects of several Korean foods on gastric cancer induced by N-methyl-N'-nitro-N-nitrosoguanidine in rats. *Japanese J. of Surgery* 15(6):427-37. Nov. *

• ***Summary:*** "Thus, gastric carcinogenesis was enhanced by red pepper and a high salt diet, was inhibited by a maejoo [meju = Korean soybean koji] and ginseng diet and was not effected by vitamin A."

1139. Hong, E.H.; Kim, S.D.; Hwang, Y.H.; et al. 1985. [A new high yielding and disease resistant sprouting soybean variety, "Pangsakong"]. *Research Reports of The Rural Development Administration* 27(2):183-86. Dec. [Kor; eng]

• ***Summary:*** A new soybean variety, Pangsakong, was developed at the Crops Experiment Station, Rural Development Administration in Suweon in 1984. This variety was originally selected from gamma-ray treated mutants with CB27 at the Korea Atomic Energy Research Institute. One-hundred seed weight of the variety was about 12 grams which was approximate optimum seed size for bean-sprout purposes. The results of regional yield trials carried out at 13 locations throughout country from 1983 to 1984 indicated that the yield of Pangsakong was lower than currently recommended soybean varieties but 34% higher than that of local indigenous bean-sprout soybean varieties. Address: 1-3. Crops Exp. Station, Suwon, South Korea.

1140. Shanmugasundaram, S.; Toung, T.S.; Chen, Li-Fen. 1985. AVRDC Soybean Evaluation Trial (ASET): 1980-1981 first report of cooperator's results. Shanhua, Tainan, Taiwan: AVRDC. iv + 62 p. Dec. 28 cm.

• ***Summary:*** In 1980 soybean varieties were tested in India, Pakistan, Philippines, Taiwan, Guatemala, and Argentina. In 1981 they were tested in Upper Volta [Burkina Faso], Sudan, India, Indonesia, Korea, Malaysia, Philippines, Thailand, Guatemala, Nicaragua, and Argentina.

Note: This is the earliest document seen giving the results from the international network of AVRDC Soybean Evaluation Trial (ASET) cooperators from 1980-81. Address: Shanhua, Tainan, Taiwan.

1141. **Product Name:** [Lecithin].
**Manufacturer's Name:** Dong Bang Corporation.
**Manufacturer's Address:** 2, 4-Ka, Yangpyung-Dong, Yungdeungpo-ku, C.P.O. Box 3031, Seoul 150, South Korea.
**Date of Introduction:** 1985.
**New Product–Documentation:** Soya Bluebook. 1985. p. 79.

1142. **Product Name:** Soybean Sprouts.
**Manufacturer's Name:** Jack and the Beanstalk.
**Manufacturer's Address:** 401 Victor Way, Suite 16, Salinas, CA 93907. Phone: 408-422-8028.
**Date of Introduction:** 1985.
**Ingredients:** Soybeans.
**How Stored:** Refrigerated.
**New Product–Documentation:** Talk with Albert Park, owner. 1991. Feb. 1. The company, whose name has not changed, is now located at 401 Victor Way, Suite 16, Salinas, California 93907. The previous owner, Mr. Hun Kim, moved it to that location from Carmel Valley about 5 years ago. Both Mr. Kim and Mr. Park are Korean-Americans, The company now makes tofu, soymilk, and soybean sprouts. Mr. Kim introduced the soybean sprouts 5-6 years ago. It is not clear whether the company was located in Salinas or in the Carmel Valley when Mr. Kim started making soybean sprouts, but he would guess that he started in Salinas.

1143. Kim, Mi-Seong; Koh, M.S.; Kwon, T.Y. 1985. [Changes of nitrosamine-related compounds by salt concentration and nitrate content during the Korean native soysauce fermentation]. *Journal of the Korean Society of Food and Nutrition* 14(4):329-38. [35 ref. Kor; eng]

• ***Summary:*** "This study was undertaken in order to research formation of nitrosamine and its related compounds by salt concentration and nitrate content during Korean native soysauce fermentation. The results from measuring the changes of nitrite and dimethylamine content can be summarized as follows. As the nitrate content in used water was getting higher and the salt concentration was getting lower, the soysauce fermentation was abnormal. As the salt concentration was getting higher, the reduction of nitrate and formation of nitrite were delayed. But whether the nitrate content in used water was-higher or not, the nitrite was continuously remained. An addition of ascorbic acid

© Copyright Soyinfo Center 2021

restrained the reduction of nitrate, and simultaneously, it could eliminate the nitrite effectively. As the nitrate content in used water, was getting higher, the content of dimethylamine was getting lower. Nitrosodimethy-lamine was detected from 0 to 261.34 ppb." Address: Dep. of Home Economics, Chonnam Univ., Kwangju, Chollanam-Do, South Korea.

1144. Kim, Soo-Ho; Lee, H.J. 1985. [Characteristics of bitter peptides from a cheese and a soybean paste]. *Korean J. of Food Science and Technology* 17(4):276-82. [27 ref. Kor; eng]
• ***Summary:*** Bitter peptides were isolated from Mozzarella cheese and a soybean paste. Key amino acids were leucine, phenylalanine, proline, and valine. Address: Dep. of Food Science & Technology, Seoul National Univ., Suwon, South Korea.

1145. Lee, Jung-Sook; Kim, Y.B.; Ko, Y.T. 1985. [Flavor and volatile compounds of soy yogurt]. *Korean J. of Food Science and Technology* 17(1):51-53. [11 ref. Kor; eng]
• ***Summary:*** Soymilks were prepared from full fat or defatted soy flour, soy protein concentrate, and soy protein isolate. Each was fermented with *Lactobacillus acidophilus* to make a yogurt-like beverage. The flavor of the soy based products was rated inferior to that of a cow's milk product by a taste panel. The flavor of the product made with soy protein isolate was considered the best. Fermentation improved the flavor of the isolate-based yogurt, and reduced the volatiles n-hexanal and increased diacetyl in the concentrate and isolate yogurts. Address: Dep. of Food and Nutrition, Duksung Women's College, Seoul, South Korea.

1146. **Product Name:** [Won, Charm, and Young Soymilk].
**Manufacturer's Name:** Lotte Chilsung Beverage Co. Ltd.
**Manufacturer's Address:** Seorak Bokji Center, 5th Floor, 433 Shinsa-Dong, Kangnam-ku, Seoul, South Korea.
**Date of Introduction:** 1985.
**New Product–Documentation:** Soya Bluebook. 1985. p. 84; 1986. p. 103.

1147. Paik, I.S.; Lim, S.J.; Ko, Y.T. 1985. [Keeping quality of yoghurt beverage prepared from soy protein concentrate]. *Korean J. of Food Science and Technology* 17(1):45-50. [21 ref. Kor; eng]*
• ***Summary:*** A soy yogurt beverage was prepared by using *Lactobacillus acidophilus* to ferment a soy protein concentrate solution. The product was stored for up to 66 days at 5ºC and 25ºC. Significant sedimentation occurred during the first hour of storage, but was inhibited by stabilizers: by greater than 0.6% carboxymethyl cellulose, greater than 0.2% propylene glycol alginate, or greater than 0.05% sodium alginate. The beverage could be stored for up to 66 days at 5ºC without significant microbial change. Some samples were contaminated by fungi, which were greatly retarded by 0.005% potassium sorbate preservative. Address: Dep. of Food & Nutrition, Duksung Women's College, Seoul, South Korea.

1148. Park, Yong-Gone; Park, B.D.; Choi, K.S. 1985. [Changes of ultrastructure of tissues, characteristics of protein, and tofu yield with increased soybean soaking time]. *Journal of the Korean Society of Food and Nutrition* 14(4):381-86. [21 ref. Kor; eng]
• ***Summary:*** Tofu yield was increased from 45.0% to 55.4% when soaking time was increased from 5 to 24 hours. Address: Dep. of Food Science & Technology, Yeungnam Univ., Gyongsangbuk-do, South Korea.

1149. Sohn, Jung-Woo; Kim, W.J. 1985. [Some quality changes in soybean curd by addition of dried soymilk residue]. *Korean J. of Food Science and Technology* 17(6):522-25. [14 ref. Kor; eng]
• ***Summary:*** Dried okara (the residue from making soymilk) was added at up to 30% to the soybean water extract used to make tofu. As proportions of okara increased, volume and water holding capacity of the curd were reduced and penetration value increased. Sag value increased up to 20% residue, then decreased drastically to 30%. Overall physical and sensory attributes indicate that 10% residue inclusion would be acceptable. Address: Dep. of Food & Nutrition, Sook-Myung Women's Univ., Seoul, South Korea.

1150. Bhatnagar, P.S. 1985. Soybeans in India–Research and development. In: H.C. Srivastava, et al, eds. 1985. Oilseed Production: Constraints and Opportunities. New Delhi: Oxford & IBH Publishing Co. xix + 700 p. See p. 205-18. [11 ref]
• ***Summary:*** Contents: Introduction. Scope in India. Production potential. Soybean in India. Returns to farmers. Place in cropping systems. Research. Constraints and strategies. Acknowledgements.

Tables show: (1) Increase or decrease in total hectarage, mean yield, and total production of soybean in Asia in 1983 (base year 1974-76). Source: Shanmugasundaram 1984. After each country listed in the table are figures. The 1st is change in hectarage (1,000 ha), the 2nd is change in yield (kg/ha), and the 3rd is change in production (1,000 metric tons). Burma (6, 144, 8). China (900, 153, 2,133), India (610, 235, 623). Indonesia (-25, 64, 24). Iran (-2, 564, 26). Japan (55, 68, 87). Kampuchea [Cambodia] (-3, 0, -3). Korea DPR [north] (19, 227, 90). Korea Rep. [south] (-64, -7, -75). Laos (2, 206, 1). Malaysia (-, 171, -). Philippines (4, 347, 7). Sri Lanka (1, 12, 1). Taiwan (based on 1982 data) (-39, 12, -48). Thailand (22, -76, 13). Turkey (25, 497, 52). Vietnam (65, 526, 88). Asia–total (1,647, 141, 3,080). USA (4,334, -40, 6,659). Brazil (2,342, 125, 4,927). World (11,272, 49, 19,741).

(2) Oil yields of the mail oilseeds as field crops. Source: FAO Production Yearbook (1972). In total yield worldwide in 1,000 tones the ranking is: 1. Soybean 8,749. 2. Groundnut (in hulls) 5,066. 3. Cotton 4,339. 4. Sunflower 3,308. 5. Rapeseed 2,525. 6. Sesame 965. 7. Flax 964. 8. Castor 385. 9. Safflower (N). Yet in terms of oil yield in kg/ha, the top three are: 1. Sunflower 376. 2. Safflower 280. 3. Castor 278. And... 6. Soybean 216.

3. Estimated area potentially available for soybean in Madhya Pradesh and Uttar Pradesh. Source: Williams 1974.

4. Targetted and actual cultivation (ha) as well as production (tonnes) in India under the centrally sponsored scheme for soybean development, from 1978-79 to 1983-84. The soybean states are Madhya Pradesh, Uttar Pradesh, Karnataka, Bihar, Himchal Pradesh, Rajasthan, Gujarat.

5. Identified / released varieties of soybean for different agro-climatic zones. The four zones are: Northern hill zone. Northern plain zone. Central zone. Southern zone.

6. The salient production technology of soybean for different agro-climatic zones in India.

7. Performance of some promising advanced breeding lines of soybean developed in India. 8. Composition of defatted soy flour. Address: Project Co-ordinator, All India Co-ordinated Research Project on Soybean (ICAR), G.B. Pant Univ. of Agriculture and Technology, Pantnagar (Nainital), Uttar Pradesh, India.

1151. Dr. Chung's Foods Company, Ltd. 1985. Dr. Chung's Foods Company, Ltd. Seoul, South Korea. 8 p. [Eng; Kor]

• ***Summary:*** The title page reads: "Chung's Foods offers health: The nutrition of soymilk and the expertise to produce it. We developed the system for producing nutritious soymilk for the first time in Korea and patented the invention." The company's main soymilk product is Vegemil. Photos show: (1) Chai-Won Chung M.D., Chairman of Dr. Chung's Foods Co., Ltd. (2) Vegemil in 180 ml bottles and 200 ml Tetra Brik cartons. Choco Woorean is a newly developed type of health food made from a mixture of undiluted Vegemil soymilk and chocolate powder. Apple Woorean is a similar product made with apple juice instead of chocolate. The company has two soymilk plants, the first at Singal, and the second at Chung Joo. The latter is one of the largest and most modern in the world. The head office is in Seoul, Korea. Address: Seoul, South Korea.

1152. Harper, Judson M.; Jansen, G. Richard. 1985. Production of nutritious precooked foods in developing countries by low-cost extrusion technology. *Food Reviews International* 1(1):27-97. [53 ref]

• ***Summary:*** Contents: Introduction: Importance of weaning foods, centrally processed weaning foods, transition from imported to locally processed weaning foods. Manufacturing alternatives: Extrusion processing, roller drum drying process, spray drying process, baked products line, milling process, selection of alternative processes, production capacity range, capital costs, operating costs, type of weaning food product, type of packaging, local equipment, energy, skill requirements, sanitation requirements, summary. Capabilities and limitations of LECs: Characteristics of low-cost extrusion cookers, Brady extruder (M&N Distributors, Torrance, California; or CIATECH, Chihuahua, Mexico), Insta-Pro extruder (Div. of Triple "F" Feeds, Des Moines, Iowa), Anderson extruder (Cleveland, Ohio), summary of LEC characteristics. Cost associated with LEC plants: Elements of a LEC plant, plant costs, manufacturing costs, project planning and implementation, preliminary study, project implementation. Cereal/legume blends: Specifications, energy, protein, dietary fiber, vitamins and minerals, ingredients, storage stability, calorie density, protein quality evaluation (corn/soy blends, corn/sorghum blends with cottonseed), metabolic studies in human infants and preschool children (extruded corn/soy blends, extruded sorghum). Full-fat soy flour: Storage studies, protein nutritional value, rat growth evaluation, baking study, potential utility of extrusion processed full-fat soy flour. Applications in developing countries: Sri Lanka (1976, Thriposha). Costa Rica (1976, 1979, Frescorchata). Tanzania (May 1978, Lisha). Guyana (1979, Cerex). Mexico (CIATECH 1978, many products), other commercial applications (Pro-Nutre in San Jose, Costa Rica; Maisoy in Santa Cruz, Bolivia), miscellaneous developments (INCAP in Guatemala, Meals for Millions in Korea, PINFST in the Philippines, Thailand, Leche Arroz in Ecuador {an extruded mixture of ground broken rice and whole soy}). Technology transfer (Colorado State University). Discussion. Summary. Sources of funding for this publication.

Figures: (1) Graph of infant mortality rate vs. duration of breast feeding for 19 countries (mostly developing countries). In general, the longer the breast feeding, the greater the infant mortality. (2) Extruder, showing rotating screw which forces product through a discharge die. (3) Typical extrusion process for food production (from storage bin to packaging). (4) Schematic of roller drum drying process for food production. (5) Typical spray drying process for weaning food production. (6) Systematic of baking line to make biscuits. (7) Systematic of simple missing process. (8) Cross sectional schematic of Brady extruder. (9) Photo of Insta-Pro 500 extruder. (10) Anderson extruder showing braker bolts, water / steam injectors, and face cutter. (11) Diagram of sequential processing operations of a LEC processing plant. (12) PERT chart showing key steps in feasibility study to establish essential process parameters. (13) PERT chart showing steps necessary to complete a central processing facility for weaning foods. (14) Viscosity of uncooked or cooked gruels made from raw dehulled corn or dehulled corn extruded from a Brady extruder at 149ºC. (15) Inside Thriposha LEC plant (in Sri Lanka; LEC started in 1976). (16) Four labels of packaged Thriposha products.

© Copyright Soyinfo Center 2021

(17) Outside front of Costa Rica LEC plant. (18) Four packages of Lisha baby food (Tanzania). (19) Four plastic laminated bags used to package Cerex in Guyana.

Also contains 18 tables–many related to soy.

Note 1. The LEC project in Korea (p. 91) uses a lower capacity extruder (less than 100 kg/hour) designed by the Meals for Millions Foundation (MFM) and constructed by the Korean Institute of Science and Technology (KIST). This extruder is made from parts that are easily available and consists of a screw 6.35 cm in diameter and 63.5 cm long driven by 22.3 kW (30 HP) electrical motor. A nutritious snack has been made for the Wonseong County Comprehensive Nutrition Program using the MFM LEC (see Cheigh 1984).

Note 2. This is the earliest and only document seen (Jan. 2011) that mentions "Leche Arroz." It appears to be a beverage resembling a mixture of rice milk and soymilk, made from rice that might otherwise go to waste. Good idea! Address: Colorado State Univ., Fort Collins, Colorado.

1153. Hume, D.J.; Shanmugasundaram, S.; Beversdorf, W.D. 1985. Soyabean (*Glycine max* (L.) Merrill). In: R.J. Summerfield and E.H. Roberts, eds. 1985. Grain Legume Crops. London: Collins. xvi + 859 p. See p. 391-432. Illust. Index. 24 cm. [192 ref]

• ***Summary:*** Contents: Introduction: History, current status and future projections. Principal economic yield and uses of crop products. Principal farming systems. Botanical and agronomic features: Symbiotic nitrogen fixation potential. Principal limitations to production and yield: Developing countries, developed countries. Fertiliser requirements. Quality of seed constituents. Germplasm resources. Principal breeding strategies: Adaptation to new geographic areas, breeding methodology, breeding objectives, seed quality, pest and disease tolerances, current trends in soyabean breeding. Avenues of communication among researchers (INTSOY, AVDRC, IITA, FAO). Prospects for larger and more stable yields.

Tables: (1) Area (1000 ha), yield (kg per ha), and production (1000 tonnes) of soyabeans from 1969-71 to 1982. (2) Maturity durations and productivity potentials of soyabeans in selected countries. (3) *Glycine* species collections around the world. (4) Sources of resistance among soyabeans to selected insect pests. (5) Sources of resistance among soyabeans to selected diseases.

Table 9 shows that there are soybean germplasm collections in 15 countries. This table has 4 columns: Country, location (city), curator, and number of accessions. AVRDC in Taiwan has the largest germplasm collection in one location (10,400 accessions, Tainan), followed by USA (9,648, Illinois and Mississippi), India (4,000, Pantnagar; 1,800 Amravati), Japan (3,541, Tsukuba; 200, Morioka), USSR (3,000, Leningrad), China (3,000 Jilin; 3,000 Hubei; 2,930 Shadong [sic, Shandong {W.-G. Shantung}]; 2,500 Beijing; 960 Heilungjiang [Heilongjiang]). Also: Australia 400, France 500, Nigeria 1,300, Indonesia 600, South Korea 2,833, North Korea 300, South Africa 600, Sweden 1,200, and Thailand 1,686.

Most tropical soybean types are determinate. Address: 1&3. Univ. of Guelph, Dep. of Crop Science, Guelph, Ontario N1G 2W1, Canada; 2. Asian Vegetable Research and Development Centre (AVRDC), PO Box 42, Shanhua, Tainan 741, Taiwan, Republic of China.

1154. Juvik, Gail A.; Bernard, R.L.; Kauffman, H.E. 1985. Directory of germplasm collections. 1. II. Food legumes (Soyabean). Rome, Italy: International Board for Plant Genetic Resources. 53 p. Co-sponsored by INTSOY. [11 ref]

• ***Summary:*** Soybean germplasm collections worldwide are listed (with address and number of accessions) in the following countries: Argentina, Australia, Austria, Bangladesh, Bolivia, Brazil (2 collections), Bulgaria, Canada, China (14 collections), Taiwan (3), Colombia, Czechoslovakia (2), France (4), Germany (East), Germany (West), Greece, Hungary (2), India (8), Indonesia (3), Italy, Japan (5), Korea (South, 2), Malaysia, Nepal, Nigeria, Papua New Guinea, Paraguay, Philippines, Poland, Portugal, Romania, Spain, Sri Lanka, Thailand (2), Turkey, USSR, United Kingdom, USA (5), Uruguay, Venezuela, Vietnam (2), Yugoslavia, Zambia, Zimbabwe.

The world's largest soybean germplasm collections are as follows: AVRDC, Tainan, Taiwan (12,200 accessions), National Seed Storage Laboratory (NSSL), Fort Collins, Colorado, USA (10,880), Univ. of Illinois, Urbana, IL, USA (8,368), Jilin Academy of Agricultural Sciences, Jilin, China (4,800), N.I. Vavilov All-Union Institute of Plant Industry (VIR), Leningrad, Moscow (4,700), All-India Coordinated Research Project on Soybean, G.B. Pant Univ. of Agriculture and Technology, Pantnagar, India (4,022), Suweon, South Korea (4,020), Tsukuba, Japan (3,741). USDA, Stoneville, Mississippi, USA (3,000).

A world map (p. 9-10) shows (1) The sites of all soybean germplasm collections, (2) the range of ancient cultivation of the soyabean (East and Southeast Asia), (3) range of the wild soybean (Glycine soja; in China and Japan), and (4) range of perennial Glycine (Australia, Papua New Guinea, Philippines, Taiwan, Melanesia, and Micronesia).

This document is "Available free to developing countries, but restricted distribution to developed countries." Address: 1&3. INTSOY, Univ. of Illinois at Urbana-Champaign; 2. USDA-ARS, Dep. of Agronomy.

1155. Noh, Chin-hwa. 1985. Traditional Korean cooking: Snacks & basic side dishes. Elizabeth, New Jersey; Seoul Korea: Hollym Corporation. 78 p. Illust. (color). Index (general). Index of Korean recipe titles. 27 cm. [Eng; kor]

• ***Summary:*** This is an excellent cookbook of authentic Korean recipes, each with its Korean name (romanized

© Copyright Soyinfo Center 2021

and in Korean characters). Each recipe is accompanied by numerous useful color photos. The front matter contains an Introduction, Preparation tips, and 2 pages about the healthy Korean diet. Soy related recipes include: Soft bean curd soup (*Sundubutchigae,* p. 10). Seasoned fermented soybean soup (*Ch'onggukchangtchigae,* with 1 cake bean curd and 6-8 tablespoons seasoned fermented soybeans, p. 11 [ch'onggukchang is Korean style natto]). Royal soybean paste soup (*Kungjungdoenjangtchigae,* with 2 tablespoons soybean paste [Korean miso], p. 12). Bean curd casserole (*Tubu Chon-gol,* p. 13). Wrapped bean curd (*Tubussamtchim,* p. 15). Stuffed bean curd (*Tubusobagi,* p. 16). Steamed bean curd (*Tubuson,* p. 16-17). Bean curd in soy sauce (*Tubut'wigimjorim,* p. 18). Salted bean curd and beef (*Tubu Soemgogijorim,* p. 18). Salted beans (*K'ongjorim,* with 1 cup black beans plus soy sauce, sugar, sesame seeds, and sesame oil, p. 19). Cold cooked bean curd (*Tubu Naengch'ae,* p. 22). Bean sprout rice (*K'ongnamulpap,* with 2/3 lb. [soy] bean sprouts, p. 24). Dried radish strips in soy sauce (*Muumallaengijangatchi,* p. 54). Cucumbers in soy sauce (*Oijangatchi,* p. 55). Sesame leaves in soy sauce (*Kkaennipchangatchi,* p. 56). Todok in red sauce (*Todokchangatchi,* with 1 cup soy sauce, p. 56). Fermented soybean lumps (*Meju,* with 18 lb. dried yellow soybeans, p. 62-63). Soy sauce (*Kanjang,* homemade, p. 62-63). Soybean paste (*Toenjang,* homemade, p. 63). Red pepper paste (*Koch'ujang,* homemade, with 2 lb. fermented soybean powder, 6 lb glutinous rice powder, p. 64).

Note 1. This is the earliest English-language document seen (Jan. 2012) that uses the word "ch'onggukchang" to refer to Korean-style natto.

Note 2. This is the earliest English-language document seen (March 2009) that uses the word "Toenjang" to refer to Korean-style soybean paste (miso), or the word "Koch'ujang" to refer to Korean-style fermented red pepper and soybean paste (miso).

The useful Glossary (p. 73-75) contains definitions of: Bean curd (*tubu*). Beans, incl. yellow soybeans (*huink'ong*) which are used to make [soybean] sprouts (*k'ongnamul*), bean curd (*tubu*), soft bean curd (*sundubu*), bean paste (*toenjang*), fermented soybeans for making soy sauce (*meju*), seasoned fermented soybeans (*ch'onggukchang* [*Korean natto*]), soybean flour (*k'ongkaru*), soy sauce (*kanjang*).

Brown soybeans (*pamk'ong*–literally "chestnut beans") are a chestnut brown color and have a smooth chestnut-like texture when cooked.

Black soybeans (*komunk'ong*) are served as a side dish.

Mung beans (*noktu*), used to make mung bean sprouts (*sukchu namul*), etc. Red kidney beans [azuki] (*kangnamk'ong*).

Bean sprouts (*k'ongnamul*) may be grown at home or purchased in the vegetable section of most grocery stores. The large sprouts are from the yellow soybean; the smaller, more delicate sprouts are from the green mung bean.

"Soybean paste (*toenjang*) is a thick brown paste made from a mixture of mashed fermented soybean lumps [soybean koji] (left from making the soy sauce), powdered red pepper seeds and salt. It is used as a thickener for soups and stews and will keep well in the refrigerator.

"Soy sauce (*kanjang*) is a brownish-black salty liquid made by cooking fermented soybean cakes with water and salt. Each household in Korea used to make their own soy sauce in the spring; some still do. These are mild and add good flavor to most any food." Soy sauce is used in cooking and at the table. Japanese "soy sauce is less salty but sweeter than Korean soy sauce.

"Sweet red beans (*p'at*) are small and round and used widely in Korean confections. When cooked and mashed they are sweet and soft textured. This sweet bean puree [Japanese *an*] is used as filling in rice cakes [mochi] and also now in donuts and rolls."

The Glossary also mentions laver (*kim*), a sea vegetable called "nori" in Japan, that is widely used in recipes in this book. No other sea vegetables are mentioned. Address: Munhwa Cooking School.

1156. Noh, Chin-hwa. 1985. Practical Korean cooking. Elizabeth, New Jersey; Seoul Korea: Hollym International Corporation. 214 p. Illust. (color). Index. 27 cm.

• ***Summary:*** Although this cookbook of authentic Korean recipes contains more than twice as many pages as the author's *Traditional Korean Cooking* (214 vs. 78), many of the recipes and photos are identical, as is the front matter: Introduction, Preparation tips, and The Korean Diet. This book contains many more meat dishes.

Most of the soy-related recipes are the same, except there are many new recipes in which "soy sauce" is included in the title; many also contain meat. A complete list of these is given in the Index under "soy sauce." For example: Beef and bamboo shoot in soy sauce (p. 42). Chicken in soy sauce (p. 45). Deep-fried chicken in soy sauce (p. 46). Abalones in soy sauce (p. 104).

The following are recipes for basic soyfoods with many color photos–Page 196: Fermented soybean lumps (*meju;* soybean koji). Pages 196-97: Soy sauce (*kanjang*). Page 197: Soybean paste (*toenjang*). Page 198: Red pepper paste (*koch'ujang*).

Here is the recipe (with many photos) for making meju, then using it to make soy sauce (kanjang): Ingredients 18 lb. dried yellow soybeans

Method: 1. Wash the soybeans and soak them in water overnight; drain.

2. Boil the soybeans in water on high heat. When they come to a boil, reduce the heat and simmer until the soybeans are thoroughly cooked. Drain the soybeans and pound them to a fine pulp while still hot, etc. Too complex to follow. Address: Munhwa Cooking School.

1157. Ontario Soya-Bean Growers' Marketing Board. 1985. Soybeans: Nature's miracle–teaching unit (Portfolio). Chatham, Ontario, Canada: OSGMB. [1] + 33 p. Undated. 28 cm.
• ***Summary:*** This interesting portfolio of materials, with 33 numbered pages of inserts plus an unnumbered first page ("Introduction to teacher's unit"), is designed to teach children in Ontario, Canada, about the growth development of a soybean from seed to mature plant, soybean cultivation, soybean processing and products, the importance of soybeans to Ontario's economy, and the Ontario Soya-Bean Growers' Marketing Board.

Contents: Introduction to teacher's unit. 1. From seed to pod: A brief history of soybeans in Canada, biology of the soybean seed, its germination and seedling growth, soybean nodules and rhizobia bacteria, parts of a young soybean plant, reproductive stages from flowering to maturity, corn heat units, tillage, word scramble.

2. Soybeans–Nature's miracle: A brief history of soybean utilization, ways that soybeans are used, soy oil, meal and soyfoods, recipes, word search. 3. Imports and exports: Importance of soybeans to the economy of Canada and Ontario, how soybeans get to market, The Ontario Soya-Bean Growers' Marketing Board.

A table on page 20 shows "Soymeal consumption by Ontario's livestock and poultry." Hogs consume 45% of the total (the total is 503,000 tonnes), poultry 34%, dairy cattle 20%, and beef cattle 1%. Page 22 notes that the bulk of Ontario's soybean exports (77%) are sold to East Asia–especially Japan, Hong Kong, Singapore, Malaysia, Indonesia, and Korea. Soyfoods are listed and discussed in a positive way, with recipes for: Bran muffins (with soy flour and soy oil). Tofamole (tofu guacamole). Tofu fruit pudding. Tofu shake.

Note: This is the earliest English-language document seen (Dec. 2003) that contains the term "Tofu shake."

The three largest farm crops in Ontario in terms of total area are hay (1,050,000 ha), grain corn (902,000 ha), and soybeans (425,000 ha). Address: Chatham, ONT, Canada.

1158. Patterson, Glenn; Bray, Walter J.; Larson, Patricia Butzer. 1985. The puffing machine for quick cooking of cereals & legumes. Davis, California: Meals for Millions / Freedom from Hunger Foundation. 28 p. Illust. 22 cm.
• ***Summary:*** Contents: Introduction. Nutritional considerations. The puffing machine. Operating the puffing machine. Safety. Heating sources. Maintenance. Producing a good product. A puffed-food business. Conclusion.

Describes a small, hand-operated metal chamber that holds grain or legumes over an open fire, until the contents reach the right temperature to pop–or puff. Many photos and several drawings show the puffing machine.

Note: Single copies are available free of charge by writing the Foundation. Address: 1-2. PhD; 3. Editor. All: P.O. Box 2000, Davis, California 95617. Phone: (916) 758-6200.

1160. Yokotsuka, Tamotsu. 1985. Fermented protein foods in the Orient, with emphasis on shoyu and miso in Japan. In: B.J.B. Wood, ed. 1985. Microbiology of Fermented Foods. Vol. 1. Essex, England: Elsevier Science Publishing Co. xx + 371 + 14 p. See p. 197-247. [146 ref]
• ***Summary:*** This book chapter is very similar to Yokotsuka (1982), "Industrial application of proteinous fermented foods." However it contains some new, additional, and very interesting information, especially concerning history, on pages 198-209 as follows: Introductory definitions of enzymatic hydrolysis, *Aspergillus* molds, miso (whose per capita consumption in Japan is about half that of shoyu by weight), saké, mirin, amasaké. Table 1 shows "Per capita annual consumption of fermented foods prepared from *Aspergillus* moulds in Japan (1981)." Shoyu 10.1 litres. Miso 4.9 kg, sake 12.3 litres, mirin 0.6 litres, shochu 2.2 litres, rice vinegar 0.25 litres, (vinegar) 2.5 litres. Note: Beer 39.5 litres. Whiskey and other foreign alcoholic beverages 3.7 litres. Japanese population 117.85 million on 1 Oct. 1981.

Introduction (p. 197): There is a basic difference between the saccharification process used in Western countries and that of East Asia. In the West, the amylolytic enzymes that break down / hydrolyze starches into sugars are derived from malt, whereas in East Asia *Aspergillus* and *Rhizopus* molds have long been used as the source of these enzymes.

History: History of fermented proteinous foods in China: Chu (koji), chiang, shi or tou-shi [fermented black soybeans], chiang-yu (soysauce), shi-tche (the extracted juice of fermented black soybeans). History of shoyu and miso in Japan: Hishio, sho, soya or soy, miso or misho, tamari, miso-damari, tare-miso and usudare, shoyu, miso of today.

Shu [Qu; koji] was first mentioned in the *Shu-Ching* [pinyin: *Shujing*] written 3,000 years ago during the Chou [Zhou] dynasty (1121-256 BC), which stated that chu is

© Copyright Soyinfo Center 2021

essential for making alcoholic beverages. Two different colors of chu were described: yellow and white. "The most popular one, which had a yellow colour indicating perhaps *Aspergillus oryzae,* was called yellow robe. The white one is presumed to be *Rhizopus* or *Mucor* and was called white robe." Originally, chu was made in granular form and called *san-chu.* But by about AD 947-79 chu was developed in cake form called *ping-chu.*

Page 205: The difference between tamari, miso-damari, tare-miso, and usudare was not always clear, however in early documents they generally refer to the liquid obtained during the fermentation of miso or *sho* [*hishio*]. "Literally, Tamari or Miso-damari, or Tare-miso" means the liquid separated from the top of miso. "or drained off from the bottom of the kegs in which the miso or sho was stored, or filtered into a bamboo cage which is put into miso or sho. But according to such books as the *Honcho-bunsho* (AD 1487), *Shijoryu-hochosho* (AD 1489) and others (AD 1504, 1537), Taremiso or Usudare seems to have been the name for the liquid drained off or press-filtered from the boiled mixture of miso or *sho* [*hishio*] and salt water." But the word *shoyu* (written with the same characters as *chiang-yu* [*jiangyou*] in Chinese) did not appear in any of these books.

Shoyu: The word "shoyu," written with the same Chinese characters with which it is written today [these characters are pronounced chiang-yu / jiangyou, and mean "soy sauce"] in Chinese, first appeared in the *Ekirinbon Setsuyoshu* (AD 1598). The word shoyu literally meant the liquid obtained from *sho / hishio.* However, to confuse matters, the liquid obtained from miso or tamari (soybean koji fermented in salt water) was also called "shoyu" in these early days. Moreover, in the book *Yoshu-fushi* (AD 1686) shoyu was defined as *shi-ju* (*shi-tche* in Chinese), the liquid obtained from salted, fermented black soybeans. In yet another book, shoyu was defined as wheat sho. All these descriptions suggest that the word "shoyu" had a broad meaning in the beginning, and only later acquired the more specific meaning it has today–the liquid obtained from the mash [moromi] in which a moulded mixture of soybeans and wheat or barley was fermented in water in the presence of salt water with a high salt concentration. This gradually became clearly differentiated from tamari or a shi-tche like product made almost entirely from soybeans [plus salt and water].

During Japan's Edo period (1603-1867), great progress was made in the technology of making shoyu, and the scale of its production was enlarged. Many books from this period describe the manufacture of shoyu: *Ryori monogatari yorozu kikigaku* (1643), *Yoshufushi* (1686), *Honcho shokukan* (1692), *Wakan sansaizue* (1715), *Mankin sangyo bukuri* (1731), *Zoshu seiho* (1716), *Sake shoyu denjuki* (1785), and *Koeki Kokusanko* (1844).

The following is a summary of what these books say about how typical Japanese shoyu (*koikuchi shoyu*) was made at that time–about 300 years ago. As basic raw materials use 1 part soybeans and one part wheat kernels or dehulled barley. Gradually it was recognized that wheat gave better quality shoyu than barley. Soak the soybeans, then boil them. Roast the wheat kernels or barley, then crack into pieces. Mix the two main ingredients well, then place them between straw mats or in wooden trays where they will be naturally inoculated and, after 2-3 days, cultured with molds. The mold cultured materials were called *koji,* a word written with the same character as its Chinese counterpart, *chu / qu.* Judge the quality of the finished koji by its color: white, yellow or brown are good, while blue or black are bad. This suggests that *Aspergillus oryzae* or *Aspergillus sojae* were already recognized as the best molds for making shoyu. Set aside a small portion of good koji to use as a starter culture for making the next batch of koji.

To make the moromi mash: Mix the koji made from a mixture of 1 part whole dry soybeans and 1 part wheat kernels with 2.2 parts of water and 1.1 parts of salt. Store this mash for about 70 days in summer or 100 days in winter. Summer was thought to be the best season for making koji and moromi. Amazake was sometimes added to the shoyu mash to add natural sweetness to the salty taste.

The total population of Japan at that time was about 30 million; of these about 1.2 million lived in Edo (today's Tokyo) and these Edo dwellers consumed much more shoyu per person per year than is the case today. One typical wooden keg of shoyu at that time contained 14.4 liters [3.80 gallons or 15.22 quarts] which was said to be enough to last one person one year (*Chohoroku* 1856, from *Shoyu-monogatari,* p. 5, written by N. Matsumoto, published by Kikkoman Shoyu Co. Ltd., 1976).

The two main centers of shoyu production in Japan were in Noda city and Choshi city, both of which were not far from Edo / Tokyo. Shoyu manufacture began in Noda and Choshi in 1561 and 1616, respectively. About 1.6 million kegs of shoyu were consumed in Edo, of which 1.5 million kegs were transported from the above two cities and the 0.1 million from places in Japan southwest of Tokyo, mainly Kishu [Wakayama prefecture], Tatsuno [a city in Hyogo prefecture, where light-colored shoyu {usukuchi shoyu} was invented in 1666], and Shodo-shima [an island in Kagawa prefecture in the Inland Sea of Japan]. Address: Kikkoman Corp., Noda-shi, Chiba-ken, Japan.

1161. **Product Name:** [Hong Kong Meal Vegetable Milk].
**Manufacturer's Address:** South Korea.
**Date of Introduction:** 1985?
**Wt/Vol., Packaging, Price:** Bottle.
**New Product–Documentation:** Color photo sent by Anders Lindner of STS. 1987. Nov. 14. 180 ml bottle with green lettering.

1162. **Product Name:** [Yuhanmil Vegetable Milk].

1163. La Choy. 1986. La Choy Kung Food Theatre. Unpublished typescript.
• ***Summary:*** The transcript of 30-second La Choy TV commercial. First aired on Jan. 20. The ugly villain in black is for Kikkoman. The good guy in white is for La Choy. The good guy says: "In a nationwide taste test my La Choy soy sauce beat your Kikkoman more than 2 to 1."

1164. Chung, Mr. 1986. Dr. Chung, Dr. Chung's Foods Company, and Vegemil in Korea (Interview). *SoyaScan Notes.* Feb. 9. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** The interviewee is Dr. Chung's nephew. Dr. Chung is a pediatrician (an M.D. in pediatrics) but he never went to high school or college. He originally developed soymilk for babies with allergy problems. Now he has 2 soymilk factories and about 1,000 employees. One plant is near Suwon (south of Seoul) and one is in Chongju (50 miles south of Seoul). He still teaches his employees, "You are the pioneers."

His Vegemil soymilk is by far the best selling brand in Korea. The flavors are plain, dairylike (lightly sweetened), with apple, and chocolate. Roughly 80% of his product is sold in soft drink bottles, 10% in Combibloc (which prints better than Tetra Brik cartons), and 10% in plastic pouches that have a shelf life of 2-3 days. Combibloc does not presently have FDA approval in the USA so these products cannot be exported to America. The second best selling soymilk in Korea is Sun-Dew, a distant second. Address: Seoul, South Korea.

1165. Chung, Won-Chul; Lee, T.S.; Nam, S.H. 1986. [Changes in free sugars of *Kochujangs* during aging]. *Korean J. of the Society for Applied Biological Chemistry* 29(1):16-21. March. [14 ref. Kor; eng]
• ***Summary:*** "Free sugars of Kochujang which were prepared with different starch sources, i.e., glutinous rice, polished barley, wheat flour and sweet potato, were investigated for three months of aging. Glucose was found in all tested samples during aging period and the content increased with time, particularly higher for glutinous rice while lower for sweet potato. Fructose also was found through aging period, its content increased for a month and decreased later. The data showed higher fructose content in the order of sources of sweet potato, wheat flour, polished barley and glutinous rice. Maltose and sucrose were detected only at the beginning of aging period and the content were less than 3.5% for maltose in all of samples and than 0.4% for sucrose with glutinous rice and wheat flour. Trace amount of rhamnose was detected in the Kochujang made from polished barley." Address: 1. Dep. of Food Science, Seoul Woman's Univ., Korea.

1166. Shon, Dong-Hwa; Lee, Hyong-Joo. 1986. [Stability of protein colloids in a mixture of cheese whey and soy milk]. *J. of the Korean Agricultural Chemical Society* 29(1):83-89. March. [23 ref. Kor; eng]
• ***Summary:*** Studies the parameters affecting the colloidal stability of whey and soybean proteins, characteristics of tofu-type gel formation, effects of heat treatment, and salt composition on colloidal stability, and effects of heat treatment on storage stability. In experimental types of tofu made from a mixture of whey and soymilk, calcium in the whey precipitated the soy proteins and disrupted gel formation, resulting in curds of poor texture. Numerous dialysis tests were conducted. Address: Dep. of Food Science & Technology, College of Agriculture, Seoul National Univ., Suwon, South Korea.

1167. St. Anthony, Neal. 1986. Tofulicious helps dish up healthy portion of market. *Star and Tribune* (*Minneapolis, Minnesota*). April 28.
• ***Summary:*** Leonard Lee, head of Eastern Foods, was born on 4 Sept. 1938 in Inchon, Korea. In 1979, armed with nearly $1 million commitment of venture capital from Control Data Corp., he resigned from his $36,000 a year job to devote full time to his tofu business. The company has high hopes for Tofulicious, a non-dairy ice cream, which sells for $1.79/pint, versus more than $2.00 for Tofutti and other competing brands. Lee owns 53% of his Eastern Foods Co., which employs about 40 people. Control Data owns 30%. Gives a history of his career: 1961 graduated from the national university in Seoul with a degree in physics; 1966 earned an accounting degree from Univ. of South Carolina; 1969 began to work for Control Data Corp.; 1971 opened an imported food store in Minneapolis, Minnesota; 1978 started making tofu; 1980 built a 16,000 square foot complex at 3235 E. Hennepin Ave. Address: Minnesota.

1168. Kwon, S.H. 1986. Daizu no hanashi [Talking about soybeans]. *Daizu Geppo* (*Soybean Monthly News*). April. p. 28-32. [11 ref. Jap]
• ***Summary:*** Includes an interesting history of soybean cultivation. Address: Seoul, South Korea.

1169. **Product Name:** [Sahm Yook Soy Cool (Plain Soymilk)].
**Foreign Name:** Sahm Yook Soy Cool.
**Manufacturer's Name:** Sahm Yook Korean Foods.
**Manufacturer's Address:** 320 Panjeong-ri, Jiksan-myun, Chunwon-gun, Choongchungnam-do 333-810, South Korea.

© Copyright Soyinfo Center 2021

**Date of Introduction:** 1986 May.
**Ingredients:** Soy milk, high fructose corn syrup, raw cream, salt, vitamin C.
**Wt/Vol., Packaging, Price:** 200 ml foil retort pouch (Doypack). Retails for 200 Won (6/90).
**How Stored:** Shelf stable; refrigerate after opening.
**New Product–Documentation:** Form filled out and label sent by C.Y. Yoon, General Manager, Sahmyook Korean Foods. 1990. June 23. The product was introduced in May 1986. Ingredients are listed in English.

Label (Foil retort pouch). Sent by C.Y. Yoon. 1990. June 23. 4 by 6.75 inches Red, yellow, dark green, and light green on silver. Front panel says "Soyalac" and an illustration shows 3 yellow soybeans in a green pod. The back panel shows the package being heated in a microwave oven. So this package is probably sold during the cold months. Note that this product contains dairy cream.

1170. Lynam, Frances. 1986. Happy birthday tofu, happy birthday tofu [David Mintz about to celebrate Tofutti's fifth birthday]. *Register* (*Shrewsbury, New Jersey*). June 25. p. 6B, 7B.
• ***Summary:*** "In 1971 Mintz read about tofu in a health magazine... For the next 10 years he spent all his free time creating Tofutti. 'It was a whole new world. It became an obsession.' Today more than 38,000 outlets in all 50 states carry the product. It is also sold in Canada, Australia, Korea, Hong Kong, and the U.S. Virgin Islands. Recently he developed an 'egg' without cholesterol called 'Eggwatchers' and a coffee whitener without milk."

1171. Kim, Hyung-Soo; Kim, Ze-Uook. 1986. [A study on the manufacturing of soysauce by the use of milled barley]. *J. of the Korean Agricultural Chemical Society* 29(2):107-15. June. [31 ref. Kor; eng]
• ***Summary:*** Investigated changes in and quality of soy sauce made by a new method, using a vinyl tent instead of a koji room and replacing the wheat in the koji with milled barley. Address: Dep. of Food Science & Technology, College of Agriculture, Seoul National Univ., Suwon, South Korea.

1172. **Product Name:** Tofu, Fried Tofu, Soymilk Curds, Soybean Sprouts, and Soymilk.
**Manufacturer's Name:** M.S.B. Food Enterprises, Inc.
**Manufacturer's Address:** 430 Casanova St., Bronx, NY 10474. Phone: (212) 617-6700.
**Date of Introduction:** 1986 June.
**How Stored:** Refrigerated.
**New Product–Documentation:** Order for tofu books from, then talk with Michael Lee, V.P. Gomé Tofu Inc. 1996. Nov. 14. His father, John Lee, a Korean-American, started M.S.B. Food Enterprises in 1986 in the Bronx to make different foods from soybeans using all natural processes. Their main products in 1986 were regular tofu, fried tofu, soymilk curds (*sun tubu*), soybean sprouts, mung bean sprouts, and a small amount of soymilk. In 1992 they introduced *doen jang* (pronounced TEN-jang, Korean Soybean Jang, like miso). MSB Food Enterprises is the parent company for a number of smaller companies, all of which make soyfoods. In 1995 they started a new division, Gomé Tofu Inc., to make tofu specially for the Caucasian American market. In December 1995 the company moved to a new address: 710 Longfellow Ave., Bronx, NY 10474. Phone: (718) 617-4105. The company's main market is still Korean-Americans in the tri-state area (New York, New Jersey, and Connecticut).

Form filled out and Label sent (faxed) by Mike Lee of M.S.B. Food Enterprises / Gômi Tofu. 1998. July 7. The address and phone number are unchanged from 1996. The company began making tofu in June 1986. One label is in Korean and the other in English. The text on the English label states: "Tofu–Original. Excellent meat substitute. More protein and calcium than meat or milk! New! Go natural... Its good for you! Gômi. Easily digestible. Cholesterol free. Low fat food. It blends in beautifully! Slice to fry or broil it. Dice it raw for salad. Mash or whip it to make an inspiring dish! No preservatives. All natural. Keep refrigerated. Change water daily after opening." Note: Gômi means "garbage" in Japanese.

1173. Gay, Julie. 1986. Farmfest visitors to get opportunity for a taste of Tofulicious [at Minnesota Soybean Growers Association]. *Agri News* (*Rochester, Minnesota*). July 31.
• ***Summary:*** The Minnesota Soybean Growers Assoc. will be offering a taste of Tofulicious frozen dessert. As many as 16 county soybean organizations are expected to participate and feature the Tofulicious at local events such as county fairs. The frozen dessert first appeared in the Twin Cities last summer. Address: Minnesota.

1174. Legler, Gretchen. 1986. Its tofu-mania. Soybean dessert treat is gaining popularity as ice cream alternative [Tofulicious from Eastern Foods Corp. in Minneapolis]. *AgWeek* (*Grand Forks, North Dakota*). Aug. 18.
• ***Summary:*** Jim Palmer, executive director of the Minnesota Soybean Growers Assoc., said the group sold 2,200 four-ounce cups of Tofulicious at the Farmfest. In the year that Eastern Foods has been making Tofulicious about 30,000 lb of tofu, soy oil, and soy protein isolate has been turned into 30,000 and 50,000 lb of the frozen treat.

"Korean soy [sauce] has a musty taste."

Note: This article appeared in the San Francisco Examiner (Sept. 3, p. 103).

1176. Lee, Cherl-Ho. 1986. Traditional food technologies and their recent developments in Korea. In: V.H. Potty, et al. eds. 1986. Traditional Foods: Some Products and Technologies. 292 p. See p. 178-90. Aug. Presented at the UN University Workshop on "Traditional Food Technologies: Their Development and Integrated Utilisation with Emerging Technologies." Held June 1983 at CFTRI, Mysore, India. [14 ref]

• ***Summary:*** The traditional Korean soybean fermentation technique is unique. Soybean is the only ingredient used, and sauce and paste are made simultaneously. In the first step of the fermentation, meju is made from cooked and mashed soybean balls, which contain no salt. Molds, mainly *Aspergillus oryzae,* grow on the surface of a meju ball, and bacteria, mainly *E.* [*sic, Bacillus*] *subtilis,* inhabit the inside of the ball. One part of meju, one part of salt, and 4 parts of water are mixed in earthen jars, and ripened for several months. The supernatant dark brown liquid of meju-brine mixture is soybean sauce and the brownish solid residue is soybean paste.

Kochujang, a mixture of fermented soybean paste and ground red pepper, is a unique food product available only in Korea; it reflects the hot spice preference of its people. It is prepared by mixing ground meju powder with steamed cereal flour, red pepper, salt and water and allowing further fermentation and ripening of the mixture in earthen jars for several months. Flowcharts are given for soy sauce, soy paste, and kochujang.

Under "Recent developments" (p. 187), the development of improved meju and meju-brine are discussed. Address: Dep. of Food Technology, Korea Univ., Seoul, Korea.

1177. Potty, V.H.; Shankar, J.V.; Ranganath, K.A.; et al. eds. 1986. Traditional foods: Some products and technologies. Mysore, India: Central Food Technological Research Inst. (CFTRI). 292 p. Aug. Papers presented at the UN University Workshop on "Traditional Food Technologies: Their Development and Integrated Utilisation with Emerging Technologies" held June 1983 at CFTRI, Mysore. 25 cm.

• ***Summary:*** This publication contains 27 papers presented by scientists from countries of Asia, Africa, Europe, and the Americas. Chapters related to soy are cited separately. The traditional foods of the following countries are discussed specifically: Ethiopia, Nigeria*, Sudan, Senegal, Pakistan*, India, Nepal*, Burma*, Thailand*, Malaysia*, Indonesia*, Philippines, Korea*, China*, Japan*, and Mexico*. Countries with foods related to soy are followed by an asterisk (*). Address: Central Food Technological Research Inst. (CFTRI), Mysore–570 013, India.

MEDICO programs in Vietnam, Laos, Kenya, Cambodia and Peru.'"

"As a living memorial to Dr. Dooley, MFM has pledged an additional 25,000 pounds of MPF to MEDICO." A photo shows Dr. Tom Dooley distributing Multi-Purpose Food at his hospital; he is holding one of the larger cans.

"Phase II: Technology and training.

"1970: 'Meals for Millions, a non-governmental foundation, is successfully utilizing free enterprise methods to help starving people throughout the world. Their educational program of self-help is one of the finest agencies in the humanitarian task of alleviating hunger.'–Governor [of California] Ronald Reagan.

"1976: MFM launches Korean Program. A comprehensive nutrition program in a very poor, rural part of Korea, Wonseong County, was launched by MFM in 1976."

"1979: Foods for Small Children. Fourteen village development workers from eleven Third World nations attended MFM June 1978 Training School focusing on 'Foods for Small Children.'" MFM has trained food technicians since 1967 at its Santa Monica laboratory and plant.

"Phase III: Education and expansion. 1981: Nutrition project planned for Thailand. 1982. African training program gets off to good start" in Kenya.

Note: Harlan H. Hobgood is president of Meals for Millions / Freedom from Hunger Foundation; his portrait photo is shown. The subtitle of these News Briefs is "Self-Help for a Hungry World." Address: P.O. Box 2000, Davis, California 95617.

1180. Rumney, Thomas. 1986. Soybeans: A new world supercrop. *Focus* 36:29-30. Fall.

• ***Summary:*** A map shows world soybean production in 1985. "The estimated value of 1982 U.S. [soybean] production was nearly $12.5 billion, with exports of soybeans and soybean products exceeding $3 billion." Also discusses the rapid growth in soybean production in Brazil, Argentina, and Paraguay. "In 1965, these three countries grew some 558,000 metric tons of soybeans (2% of world production); by 1985, that figure had increased to 23,050,000 metric tons (26% of the world's total)."

"As recently as 1969 India grew no soybeans, yet by 1985 the Indian output was 750,000 metric tons annually. Less spectacular, although quite substantial, are production increases in Taiwan, North and South Korea, Indonesia, and Malaysia." Address: State University College, Plattsburg, New York.

1181. Kozaki, Michio. 1986. Monsuun Ajia no hakkô shokuhin [The fermented foods of monsoon Asia]. In: Kô Aida, et al. eds. 1986. Proceedings of the Asian Symposium on Non-Salted Soybean Fermentation. Japan: Takeshima Shigeru. 319 p. See p. 5-8. Held July 1985 at Tsukuba, Japan. [Jap; eng]

• ***Summary:*** A general review, including many fermented foods not containing soy–but with some containing soy, such as soy sauce (toyo sarsa, si-iu, kecap, nuoc-tuong) and soy paste (Toyo pasta, tao-chieo, tauco). Natto, soy sauce, miso, and tempe are mentioned in Fig. 2, a map titled "Distribution of fermented soy bean foods in Asia." Address: Dep. of Agriculture, Tokyo Univ. of Agriculture.

1182. Yoshida, Shuji. 1986. Minzokugaku kara mita muen hakkô daizu to sono shûhen [The origin of non-salted fermented soybeans from the viewpoint of ethnology]. In: Kô Aida, et al. eds. 1986. Proceedings of the Asian Symposium on Non-Salted Soybean Fermentation. Japan: Takeshima Shigeru. 319 p. See p. 166-78. Held July 1985 at Tsukuba, Japan. English-language summary in Symposium Abstracts, p. 62-62. [20 ref. Jap]

• ***Summary:*** "Two of the earliest kinds of fermented soybeans were *shì* and *dòu-jiàng*. The former antedates the latter, because *shì* can be traced to the Han Dynasty (206 BC-A.D. 200), whereas *dòu-jiàng* does not emerge until the description in *Qimin Yaoshu* (A.D. 536-550). Good descriptions of *shì* and *dòu-jiàng* are given in *Qimin Yaoshu. Shì* is made as follows: A yellow mold is permitted to grow on boiled beans, which are then washed and wetted, after which they are fermented in a cellar for 10-12 days. *Shì* was eaten as a condiment.

"However, *shì* as a food would have appeared prior to *shì* as a condiment. *Sake* which was made from grain through mold fermentation, was originally not for drinking, but rather for eating. Such a primitive *Sake* is still used in Yúnnán. I suppose that a primitive *shì* also was eaten, and that the place of origin of *shì* was South China, according to the description in *Bencao Gangmu* (*shì* was commonly made in South China), and *Bówùzhì* (*shì* was exotic).

"*Dòu-jiàng*, which may have been first mentioned in *Bencao Gangmu* (1596), was a simple mold bean and was technologically more primitive than *shì*, although the existence of *dòu-jiàng* or a similar substance cannot be traced in the literature before *Qimin Yaoshu.* It seems that the first product of fermented beans would be *dòu-jiàng*, or a similar substance, and that its making would have been influenced by *sake* production. Later, *shì* as a food would have appeared and then *shì* as a condiment was produced, as we see from the *Qimin Yaoshu.*

"On the other hand, *dòu-jiàng* was developed from *ròu-jiáng*, preserved meat... *Natto*, *kinema* and *tempeh* would be identified as a substance similar to *dòu-jiàng*, which was a primitive fermented soybean product. Boiled beans became *dòu-jiàng* if they were covered by *Imperata cylindrica* grass, *kinema* if covered by certain leaves, *tempeh* if covered by leaves of *Hibiscus tiliaceus* or banana leaves, and *natto* if covered by ricestraw.

"We know that various kinds of plants are used for

© Copyright Soyinfo Center 2021

making *sake* or mold bran. The species used varies by place. Fermented soybeans occur within the *sake*-making area and only at the margin of the distribution. That means several new fermented soybean products like *shì* and *dòu-jiàng* were made in the center of the fermented soybean distribution, and the area gradually expanded toward the margins. They were accepted in areas close to the center, but the most primitive forms would have remained only in the marginal places, where new ones were not accepted."

A large chart (p. 169) shows the relatives and development of fermented black soybeans (*shi*)*;* it includes the names of various unsalted fermented soyfoods and soy condiments (with their geographical area in parentheses). Relatives (fermented soyfoods made from yellow soybeans): Akuni (Sema Naga, in the Himalayas in northeast India), kinema (Limbu, in eastern Nepal), pe-bout (Shan, in eastern Burma), itohiki natto (Japan), and tempeh (Indonesia). Stage 1. Itohiki natto became Chon Kujjiang [perhaps *chungkuk jang,* Korean-style natto] of the Zhanguo Warring States period (475-221 BC) in China. Stage 2A: Unsalted fermented black soybeans were originally used as a food, rather than as a seasoning. To these unsalted fermented black soybeans, koji was added to create homemade unsalted fermented black soybeans (*doushi,* of China), Stage 2B: Salt was added to the unsalted fermented black soybeans to make various salted foods (each with a firm texture like raisins): Daitokuji natto (Japan; with wheat flour added), *pe-ngapi* (upper Burma), and *seang* (Cambodia). Stage 3. Unsalted fermented black soybeans (*doushi*) developed into closely related danshi. Koji was added to danshi to make *rul-kre* (of Bhutan). Cooked soybeans were shaped into balls and fermented naturally to make miso-dama ("unsalted miso balls" [meju], Korea and Japan). Then salt was added to the miso-dama to make various seasonings (each with a consistency like applesauce or paste / miso): Korean soybean jang (*doen jang*), Korean soy sauce (*kan jang*), or soybean miso (*mamé miso,* Hatcho miso, Japan). Stage 4. Salt was added to unsalted fermented black soybeans (*shi*) to make salted fermented black soybeans, from which developed inyu (a fermented soy sauce made with black soy beans, in Taiwan), *inshi* (meaning unclear, of Taiwan), and taucho (*tauco,* of Indonesia). Stage 5. Koji was added to salted fermented black soybeans to make *shi* for food use, and *doushi* (of Sichuan, China). Stage 6. Flour was added to salted fermented black soybeans to make red pepper jang (*kochu jang,* Korea) and spicy fermented black soybeans (*doubanshi,* China).

Note: This chart may be easier to understand when viewed in chart form, however the logic and some of the products seem a bit unclear. It is also unclear which products are fermented with bacteria (like natto). Soyfoods Center has an English-language translation of this chart. Address: National Museum of Ethnology, Osaka (Kokuritsu Minzokugaku Hakubutsukan).

1183. Pie, J-E.; Paik, H.Y. 1986. [The effects of meat protein and soy protein on calcium metabolism in young adult Korean women]. *Korean J. of Nutrition* 19:32-40. [Kor; eng]*

• ***Summary:*** Despite similar dietary calcium intakes, a meat-based diet caused significantly higher urinary and fecal calcium excretion than a soy-based diet (urine: 127 vs. 88 mg/d; fecal: 467 vs. 284 mg/d).

1184. Bensky, Dan; Gamble, Andrew; Kaptchuk, Ted. comp. and trans. 1986. Chinese herbal medicine: Materia medica. Seattle, Washington: Eastland Press. xiv + 723 p. Illustrations adapted by Lilian Lai Bensky. Index. 29 cm. [1 ref]

• ***Summary:*** The soybean is discussed and illustrated on p. 61-62. The illustration shows several clusters of fresh soybean leaves, with flowers and pods. The pharmaceutical name of the preparation is Semen Sojae Preparatum Chinese: *dan dou chi.* Japanese: *tantôshi.* Korean: *tamdugo.* English: Prepared soybean. Properties: sweet, slightly bitter, cold or warm (depending on preparation). Channels entered: Lung, Stomach. Text in which first appeared: *Treasury of Words on the Materia Medica.* The soybean is also listed in "Major combinations" on p. 48 (with scallion or spring onion to treat chills or fever), and on p. 79 (with cape jasmine or gardenia fruit to treat deficiency irritability and insomnia resulting from lingering Heat disturbance in the chest).

Also discusses: Kudzu root–Radix Puerariae–*Pueraria lobata, P. omeiensis, or P. thomsanii* (p. 66-67).

Note: Ted Kaptchuk was born in 1947 and Andrew Gamble in 1946.

1185. Chung, Yong-kyu. 1986. The development of multi-cropping systems and soybean production in the Asian-Pacific region. In: S. Shanmugasundaram and E.W. Sulzberger, eds. 1986. Soybean in Tropical and Subtropical Cropping Systems. Shanhua, Taiwan: Asian Vegetable Research and Development Center. xv + 471 p. See p. 409-16. [10 ref]

• ***Summary:*** A major reason for slow production growth is the low net income. In U.S. dollars it was only $65/ha in Taiwan, but minus $100/ha in Japan and minus $200/ha in Korea.

"The need to develop multi-cropping systems for Asian and Pacific countries is widely recognized... Rice is the dominant crop in the region, and there may be a regional surplus by the late 1980s. Japan and Taiwan have already instituted rice reduction programs..."

"A case study in Korea revealed that the income elasticity for soybean demand, including induced demand, was 1.2851, while the value in relation to soybean used for human consumption was 9.8418... This means that a 10% increase in real per capita income will result in a 12.9% increase in aggregate soybean demand and an 8.4% increase

© Copyright Soyinfo Center 2021

in direct consumption."

"World soybean production increased by 5.7% per annum during the last decade... Soybean production in the Asian and Pacific region, however, increased at a rate of only 4.8% during this period. Japan and Korea had small production increases, mainly because of higher yields. Production in Taiwan decreased from 65,000 tonnes in 1970 to 26,000 tonnes in 1980."

"The prospects for soybean production in Taiwan, Japan, and Korea are poor considering recent decreases in production and strong price supports for other crops. The ratio of the farm household sale price to the imported price (1981) in Taiwan, Japan, and Korea was 1.7, 3.7, and 3.1, respectively. This was primarily due to differences in production costs. For example, the production cost for 10 kg of soybean in the USA (1979) was estimated at US $1.34 (Pan 1980) compared with U.S. $3.82 in Taiwan, and US $12.78 in Japan. A dramatic increase in soybean production in the region is therefore unlikely."

"Most governments in the region have already established strong price supports for soybean." Address: Agricultural Economist, Food and Fertilizer Technology Center for the Asian and Pacific Region, 5th Floor, 14 Wenchow St., Taipei, Taiwan.

1186. *Diversity.* 1986. University of Illinois geneticists Theodore Hymowitz and Richard Bernard, also with USDA, have developed soybean germplasm lines that could result in an estimated savings of between $100 and $500 million in processing costs. 9:40.

• ***Summary:*** The new lines, based on germplasm from Korea, lack the Kunitz trypsin inhibitor and do not require heating before feeding to swine and poultry. Address: Univ. of Illinois.

Berlin & Stuttgart: J. Cramer.) Previously published in 1981 in USDA Miscellaneous Publication FL-MS-333. [11 ref]

• ***Summary:*** Contents: Introduction. Positive factors for increased use of fermented foods. Trends in production of fermented foods. Factors that may effect the wider use of fermented foods in the West. Literature cited. Address: USDA/NRRC, 1815 N. University St., Peoria, Illinois 61604.

1188. Hwang, Y.H.; Hong, E.H.; Kim, S.D. 1986. Soybean-based cropping systems in Korea. In: S. Shanmugasundaram and E.W. Sulzberger, eds. 1986. Soybean in Tropical and Subtropical Cropping Systems. Shanhua, Taiwan: Asian Vegetable Research and Development Center. xv + 471 p. See p. 107-12. [16 ref]

• ***Summary:*** Contents: Introduction. Major soybean-based upland cropping systems: Monocultures, sequential cropping (crop rotation), intercropping (barley/soybean relay-intercropping, corn/soybean strip-intercropping, potato/soybean relay-intercropping, tobacco/soybean relay-intercropping), summer soybean, rice-bund soybean (approximately 15,000 ha/year of rice-bund soybeans are grown in Korea, equal to 7.3% of the country's total soybean acreage). Address: Crop Experiment Station, Office of Rural Development, Suwon 170, South Korea.

1189. Hyun, Peter. 1986. Man sei!: the making of a Korean American. Honolulu, Hawaii: University of Hawaii Press. xiii + 186 p. Plus 3 unnumbered pages of plates. Illust. No index. 22 cm.

• ***Summary:*** *Man sei!* means "Long live Korea." In this autobiographical sketch, the author describes what it was like growing up in occupied Korea under Japanese rule. "Peter was born in Hawaii in 1906, but grew up in Seoul, Korea, where his father, the Reverend Soon Hyun, was one of the leaders of the Korean independence movement struggling against Japanese colonial rule. In Seoul, at age 12, he took part in the nonviolent March First (1919) uprising for independence and freedom; a year later, he and his family escaped to join his father in Shanghai. There, his father and other patriots, established the Korean Provisional Government in Exile. When Peter was age 17 the family moved to Hawaii.

Page 142: He is discussing his life (at age 15) of hunger, poverty and cold in Nanking, China. "Whenever Umma sent me a little money, I would go to the store and buy a jar of preserved tofu–salted beancurd–which I would take with me to the dining room. When the Chinese students finished eating and the table had been picked clean, I would order my precious jar of salted tofu. And because there was always some left-over rice, I could sit alone and leisurely eat three more bowls of rice, spiced with tofu.

Page 31: In Korean, soybean sprouts are known as *kong-na-mul.*

Page 73: *Bee-bim-pap* is a traditional Korean dish made of rice mixed with marinated meat, bean sprouts, and pickled radish; it is "seasoned with soy sauce and sesame oil."

Page 89: They served us bowls of steaming rice gruel (*jook*) "with soy sauce and roasted peanuts in separate dishes."

"That was how I survived."

On the rear dust jacket is a photo of Peter Hyun and a brief biography. A longer biography appears on the next to last page, under "About the author." Address: Oxnard, California.

labels of more than 20 soymilk cartons sold in Korea. Address: Head, Food Science & Technology Lab., Korea Food Research Inst., P.O. Box 131, Cheongryang, Seoul, South Korea.

1191. Shanmugasundaram, S.; Sulzberger, E.W. eds. 1986. Soybean in tropical and subtropical cropping systems: Proceedings of a symposium, Tsukuba, Japan, 26 September–1 October 1983. Revised ed. Shanhua, Taiwan: Asian Vegetable Research and Development Center. xv + 471 p. Illust. Index. 26 cm. [500+ ref. Eng]
• ***Summary:*** Note: The first edition, hardcover, published Oct. 1985, was recalled and discarded, due to errors in the text. Contents: Section 1. Cropping systems. 2. Plant breeding. 3. Management. 4. Diseases and insects. 5. Plant nutrition. 6. Physiology. 7. Economics. 8. Related topics. 59 chapters total, most of which are cited separately. Symposium participants. Author index. Subject index.

In the Foreword, G.W. Sellek, Director General of AVRDC, notes that the proceedings of this symposium were published in two sections. The proceedings of the first section, recently published by the Tropical Agricultural Research Center of Japan (TARC), cover country reports and special research projects. These proceedings cover cropping systems. "In the recent past, research was aimed almost exclusively at raising soybean yields rather than developing cropping systems that provide the stability needed to grow soybeans under high-risk conditions. There also seems to be a greater sense of urgency to integrate cropping systems research with disciplines such as plant breeding, crop management, pest control, and plant nutrition." There is a strong "need to ensure that scientists from a variety of disciplines and backgrounds work together so that their research efforts are well coordinated." Address: AVRDC, Taiwan.

1192. Wang, H.L.; Hesseltine, C.W. 1986. Glossary of indigenous fermented foods. *Mycologia Memoir* No. 11. p. 317-44. Chap. 18. (C.W. Hesseltine and Hwa L. Wang, eds. Indigenous Fermented Food of Non-Western Origin. Berlin & Stuttgart: J. Cramer). [29 ref]
• ***Summary:*** The section titled "Fermented Legume Products" defines chao (Vietnamese fermented tofu), chiang-chu (Chinese koji), ch'ou-toufu and ch'ou-toufu-ru (fermented tofu), Damsuejang and doenjang (Korean miso), furu, sufu, hon-fan or red sufu (fermented tofu), in-shi ("Fermented black soybeans from China"), in-yu (Type of Chinese soy sauce made from black soybeans), kanjang (Korean soy sauce), kenima [sic, kinema], ketjap or kecap (Indonesian soy sauce from black soybeans), meitauza or mei-tou-cha (fermented okara), meju (maiju or maeju; Korean soybean koji), natto, oncom (onchom or oncom), see-iu (see-iew; Thai soy sauce made from whole soybeans); soy sauce, soybean paste, tahuri (tahuli; Filipino fermented tofu. See sufu), tao-chieo (tao-jiao; Thai miso), taohu-yi (Fermented tofu from Thailand. See sufu), taokoan, tempe (many types), thua-kab (dry thua-nao), thua-merk (wet and cooked thua-nao), thua-nao (Thai natto), tosufu (see sufu), toufu-ru (fermented tofu), tsue-fan (tsui-fan, chee fan; fermented tofu).

Note 1. This is the earliest English-language document seen (Nov. 2011) that contains the term "Fermented black soybeans from China," or that uses these terms to refer to *in-shi*.

Under "Fermented Cereal-Legume Products" we find: chiang, chiang-yu (chau-yu, Chinese soy sauce), fermented soybeans (fermented black soybeans), hamanatto, kochujang (kochu chang), miso, shoyu, tamari, taotjo (tao-tjo, tao dji; Fermented soybeans from Indonesia or Thailand [sic, No! *Tao-tjo* is Indonesian-style miso and *tao dji* are Indonesian fermented black soybeans]), tao-tjung or tou-chiang (chiang), tao-yu (tou-yu; Chinese soy sauce), tauco (taocho, taoco, taucho; Indonesian miso), tou-pan-chiang (Chinese fava bean miso), tou-shi (toushih; Chinese fermented black soybeans), toyo (Filipino soy sauce). Note 2. This is the earliest English-language document seen (March 2009) that uses the word "taocho" to refer to Indonesian-style miso.

Fermented Vegetable Products include: Chiang-tsai (chiang-tsay; Vegetables in China pickled in chiang or soy sauce or tien-mien-chiang), miso-zuke. Address: USDA/NRRC, 1815 N. University St., Peoria, Illinois 61604.

1195. Hammer, K.; Chan, Baik Mun. 1986? Variable landraces collected in Democratic People's Republic of Korea. *Plant Genetic Resources Newsletter* (*FAO/IBPGR*) No. 67. p. 19-21. Undated. [2 ref. Eng]
• ***Summary:*** "Within the framework of an agreement between the respective Academies of Sciences of the Democratic People's Republic of Korea and the German Democratic Republic, a joint mission for exploration and collection of crop genetic resources was conducted in Korea in 1985.

"The collecting work was concentrated in the area around Pyongyang City and covered neighbouring parts of southern Pyongan [sic] and northern Hwanghae Provinces. Collecting was also carried out in Kangwon Province near Wonsan and in Chagang Province near Guichon (Fig. 1)."

Six soybean plants were collected.

Figures: (1) A map shows the collecting route. (2) A photo of representative pulses collected during the mission.

Note: Democratic People's Republic of Korea is also known as North Korea. The German Democratic Republic (DDR) is also known as East Germany. Address: 1. Zentralinstitut fuer Genetik und Kulturpflanzenforschung der Akademie der Wissenschaften der DDR, DDR-4325, GDR.

1196. Probber, Jonathan. 1987. Food and fitness: Soy sauce and diet. *New York Times.* Jan. 21. p. C2.
• ***Summary:*** The Chinese invented soy sauce. The Japanese use a great deal of soy sauce, but theirs is "lighter than Chinese soy sauce." Many households in Korea still prepare their own soy sauce each fall.

There has been a proliferation of soy sauce brands in the USA. Old favorites such as Kikkoman and Ka-me [Kame], which are sold in supermarkets, are now also sold in lower-sodium versions. There is also a brand named Sushi Chef for those who like to make sushi at home.

Regardless of brand, soy sauces contain large amounts of sodium–even the "lite" versions. Kikkoman's "lite," for example, contains 160 milligrams per half teaspoon, which (multiplied by 6) translates into 960 milligrams per tablespoon.

For those on a low-sodium diet–which allows about 1,600 mg of sodium per day–the writer recommends a spray bottle dispenser, with the nozzle adjusted for a fine, misty spray.

1197. **Product Name:** Eastern Flavor Dim Sum or Pot Sticker (Stuffed Dumpling in Wonton Skin) [Vegetable, Shrimp, or Mushroom].
**Manufacturer's Name:** Eastern Foods Corp. (Distributor).
**Manufacturer's Address:** 3235 E. Hennepin Ave., Minneapolis, MN 55413.
**Date of Introduction:** 1987 January.
**Ingredients:** Vegetable: Wheat flour, soy bean protein [isolate], soy bean oil, soy bean curd (soy beans, water, calcium sulfate), green onion, onion, spinach, water, soy sauce, sesame oil, ginger, salt, black pepper. Note: Shrimp is same ingredients except shrimp is listed first.
**Wt/Vol., Packaging, Price:** 7.94 oz (225 gm). Package of 15 retails for $1.89 to $2.49.
**How Stored:** Frozen.
**New Product–Documentation:** Label. 1987. 6 by 9 inches. Gold, red, and blue on clear film. "Microwave Oriental Snack. Fully Cooked. Keep Frozen. Microwaves in 3 minutes. Vegetable Recipe." Talk with Mr. Lee. 1987. Nov. 11. Product was introduced in January 1987. It contains no okara and is now the company's main focus of energy.

1198. **Product Name:** Eastern Flavor Dim Sum or Powza (Stuffed Dumpling in Raised Round Dough) [Vegetable, Shrimp, or Mushroom].
**Manufacturer's Name:** Eastern Foods Corp. (Distributor).
**Manufacturer's Address:** 3235 E. Hennepin Ave., Minneapolis, MN 55413.
**Date of Introduction:** 1987 January.
**Ingredients:** Vegetable: Wheat flour, soy bean protein [isolate], soy bean oil, soy bean curd (soy beans, water, calcium sulfate), green onion, onion, spinach, water, soy sauce, sesame oil, ginger, garlic, salt, black pepper, yeast. Note: Shrimp is same ingredients but shrimp listed first.
**Wt/Vol., Packaging, Price:** 7.94 oz (225 gm). Package of 15 retails for $1.89 to $2.49.
**How Stored:** Frozen.
**New Product–Documentation:** Label. 1987. 6.5 inches square. Gold, red, and blue on clear film. "Microwave Oriental Snack. Fully Cooked. Keep Frozen. Microwaves in 3 minutes. Vegetable Recipe." Talk with Mr. Lee. 1987. Nov. 11. Product was introduced in January 1987. It contains no okara and is now the company's main focus of energy. Brochure. 1987. Percentage of households owning Microwaves: 1982 28%, 1987 65%, 1990 79% (Source: Amana study 1986). Dim Sum is grazing food.

1199. *Soybean Update.* 1987. Top officials of Korea's three soybean crushers are in the U.S. this week to buy soybeans. Feb. 23. p. 3.
• ***Summary:*** "Korea is one of the most rapidly developing soybean markets in Asia, purchasing 35.8 million bu of U.S. soybeans last year. That's up from 15.3 million bu in 1979, the year ASA (American Soybean Assoc.) opened its office in Seoul. Current Korean soymeal demand outpaces demand for soyoil... holding back a potential market for 11 million bu of U.S. soybeans. Whereas more than 98% of Korea's soybean needs are supplied by the U.S., the U.S. supplies less than 40% of Korea's soymeal requirements."

1200. *J. of the American Oil Chemists' Society.* 1987. Oilseeds outlook. Far East soy markets. 64(3):306, 308-09. March.

© Copyright Soyinfo Center 2021

• ***Summary:*** Mainly a discussion of the outlook in Japan. Last year China exported 280,000 metric tons (MT) of soybeans to Japan. ASA's Beijing office hopes to help China develop ways of using its own soybeans. Yet the USA can expect to continue to be the primary source of soybeans for Japan.

1201. Yanagida, Fujiharu. 1987. Traditional foods and their processing in Asia. Tokyo: NODAI Research Institute, Tokyo Univ. of Agriculture (Tokyo Nogyo Daigaku, Sogo Kenkyugo). vii + 235 p. Illust. No index. 26 cm. [50+ ref]
• ***Summary:*** "This volume was compiled from manuscripts presented at the seminar entitled "Seminar on Traditional Foods and Their Processing in Asia," which was held on November 13-15, 1986 at the Tokyo University of Agriculture, Japan." About 100 scientists from Japan, Indonesia, the Philippines, Thailand, Burma, Korea, Malaysia, Nepal, and Taiwan attended. The seminar was organized by NODAI Research Institute of Tokyo University of Agriculture. Address: Faculty of Agriculture, Gadjah Mada Univ., Indonesia.

1202. **Product Name:** Tofulicious Chocolate Covered Dessert Bars (Soy Ice Cream Novelties) [Dutch Chocolate, or Vanilla Almond].
**Manufacturer's Name:** Eastern Foods, Inc.
**Manufacturer's Address:** 3235 E. Hennepin Ave., Minneapolis, MN 55413.
**Date of Introduction:** 1987 May.
**Ingredients:** Vanilla Almond: Water, corn sweeteners, partially hydrogenated soybean oil, tofu (soybeans, water, calcium sulfate), isolated soybean protein, tapioca dextrin, natural flavors, calcium carbonate, microcrystalline cellulose (cellulose gel), cellulose gum, mono and diglycerides, carrageenan. Coating: Coconut oil, sugar, cocoa, cocoa (alkali treated), lecithin, vanillin.
**Wt/Vol., Packaging, Price:** 2.5 fluid oz bar, 10 fluid oz per package, in paperboard carton.
**How Stored:** Frozen.
**Nutrition:** Per 2.5 oz. bar: Calories 180, protein 2 gm, carbohydrate 16 gm, fat 12 gm, sodium 28 mg. 11% of RDA for calcium.
**New Product–Documentation:** Labels. 1987. Paper box. 2 by 4 by 7 inches. Full color. Four bars per box. "Non-Dairy Frozen Dessert. No Cholesterol & Lactose Free. Great Taste... That's Good for You." Kingma. 1987. Soya Newsletter. 1(3):10. Talk with Mr. Lee. The product was introduced in May 1987.

1203. Jacobs, Barbara; Jacobs, Leonard. 1987. Cooking with seitan: Delicious natural foods from whole grains. New York, NY: Japan Publications. 256 p. Foreword by Aveline Kushi. Index. 26 cm. [16 ref]
• ***Summary:*** "Seitan is cooked and flavored gluten that has been extracted from [high-gluten] wheat flour. It is very rich in protein, while being extremely low in fat and calories... The traditional Japanese way of seasoning seitan is to cook it in a broth using kombu sea vegetable, natural soy sauce, and fresh ginger root. This... is the one taken for granted as the 'standard seitan flavor' by commercial seitan makers and most people who are familiar with seitan. Many other mixtures of seasonings can be added to the basic seitan broth. Several earlier books on wheat gluten have been written, generally by Mormons.

This book offers you the history, nutritional information, a variety of preparation techniques, and hundreds of recipes that will allow you to convert wheat into a delicious and nutritious food. Especially suited for vegetarians who are interested in high-protein substitutes for animal foods.

Contents: Acknowledgments. Introduction: About wheat

All about saving and using wheat starch. 2. Storing uncooked seitan. Storing cooked seitan. 4. Commonly encountered problems and some solutions. Nutritional information. Questionnaire for readers. About our ingredients (discusses natural soy sauce, and soymilk). Glossary (includes fu [dried gluten], miso, natural soy sauce or shoyu, soymilk, tamari, tofu). Bibliography.

Recipes containing soyfoods include: Miso soup with fu and wakame (p. 79). Miso-lemon dressing (p. 171). Tangy miso-tahini sauce (p. 180). Tofu spread with variations (p. 181). Seitan-tofu paté (p. 181-82). Tofu "feta cheese" (p. 192-93). Miso-tahini sauce or spread (p. 209).

When Michio and Aveline Kushi started the Seventh Inn Restaurant in Boston in 1971, they introduced seitan, a food that George Ohsawa had popularized in Japan, especially among macrobiotic people. Yumie Kono taught the chefs, one of whom was Lenny Jacobs, how to make seitan (p. 5).

The Introduction (p. 17-18) states: "Seitan is a food with a long history. Although not widely known in the West, it was traditionally eaten in China, Korea, Japan, Russia, the Middle East, and probably many other countries that grew wheat. In America, the Mormons and the Seventh Day Adventists made gluten and used it on a regular basis... The name *seitan* comes to us from the Japanese, who have prepared cooked wheat gluten for hundreds of years... Some natural foods industry insiders think seitan will become the 'tofu of the '80s.'

"Seitan was introduced to the U.S. natural foods industry about sixteen years ago [1970] when a Japanese variety, shrink-wrapped and quite dry and salty, was first imported. There had been several other varieties available from vegetarian groups, primarily the Seventh Day Adventists and the Mormons. Chinese restaurants have also been preparing wheat gluten for many years. The Chinese call it *mien ching,* or *yu mien ching.* Chinese restaurants often refer to it as 'Buddha Food,' claiming that it was developed by Buddhist monks as a meat substitute. There is also a dried wheat gluten available in Oriental food markets called *fu* by the Japanese and *k'ao fu* or *kofu* by the Chinese."

In the USA, about 130,000 pounds of seitan are made each year. The market is growing rapidly. Current U.S. seitan manufacturers are: 1. Upcountry Seitan in Lenox, Massachusetts, the largest known producer in America, which makes about 600 lb/week and distributes it in 6 states. The company, started about 3½ years ago (counting from Jan. 1987, i.e. founded in about mid-1983) by Win Donovan, is now owned and operated by Wendy Rowe and Sandy Chianfoni. They get a yield of 1.33 (i.e. 90 pounds of flour result in 120 pounds of seitan). 2. Rising Tide Natural Market in Long Island, New York. Michael Vitti has been making seitan for 6 years. About 1/3 of his production is bought by another company for use in making sandwiches. 3. Grain Dance in San Francisco, California. Ron Harris has been making seitan for 8 years and is currently selling 250 lb/week in 8 oz. packages. 4. Creative Kitchens in Miami, Florida. Yaron Yemini has been making seitan for 3 years. and has seen a 5-fold increase during this time. He now makes 120 lb/week. His yield is 0.7. 5. The Bridge in Middletown, Massachusetts. The company was founded in March 1981 by Roberto Marrocchesi and Bill Spear. They were making seitan by Oct. 1982. Steve Lepenta now makes 400 lb of cooked seitan each week and claims that sales have doubled in the past two years. 6. Maritime Foods in Portland, Maine. Rosemary Whittaker makes 50 lb/week of seitan. 7. Real Foods of Towson, Maryland. Sharon Warren has been making seitan for 6 years and now makes 150 lb/week.

Reviewed by Linda Elliot in East West. June 1987, p. 94. Note: Talk with Lenny Jacobs. 1990. Sept. 10. There has been little growth in the U.S. seitan industry since the book was published in May 1987. Problems with price and quality. If seitan is frozen, after defrosting it can become spongy and soggy. Address: Massachusetts. Phone: 617-232-1000.

1204. Millon, Marc. 1987. They spend their weekends in search of bellflower, dropwort, sow's thistle and wild mushrooms. *Guardian* (*England*). June 12. p. 21.
• ***Summary:*** Many Koreans spend their weekends (especially in the spring) searching for these wild foods. A recipe for Bulgogi calls for "1/3 pint light soy sauce (such as Kikkoman)" in the marinade.

1205. Kim, Bok-Ran; Han, Y.B.; Park, C.H. 1987. [Changes of free sugar and free amino acid during the natto fermentation used by *Bacillus subtilis* S.N.U. 816]. *J. of the Korean Agricultural Chemical Society* 30(2):192-97. June. (Chem. Abst. 107:19743). [39 ref. Kor; eng]
• ***Summary:*** The free sugars examined were fructose, glucose, sucrose, and maltose. Remarkable increases in the levels of fructose and glucose were observed after 4 hours of fermentation. After that, however, their contents were reduced to a very low level as fermentation continued. The sucrose content dropped dramatically to about the 10% level and stayed low thereafter.

The free amino acid content of natto during 20 hours of fermentation was twice as high as that of unfermented soybeans.

Sensory evaluation showed that 20 hours of fermentation at 43ºC produced the best quality natto based on taste, odor and color.

1206. American Soybean Association. 1987. Soya Bluebook '87. St. Louis, Missouri: American Soybean Assoc. 270 p. July. Index (bold face type indicates advertiser). 22 cm.
• ***Summary:*** This is the last issue of the *Soya Bluebook* published by the American Soybean Association.

Contents: Organization: International associations, government trading agencies. Soy Directory: Oil extraction plants/refineries, manufacturers of edible grade soy products & soyfoods, manufacturers of industrial grade soy products. Soybean manufacturing support industries: Category listings, product handling equipment & supplies, soybean processing equipment & supplies, manufacturing services, alphabetical company listings. Marketing & auxiliary services: Marketing services, commercial services & suppliers, exporters of soybeans & soybean products, importers of soybeans & soybean products. Soy statistics: Metric conversions, tables, charts, graphs. Glossary. Standards and Specifications. Indexes: Alphabetical company listings, Soya Bluebook sections and categories, advertisers. Maps.

The section titled "Soy statistics (tables, charts, graphs) (p. 185-244) is a rich source of information, worldwide. Contents: Soybean production–Area planted / harvested and yield: U.S. soybean planting and harvesting dates. U.S. soybean acreage, yield, and production. U.S. soybean planted acreage by state. U.S. soybean harvested acreage by state. U.S. soybean yield by state. U.S. soybean production by state.

U.S. production of major crops: Soybeans, corn, wheat, cotton (graph). U.S. harvested acreage of major crops: Soybeans, corn, wheat, cotton (graph). U.S. yield per acre of major crops: Soybeans, corn, wheat, cotton (graph). Argentine soybean area, yield and production by province. Brazilian soybean area, yield and production by state. Canadian soybean production. Canadian soybean production and utilization.

Soybean production by major countries (graph). Share of world soybean production by major countries (graph). World soybean production. Soybean acreage by major countries (graph). Share of world soybean acreage by major countries (graph).

Soybeans and soybean products: Supply and disposition: U.S. soybeans: Supply, disposition, acreage / yield and price. U.S. soybean meal and oil: Supply and disposition. Soybean usage in the U.S. (graph). U.S. soybean exports–percent of total usage (graph). Argentine soybeans: Supply and disposition. Argentine soybean meal and oil: Supply and disposition. Brazilian soybeans: Supply and disposition. Brazilian soybean meal and oil: Supply and disposition.

U.S. soybean prices, crop value, farm marketings: Prices of U.S. soybeans: No.1 yellow. Prices of U.S. soybeans: Received by farmers. U.S. soybean price support operations. U.S. soybean crop value. U.S. farm marketings of soybeans.

Soybean processing and products–processing facilities and product value: U.S. soybean processing plants (map). Value of U.S. soybean products and crush margin.

Meal: U.S. soybean meal: Prices paid by farmers. U.S. soybean meal: Average wholesale price, Decatur [Illinois]. U.S. soybean meal: Beginning stocks, production, exports and domestic disappearance. U.S. oilseed cake and meals: Supply, disposition, and price. World major protein meals: Supply and utilization.

Fat and Oils: World major oilseeds: Supply and utilization. World major vegetable and marine oils: Supply and utilization. Prices of U.S. soybean oil. U.S. soybean oil utilization. U.S. soybean oil value as percent of total soybean value (graph). U.S. soybean oil: Supply, disposition, and price. U.S. edible fats and oils: Supply and disappearance.

Exports and imports–U.S. exports of soybeans by month. U.S. soybean exports by port and country of destination. U.S. exports: Soybeans by country of destination. U.S. soybean exports by port areas (map). U.S. exports: Soybean oilseed cake and meal by country of destination. U.S. exports: Soybean oil by country of destination. U.S. exports: Soybean oil, P.L. 480, title I and III by country of destination. U.S. exports: Soybean, cottonseed and sunflowerseed oils by country of destination. U.S. exports: Soybean and cottonseed oils by year. Brazilian exports of soybeans and products to major countries. Soybean and product exports by major countries (graph). World share of soybean and product exports (graph).

Before page 199 are two fold-out color maps (color coded by county): U.S. soybean production 1985, and U.S. soybean acreage 1985. Two other maps are: American Soybean Association international offices / world regions, U.S. soybean processing plants, and U.S. soybean exports by port areas.

A full-page table (p. 235) shows U.S. exports of whole soybeans, 1982-1986–Volume of exports (in metric tons) by country of destination and total value each year. Region and country of destination: North America: Canada, Mexico, other, total. South America: Brazil, Colombia, Ecuador, Peru, Venezuela, other, total. Europe and Russia: Belgium & Luxembourg, Czechoslovakia, Denmark, France, Germany (West), Germany (East), Greece, Ireland, Italy, Netherlands, Norway, Portugal, Romania, Soviet Union, Spain, Switzerland, United Kingdom, Yugoslavia, other, total. Middle East. Africa. Asia: China–PRC, China–Taiwan, India, Indonesia, Japan, Korea (South), Pakistan, other, total. Australia & Oceania. Other unidentified. Grand total. Value of exports–total (million $). Address: P.O. Box 27300, St. Louis, Missouri 63141.

1207. *Corporate Report Wisconsin* (*Milwaukee, Wisconsin*). 1987. Kikkoman brews up super soy sauce. July.
• ***Summary:*** The plant on the Big Foot Prairie, 3 miles northwest of Walworth, is operated by Kikkoman Foods Inc., a unit of Kikkoman Shoyu Co. Ltd. of Japan. Production is

now about 8 million gallons a year compared to about 1.7 million gallons in the plant's first year of operation. In 1977 Kikkoman became the leader in the U.S. soy sauce market. Presently U.S. retail market shares are Kikkoman 47%, La Choy 37%, and Chun King a distant third. "Kikkoman is one of the few Japanese companies to succeed in the U.S. with a traditional Japanese product. It has done so in part by promoting its sweet and salty sauce as an all-purpose and all-American product."

1208. *Soybean Digest.* 1987. Tofulicious–Checkoff research has its just desserts. A good taste that's good for you–and low in calories and fat–comes to you courtesy of soybean checkoff research. June/July. Supplement. p. 4.
• ***Summary:*** Tofulicious began as a research project at the University of Minnesota, funded by state soybean farmers. Minnesota Soybean Growers Assoc. executive Jim Palmer helped coordinate the research with U of M food scientist Dr. William Breene. One of Breene's students, upon graduation, went to work for Eastern Foods Co. in Minneapolis, the manufacturer. Thom Menie, Vice President for Sales and Marketing, says the company is expanding distribution of the five flavors of Tofulicious. The company also makes Dim Sum, a microwavable Oriental snack containing tofu, soy protein, and soybean oil, will soon be available nationwide. A large black-and-white photo shows the front of a carton of Tofulicious brand Non-Dairy Frozen Dessert.

1209. Bernard, Richard L.; Juvik, Gail A.; Nelson, Randall L. 1987. USDA soybean germplasm collection inventory [1898-1944]. Vol. 1. *INTSOY Series* No. 30. vi + 80 p. Aug. [20 ref]
• ***Summary:*** The title page states: "Information on the origins of soybean and wild soybean germplasm including introduced and old United States and Canadian domestic varieties and foreign and domestic strains identified by FC and PI numbers up to PI 150.000 acquired through 1944 and maintained by the United States Department of Agriculture." Note: PI can stand for either "Plant Inventory" or "Plant Introduction."

Contents: Foreword. Curator staff. The USDA soybean germplasm collection: Introduction, history, PI numbers, divisions of the collection, maintenance of the collection, statistical summaries, United States and Canadian varieties, foreign introductions, appendixes, abbreviations (EAS, ARS [Agricultural Research Service], ES, INTSOY, USDA, and USRSL).

Statistical tables: 1. Number of strains by maturity group (MG, p. 4). This table is divided vertically into north (MG 000 to IV), south (MG V to X), and wild soybeans. There are columns for: Old domestic varieties (before 1946), FC strains (mostly from USA), PI strains to 150,000, and total. The three maturity groups with the greatest number of strains are III (479), II (436), and IV (376)–all in the north.

2. Number of strains by country of origin (p. 5). This table is divided vertically into old domestic varieties (before 1946), FC strains, PI strains to 150,000, grand total, and wild soybeans to PI 150,000. The countries that have contributed the most strains to the U.S. collection are: China 871, Korea 335, and Japan 288.

3. Number of PI strains by year from 1898 to 1945 (p. 6). Columns show: Year. Plant Inventory volume. Initial PI designation for all crops. Number of soybean PI designations plus number of domestic varieties derived from them. Number of strains in collection each year. Accumulative total. A total of 7,867 PI soybean strains were introduced out of a total 150,209 plant introductions (about 5.2% of the total was soybeans). 413 domestic varieties were derived from these soybean introductions. The most active years for soybean introduction were 1926-1932. In 1954 there were 1,524 soybeans in the collection, or only 19.4% of those introduced with PI numbers. The rest were lost or discarded.

4. Historical summary of soybean introduction, in four time periods (p. 7): 1898-1923 (26 years, 40 strains/year). 1924-1928 (5 years, 375 strains/year). 1929-1932 (4 years, 1,193 strains/year). 1933-1944 (12 years, 14 strains/year).

5. Soybean instructions from major collecting expeditions (p. 7). Frank N. Meyer in China, Korea, and USSR from 1906 to 1917 collected 114 soybean PI strains–including 1 wild soybean in 1913. P.H. Dorsett in China from 1924 to 1927 collected 969 PI strains–including 5 wild soybeans in 1925. P.H. Dorsett and W.J. Morse in China, Korea, and Japan from 1929 to 1932 collected 4,451 PI strains.

6. Source and identification of individual strains: Old domestic varieties (p. 8-19). 7. Source and identification of individual strains: FC [Forage Crop] strains (p. 20-23). 8. Source and identification of individual strains: PI strains (by year, 1907-1944, to PI 150.000; p. 24-59). A sample entry (p. 34) states: Collected in Japan by P.H. Dorsett and W.J. Morse, USDA Agricultural Explorers, in April to June 1929. Obtained at Nishigahara, Tokyo, on April 15. PI 80.466. Maturity Group V. 32 seeds. 'Okura Maru Daizu,' originally from Hokushu, used candied and the product is called 'Mimame' [sic, Nimame]. Note: Right below this is PI 80.468. Tsurunoko Daizu.

Source and identification of individual strains: Wild soybean strains (by year, 1925-1940, to PI 150.000).

Appendixes: 1. PI strains from which old domestic varieties were derived. 2. Old domestic varieties introduced without PI designation. 3. Old domestic varieties of hybrid or unknown origin. 4. FC strains summarized by country and year. 5. PI strains summarized by country and year: 1898 to 1944 (PI 1 to PI 150.000). 6. Chinese location names. 7. Korean location names.

The source, date, maturity group, and other information for the following 191 old domestic varieties (all of which are still in the USDA soybean germplasm collection)

© Copyright Soyinfo Center 2021

is given (p. 8-19): Acadian, Agate, A.K. [FC 30.761], A.K. [Kansas], A.K. (Harrow), Aksarben, Aoda, Arisoy, Arksoy, Arlington, Armredo, Austin, Avoyelles, Bansei, Bansei [Ames], Barchet, Bavender Special A, B, C, Biloxi, Blackeye, Black Eyebrow, Boone, Burwell, Capital, Cayuga, Charlee, Cherokee, Chestnut, Chief, Chusei, Clemson (from Nanjing, China in 1927; released in 1939), Cloud, CNS, Columbia, Creole, Delsoy, Delsta, Dixie, Dunfield, Earlyana, Early White Eyebrow, Easycook, Ebony, Elton, Emperor, Etum, Flambeau, Fuji, Funk Delicious, Funman, Gatan, Georgian, Giant Green, Gibson, Boku, Goldsoy, Granger, Green and Black, Guelph (from Japan in 1889 by Prof. W.P. Brooks, Massachusetts AES; called 'Medium Green' from 1903 to 1907), Habaro, Haberlandt, Hahto, Hahto [Michigan], Hakote, Harbinsoy, Harman, Harrel, Hayseed, Hidatsa, Higan, Hokkaido, Hollybrook, Hongkong, Hoosier, Hurrelbrink, Illington, Illini, Ilsoy, Imperial, Improved Pelican, Jefferson, J.E.W. 45, Jogun, Jogun [Ames], Kabott, Kagon, Kanro, Kanum, Kingston, Kingwa, Korean, Kura, Laredo, Lexington, Lincoln, Linman 533, Louisiana Green, Luthy, Macoupin, Magnolia, Mamloxi, Mammoth Yellow, Mamotan 6640, Mamredo, Manchu, Manchu [Lafayette], Manchu [Lafayette] B, Manchu [Madison], Manchu–Hudson, Manchu–Montreal, Manchu 3, Manchu 606, Manchu 2204, Manchukota, Manchuria, Manchuria 13177, Manchuria 20173, Mandarin, Mandarin (Ottawa), Mandarin 507, Mandell, Manitoba Brown, Mansoy, Medium Green, Mendota, Midwest, Miller 67, Mingo, Minsoy, Missoy, Monetta, Morse, Mukden, Nanda, Nansemond, Nela, Norredo, Norsoy, OAC 211, Ogden, Ogemaw, Old Dominion, Ontario, Osaya, Otootan, Pagoda, Palmetto, Pando, Patoka, Patterson, Peking, Peking S, Pennsoy, Pine Dell Perfection, Pluto, Pocahontas, Poland Yellow, Portugal, Ralsoy, Richland, Roanoke, Rokusun, Rose Non Pop, S-100, Sac, Sanga, Sato, Scioto, Seminole, Seneca, Shingto, Shiro, Sioux, Sooty, Sousei, Soysota, Tanner, Tarheel Black, Tastee, Tennessee Non Pop, Toku, Tokyo, Tortoise Egg, Viking, Virginia, Virginia S, Volstate, Waseda, Wea, White Biloxi, Willomi, Willomi B, Wilson, Wilson B, Wilson-Five, Wilson-Five B, Wilson-6, Wing Jet, Wisconsin Black, Wolverine, Woods Yellow, Yellow Marvel, Yelredo.

For each of these 191 varieties, a table gives the following information: Variety name, maturity group, source and other information [such as country of origin and year of introduction to the USA], prior designation [usually a P.I. number], year named or released, developer or sponsor, literature. The last column refers to a list of 20 bibliographic references in chronological order (from 1907 to 1977) on p. 18-19. Address: Univ. of Illinois.

margarines and related products, soybean lecithin products. 11. Grades, standards, and specifications for soybeans and their primary products: Grades of soybeans, specifications for soybean meals and flours, trading specifications for soybean oils, specifications for lecithins, standards for the use of soy protein products in other foods. References in each chapter. Glossary.

This book is well written (though largely a repetition of previous works) in the area of modern soy protein products. It is weak and poorly researched in the area of "Oriental Soy Food Products," which comprises only 1 chapter (22 pages) of the total, making the book unbalanced. The author of this chapter seems to be almost completely unaware of the many major developments in the Western world during the past 10 years.

Note the following Korean soyfood terms: Fresh soybean = Put Kong. Toasted soy powder = Kong Ka Ru. Soy sprouts = Kong Na Mool. Soymilk = Kong Kook or Doo Yoo. Yuba (Soymilk film) = Kong Kook. Tofu (Soy curd) = Doo Bu. Tempeh (Fermented Whole Soybeans) = no name. Natto = Chung Kook Jang. Soy sauce = Kan Jang. Miso (Soy Paste) = Doen Jang. Fermented tofu (Fermented Soy Curd) = no name. Fermented okara (fermented soy pulp) = no name.

Note the following Chinese soyfood terms: Fresh soybean = Mao-Tou. Toasted soy powder = Tou-Fen. Soy sprouts = Huang-Tou-Ya. Soymilk = Tou-Chiang. Yuba (Soymilk film) = Tou-Fu-Pi. Tofu (Soy curd) = Tou-Fu. Tempeh (Fermented Whole Soybeans) = no name. Natto = no name. Soy sauce = Chiang-Yu. Miso (Soy Paste) = Chiang. Fermented tofu (Fermented Soy Curd) = Su-Fu. Fermented okara (fermented soy pulp) = no name.

Note: This is the earliest English-language document seen (Nov. 2012) that uses the term "Toasted soy powder" to refer to roasted soy flour. Address: 1. Prof., Food Science Dep., Univ. of Arkansas, Fayetteville, AR; 2. Principal Research Scientist, Div. of Biological Science & Engineering, Korea Advanced Inst. of Science and Technology, Seoul, South Korea.

1213. *Soybean Digest.* 1987. Koreans consume more soymilk. Aug/Sept. p. 40.
• ***Summary:*** "Koreans are drinking more soymilk, in part because of the American Soybean Association's programs to promote soyfoods. In 1986, 10 soymilk makers produced 7.8 million liters (2.028 million gallons) of soymilk, a $60 million (U.S.) value and a 23% volume increase compared to 3 years ago."

1214. Unnevehr, Laurian J.; Gleason, Jane E.; Kauffman, Harold E. 1987. Soybeans in international agriculture. *Illinois Research* (*Illinois Agric. Exp. Station, Urbana*) 29(2/3):24-26. Summer/Fall.
• ***Summary:*** Soybean cultivation originated in the North China Plain. Today, China is still a major producer of soybean, accounting for about 10% of world production. Other countries in Asia produce only minor quantities. Since 1970, production of soybeans has expanded significantly in four Latin American countries: Argentina, Brazil, Paraguay, and Uruguay. Among the major producers, the U.S. and Argentina have the highest average yields of about 2 tonnes/ha (30 bushels/acre). Lowest average yields, about 1 tonne/ha (15 bushels/acre), are found in China. Over 80% of world soybean production is crushed to provide meal and oil. The soybean is the single largest source of supply in both protein meal and edible oil markets, providing 30% of the world's edible oil and 50% of world supply of protein meal for animal feeds. Its ratio of protein to oil is highest among all oilseeds. The soybean also has high-quality protein compared to other oilseeds.

Because income is a major determinant of soybean meal and oil consumption, it is not surprising that high-income industrial countries are the largest consumers. The European Economic Community (EEC), Japan, and the U.S. account for two-thirds of world soybean meal consumption and one-half of world soybean oil consumption. Recent growth in demand for soybean products has been greatest in less developed countries because incomes are growing most rapidly there. From 1960 to 1980, per capita income in South Korea tripled from $500 to $1,500.

As a result, meat consumption increased from 12 to 40 kilograms per capita. To satisfy increased meat demand, livestock production and feed use also increased rapidly, causing soybean meal consumption to increase from 0 to 300,000 tons in only 20 years. The use of soybeans for food products is a very small part of total use in most countries, but there are some exceptions. For instance, from 1983 to 1985, Indonesia used 92.9% as food; China, 73.8%; and South Korea, 35.9%. Japan protects its domestic soybean processors by confining imports to whole beans. Address: 1. Asst. Prof. of Agricultural Economics; 2. INTSOY agricultural economist; 3. Director, INTSOY, and Prof. of International Agriculture. All: Univ. of Illinois, Urbana, IL 61801.

1215. *Beachcomber* (*Vashon, Washington*). 1987. Tofu revolution to proceed, problem settled; no sale [at Island Spring]. Oct. 22.
• ***Summary:*** This week Luke Lukoskie struggled to advert an advertised sale of $3,891,800 worth of tofu making equipment Friday. The public sale was to "satisfy obligations" according to the public notice an attorney published in a Seattle newspaper without Lukoskie's consent. A power struggle was taking place. The company was founded 11 years ago by Lukoskie and Sylvia Nogaki in a westside woodshed. She went on to be a business writer and continues as a minor stockholder. After Lukoskie married Soon "Suni" Kim, a Korean-American graduate food technologist, sales expanded. With the help of Cal Tech

© Copyright Soyinfo Center 2021

graduate Cliff Brown, the Lukoskies developed machinery to make tofu continuously. An investor was found to pay for a $6 million leap in to national and perhaps international production and marketing.

The U.S. subsidiary of an international food machinery maker made the production line model of the continuous production machine. It now stands on the island in crates awaiting completion of a new 37,000 square foot building near K2. Production in the new plant is expected to start in early 1988. Address: Washington.

Rachie, and K.E. Dashiell. eds. 1987. Soybeans for the Tropics: Research, Production and Utilization. New York, etc: John Wiley & Sons Ltd. xx + 230 p. See p. 101-09. Chapt. 10.

• ***Summary:*** Contents: Introduction. Constraints. National research programmes: Varietal improvement, cultural practices. Cooperative research: A new dimension.

Demand for soybeans and products in the region is about twice the regional production. By the year 2000, if current trends continue, Asia's demand for soybeans is projected to be more than three times the amount produced.

The leading soybean producers in Asia, in descending order of tonnes produced in 1983, are China, India, Indonesia, Korea, and Thailand. In Indonesia, soybean production during the past 10 years has been constant at about 700,000 tonnes (metric tons) per year; soybeans are produced mainly in Java.

In 1984 Thailand produced 284,000 tonnes, which was far below its demand of about 350,000 to 450,000 tonnes. A national program set a goal of producing 390,000 tonnes by 1986.

In the Philippines, Mindanao, located in the south, is the leading soybean producer. During the last 10 years, producing has gradually increased, however in 1983 only 8,320 ha were planted to soybeans; that year, imports totaled 261,000 tonnes of soybean meal and 31,000 tonne of whole soybeans.

In Pakistan, commercial soybean production began in 1970 and is concentrated in the North Frontier Province, Sind and Punjab. The area planted to soybeans is small (4,300 ha) but the potential for expansion is very large.

Vietnam produces only about 1% of Asia's soybeans, however the amount is increasing.

The following countries started research programs on soybean breeding and production at an early date: China, Indonesia, Thailand, India, Philippines, Korea, and Sri Lanka; these programs have made great progress during the past few years. China has large and well-run germplasm collections.

Since 1967, the Indian Council of Agricultural Research has had an interdisciplinary team working on soybeans. The project's headquarters are currently at Pantnagar, and a network of 19 centers throughout India tests varieties and production techniques.

In Indonesia, soybean research is coordinated by the Central Research Institute for Food Crops in Bogor, and conducted by five research institutions.

In Thailand, soybean research is coordinated by the Field Crop Research Center at Chiangmai.

In Sri Lanka, in 1973, the government initiated soybean research, with technical assistance from the International Soybean Program (INTSOY), to promote soybean production and utilization in the country.

In 1984 the Asian Soybean Improvement Network (ASIN) was launched in a cooperative effort to extend the resources devoted to research by national programs, IITA, IRRI, AVRDC, INTSOY, the Australian Centre for International Agricultural Research (ACIAR), and the United Nations Economic and Social Council for Asia and the Pacific. The network is coordinated by representatives of AVRDC and IITA.

Figures show: (1) Pie charts–Asia's proportion of world area and production of soybeans. Concerning world production, Asia has about 15.7% of the total, compared with 57.3% for North and Central America, 24.6% for South America, and 2.4% for others. Within Asia, China has 79.1% of Asia's total soybean production, followed by India (5.9%), Indonesia (4.5%), Korea (3.0%), Others (incl. Japan; 7.2%).

(2) Pie charts–Trade in soybeans, soybean meal and oil in Asia and the world. For soybean oil imports, Asia is the leader (37.9% of the world total), followed by Europe (24.5%), Africa (13.9%), South America (12.5%) ad Others (9.2%). For soymeal imports, Europe is the leader (73.0% of the world total), followed by USSR (10.2%), Asia (8.2%), and Others (8.6%). For whole soybean imports, Europe is the leader (58.0% of the world total), followed by Asia (30.6%), North & Central America (6.4%), USSR (5.0%), and Others (0.0%). Within Asia, for soybean oil imports, India is the leader (36.4%), followed by Iran (22.9%), Pakistan (19.3%), Turkey (6.4%), Bangladesh (3.57%), and Others (11.4%). For soymeal imports, Korea is the leader (15.2%), followed by Philippines (14.7%), Iran (12.9%), Japan (12.5%), Thailand (10.0%), Malaysia (8.0%), Others (26.7%). For whole soybean imports, Japan is the leader (61.2%), followed by China (17.5%), Korea (6.6%), Israel (6.6%), Indonesia (2.7%), and Others (3.9%).

(3) Changes in the area planted to soybean over the past 15 years (1965-1983) in selected Asian countries. Graphs of India, Thailand, Indonesia (which have increased, with India's graph increasing dramatically), Asia, China, and Korea (which have decreased somewhat).

(4) Soybean production, consumption, and projected demand in Asia by the year 2000 (Source FAO, 1960-83; IFPRI, 1977). Asia will have to steadily increase its imports

1217. Lee, Leonard L. 1987. Eastern Foods Corporation and Tofulicious (Interview). *SoyaScan Notes.* Nov. 11. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** His Eastern Foods Corp. presently makes about 10,000 lb/week of tofu; the capacity is 5,000 to 7,000 lb/day. They also make egg roll and wonton skins. An expensive Pillsbury executive was hired to make a big splash with Tofulicious. It flopped and almost killed the company. He now wants to start importing a line of traditional natural foods from Korea with a classmate (incl. ramen, noodles, crackers, rice vinegar) and to enter the health food, gourmet, and military markets. He is now importing dim sum and has set up a branch in Korea. Line name: Naturally Koryo. He tried to export Tofulicious to Japan, developing a cheerleader point of purchase ad; it flopped. Address: Minneapolis, Minnesota.

1218. *Toyo Shinpo* (*Soyfoods News*). 1987. Okara kara jinzô niku tsukuru. Nihon Powder Kankoku de gôben seisan kaishi. Yasukute fûmi batsugun. Gyôkai no chûmoku atsumeru shin shôhin [Making an artificial meat from okara. Nihon Powder starts a joint company in Korea. The meat is inexpensive and tastes great. It is the new food which is getting the attention of the industry]. Nov. 11. p. 2. [Jap; eng+]
• ***Summary:*** Mr. Koichi Yoshida is the president of Nihon Powder, Uchikanda, Chiyoda-ku, Tokyo, Japan. Phone 03-256-7931. Nihon Powder has decided to produce artificial meat made from okara on a large scale in Korea starting in January 1988. They established a joint company with Hoko Shokuhin (a protein food company in Korea). Nihon Powder has ¥36,000,000 invested in the new joint company or 49% of the control. Together they make a product which is better tasting than any artificial meat made from soy. The new product has a better texture and flavor than other such products. They process okara by adding calcium chloride to it and tofu coagulants to make a fresh tofu chunk. The tofu undergoes an ice-cold temperature ripening process, and is then processed using 2 screw-extruders to make a meatlike product. Before this process can be used though, soybean hulls must be removed to produce a good texture soy imitation meat. Fortunately, the manufacturers use an enzyme which breaks down the bean hulls, allowing them to use okara in their processing.

Okara is such a big problem in Japan that the phrase okara pollution (*okara kogai*) was invented. Some of the tofu makers are very concerned about the build-up of this okara waste. The Nihon Powder company has also invested another ¥180,000,000 to make a plant (320 square meters of space) on 16,500 square meters of land which is scheduled for completion in November of 1987.

1219. *Soybean Update.* 1987. Twenty-six oilseed processors from 18 countries are attending a soybean processing short course sponsored by ASA at Texas A&M University. Nov. 23. p. 3. Also in Soybean Digest. Dec. p. 51.
• ***Summary:*** Specialists in the U.S. processing industry teach the classes which feature lectures and hands-on experience. Ricardo Lopez, Asst. Manager of Prograsa, plans to open the first soybean crushing facility in Honduras in January 1988. Cheil Sugar & Co., Korea's second largest soybean importer, buys about 400,000 tonnes of soybeans a year. His industry is growing at least 10% a year. Participants will use their new knowledge to produce better soybean oil and meal in their own countries.

was reached with Marubeni Shiryo Company, Ltd., a large Japanese feed manufacturer. And last fall a technology agreement was signed with the Cheil Sugar & Co., Ltd., a large Korean firm engaged in feed manufacturing and oilseed processing. "This is a continuation of our strategy to become a larger part of the Asian market," said Thomas G. Hauenstein, Vice President-International Feed. Address: Fort Wayne, Indiana.

1223. Weinreb, Sam; Martin, Shelly. 1987. Tofu in New York City (Interview). *SoyaScan Notes.* Dec. 29. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Sam: Tofu has become a lost leader in New York City health food stores, sold at a small markup. He makes 1,800 lb/week of tofu including round tofu. He is supported by the co-ops, and is surviving out of sheer stubbornness and because he thinks what he is doing is important.

Shelly: The New York City health food industry is being taken over by the Koreans. They keep their stores open 24 hours a day and pay low or no wages (as to family). They are hard for a manufacturer to do business with. Soy Source has its soy sauce specially made by Wajashan. Address: 1. Local Tofu, West Nyack, New York 10994; 2. Appropriate Foods / Soy Source.

1224. *ASA Member Letter.* 1987. Soybean buyers confer on quality. Nov/Dec.
• ***Summary:*** Soybean buyers in Japan and Korea are learning about U.S. soybean quality from Jim Guinn, American Soybean Association soybean quality director, at soybean quality outlook conferences in Tokyo and Seoul this week. Last year Japan imported 151 million bu of U.S. soybeans; Korea imported almost 38 million bu.

1225. Carter, Thomas E., Jr. 1987. Genetic alteration of seed size: Breeding strategies and market potential. In: Dolores Wilkinson, ed. 1987. Proceedings of the 17th Soybean Seed Research Conference 1987. Washington, DC: American Seed Trade Association. vii + 114 p. See p. 33-45. Held 9-10 Dec. 1987 in Chicago, Illinois. [21 ref]
• ***Summary:*** Contents: Introduction. Soyfood market size. Soyfood market trends–short and long range. Premiums and acreage, the breeder's perspective. Breeding special varieties. Future breeding goals. Conclusions.

"The expanding soyfood markets in Japan and the U.S. have generated considerable interest among American soybean producers in recent years. More than 60% of the soybeans used in these markets are grown in the U.S."

Table 1 (p. 34) shows "Soybean consumption as soyfoods in Japan and the U.S." In Japan about 851,000 metric tons of soybeans are used to make soyfoods such as tofu (532,000), miso (180,000), natto (99,000), soymilk (12,000), and soy sauce (5,000 [plus large amounts of defatted soybean meal]). Large-seeded soybeans grow in the U.S. have found acceptance in making tofu and soymilk, capturing 81 and 100% of the raw soybean sales respectively for these products.

"In survey results, 39 of 43 public breeders and 44 or 67 private breeders responded to questions regarding the breeding of specialty varieties. Twenty-four breeders reported that they are maintaining 36 separate projects for large- and small-seeded varieties (Table 3). Public and private breeders are represented equally in this effort with the majority of these projects underway in the Midwest. Eight public and eight private programs are developing varieties specifically for tofu while 13 public and 7 private programs are developing varieties for natto. One public breeder was interested in soy milk varieties but considered varieties for tofu and soymilk as the same. One private and two public breeders are interested in large-seeded garden types for the fresh market in urban areas with large oriental populations. One public and one private breeder expressed interest in small-seeded varieties for sprouts. Soybean sprouts are primarily a Korean soyfood; and, Koreans buy U.S. soybeans for making sprouts in some years." Address: Research Geneticist, USDA-ARS, North Carolina State Univ., Raleigh, NC. Phone: 919-737-2734.

1226. Jacobson, Jodi L. 1987. Planning the global family. *Worldwatch Paper* No. 80. 56 p. Dec. Worldwatch Inst., Washington, DC.
• ***Summary:*** Over the past two decades, steadily declining birthrates have contributed significant improvements to the health and well being of millions of people and to the growth of national economies. Yet the world population increased by 87 million people in 1987, the largest annual increment ever. Encouraging small families requires a two-pronged strategy: family planning and social change. With few exceptions total fertility rates in the industrial world are below replacement level. The most dramatic declines in total fertility rates (number of children per woman) took place in East Asia and Cuba. From 1960 to 1987 the average number of children per woman fell as follows: Singapore 75%, Taiwan 72%, South Korea 65%, Cuba 62%, China 56% (from 5.5 to 2.4 children/woman), Chile 55%... Mexico 44%, Brazil 44%, Malaysia 43%, Indonesia 41%... India 31%. But in Sub-Saharan Africa, fertility rates have not declined at all. Address: Washington, DC.

• ***Summary:*** The 1988 Summer Olympics in Seoul introduced Korea to the modern world in a big, new way. This book was written for that event.

The chapter titled "Korean cuisine" (p. 58+) explains that it is the least known of the culinary traditions of Asia, and offers strong evidence of the nation's distinctiveness, which shows clear Mongol influence. Like the Chinese and Japanese, the Koreans also eat "soy beans and bean curd" [tofu], and bean sprouts [soy sprouts are more popular than mung bean sprouts]. The undisputed mark of Korean cuisine is kimch'i [kimchi], most of which is still made by fermentation at home of a vegetable (such as cabbage), always with chili and garlic; there are many different types of kimch'i, the most popular of which are cabbage stuffed with oysters, sliced cucumbers with radish and ginger, diced daikon radish with scallions, and white radish sticks floating in brine. Other favorite Korean seasonings, besides garlic and chili, are scallions, ginger, sesame oil, sesame seeds, and soy sauce.

Pages 60-62: "There is also a whole range of fermented pastes and sauces for dipping, called *chang.* Every home and restaurant has its own recipe for *chang,* and each batch comes out differently. Based on a fermented mash of soybeans, the three most common varieties are *"kan chang,* a dark liquid, like soy sauce, *daen chang,* a thick, pungent paste, and *kochu chang,* a fiery version laced with chilies."

Note: This is the earliest English-language document seen (April 2012) that uses the term *kan jang* to refer to Korean soy sauce.

Side dishes, known as *panch'an,* accompany the main dish, rice, and add variety to the basic Korean meal. They include: *Tubu:* Soybean curd, tofu. *Manul changah-chee:* Green garlic pickled in soy sauce. *Don chun:* Beef and bean curd patties spiced with ginger.

Koreas love to make rich, thick stews, especially in winter. *"Chigae* is a special thick stew simmered in heavy clay crocks." Favorite Korean soups (*tang*) and stews include: *Maeun tang:* Rich soup of meat, fish, bean curd, zucchini and scallions. *Ten chang chigae:* Thick stew of meat, fish, bean curd, squash and chilies.

Simple "one-bowl" meals, especially popular as summer lunches, include: *Kong kookso:* Wheat noodles in fresh soy milk. *Udong* [Jap. udon]: Broad wheat noodles with onions, bean curd, egg and chili. *Kongnamul pap:* [Soy] bean sprouts, beef and cabbage served over rice.

A photo (p. 63) shows a man grinding food using a hand-turned stone mill (quern).

1234. Sayers, Robert; Rinzler, Ralph. 1987. The Korean onggi potter. Washington, DC: Smithsonian Institution Press. 288 p. See p. 58-60, 71, 75, 77. Illust. 23 cm. Series: Smithsonian Folklife Studies, No. 5. [166* endnotes]

• ***Summary:*** Onggi are traditional Korean earthenware vessels, used for the storage of pickled vegetables, bean pastes and soy sauces. Fieldwork for this project was initiated by Ralph Rinzler in 1971.

The section titled "Storage containers" (p. 58-59) contains a list of the names of ceramic food jars, with their appropriate uses, as given by people in Korea's capital, Seoul. "Soy sauce, for example, is stored in quantity throughout the year in large and medium size outdoor receptacles (*kannjang tok* and *kanjang hangari*)*;* as needed, the liquid is transferred to a small spouted kitchen form (*kanjang tanji*)." The large outdoor jar used to store soy paste *toenjang* is called a *toenjang tok* and the small kitchen form a *toenjang tanji.* The corresponding jars for red-pepper paste (*koch'ujang*) are called *koch'ujang hangari* and *koch'ujang tanji.*

To understand better how these storage jars are used, it is useful to describe the preparation of four Korean dietary staples: soy sauce, soybean paste, red pepper paste, and kimch'i. "The first of these, reddish black soy sauce (*kanjang*), is made from yellow soy beans boiled four or five hours, then mashed into a paste called *meju.* Today yeast is added to the meju; formerly it was molded into large rectangles or truncated cones, which were dried outdoors on rice straw mats, then hung from the house rafters to leaven [sic, mold] naturally over several months. In the springtime, the mold-covered *meju* is broken up into smaller chunks and submerged in a brine-filled *tok* positioned on an architectural feature of the outdoor living space called a *changdoktae* ("place for sauce jars"). This might be a stone or concrete terrace built up in a sunny part of the dwelling's inner courtyard or, in the city, an apartment balcony or rooftop (Figures 8 and 9, p. 60-61).

Over a period of two or three months, the mistress of the house checks her jars, taking care to see that their contents receive only the proper amount of sunlight. Then, in May or June, she boils the clear, dark liquid in a cauldron and replaces it in still other jars along with red peppers and chunks of wood charcoal, which absorb dirt and inhibit strong odors. The solid moldy matter that floats to the top is

© Copyright Soyinfo Center 2021

skimmed off, then crushed, salted, and kneaded into a paste (*toenjang*), which constitutes a second major soy by-product. For most Koreans the making of soy sauce and soy paste is a yearly activity." An affluent family might prepare an even larger supply. The sauce is believed to stay fresh up to three years, and is even said to improve with age.

"A second staple is the hot seasoning *koch'ujang.* In autumn, red chili peppers are harvested and sun-dried for a week or more. Then the peppers are split open and left in the sun a few days longer, after which the seeds are dislodged with a pole. What remains is pulverized in a mortar, then sifted through a pine-root sieve. Simultaneously (or during the making of soy sauce), a *meju* ring is prepared and secreted away in a dark corner of the house to ripen. In the springtime, the red pepper powder and pulverized *meju* are combined with rice paste *ch'apssalchuk,* salt, and sugar. The *koch'ujang* is not cooked, but is left to ferment in a storage jar for three or four months."

Most cauldrons are made of iron, although some, made of carved soapstone, are used for preparing medicinal foods. "Ceramic cauldrons are perhaps the least common; however a stew of fermented soybean paste [*toenjang*] is sometimes cooked in a small example (*toenjang sot*) manufactured from a low-firing refractory clay called *koryôngt'o,* which is more resistant to shattering than dense, homogeneous stoneware bodies (*chômt'o*) (Fig. 17), p. 71.

Photos show: (1) Korean onggi peddlers, ca. 1900, with long wooden racks that hold a heavy load of many containers on their backs (frontispiece). (2) Rooftop terrace (*changdoktae*) for sauce jars. Photo by Ralph Rinzler, 1971 (p. 60). (3) Rural version of *changdoktae* at Kaya village, Kyonggi Province (p. 61). (4) A small ceramic cauldron (*toenjang sot*) for preparing soy paste, Kyongju, N. Kyongsang Province (p. 71). (5) A small pouring vessel (*kanjang tanji*) for soy sauce (p. 77). Address: 1. Dep. of Anthropology, California Academy of Sciences, San Francisco, CA 94118.

1235. Shurtleff, William; Aoyagi, Akiko. 1987. Soymilk industry and market: Updates from 1984 to 1987. Lafayette, California: Soyfoods Center. 17 + 59 p. Index. 28 cm. [165 ref]
• ***Summary:*** This 1987 update to the Soyfoods Center's two-volume 1984 *Soymilk Industry and Market* has two parts: (1) Year in Review, describing key events and trends each year from 1984 to 1986. (2) A bibliography of soymilk from January 1987 to late 1987, based on records in the SoyaScan database; at the end is a 10-page index. Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549.

1236. Miyazawa, Mitsuo. 1988. [Re: History of Sendai Miso Shoyu Co. Ltd.]. Letter to William Shurtleff at Soyfoods Center, Jan. 14. 2 p. Handwritten. [Jap; eng+]
• ***Summary:*** Although this company was founded in 1919, its roots go back to the late 1500s. In March 1593 (Bunroku 2) 3,000 soldiers of Idate Han (the former feudal domain in northeast Japan where Sendai is now located) went to Korea, led by Daté Masamuné (DAH-tay Mah-sah-MU-nay) in the army of Toyotomi Hideyoshi. It was found during the summer battles that the miso brought by the soldiers from most other Hans started to spoil; only that from Idate Han (Sendai) remained tasty, and it was shared with the other soldiers. From this time the fame of Sendai Miso began to spread throughout Japan.

During the Genroku Period (1688-1703) the miso makers in the Sendai area formed a trade group named Miso Nakama. "Nakama" means "colleague, fellow worker, comrade, or associate." They established rules and made miso under the motto "Examine the quality first." During the Kyoho Period (1716-1735) they started selling shoyu and the group changed its name to Miso Shoyu Nakama." Sasa Ju (Sasaki Jubei) joined this group in the year 1834 (Tempo 5) and worked to protect its quality and tradition. During the Taisho Period (1912-1916) the Japanese economy was strong and demand for miso and shoyu from the Sendai area increased. So in 1919 the members of the Miso Shoyu Nakama formed Sendai Miso Shoyu K.K., headed by a descendant of Sasaki Jubei with the same name. The current president of Sendai Miso Shoyu K.K. is the 8th generation named Sasaki Jubei.

Since the mid-1970s the company has exported quite a bit of its naturally fermented miso and shoyu to macrobiotic and natural foods companies in the USA and Europe. Address: Sendai Miso Shoyu Co. Ltd., Furujiro 1-5-1, Sendai 982, Japan.

• ***Summary:*** "Koha KochuJang. $1.49. 8 oz."

1238. Chung, Je-Bong; Lee, K.H.; Sohn, H.S.; Kim, S.M. 1988. Studies on thermophilic flat-sour bacteria in soymilk: Isolation, identification and determination of heat resistance. *Korean J. of Food Science and Technology* 20(2):218-24. [16 ref. Eng; kor]
• ***Summary:*** To optimize thermal processing of soymilk, 4 strains of thermoresistant flat-sour bacteria were isolated from soymilk. The isolates were aerobic spore-forming rods and grew at 65ºC. Based on morphological and physiological properties, all isolated strains were identified as *Bacillus stearothermophilus.* The average D values for the 4 strains were 77.27, 20.20, and 2.76 and 1.39 minutes at 110, 115, 121 and 125ºC, respectively, and the average z value was 8.36ºC. Address: All: Central Research Inst., Dr. Chung's Foods Co. Ltd., 1-25 Songjung-dong, Chungju, Choongbuk-do 360-290, South Korea.

1240. *Soybean Digest.* 1988. Million metric milestone marked. Feb. p. 44.
• ***Summary:*** Korea had another record-setting year by importing 1,081,075 tonnes (40 million bushels) of U.S. soybeans in 1987. Korea used 937,063 tonnes for crushing and 144,012 as food. This marks the second year in a row that Korea surpassed the million tonne mark in soybean imports from the U.S.

1241. Jangtoh Soontofu Restaurant. 1988. March. New soyfoods restaurant or deli. 4451 Beverly Blvd., Los Angeles, California (in the Beverly Hobart Plaza).
• ***Summary:*** This restaurant, which opened in March 1988, is geared for Koreans. Signs outside are written in Hangul, the Korean alphabet. "The restaurant serves only two dishes–*soontofu* and *kongbiji*, both of them soups. *Soontofu* is made with tofu, *kongbiji* with ground soybeans. That may sound like an extremely limited menu, but there are variations."

"Jangtoh makes its own tofu, producing several batches a day. If you've never tasked warm, soft, fresh tofu, don't miss the opportunity to try it here. A small bowl of this cloud-like substance comes with each meal. The kitchen garnishes it with a bit of chopped green onion, dried seaweed and sesame seeds. Then you spoon on a wonderful sesame-soy sauce-garlic condiment from a jar on the table."

Jangtoh, owned by Bu-A and Brian Chung, opened in March 1988.

Jangtoh Soontofu Restaurant, 4451 Beverly Blvd., Los Angeles; (213) 665-8664. Address: Los Angeles, California. Phone: 213-665-8664.

1242. **Product Name:** [Korean Soybean Jang / Miso {Tehn-Jung Miso, Ten-Gan}].
**Foreign Name:** Ten Gan.
**Manufacturer's Name:** Park's Brand Products.
**Manufacturer's Address:** Vineyard Blvd., Kalihi Valley, Oahu, Hawaii.
**Date of Introduction:** 1988 March.
**New Product–Documentation:** Hawaii Directory of Manufacturers. 1973. p. 11. Park's Brand Products, Inc., Dba Park's Brand Kim Chee, 145 North King St., Stand 53, Honolulu, HI 96817. Tehn Jung (Mise) [Miso]. Note: This product is called "Mise" in all Hawaii Directories of Food Manufacturers, 1973-78. The company was not listed in any previous Directory of Manufacturers from 1953 to 1971.

Hawaii Directory of Manufacturers. 1979-80. p. 11. The address has changed to 1712 Liliha St., Honolulu, HI 96817. The product is now called "Tehn Jung-Miso." They also make roasted sesame seeds. Letter from Takao Nihei. 1988. July 19. Says the address is now 1657 Liliha, Honolulu, Oahu, HI 96817. But the Honolulu Phone Directory shows the address as 3171 Waialae Ave., Honolulu, HI 96816. Phone: 808-733-1302.

Talk with Mike Irish, the owner. 1988. July 22. In March 1988 the company moved from the plant at Liliha St. to 3171 Waialae Ave. At the time they bought another kimchi company, Ham's kimchi. The King Street address was where the product was and still is sold. Most of it is sold there, with a little being sold at a couple of other Korean stores. The only soyfood product they make is Korean soybean jang (doen jang); he pronounces it "ten-jang" but spells it Ten-Gan on the label. He also makes kochu jang, the Korean hot chili paste, with sweet mochi rice as the base; it contains no soy. He also makes lots of kimchi. Parks Brand Products was founded in 1938 by a lady in a little store on Vineyard Blvd., in the Kalihi Valley on Oahu. Her maiden name was Park and her married name was Ko. Her company started out making kimchi, kochu jang, and soybean jang as their three main lines. She grew her own vegetables to make the kimchi. In 1973 they discontinued kimchi but made kimchi sauce in bottles. Mrs. Park's kids took over the company. When they wanted to retire, Mike bought the company from them in 1985. He is half Korean, half Irish. Mrs. Park/Ko died in 1987. He believes he is the oldest existing miso manufacturer in Hawaii. He is the largest Korean food manufacturer in the state and his biggest product is kimchi. He doesn't sell much of his soybean jang, largely because the price is about 2.5 times as much as most Japanese miso or imported Korean Jang. He sells it in small porcelain crocks as a specialty item. Note: In Honolulu/Oahu City Directories 1941-42, 1947-48, 1958-59 there is no listing for Parks Products. Letter from Michael P. Irish. 1988. Nov. 29. "We no longer produce miso (ten-gan) and I no longer have any old labels or articles about the product."

1243. *High Plains Journal* (*Dodge City, Kansas*). 1988. Farmers in Asia, U.S. gain from soy fish feeds. April 18. Also in Soybean Update. March 21. p. 3.
• ***Summary:*** Dr. Dean Akiyama, who heads up the American Soybean Association's aquaculture programs in Japan, Korea, Taiwan and southern China, says U.S. soybean meal and science could push shrimp production to all-time highs. "Shrimp culture in Southeast Asia is booming," Akiyama said. He also noted that feed trials have shown shrimp feeds can use up to 40% soymeal [mixed with fish meal] with no substantial loss in overall production. In the past, only fish meal has been used to feed shrimp.

"Soymeal is cost effective," Akiyama said, "The basic

© Copyright Soyinfo Center 2021

nutritional principles found in fish meal are also found in soymeal. The only difference is, soymeal is cheaper. We have proven soymeal mixed with fish meal can save a farmer up to 45% on his feeds costs." A shrimp farmer spends about $4 to $8 to raise a pound of shrimp, then sells it for $15 a pound. A typical farm can have up to a tonne of shrimp per acre, per crop. Producing 2.5 tonnes/acre on an average year, the farmer makes $18,000 for every acre farmed.

1244. Business Trend Analysts, Inc. 1988. The market for salad dressings, sauces and condiments. 2171 Jericho Turnpike, Commack, NY 11725. 260 p. Price: $750.
• ***Summary:*** Sauces include the following table sauces: Ketchup, meat (incl. steak, worcestershire, vegetable, and seafood sauces), barbecue, Mexican (incl. chili, taco, enchilada, etc.), prepared mustard, and soy and teriyaki. Gravies, dips, and dry sauce mixes are not included. Ketchup is the largest segment, about 40% of the total. It has grown at 4.6% annually from 1982-87, but growing faster during the same time are soy and teriyaki sauce (10.3%), barbecue sauce (11.4%), and Mexican sauce (9.2%). In 1977 soy and teriyaki revenues represented 3.1% of total sauce sales, compared to 6.7% in 1987. BTA expects the market to grow at 8.9% annually reaching $280 million in 1997. Kikkoman, the leading producer of soy sauce in the U.S. sells most of its product is the western portion of the country. In 1987 it launched a national ad campaign to expand to the rest of the country.

According to U.S. Dept. of Commerce statistics, sales of soy and teriyaki sauce (in million dollars) and market percentage have grown from $7.7 and 1.8% in 1972, to $25.0 and 3.1% in 1977, to $50.1 and 4.9% in 1980, to $98.1 and 6.0% in 1985, and to an estimated $132.0 and 7.0% in 1988. Other estimated market shares in 1988 were ketchup 39.2%, meat 19.6%, barbecue 14.4%, Mexican 12.1%, and prepared mustard 7.8%. Thus soy and teriyaki have the smallest share.

But the growth rate for soy and teriyaki sales have been slowing, in part due to lower inflation rates. The rate was 26.6% in 1972-77, 24.2% in 1977-82, 10.3% in 1982-87, and a projected 8.9% in 1987-97. In this latter period the growth rate is higher than for any other sauce category.

In 1987 for leading U.S. soy sauce producers, sales and market share were: Kikkoman Foods Inc. $49 million and 41% market share; La Choy Food Products (Subsidiary Beatrice/Hunt-Wesson) $43 million and 36%; Nabisco Brands Inc. (Subsidiary RJR Nabisco), maker of Chun King, $12 million and 10%. All others, $16 million and 13%. Note: Chun King Frozen Foods line was sold to ConAgra, Inc. (Omaha, Nebraska) in 1987. Nabisco still owns the soy sauce and other packaged goods. the U.S. soy and teriyaki market, an estimated 41%., with 1987 sales of $49 million.

According to Department of commerce statistics, U.S. imports of "thin" soy sauce have grown steadily from 13.3 million lb in 1978, to 15.9 in 1980, to 29.6 in 1985, and an estimated 40.0 in 1987. In 1986 roughly 38.9% of this came from Japan, followed by 26.9% from Hong Kong, 12.8% from China, 12.0% from Taiwan, and 9.3% from Others (incl. South Korea, Canada, and Philippines). These imports of 32.5 million lb in 1986 were worth $13.9 million. Between 1980 and 1986 roughly 2,500 lb/year of soy sauce have been exported, a negligible amount. The main destinations were West Germany, Canada, and Mexico. Address: Commack, New York.

1245. *Graphic* (*Brooklyn, New York*). 1988. The "scoop" on David Mintz, the father of Tofutti. May 25.
• ***Summary:*** David Mintz, a successful kosher caterer from Brooklyn, never believed tofu could change his life, but it has. In 1972, while searching for a milk substitute for kosher desserts, pastries, pies and sauces, he discovered tofu. In 1981, he introduced Tofutti ice cream to the world. More than 38,000 outlets in all 50 states–including supermarkets, health food stores, groceries, gourmet shops and department stores–carry the product. Tofutti is also available in Canada, Japan, Australia, Korea, Hong Kong, and the U.S. Virgin Islands.

1246. Menie, Tom. 1988. Eastern Foods Corp. and Mr. Lee R. Lee's resignation in April (Interview). *SoyaScan Notes.* May 27. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Mr. Lee resigned as the head of the company at the end of April and is now probably involved in his new venture of importing natural foods from Korea. He still owns stock in the company and is still on the board. The company was in bad financial shape at the time. The corporation is owned by its stockholders. He and his brother in law owned a controlling interest, but with some options on the company's last stock offering, some other people ended up controlling the company. Now, Tom is handling the sales and marketing duties and Warren Thunstrom is handling production. The company is planning a stock offering in the near future and has many innovative food ideas on the drawing boards.

Tom says he heard from someone and read in some publication a figure of $50 million projected for retail sales of Kikkoman's tofu in 1988. William Shurtleff believes that this figure at least 5 times too high. Address: Sales and Marketing Manager, Eastern Foods Corp., 3225 Hennepin Ave., Minneapolis, Minnesota 55413. Phone: 612-331-3353.

1247. Lamalle, Cecile. 1988. What's new in food world. *Post* (*New York, NY*). June 1.
• ***Summary:*** "Another product–though this one's never going to make it in Sheboygan, I predict–are the frozen soybean pods from Korea. You don't eat the pod, but you pop out and eat the soybeans inside: they make for a satisfying, high protein, gentle snack. Koreans enjoy these with a glass of

© Copyright Soyinfo Center 2021

beer. I loved them, but I'm afraid their taste is too subtle for palates dulled by the salty, sugary, MSG-laden snacks so favored by most Americans."

1248. *Toyo Shinpo* (*Soyfoods News*). 1988. Hyakkaten deno tôfu jitsuen hanbai hajimaru [Tofu is being made and sold in a department store in Korea]. June 1. p. 11. [Jap; eng+]
• ***Summary:*** In Seoul, Korea, there is a newly built department store, "Lotte World." In it there is a traditional tofu shop which uses a stone grinder to crush their soybeans. They had to get special permission to use a stone grinder, as they are generally considered unsanitary. Their shop is arranged so that shoppers can get a good look at how the tofu is being made, unlike the equivalent store in the Ikebukuro department store in Japan. There is also a counter where customers can eat their tofu. The store does not put the tofu in a water tank. The tofu is very firm.

1249. *Soybean Update.* 1988. Import of soybeans and soymeal on the rise. June 27.
• ***Summary:*** ... at an annual rate of 15% in Korea. Kyung Lee is director of ASA's office in Seoul, Korea. "Lee says soybean crushers in Korea have put together multi-million-dollar campaigns to promote soyoil as a cooking oil." However, Lee says ASA (The American Soybean Association) is "emphasizing cold uses of soybean oil. You can pour soyoil straight onto salads or fish."

"Crushers in Korea prefer U.S. soybeans over those from nearby China, mostly due to the inconsistency of the Chinese shipments."

1250. Harper, J.M. 1988. Feature personality: Interview with Mr. Mark H. Sterner on his work with LECs. *LEC Newsletter* 12(2):1-3. July.
• ***Summary:*** Beginning with this issue, the LEC Newsletter will feature one of these groups or individuals. We contacted Mark Sterner for our first profile, because he has been associated with the LEC project almost from the start of the concept. He has made a number of contributions to the literature and the world through the expertise he possesses."

"LEC: What are you currently involved with in your work?

"MHS: I am with Island Empire Foods, a company I started about three years ago."

"LEC: When did you first become interested in extrusion processing as a method for manufacturing soy-based foods?

"MHS: Back in 1970, by watching an extruder at Wenger Manufacturing operate in Sabetha, Kansas. Just seeing one operate and being somewhat amazed at the possibilities that exist started me thinking.

"LEC: After your initial exposure, you began work at Meals for Millions Foundation. What were you doing there?

"MHS: I was interested in becoming more familiar with extrusion, and the opportunity arose at Meals for Millions to set up a training program and a pilot lab for different companies to come in and do test work at Meals for Millions.

"LEC: What kind of extruders did you first have at Meals for Millions?"

"MHS: When I first started, they only had a Wenger X-5 on which we did some screw design work and parts changing to allow us to texturize protein. We sent a film to Wenger showing their X-5 texturizing protein, which was a first on this equipment.

"LEC: Didn't Meals for Millions mostly use Sprout-Waldron extruders?

"MHS: Sprout-Waldron had manufactured an extruder for the pet food industry and they wanted to get into human food products. They had enough interest and faith in it that they were willing to go ahead and donate a machine to Meals for Millions which we modernized to make it capable of texturizing protein."

LEC: Why did you move away from testing existing machines and start to design your own MFM extruder made from local parts? [found in developing countries].

MHS: People from developing countries who came to our training program where they learned to use extruders (made in the USA) couldn't afford such an imported extruder, so the need for a locally built extruder kept arising.

"LEC: Next, you designed a small-scale extrusion machine [the village texturizer] and provided plans to interested people. How many of these machines were manufactured?

"MHS: We don't really know exactly because we produced units at Meals for Millions and also through a joint venture with the Korea Institute of Science & Technology [KIST, Seoul, Korea] for their use in Korea and Asia.

"LEC: Is it still possible for people to get plans to build their own machine?

MHS: Yes, definitely from KIST and probably from Meals for Millions (P.O. Box 2000, Davis, California 95615 USA). Address: Inland Empire Foods, 1710 Palmyrita Ave., Suite 8, Riverside, California 92507.

1251. **Product Name:** [Sahm Yook Soymilk (Plain)].
**Foreign Name:** Sahm Yook Dou Ru.
**Manufacturer's Name:** Sahm Yook Korean Foods.
**Manufacturer's Address:** 320 Panjeong-ri, Jiksan-myun, Chunwon-gun, Choongchungnam-do 333-810, South Korea.
**Date of Introduction:** 1988 July.
**Ingredients:** Soy milk, high fructose corn syrup, corn oil, rapeseed oil, salt.
**Wt/Vol., Packaging, Price:** 200 ml Tetra Brik Aseptic carton. Retails for 220 Won (6/90).
**How Stored:** Shelf stable; refrigerate after opening.
**New Product–Documentation:** Talk with Eric C. Fehlberg. 1990. March 8. The Seventh-day Adventist food company in South Korea, Sahm Yook Foods, now makes soymilk (only plain, no flavors) packaged in Tetra Brik cartons and foil

© Copyright Soyinfo Center 2021

Doypack/Doynpack. The company was established in about 1978, and it began to make soymilk in May 1985. After launching soymilk, the company began to grow dramatically, as that product grew. Last year they built a very large, new soymilk plant (based on Adventist technology) and they are now about the 2nd or 3rd largest soymilk maker in Korea.

Label (Tetra Brik carton). Sent by Eric Fehlberg. 1990. March 12. 2.5 by 3.25 by 1.5 inches carton. Red, yellow, dark green, and light green on white. Front panel says "Soy Milk" and an illustration shows 3 yellow soybeans in a green pod.

Form filled out by C.Y. Yoon, General Manager, Sahmyook Korean Foods. 1990. June 23. Note that on the envelope the company name is printed Sahmyook Korean Foods, but the brand name is typed 4 times on the form as Sahm Yook. The address on the envelope is 320 Panjung Jiksan Chunwon Choongnam, Korea. The soy milk in a foil retort pouch was introduced in April 1985. The same product with the same ingredients was launched in a Tetra Brik carton in July 1987.

1252. Hymowitz, Ted. 1988. Dr. C.M. Woodworth and the start of modern soybean varieties. Thoughts on soybean breeding today (Interview). *SoyaScan Notes.* Aug. 1. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Ted considers 1921 to be the year that the soybean success story began in America. That was the year the Woodworth came to Illinois and became the first person in the U.S. to really look at the soybean from a technical, genetic point of view. That was when the first varieties started to be developed using genetic principles. He started the first hybridization program. Illini, a selection from AK (a mixture of "all kinds") and the first modern variety based on genetic principles, was released in 1927.

Ted is a soybean geneticist, not a breeder. A breeder develops varieties for commercial purposes; a geneticist studies inheritance. They are very different. The faster that university breeders are phased out, the better. Universities do not have the resources to compete. The cost is horrendous, and the results are marginal. Private companies have the resources to advertise, the facilities and computers and staff. Universities shouldn't be in that field. One main rationale was to have breeders to train other breeders. One problem with the companies is that they take from germplasm collections but do not return anything. That is causing a lot of trouble. There are a lot of hard feelings. The USDA soybean germplasm collections in Illinois and Mississippi are available free of charge with no questions asked to anyone (government, company, or individual) in the world, including the Third World. So it is a back and forth exchange. Last year they sent out something like 18,000 packets of soybeans. Only Cuba, North Korea, etc. can't order. Even the Soviets can order our soybean varieties.

Bogdan Belic (pronounced BEL-ich) was the man who sent Ted the early reference to the soybean in a monastery in Eastern Europe. He was a real scholar, a professor in the European sense, one who was not above advocating a cause such as Paul Erlich and Rachael Carson. Nowadays America produces narrow academic specialists, and few are hungry to learn. Address: Dep. of Agronomy, Univ. of Illinois, Urbana, IL.

1253. Weiss, Don; Weiss, Phyllis Wachob. 1988. Seoul food: beyond the kimchee barrier. *San Francisco Examiner* (*California*). Aug. 21. p. 149.
• ***Summary:*** "Special to the Examiner: The only Asian food on the official menu at the Los Angeles Olympics was kimchee, the spicy pickled vegetable dish of Korea. You can bet the menu will be a lot different at the 1988 Seoul Olympic Games."

Sesame seeds "make a nice compliment to the other inevitable ingredient of pulgogi, a thick red chili sauce called *kochujang.*"

1254. Drake, Milan. 1988. La Choy and other teriyaki sauces (Interview). *SoyaScan Notes.* Aug. 24. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** La Choy now makes and sells 2 teriyaki sauces, the regular and the new (1987) Thick and Rich, which is more of a basting sauce, similar to the Armour basting sauces. The regular was launched at least 20 years ago. He has been with the company for 16 years, now in charge of technical services. In about 1984 La Choy was acquired by Hunt-Wesson, and now much of La Choy's information is located in Fullerton, California. He is not aware of the S&W company. La Choy's big competitor for teriyaki sauce is Kikkoman. Chun King (Gino Pallouci), may have had an early teriyaki sauce, but no longer sells it, after Reynolds took them over.

Chun King started a lot of things then dropped them. Armour was in Chicago, probably now in Phoenix. La Choy no longer makes any fermented soy sauce; its now all hydrolyzed (HVP), and that is what goes into their teriyaki. They also add soy sauce to quite of few of their own products, such as egg rolls. Este Kiern of the Oriental Show-You Company, Columbia City, Indiana, is a super man, now in his 80s but looks like he's 50, and the best living source on the early U.S. soy sauce industry. Address: La Choy Food Products, Archbold, Ohio 43502.

1255. Chen, Edwin. 1988. Criminal charges filed over 'grossly filthy' tofu plant [K.Y. Foods]. *Los Angeles Times.* Aug. 30. p. 3. Metro section.
• ***Summary:*** The plant, at 4607 S. Main St., has been the subject of two previous criminal prosecutions, in 1979 and 1982, when it was owned by D.Y. Imports, which was acquired a year ago by K.Y. Foods.

Named in Monday's complaint were K.Y. Foods Inc.'s

© Copyright Soyinfo Center 2021

general manager, Taek Kwan Oh of Monterey Park, and president Kyu Yong Kim of Alhambra. Address: California.

1256. Hill-Holtzman, Nancy. 1988. Korean foodmaker charged with allowing fecal bacteria in its tofu. *Los Angeles Herald-Examiner.* Aug. 30.
• ***Summary:*** A Korean-style food manufacturer with a history of health violations was charged yesterday with 31 misdemeanors after inspectors found high levels of fecal bacteria in the firm's tofu products and decaying rodents in its warehouse. K.Y. Foods, under its former ownership of D.Y. Imports, was hit with criminal charges in 1979 and 1982 for health violations, Hahn said. In 1985, the company destroyed $30,000 worth of contaminated tofu during inspections.

The company's food products are sold under the brand names CR Brand, DY Brand and KY Foods.

KY Foods General Manager Taek Kwan Oh, 25 of Monterey Park and its president, Kyu Yong Kim, 53, of Alhambra, were named in the complaint. Address: California.

1257. *ASA Member Letter.* 1988. Lee wants to better the best in Korea. Aug. p. 2.
• ***Summary:*** With soybean imports increasing at an annual rate of 15% in Korea, Kyung Lee thinks the future is bright. "Soybean oil consumption still needs to be improved, and we're running promotion programs to get the message across." Lee said that soybean crushers in Korea have developed multimillion dollar campaigns to promote soyoil as a cooking oil. However, Lee said the American Soybean Association is taking a different approach. "We're emphasizing cold uses of soybean oil," Lee said. "You can pour soybean oil straight on salads or fish."

1258. *Toyo Shinpo* (*Soyfoods News*). 1988. Kankoku tônyû saisei choki e. Nihon no tônyû gyôkai wa teimei [Korean soymilk market starts to grow again. Japanese soymilk industry is in a low state]. Oct. 1. p. 14. [Jap; eng+]
• ***Summary:*** The Korean soymilk market, which rose and then fell like the Japanese soymilk market, is now re-entering a period of growth. According to a recent Korean newspaper, domestic soymilk sales from January to August, 1988 were 42,000 million won, up 20% over last year's figure. Sales are expected to increase during the winter at the end of this year, so total sales for the year are expected to reach 72,000 million won. The won is the Korean unit of currency.

1259. Yamauchi, Shoan. 1988. The Los Angeles tofu market (Interview). *SoyaScan Notes.* Oct. 23. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** The Los Angeles tofu market has become extremely competitive in recent years. There are at least 9 tofu manufacturers in the greater Los Angeles area, all run by Asian-Americans. The Japanese-American companies, ranked in descending order of size are: House Foods & Yamauchi Inc., Aloha Products (Culver City), and Meiji Tofu. The Chinese-American companies, ranked by size, are American Food Co. (Mr. Jackson Wu), Mighty Soy, Soyfoods of America (Ken Lee), Wy Ky, and Visoy. The only Korean company is Obok in Orange County. Address: House Foods & Yamauchi Inc., 526 S. Stanford Ave., Los Angeles, California 90013. Phone: 213-624-3615.

1260. Bernard, Richard L.; Juvik, Gail A.; Hartwig, Edgar E.; Edwards, Calton J., Jr. 1988. Origins and pedigrees of public soybean varieties in the United States and Canada. *USDA Technical Bulletin* No. 1746. 68 p. Oct. [20 ref]
• ***Summary:*** Contents: Old domestic varieties. Modern domestic varieties from public institutions. Germplasm resources information network. Tables: 1. Number of U.S. and Canadian soybean varieties by maturity group. 2. Number of U.S. and Canadian soybean varieties by country of origin. 3. Origins and pedigrees of old domestic soybean varieties. 4. Lost old domestic soybean varieties. 5. Literature on old domestic soybean varieties in chronological order. 6. Origins and pedigrees of modern domestic soybean varieties from public institutions. 7. Genetic information on backcross-derived public soybean varieties. 8. Genetic information on backcross-derived soybean parental lines. 9. Public soybean variety registrations and licenses. 10. Corrections to published pedigree information.

Abstract: "In this report are described the origins of the 440 U.S. and Canadian soybean varieties that are maintained in the USDA Germplasm Collection at Urbana, Illinois, and Stoneville, Mississippi. Varieties in commercial use before the mid-1940's were mostly introductions, and this report includes for each the geographic place of origin, the person or institution that provided the seeds, the foreign variety name (if any), as well as information about when it was released and who released it in the United States or Canada. Modern varieties have been developed by hybridization and selection. In this bulletin, the pedigree is specified and where and when each variety was developed and released. This information allows researchers and breeders to trace modern soybean varieties back to their introduced ancestors and facilitates breeding plans and evaluation of the germplasm base of the current commercial soybean crop."

Table 4, titled "Lost old domestic varieties," lists the source of each: Acme–PI 14.954 from Shanghai, China, in 1905. Akasoya–From Japan via Indiana. Allison Black–D.T. Allison, Tennessee. Amherst–PI 4.913 (PI 17.275) from Japan in 1900. Arikara–O. Will Company, North Dakota. Arkan–PI 87.050 from Niummen, Keisho Nando, Korea, in 1930. Arksoy 2913–Arkansas Experiment Station, Marianna (similar to 'Arksoy'). Auburn–PI 21.079A from Tieling, Manchuria, China, in 1907. Baird–PI 6.414 (PI 22.333) from Pyongyang [P'yongyang], Korea, in 1901. Biltan–Selection

from 'Otootan', South Africa.

Brindle–PI 20.407 from Merkoechofka, Siberia, in 1906. Brooks–PI 16.789 from Hangchow, China, in 1905. Brownie–PI 6.414 (PI 17.256) from Pyongyang, Korea, in 1901. Buckshot–PI 6.334 (PI 17.251) from Tokyo, Japan, in 1901. Burnette–From Farmville, North Carolina. Butterball–PI 8.433 (PI 17.273) from Japan in 1902, via Rhode Island AES [Agricultural Experiment Station] in 1903. Chame–PI 80.473 from Tokyo, Japan, in 1929. Chang–PI 54.610-2 from Changchun, Kirin, China, in 1921. Chernie–PI 18.227 from Khabarovsk, Siberia, in 1906. Chinaton Echo–From Harrow, Ontario, Canada.

Chiquita–PI 27.707 from Hankow, China, in 1910. Chuku–La Choy Company, Ohio. Cibao–From El Salvador. Delnoshat–Delta Station selection 6679, Mississippi. Delredo–From Mississippi. DeSoto–Ohio farmer. Dortchsoy No. 2–Dortch Seed Company, Arkansas (selected from 'Ogden', similar to 'Ogden'). Dortchsoy No. 6–Dortch Seed Company, Arkansas. Dortchsoy No. 7–Dortch See Company, Arkansas. Doxie–Georgia Experiment Station.

Duggar–PI 17.268C, a selection from 'Ito San.' Early Brown–PI 25.130 and PI 25.161 from Tennessee AES and Indiana AES in 1909. Eda–PI 17.257 from Japan in 1890. Edgecombe–R.P. Cocke, Williamsburg, Virginia. Edna–PI 6.312 (PI 17.252C) from Tokyo, Japan, in 1901. Edward–PI 14.953 from Shanghai, China, in 1905. Fairchild–PI 19.184 from Newchwang, Manchuria, China, in 1906. Farnham–PI 22.312 from Shanghai, China, in 1908. Feed All–A.M. Johnson, North Carolina. Flat King–PI 6.312 (PI 17.252) from Tokyo, Japan, in 1901.

Flava–PI 16.789A from Hangchow, China, in 1905. Gala–Georgia Experiment Station. Gem–P.B. Hutchins, Missouri. George Washington–From Virginia. Giant Yellow–PI 22.415 from Naples, Italy, in 1908. Golden–Harrow Experiment Station, Ontario, Canada. Goshen Prolific–Farmer selection, North Carolina. Hamilton–From USDA number 23 by Ohio Experiment Station in 1909. Hankow–PI 6.559 from beyond Chiu Niu, China, in 1901. Hansen–PI 20.409 from Merkoechofka, Siberia, in 1906.

Hay Boy–Farmer selection, North Carolina. Herman–From North Carolina. Hiro–PI 86.038 from Obihiro, Hokkaido, Japan, in 1930. Hope–PI 6.335 (PI 17.267) from Tokyo, Japan, in 1901. Ignotum–E.E. Evans, Michigan. Italian–Canada Experiment Station. Ito San–PI 17.268 from Japan in 1890. Jet–PI 17.861 from Sachon, China, in 1906. Johnsoy–A.E. Johnson, North Carolina. Kentucky A–Kentucky Experiment Station selection.

Kia–Illinois Experiment Station selection. Kungchuling–From Manchuria, China. Looney No. 2–Farmer selection, Tennessee. Lowrie–PI 22.898A from Paotingfu, Chihli, China, in 1908. Loxitan–Delta Experiment Station selection, Mississippi. Ludeke–Farmer selection, North Carolina. LZ–Louisiana Experiment Station selection. Mammoth Brown–Unknown. Manhattan–PI 6.333 (PI 17.277) from Tokyo, Japan, in 1901. Matthews–Farmer selection, Georgia.

Merko–PI 20.412 from Merkoechofka, Siberia, in 1906. Meyer–PI 17.852 from Peking, China, in 1906. Midunk–Funk Brothers Seed Company, Illinois. Mikado–Farmer selection, Indiana. Misstucky–Farmer selection, Kentucky. Morgan–PI 22.633 from Sheklung, Kwongtung [Kwangtung / Guangdong], China, in 1908. Mount Carmel–PI 70.218-2 from Wuchiatzu, Manchuria, China, in 1926. Mukden No. 4–Wisconsin Experiment Station selection. Nanking–PI 71.597 from Nanking, China, in 1927 (see CNS, p. 6). Nanksoy–PI 104.881 from Nanking, China, in 1934.

Nansemond Early–Farmer selection, Virginia. Natsu–PI 19.984 from Yokohama, Japan, in 1907. Nemo–PI 19.985 from Yokohama, Japan, in 1907. Nielsen–PI 22.644B from Hangchow, Chekiang, China, in 1908. Nigra–PI 22.407 from Hong Kong, China, in 1908. Nuttall–PI 6.416 (PI 17.253) from Pyongyang, Korea, in 1901. Okute–PI 19.986 from Yokohama, Japan, in 1907. Oloxi–Coker's Seed Company, South Carolina. Otoxi–From South Africa. Ozark–PI 37.272 from Kogen Province, Korea, in 1914.

Pee Dee–Coker's Seed Company, South Carolina. Pingsu–PI 18.259 from Tschang-ping-tsu, China, in 1906. Preston–Virginia Experiment Station selection. Quillian–Farmer selection, Oklahoma. Rattlesnake–Kentucky Experiment Station selection. Riceland–PI 20.797 from Shanghai, China, in 1907. Rila–Marsh Foundation, Ohio. Sainte Anne–Canada Experiment Station selection. Samarow–PI 17.260 from J.M. Thorburn and Company in 1902. Saskatoon–Farmer selection, Canada.

Sedo–PI 23.229 from Tientsin, Chihli, China, in 1908. Sherwood–PI 17.862 from Tientsin, China, in 1906. Southern Green–PI 62.839 from Nanking, China, in 1925. Southern Prolific–PI 37.250 from Keiki Province, Korea, in 1914. Stuart–PI 22.644 from Hangchow, Chekiang, China, in 1908. Summerland–Canada Experiment Station selection [British Columbia]. Suru–PI 89.128 from Kyojo, Korea, in 1930. Swan–PI 22.379 from Canton, Kwangtung, China, in 1908. Taha–PI 21.999 from Boshan, Shantung, China, in 1907. Tanloxi–Delta Station selection 483, Mississippi.

Tashing–PI 20.854 from Harbin, Manchuria, China, in 1907. Tensas–PI 104.881 from Nanking, China, in 1934 (same as Nanksoy). Texoil–Farmer selection, Texas. Tinzan–From Australia. Trenton–PI 24.610, a selection from 'Mammoth (Yellow)' in Kentucky in 1904. Trinitaria–From El Salvador. U.S.-5–PI 54.563-5 from Jungchiangko, Shengking [Liaoning], China, in 1921. Vilnensis–From Poland. Vireo–PI 22.874 from Tokyo, Japan, in 1908. White Eyebrow–PI 30.745 from Wulukai, Kirin, China, in 1911.

Yellow Biloxi–North Carolina Experiment Station selection. Yokotenn–PI 19.981 from Yokohama, Japan, in 1907. Yosho–PI 6.314 (PI 17.262) from Tokyo, Japan, in 1901.

Talk with Dr. Richard Bernard. 1998. July 12. He considers this to be his best publication on this subject, but

it is quite similar to *INTSOY Series* No. 30 titled "USDA soybean germplasm collection inventory. Vol. 1," published in August 1987. Address: 1-2. Urbana, Illinois; 3-4. Stoneville, Mississippi.

1261. Karta, Susani K. 1988. Market trends in the development of traditional soyfood. Paper presented at the ASEAN Food Conference '88: Food Science and Technology in Industrial Development. 18 p. Held 24-26 Oct. 1988 at Bangkok, Thailand.
• ***Summary:*** Contents: Introduction. Traditional soyfood. Market situation and trends. Indonesia. Singapore. Malaysia. Thailand. Constraints in the market development of soyfood (in each of the above 4 nations). Major trends in the development of traditional soyfoods. Marketing strategy of soyfood. Tables: 1. Traditional non-fermented soyfood products. 2. Nutritional composition of traditional non-fermented soyfoods. 3. Description and uses of traditional fermented soyfood products. 4. Nutritional composition of traditional fermented soyfoods.

5. 1987 estimated consumption of soybeans as foods in the Far East [total and per capita in East Asia]. China, 1,062 million population, 7,325,000 tonnes, 6.9 kg/capita. Japan, 122 million population, 1,141,000 tonnes, 9.3 kg/capita. South Korea, 42.1 million population, 330,000 tonnes, 7.8 kg/capita. Taiwan, 19.6 million population, 260,000 tonnes, 13.3 kg/capita.

6. Southeast Asia soybean consumption for food. From 1983 to 1989 the increase in 1,000 metric tons was: Indonesia 927 to 1,600. Singapore 14 to 26. Malaysia 32 to 70. Thailand 40 to 150. Philippines 9 to 24. Total 1,022 to 1,870 (increase of 82.9% in 7 years).

7. Per capita soybean consumption for food in Southeast Asia. From 1983 to 1989 the increase in kg/person was: Indonesia 6.0 to 8.8. Singapore 5.6 to 10.5. Malaysia 2.1 to 3.7. Thailand 0.8 to 2.6. Philippines 0.2 to 0.5. Average total: 3.8 to 5.9 (increase of 55.3% in 7 years).

8. 1987 estimated consumption of soybeans as foods in Southeast Asia [total and per capita]. Indonesia, 175 million population, 1,575,000 tonnes, 9.0 kg/capita. Thailand, 53.6 million population, 118,000 tonnes, 2.2 kg/capita. Malaysia, 16.1 million population, 55,000 tonnes, 3.4 kg/capita. Singapore, 2.6 million population, 20,000 tonnes, 7.7 kg/capita. Philippines, 61.5 million population, 18,000 tonnes, 0.3 kg/capita.

9. Indonesian soybean production, imports, and consumption as food (in tonnes). From 1983 to 1989, production rose from 536,000 to 1,250,000, imports decreased from 391,000 to 350,000, and the amount consumed as food increased from 927,000 to 1,600,000. About 50% of the soybeans used for foods in Indonesia go to make tempeh, and 40% are used to make tofu.

10. Singapore soybean consumption as food. From 1983 to 1989 the amount increased from 14,000 tonnes to 26,000 tonnes. Most of these soybeans are used to make tofu and soymilk. 11. Malaysia soybean imports and consumption as food (in tonnes). From 1983 to 1989, production rose from 182,000 to 440,000, and the amount consumed as food increased from 32,000 to 70,000. 12. Thailand soybean production, and consumption as food (in tonnes). From 1983 to 1989, production rose from 113,000 to 490,000, and the amount consumed as food increased from 40,000 to 150,000. Only in 1988 were soybeans imported–40,000 tonnes. This growth of soyfood consumption is due partially to the Government of Thailand's interest in promoting the awareness and utilization of soyfood products. The Thailand Agricultural Extension Service program and other institutions have been actively advocating of soyfoods into the food industry and the human diet, especially in rural areas. The government controls soybean imports by issuing licenses.

In summary: The soybeans with the highest per capita soybean consumption for soyfoods are: Taiwan 13.3 kg, Japan 9.3 kg, Indonesia 9.0 kg, Singapore 7.7 kg, South Korea 7.3 kg, and China 6.9 kg. The greatest potential for growth lies in China, where it is very common to find markets running out of soyfoods early in the morning. There is also great potential for growth in Malaysia, Thailand, and the Philippines. Address: American Soybean Assoc., 541 Orchard Rd., #11-03 Liat Towers, Singapore 0923, Republic of Singapore.

1262. Meyer, Amy. 1988. The soy sauce market in America (Interview). *SoyaScan Notes.* Nov. 1. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Total soy sauce sales in the U.S. are about $125 million for 1987. The major market segments are consumer retail, restaurants and institutions, and industrial/food processors. The latter is estimated at about $4 million. The figures compiled annually by Progressive Grocer only cover grocery stores.

La Choy is the leader is retail sales, followed by Kikkoman, then Chun King. Kikkoman is the leader in sales to restaurants, followed by Yamasa, then Chinese imports.

Last year San-J sold about $5 million worth of soy sauce in the U.S. Of this, $3 million went to industry (food processors) and $2 million to retail (mostly health food). Amy is gathering this information for publication in a professional journal, probably the *Journal of International Marketing.* Address: 21 Beacon St. #10, Boston, Massachusetts 02108. Phone: 617-523-3780.

1263. Nordquist, Ted. 1988. Brief early history of Aros Sojaprodukter in Sweden (Interview). *SoyaScan Notes.* Nov. 22-24. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Ted Nordquist, the foremost soyfoods and tofu pioneer in Sweden and in Scandinavia, founded Aros Sojaprodukter and started making tofu there in Feb. 1981.

© Copyright Soyinfo Center 2021

Born on 10 Dec. 1945 in Oakland and raised in California, Ted graduated from Alameda High School (Alameda, California) in 1963. He attended college at Cal Poly in San Luis Obispo. During his sophomore year he won a scholarship from the California State International Programs to spend his sophomore year at the University of Uppsala in Sweden, where he arrived in September 1965. He studied Swedish his first year, and then took classes in Swedish. He also studied Swedish for a year at Stockholm. Ted lived in Stockholm from Sept. 1967 to Sept. 1968. He then moved to Uppsala, where on 26 March 1969 he "ran into" a Swedish woman named Anne-Marie Karlson at a grocery store. "I asked her out to a movie and after the movie a cup of hot chocolate. We have been together ever since."

Returning to Cal Poly he graduated in Aug. 1968 with a BSc degree in Industrial Arts. He was then accepted for international graduate school at Stockholm University, where he arrived in Sept. 1968. After 1 year of study he entered a PhD program at Uppsala University in Sept. 1969, doing research on problems of developing countries and working in a mental hospital.

On 9 Jan. 1971 he was married in Golden Gate Park, California to Anne-Marie Karlson. The marriage ceremony was performed by Dr. Haridas Chaudhuri, President of the Cultural Integration Fellowship and California Institute of Asian Studies (in San Francisco).

In the summer of 1971 he completed his oral examinations for the political science degree, but still had to write his thesis. Then the U.S. government tried to draft him into the military to go to Vietnam. The American Friends' Service Committee (Quaker) helped him to obtain Conscientious Objector status. He did his alternative service at the California Institute of Asian Studies in San Francisco under Dr. Haridas Chaudhuri, as director of research. While at the Institute, Ted also took (for graduate credit) several years of Sanskrit and comparative religion and philosophy. At the time Ted was thinking of taking a PhD degree at the California Institute of Asian Studies.

At about this time Andreas, Ted and Anne-Marie's first child (and son) was born on 3 Sept. 1973 at St. Francis Hospital in San Francisco.

After going back and forth on the idea, Ted and Anne-Marie decided to go back to Uppsala–which they did just before Christmas, 1973. Ted had applied for and received a grant to write his dissertation. In Sweden, Ted returned to the department of political science at Uppsala and told them he wanted to do his dissertation on Auroville, the famous spiritual center founded by Sri Aurobindu in southeast India. Ted wanted to write on the cultural & political aspect of the community there. But the political science authorities didn't feel competent to let Ted do that. "It was very strange to them. So they sent me to the department of philosophy, which sent me to the theology faculty. None of them agreed to let me do my dissertation on Auroville." But then Ted found a way around the problem. He had read about Dag Hammarskjöld (the Swedish diplomat, economist, and author) and in pursuing this interest he met a man who had the chair of the faculty of the history of religion in the humanities (not theology); he lived in the old tower building behind the cathedral at Uppsala. He said that he would serve as Ted's advisor, but that Ted would first have to take a degree in the history of religion before writing his thesis on Auroville. So Ted got a Swedish bachelor's degree in history of religion–but with a lot of credit for his previous work at the California Institute of Asian Studies. Instead of the typical 3 years, it took Ted only about one year to get his degree. All of Ted's reading and classes (since 1969) were in Swedish. Ted's grant to write the thesis was transferred to the history of religion department. But before he could write his thesis, Ted applied for a grant to go to Auroville, India–which he was unable to get.

Ted had been in communication with Kriyananda (see color photo; born James Donald Walters in 1926; he was a direct disciple of the great Paramahansa Yogananda), so he decided to return to California. He and Anne-Marie went to New York in July 1975, bought a Volkswagen bus, and drove to California and the Ananda ashram. Ted had a $250/month grant to do his dissertation. Ted and his family went to Ananda with a tent and sleeping bags. Ted was there for 12 months and during that time he did all the field work and research for his dissertation. Anne-Marie ended up going back to Sweden with Andreas, who was only 2 years old at the time.

In Oct. 1975 Ted and Janet Fehring (Ahava) met Bill Shurtleff, Akiko, and Bobbie Shurtleff (Bill's mother) at Ananda Cooperative Village, where Bill and Akiko had been invited to do a program on tofu. Afterwards the five went hiking at Echo Lake, Desolation Valley, and Lake Tahoe.

Then Ted started making and selling a tofu kit in Alameda. On 14 Jan. 1976 Ted and Janet attended a lecture on tofu that Bill and Akiko presented at the Berkeley Co-op, and helped prepare a tofu dip. Ted's father, Leo, had become very ill with cancer and Ted was making him fresh tofu, one of the few foods he could digest, every morning. In Jan. 1976 Ted's father died in Alameda.

Ted stayed in the USA until March, went back to Sweden for a short visit to see Anne-Marie, then returned to California to help his mom sell her house. In Sept. 1976 he returned to Sweden permanently. For the next two years, he wrote his dissertation, had it published in book form, and defended it in June 1978. His dissertation was titled *Ananda Cooperative Village, a Yoga Community in California.* That same month Ted got his PhD degree at the Univ. of Uppsala with his thesis on the history of Ananda Cooperative Village.

But by this time Ted was already working at the Univ. of Uppsala as a research assistant (with a hefty salary) and teaching. He was teaching social psychology of religion. In about 1978 Ted met Tim Öhlund (Ohlund) in Sweden.

© Copyright Soyinfo Center 2021

Tim was taking night classes in traditional Asian foods. They started talking about tofu and Tim suggested that Ted give a class on tofu as part of the course Tim was taking. With about 30 people in attendance, Ted made tofu and then showed slides. There was a lot of interest in the subject and various health organizations started asking Ted to do classes and demonstrate tofu. This turned into Ted's hobby. But in late 1978 and early 1979 he started thinking it would be interesting to start a business on the side, while still working and teaching at the university.

In 1979 Ted visited Traditional Tofu Co. in Oakland, and first saw tofu made on a commercial scale. In Feb. 1980 Ted founded Aros Sojaprodukter in Uppsala, then from June to Dec. Ted and his wife's (Anne-Marie's) father renovated a soft drink factory in Örsundsbro (about 25 minutes by car from Uppsala) to make it a tofu plant. It was the perfect facility; it was inexpensive ($175/month), the room they planned to use to make tofu had plenty of water and electrical outlets, as well as floor drains. Ted was able to assemble the funding by mid-1978. Part of the money came from a loan from Ted's mom. A Korean professor named Kim also invested with a buy-out option. The lady who owns Sweden's largest health food store also gave Ted a loan.

That December Ted installed Japanese (Takai) tofu equipment in the plant. In Feb. 1981 Ted and Tim Ohlund started tofu production, water packed. At about the same time their Book of Tofu was published in Swedish. By fall, they started vacuum packing with in shallow plastic trays.

In the summer of 1984 Ted quit working at the university and devoted all his time and effort to Aros Sojaprodukter. Address: Orsundsbro, Sweden. Phone: 0171-604 56.

1264. Chen, Edwin. 1988. Tofu maker closed for 2 years for filthy plant. *Los Angeles Times.* Dec. 6. p. 1, 8.
• ***Summary:*** K.Y. Foods, a major West Coast producer and supplier of tofu and other Asian-style fare, on Monday was banned from operating for two years and ordered to pay more than $20,000 in fines and other penalties as a result of grossly unsanitary conditions at its Los Angeles plant. In exchange for a no-contest plea, charges against two K.Y. executive–General Manager Taek Kwan Oh, 25 of Monterey Park, and President Kyu Yong Kim, 53, of Alhambra–were dropped by the Los Angeles city attorney's office.

The plant at 4607 S. Main St., had been the subject of two previous criminal prosecutions in 1979 and 1982 when it was owned by D.Y. Imports which was acquired in July 1987 by K.Y. Foods. K.Y. products were sold in Los Angeles, San Francisco and in parts of Colorado and Nevada under the brand names of CR Brand, DY Brand and KY Foods. In 1979 the D.Y. Imports plant pleaded no contest to five counts of health violations and paid a $3,150 fine. In 1982, it pleaded no contest to another six health code violations and paid a $3,400 fine. Similar conditions in 1985 prompted health officials to issue a recall of tofu made at the plant.

1265. **Product Name:** Smoked Tofu, Teriyaki Tofu, Homestyle Tofu Balls, Gourmet [Nigari] Firm Tofu, Fiber Tofu, BBQ Tofu.
**Manufacturer's Name:** Dae Han, Inc.
**Manufacturer's Address:** 737 S.E. Alder St., Portland, OR 97214. Phone: 503-233-8638.
**Date of Introduction:** 1988 December.
**Ingredients:** No ingredients given on labels.
**How Stored:** Refrigerated.
**New Product–Documentation:** Talk with Paul Moss, who has worked with Dae Han for 7 years. The company name is now Dae Han, Inc., 737 S.E. Alder St., Portland, Oregon 97214. Phone: 503-233-8638. They now make tofu, smoked (& baked) tofu (7.5 oz), regular and cajun-style tofu burgers, homestyle tofu balls (5.25 oz), soymilk, teriyaki tofu (7.5 oz), fiber tofu (10 oz), BBQ (barbecue) tofu (7.5 oz), and kimchi. All the products listed above were introduced in Dec. 1988. Paul plans to use their plant to make tempeh.

Labels for each of these products sent by Paul Moss. 1990. May 10. 4 by 2.5 inches. Self adhesive. Colorful. On each label is written "High protein. Low calorie. Cholesterol free. No preservatives. (Keep Refrigerated)." The Gourmet firm tofu is certified kosher by Rabbi Yonah H. Geller.

Leaflet from Dae Han, Inc. 1991. July. Quality and unique. A photo shows all of the products, and their names are listed.

1266. **Product Name:** Tofu Burger [BBQ Style, or Cajun Style].
**Manufacturer's Name:** Dae Han, Inc.
**Manufacturer's Address:** 737 S.E. Alder St., Portland, OR 97214. Phone: 503-233-8638.
**Date of Introduction:** 1988 December.
**Ingredients:** No ingredients given on labels.
**Wt/Vol., Packaging, Price:** 7 oz.
**How Stored:** Refrigerated.
**New Product–Documentation:** Talk with Paul Moss, who has worked with Dae Han for 7 years. 1990. March 28. The company now makes these 2 burgers, which were introduced in Dec. 1988.

Labels sent by Paul Moss. 1990. May 10. 4.5 by 3 inches, oval. Self adhesive. Dark brown, light brown, red, black, and white. On each label is written "High protein. Low calorie. Cholesterol free. No preservatives. (Keep Refrigerated)."

Leaflet from Dae Han, Inc. 1991. July. Quality and unique. A photo shows all of the products, and their names are listed. The company also makes kim chee (mild or spicy).

(doenjang) and soysauce (kanjang) by traditional method. *J. of Food Protection* 51(12):938-45. Dec. [26 ref]
• ***Summary:*** "Aflatoxin (AF) production and its stability on meju (crushed Korean soybean cake) by a pure culture of *Aspergillus parasiticus* and a mixed culture of *A. parasiticus. A. oryzae* and *Bacillus subtilis* (fermentation 1) during the manufacture by traditional methods of Korean soy paste (doenjang) and soy sauce (kanjang) were studied. There was a difference in the amount of aflatoxin production on different varieties of soybeans, but the pattern of toxin production was similar."

"Doenjang (fermented soy paste) and kanjang (fermented soy sauce) are the most important soybean products in Korea."

Note: This is the earliest English-language document seen (April 2021) that uses the term "soypaste" to refer to a type of miso. Address: 1-2. Dep. of Food Science and Nutrition, Pusan National Univ., Pusan, Korea.

1268. *FAO Yearbook–Production.* 1988-2004. Serial/periodical. Rome, Italy: Food and Agricultural Organization of the United Nations. Yearly. ca. 350 p.
• ***Summary:*** See also the earlier FAO Production Yearbook, of which Vol. 12 was 1958.

Address: Gyeongsang National Univ., Chinju Coll. of Agriculture, South Korea.

1270. **Product Name:** La Choy Lite Soy Sauce.
**Manufacturer's Name:** La Choy Food Products. Div. of Beatrice/Hunt-Wesson, Inc.
**Manufacturer's Address:** 901 Stryker St., Archbold, OH 43502.
**Date of Introduction:** 1988.
**Wt/Vol., Packaging, Price:** 10 oz bottle retails for $1.39 (3/89).
**How Stored:** Shelf stable.
**New Product–Documentation:** Ad in Cooking Light. 1989. Jan/Feb. p. 103. "Revolutionary China. New La Choy Lite Soy Sauce. It's based on the idea that less sodium doesn't have to mean less taste. So it has 47% less sodium than regular soy sauce. And the great taste that beat Kikkoman Lite 2 to 1."

Sun-Tattler (Hollywood, Florida). 1989. March 16. This product contains 110 mg of sodium per ½ teaspoon. It also contains preservatives.

1271. Cost, Bruce. 1988. Asian ingredients: Buying and cooking the staple foods of China, Japan and Southwest Asia. New York, NY: William Morrow & Co. 333 p. Illust. Index. 27 cm. [39 ref]
• ***Summary:*** Soy related: Soybean sprouts and recipe (p. 86). Beans, incl. soybeans (p. 146-50). Asian "dairy" (p. 186-87): The soybean and the coconut (incl. bean curd, doufu-nao, fermented bean curd / fu-ru, molded bean curd / chou dou-fu, dried bean curd / dou-fu gan, and bean curd skin [yuba]. Soybean milk.

Soybean sauces, condiments and pastes (p. 195-211): Salted and fermented black beans with recipes for "Roast chicken with black beans stuffed under the skin," and "Soft-shell crabs with ginger, lemon, and black beans" ("Fermented black beans, often flavored with bits of ginger and sometimes orange peel, are usually sold in 8-ounce plastic bags." Acceptable brands: Mee Chun or Koon Chun Sauce Factory. "Earthier and probably more classic are the Yang Jiang Preserved Beans (with ginger) from Kwangtung, China), bean sauce (other names: Yellow bean sauce, brown beans sauce, bean paste, jiang; two types are with the beans whole or ground), hot bean sauce / paste with recipe, hoisin sauce, sweet bean sauce (made with soybeans [probably tian mian jiang, p. 202], Taiwan), soy sauce (Chinese, Japanese, tamari; Highly recommended light soy sauce: Pearl River Bridge. Highly recommended dark: Pearl River Bridge Mushroom Soy, flavored with straw mushrooms), Java's ketjap and other soy sauces miso with recipe, yellow miso (*Shinshu miso*), white miso (*shiro miso, Kyoto shiro miso*, sweet white miso), red miso (*aka miso*), Hatcho miso [soybean miso], barley miso (*mugi miso*), fermented bean curd (white or red; also called preserved bean curd, wet bean curd, bean cheese, dou-fu ru or fu-ru {Mandarin}, fu yu {Cantonese}) with two recipes).

"Red fermented bean curd" is described on pages 210 (also called "red bean cheese"), 211, and 283 (together with "red rice").

Concerning ketjap (p. 206): Tomato ketchup, although it may seem to be of Asian origin, may or may not come from a family of Asian pickled products. But the word "ketchup" is clearly of Asian origin. [Note: The modern Indonesian word for soy sauce is *kecap / ketjap / kechap.*] "It comes from the Malay *kechap*, which apparently derives from the *kôe-chiap* of a southern Chinese dialect (Amoy); both of these refer to the kind of briny liquid preserves that include fish and soy sauces." Throughout most of Southeast Asia, fish sauces are the standard condiment, in Indonesia (incl. Java) soy sauce is more widely used. Sweet Indonesian soy sauce (*ketjap manis*), which is very widely used, is traditionally sweetened with palm syrup and seasoned with garlic, star anise, salam leaves, and galangal.

Also discusses: Seaweed (p. 165-70): Kelp (Laminaria), laver (Porphyra), wakame, dashi, hair vegetable / black moss / hairlike vegetable (China; Gracilaria verrucosa), agar-agar. Monosodium glutamate (p. 247)

Bruce Cost was born in 1945. A photo and brief biography appears on the inside rear dust jacket. Address:

1272. Kloppenburg, Jack Ralph, Jr. ed. 1988. Seeds and sovereignty: The use and control of plant genetic resources. Durham, North Carolina: Duke University Press. viii + 368 p. Index. 24 cm. Published in cooperation with the American Association for the Advancement of Science. [100+* ref]
• ***Summary:*** This book contains 16 chapters by various authors, divided into four sections. References are found at the end of each chapter. See also Kloppenburg's chapter titled "Seeds of Struggle."

Soybeans are mentioned in several places: They were introduced to the USA from Manchuria, Korea, China, and Japan (p. 70-71).

The potato was in Europe for more than 150 years before it became a successful crop; the soybean was in the USA for more than 100 years before it became successful (p. 87-88).

In Chapter 7, titled "The contribution of exotic germplasm to American agriculture," by Thomas S Cox, J. Paul Murphy, and Major M. Goodman, is a section devoted to "Soybeans (*Glycine max*)" (p. 130-32). Address: Asst. Prof. of Rural Sociology, Univ. of Wisconsin, Madison.

1273. Lautensach, Hermann; Dege, Katherine; Dege, Eckhart. 1988. Korea: A geography based on the author's travels and literature. Translated from the German. Supplemented with a thoroughly revised and expanded index. And edited by Katherine and Eckhart Dege. Berlin, Heidelberg, New York, London, Paris, Tokyo: Springer-Verlag. xvii + 598 p. See p. 20, 160, 174, 180-81, 201, 203, 229, 420-21, 452, 476, 482, 488. Illust. Maps (some color). 26 cm. [936* ref]
• ***Summary:*** "With 42 photographs, 95 diagrams, 46 tables and a [larger color] map." This classic was first published 40 years ago (a few months before the end of World War II) and the field work was done 50 years ago, when Japan still ruled Korea and all place names were Japanese; these names have all been updated.

Vavilov classes soybeans among the plants that originated in the East Asian grain gene pool, and he includes Korea in the gene pool. Thus it is "quite possible" that soybeans were domesticated in Korea itself. Hulbert (1902) includes among the non-Chinese crops black soybeans, two of the three kinds of kaoliang, wild sesame (Perilla), and buckwheat (p. 20).

On page 21 is a very interesting "Chronological table of Korean history. Comparison with Chinese and Japanese history." A major change took place in 680 AD when the Three Hans [Three kingdoms] (Tribal Leagues; Koguryo [Gouryeo, in the north], Paekche [Baekje, in the southwest], and Shilla [Silla, in the central and south east]) merged into one, named Silla. In 918-925 it became Koryô [Kingdom of Goryeo; Wang Dynasty], which in July 1392 became Chosôn [Joseon Dynasty; Yi Dynasty], that lasted until August 1910 when the Japan-Korea Annexation Treaty was enforced by the Empire of Japan.

Chapter 6, titled "The anthropogeographical character of ancient Korea" (p. 149+) contains extensive information about agriculture and food. Page 160: In wealthier sites, the farm buildings enclose a courtyard, to which an entrance gate gives access (Fig. 37c, p. 158). Some enclosures are so complete that a square courtyard results. "In some corner or other of the courtyard stand the huge brown earthenware jars, in which soy sauce (Jap. *shoyu*, Kor. *kanjang*) is prepared and stored."

Nature and traditional culture: Plants found between the subtropical zone and the temperate zone include soybeans, foxtail millet, maize, and hemp. Since ancient times, rice has been Korea's most important cereal crop. The great majority of it is grown in irrigated paddies. Paddy rice (an aquatic plant) has a different name in Korea from upland rice. Hubert (1902, p. 108) mentioned eight varieties of rice grown in traditional Korea, including glutinous rice, whose flour is made into rice cakes by mixing it with water and spicy herbs, then beating the cold mass for a long time with wooden hammers (p. 174).

Page 180: In East Asia, after cereal grains, pulses / legumes are the next most important crop. In Korea, by far the most important is the soybean (Kor. *k'ong*), which makes few demands on the soil. Korea's climate is ideal for soybeans (Tanaka 1931, p. 18); it is even better than Manchuria's climate, because of the large amount of precipitation during the summer. Today, soybeans are an indispensable part of the various dry-field crop rotations. After planting of the paddies has finished, soybeans are planted on the ridges too; there they grow extremely well without being fertilized. Soybeans are grown throughout Korea, but least in the Kaema upland because of the warmth they require. In northern Korea, on dry fields, they are planted between the end of March and beginning of May. Toward the south, planting is delayed until the end of June. They are generally harvested in October, except in Chejudo, where they are not harvested until early November. Soybeans are the crop that is left standing the longest, and they are not harvested until their leaves have turned brown and started to fall.

Soybeans are used as a very nutritious food for both humans and horses. Also, cooked soybeans are used as a fertilizer for the rice paddies. "Above all, though, the hot brown soy sauce, which is never lacking on any Korean or Japanese table, is made of them, using salt and pepper and a process of fermentation. Bean curd (Kor. *tubu*, Jap. *tofu*) and soybean paste (Kor. *toenjang*, Jap. *miso*) are also made of them."

Adzuki beans, cotton and hemp are discussed on p. 181.

The Korean regions: On the forest slopes, which were deforested but the Japanese are energetically reforesting, one

© Copyright Soyinfo Center 2021

can find various lianas [climbing vines] such as *Pueraria hirsuta* [Jap. kudzu]. In the northern part of the coastal fringe, soybeans are grown on the ridges between paddies (p. 200-01).

Namyang is a link in the shortest connection between Tokyo and Harbin, which includes the ship passage between Tsuruga or Niigata and Ch'ongjin. "For this reason, this section has been operated by the South Manchurian Railway since 1 October 1933." The northernmost bays and harbors, especially Unggi, Najin, and Ch'ongjin, and their cities, are developing at an unusually rapid rate. "They have become the export harbors for central Manchuria, particularly for soybeans" (p. 203).

In the Kaema upland we find "fire-field farming" and soybean fields in the valley bottoms or basins. "The most important fire-field crops at lower elevations are foxtail and barnyard millet, barley, soybeans, kidney beans, hemp and sesame." "The Japanese forestry commission has taken over management of the remaining forests. In the natural forests, wood is cut selectively and only as much as grows back" (p. 229).

Korea as a Japanese possession [colony]: "In southern Korea, barley has replaced rice as the principal staple food under the influence of Japanese economic policy." A large portion of the rice is sold to Japan.

Table 37 (p. 420), titled "Cultivated area, harvested amounts and yields per acre of the most important crops, 1935," includes: Soybeans: 785,000 ha. 7.9 hectoliters of weight. Worth: 60.2 million yen. Yield: 10.1 hectoliters per ha. Adzuki beans: 235,000 ha. 1.7 hectoliters of weight. Worth: 14.3 million yen. Yield: 7.3 hectoliters per ha. The table also includes paddy rice, upland rice, barley, naked barley, wheat, foxtail millet, barnyard millet, broomcorn millet, kaoliang, maize, oats, buckwheat, potatoes, sweet potatoes, mung beans, etc.

"The soybean vies with foxtail for the third place in the order of crops, by cultivated area. Its is a very profitable, undemanding crop that does not fail even in meteorologically abnormal years. Therefore its harvest curve does not have the ups and downs that are characteristic of many other crops, particularly paddy rice (Fig. 84). Acreage and yield per hectare have not increased nearly as much during the Japanese period, however, as for many other crops. Nevertheless, soybeans are the third most important item of agricultural export today, and the quality is supervised by the state. Approximately one-fourth of the harvest is exported. The most important export markets are Unggi, Ch'ongjin, Songjin, Wonsan, Shinuiju, P'yong-yang, Kumch'on and Ch'olsan (T. Tanaka 1931). They are located without exception in the northern half of the country" (p. 421). Note: Since 1948, the northern half of Korea has been a separate nation, North Korea.

"The Korean adzuki bean, particularly that from the northeastern coast, is highly priced in the Japanese market because of its high quality." By acreage it is the sixth most important crop in Korea (p. 421).

The soybean mills that process Manchurian soybeans into oil and meal lie on the Japan Sea coast of Hamgyongbuk-do (p. 452).

Table 43 (p. 476), titled "Korea's most important import and export goods, 1939," shows that "Beans" were the No. 7 export item to Japan, worth 23 million yen. The leading export was rice (149 million yen) followed by fertilizer (53), copper (52), fish etc. (32). "Of the beans exported to Japan... soybean take first place. Soybean exports to Japan had a weight of 1.3 to 1.9 million q" [1 quintal = 100 kg] in the years 1934-1938. "In contrast, from the northeastern ports Manchurian beans were shipped to Germany and England." In addition, large amounts of soybeans were imported by Korea itself from Manchuria (0.29 to 1.02 million q). Large amounts of soybean products made in Korea were also shipped to Japan (incl. soybean oil as much as 11.500 q, bean curd [tofu] up to 1.2 million q). Moreover soybean oil (up to 3,210 q) and bean curd (as much as 1.3 million q) were imported from Manchuria (p. 476).

Considerable amounts of dried seaweed and laver [nori] were also exported to Japan (p. 477).

Pages 482-83 try to characterize Korea's significance in 1938 for the economy of Greater Japan (pan-Japan) in general and Japan proper in particular. Pan-Japanese production included that of Korea, Manchuria, and Formosa. "The Korean rice crop in 1938 (44.8 million q) amounted to 23.4% of the pan-Japanese crop and 36.6% of that of Japan proper; 63.2% of Japan's rice imports came from Korea. The soybean crop in 1938 amounted to 6.4% of the pan-Japanese crop, 68.7% of the crop of Japan proper; 17.8% of the soybean imports of Japan proper came from Korea. The relationship was that of a master country to a dominated colony. For example, the Japanese forced the Koreans to eat barley so that the Japanese could import and enjoy the rice grown in Korea.

Soybean production on steep slopes and at high altitudes is mentioned (p. 488).

Hermann Lautensach lived 1886-1971. This book was first published in 1945 in German. Address: Prof., Dr.

1274. Rapp, Neville Sue; Chung, Y.; Shin, S.H.; Hong, I.S.; Jang, J.Y.; Seel, D.J. 1988. Mutagenic and anti-mutagenic properties of meju and other Korean food products from fermented soybeans. *Yonsei Medical Journal* 29(2):117-23. [26 ref]

• ***Summary:*** "In order to investigate the mutagenic activity of Meju [soybean koji], an important component of the Korean diet, both chemical techniques and the Ames test were used. To determine if antimutagenic activity is present in Meju and other soybean based foods, the Ames Test was done in the presence of aflatoxin B1, benzo(a)pyrene, and other mutagens. Although aflatoxin contamination was found

© Copyright Soyinfo Center 2021

in 6 of 43 samples of Meju tested, the amounts were less than 1 ppb in all but one. Meju had a protective effect against mutations produced by both aflatoxins and benzo(a)pyrene, both of which act via an epoxide, but not against other mutagens tested."

The Meju was collected from rural households in Chonbuk, Chonnam, and Kyungnam Provinces in south central Korea. "One sample each of Doenjang (soy paste) and Kanjang (soy sauce) from Chonbuk were also tested for mutagenicity. These foodstuffs are both produced from Meju; neither contained any mutagenic activity." Address: 1. Christian Medical Research Center, Presbyterian Medical Center, Chonju, Korea.

1275. Belleme, John. 1989. The imperial sauce: Rich, dark, and subtle, Japan's traditionally made shoyu is an outstanding and versatile seasoning. *East West.* Jan. p. 72-77. [2 ref]

• ***Summary:*** Westerners indiscriminately sprinkle soy sauce on everything from beef to popcorn. Almost half of the 60 million dollars spent annually by Americans on soy sauce goes for a product that is not even fermented. Kame, La Choy, and Chun King brands for example, are the result of a 1-day chemical process. The ingredients are soy extract, alcohol, sugar, salt, food coloring, and preservatives. Nearly all other soy sauce sold in the U.S.–such as Kikkoman, Yamasa, Marukin, Higashi-Maru, and Maruten–is made from chemically processed soy meal by a high-tech, accelerated method and temperature-controlled fermentation, and it usually contains sodium benzoate as a preservative.

Traditional shoyu products reach U.S. consumers in a roundabout way. For example, Muso buys traditional shoyu from the Marushima Brewing Co. of Shoda Shima, Japan, and exports it to Eden Foods, which sells it to American consumers under the Eden label. Ohsawa Japan buys from the Yamaki Brewing Co. of Tokyo, and sells to Ohsawa America, which bottles and sells it under the Lima label. The largest producer of traditional shoyu is the Sendai Shoyu and Miso Co. of Sendai, Japan. Sendai makes Johsen Shoyu, which is exported by Mitoku and is bottled in the U.S. under different brand names, including Westbrae, Tree of Life, Emperor's Kitchen, Mitoku-Johsen, and Mitoku Macrobiotic.

The author notes that, "My 8 years of miso-making in Japan and at American Miso Co. have taught me that miso aged in wood is superior to that aged in plastic... although Sendai shoyu and Miso Company started making high tech shoyu in 1950, Sasaki insisted that his company also continue to make traditional shoyu." Although at times Sasaki's pet project seemed a financial disaster, in 1970 he received a phone call from a Tokyo businessman, Akiyoshi Kazama. Kazama, a friend of macrobiotic teacher Michio Kushi, was looking for a supply of traditional shoyu for Kushi's students. When Sasaki showed Kazama his 12 2,000 gallon cedar casks of naturally aging whole soybean shoyu a few days later, Kazama knew his search was over. Kazama shipped Johsen Shoyu to the U.S. in 5 gallon wooden buckets at first.

Jubei Sasaki has passed away, but his 12 casks of traditional shoyu have grown to 100 and his son continues the whole soybean shoyu tradition.

1276. *LEC Newsletter.* 1989. Whole raw soybeans texturized. 13(1):7-8. Jan.

• ***Summary:*** Until now, the manufacture of textured plant proteins has required the use of defatted oilseed flours which have received little or no heat treatment. Some years ago Hank and Mark Sterner, while employed by Meals for Millions, developed an innovative LEC, the design of which was subsequently taken over by the Korean Inst. of Science and Technology [KIST] in Seoul. Paul Allred, of Riverside, California, is a retired Seventh-day Adventist who has worked extensively on extrusion processing with Wenger equipment in Mexico. He directed a project in Navojoa, Mexico, which now uses several X-25 extruders to make standard textured soy protein products. Recently Mr. Allred observed that the Sterner screw design permits texturization of oilseeds without removal of the oil. The resulting product has a typical textured soy protein structure and a pleasant roasted soy flavor. The extra oil in the product makes it much more palatable directly from the extruder. Allred recently made parts for a Wenger extruder located at Africa Basic Foods in Uganda. He believes these will enable that machine to texturize whole (undefatted) soybeans. Address: Colorado State Univ., Ft. Collins, Colorado.

1277. Han, I.K.; Choi, Y.J.; Chu, K.S. 1989. The utilization of full fat soybean for egg production and egg quality in the laying hens. In: A.J. Pascale, ed. 1989. World Soybean Research Conference IV. Buenos Aires: Continuing Committee. xxviii + 2152 p. See p. 1861-65. [24 ref]

• ***Summary:*** "Extruded full fat soybean can serve as effective protein source for layer diets if economically justified." Address: College of Agriculture, Seoul National Univ., Suweon 440-744, Korea.

1278. Ontario Soybean Growers' Marketing Board. 1989. 40 years of progress: Fortieth anniversary, 1949-1999. Chatham, Ontario, Canada: OSGMB. 49 p. 22 x 28 cm.

• ***Summary:*** Contents: A message from the Ontario Minister of Agriculture and Food (Jack Riddell). Chairman's message (Ted McGrail). History of soybeans in Ontario (p. 3). Year by year: 1948-1989–One page is devoted to each year. The 3-element / column format is the same for most years and pages, except when there is a photo of the new staff person or a special photo is added: (a) A portrait photo of

© Copyright Soyinfo Center 2021

the chairman for that year. (b) Brief statement of important developments that year (mostly soybean price, production, acreage, yield, support price or deficiency payments). (c) Names of the director(s) from each of the six districts–1. Elgin. 2. Essex. 3. Pelee Island. 4. Kent. 5. Lambton. 6. Middlesex. Page 47 briefly summarizes 40 years of progress.

Four graphs (p. 48-49) show changes related to Ontario soybeans from 1949 to 1989: (1) Soybean acreage grew from 104,000 acres to 1,290,000 acres; the most rapid growth occurred after 1976. Annual average yields and 5-year average yields have increased steadily–the 5-year average from about 18 bushels/acre in 1949 to about 36 bushels in 1989. Soybean production grew from about 3 million bushels in 1949 to a peak of about 45 million bushels in 1987. The soybean crop value (farm cash receipts) grew from almost nothing in 1949 to over $351 million in 1988; rapid growth began after 1971 and 1976.

Chronology of some important events extracted mainly from individual years.

"1949–The Ontario Soya-Bean Growers' Marketing Board was established under the Farm Products Marketing Act. Under the provisions of the new regulations eleven soybean growers were elected as directors to the board. Together they represented some 6,000 soybean producers in six Ontario districts. The first office of the board was located in the office of the Agricultural Representative in Essex, and Angus McKinney was the first secretary. K.A. Standing acted as assistant on a part-time basis. Board operations were financed during the 1949-50 crop year by one half cent per bushel license fee [like the later U.S. checkoff fee].

"1950–The license fee was increased [doubled] from one-half cent to one cent per bushel, the level at which it remained until 1959.

"1951–The first annual convention of soybean growers was held Feb. 15-16, 1951 at the Community Hall, Chatham [County of Kent]. Imports from the U.S. were totalling about 5 million bushels annually.

1952–K.A. Standing became general manager (with portrait photo). The board established its office in Chatham sharing facilities and staff of one secretary with the Ontario Seed Corn Marketing Board on Market Street. The first task was to set up a complete grower records system.

"1953–Expansion of office requirements resulted in a move to new quarters on Fourth Street in Chatham.

1954–The OSGMB organized the first export of Canadian soybeans. The shipment was made from Port Stanley [Ontario] to interests in the United Kingdom. Initiated to generate competition in the domestic market, exports were to continue in every succeeding year. Some 1,492,000 bushels of soybeans were exported during the 1954-55 crop year.

1956–The number of elected directors increased to 14 from 11.

1957–The average price of soybeans paid to growers dropped to $1.95 per bushel–the lowest since World War II. The board pressed for legislation to stabilize returns to growers.

"1958–The board was successful in having soybeans brought under the Agricultural Stabilization Act. The crop was supported at $2.10 per bushel. The average price paid to growers was $1.90, resulting in a deficiency payment of 19.6 cents per bushel for a total of $1,200,000 paid to growers. The office was moved from Fourth Street to Wellington Street West in Chatham. Otis McGregor became assistant secretary-manager (with portrait photo).

Note. Letter (e-mail) from Kim Cooper formerly of OSGMB. 2010. Feb. 18. The growers always had to pay a premium to take part in income stabilization programs. So it was not simply a government subsidy. At first, the premiums had to be paid up front, but after a few years, the premiums were deducted from the payout, if there was any payout.

1960–L.R. Addeman became information officer for both the soybean and wheat boards.

1963–The ban on coloured margarine is lifted in Ontario.

"1964–Increased emphasis was put on [soybean] research when federal and provincial programs were brought under a coordinated plan.

"1965–Domestic crushings reached a 16-year high at 20.8 million bushels, as did soybean imports at 16.5 million. There was no price support in 1965 and succeeding crops, the last having been applied to the 1964 crop at $2.15 per bushel."

1970–Canadian soybean production first tops 10 million bushels.

1973–The first shipment of Ontario soybeans (Harosoy variety) was made to Japan. The Ontario Soybean Symposium was held at Ridgetown College of Agricultural Technology, sponsored by the Board, the Ministry of Agriculture, and Food and Agriculture Canada. K.A. Standing became general manager of both the soybean and wheat boards and Otis McGregor was appointed marketing manager of both boards.

1974–D. Sanderson became secretary to the Ontario soybean and wheat boards.

1975–The Soybean Board established its own separate office in a rented building on Kell Drive in Chatham. Otis McGregor became secretary manager of the Soybean Board.

1977–The metric system started to be used in agriculture in Canada; metric ton (tonne) officially replaced bushel. "An Advance Payment Program was established for soybeans under the federal Advance Payments for Crops Act. The program provided interest free loans to producers who stored their soybean crop at harvest for future sale." A record high yield average of 39 bushels per acre was set. Mario Baletto became market information coordinator.

"1979–The Board initiated a program to promote soybeans as a food product and hired home economist Linda

© Copyright Soyinfo Center 2021

Lantz to manage the program. Soybeans were the featured crop at the Royal Agricultural Winter Fair.

"1980–Soybeans began trading duty free between Canada and the United States following the elimination of a 60 cent per bushel tariff, via the General Agreement on Tariffs and Trade" (GATT). Fred Brandenburg became assistant secretary manager.

"1982–The Board participated in a soybean export market development mission to Japan, Hong Kong, Malaysia, Singapore, and Korea; it was organized by the Ontario Ministry of Agriculture and Food. Continued low prices trigger stabilization payments of 38 cents per bushel federally and 37 cents per bushel provincially."

1983–Two new districts were formed, bringing the total to 8. District 7 ran east to the Quebec border reflecting the advance of soybean production to the north and east from its traditional area.

1984–A new office for the Board was erected at 180 Riverside Drive in Chatham. "A two-day conference–the Ontario Soybean Symposium–and an incoming mission of soybean buyers from the Far East [East Asia] and Europe were sponsored jointly" by OSGMB and OMAF. "Prices dropped again making a provincial stabilization payment of 36 cents per bushel necessary." Note: Stabilization support prices are based on an average of market prices for the past five years.

1985–Fred Brandenburg became secretary manager of the board and John Davidse became executive assistant to the board. "Ontario became self-sufficient in soybean production for the first time as the 37,000,000 bushel crop exceeded the 33,165,000 bushel crush. Low prices continued as did stabilization payments–42 cents per bushel from the federal program and 39 cents from the provincial program."

1986–"Ontario's single biggest soybean export sale of 50,000 tonnes was made to the USSR." Low soybean prices paid to producers continued. In addition to federal and provincial stabilization payments, "the Special Canadian Grains Program paid soybean growers on the basis of 18 cents per bushel."

1987–Tino Breuer became marketing specialist. Districts were again redistributed to reflect the average soybean production in each.

1989–The Board celebrates its 40th birthday with a new logo and a change in the spelling of its name from "Soya-Bean" to "Soybean." 15 directors now represent 24,000 growers in 8 districts across the province. 1,280,000 acres of soybeans were grown in 1988–more than 14 times as many as in 1948. Soybeans are Ontario's #1 cash crop, worth over $350 million in farm cash receipts in 1988. Address: P.O. Box 1199, Chatham, Ontario, Canada N7M 5L8. Phone: 519-352-7730.

1279. Packaged Facts. Subsidiary of FIND/SVP. 1989. The Oriental foods market. 625 Avenue of the Americas, New York, NY 10011. 225 p. Feb. [1 ref]

• ***Summary:*** Contents (main divisions): I. Introduction. II. The overall market, including a brief history in America. The market leaders, in descending order, are La Choy, Stouffer, Chun King, Nissin, Kikkoman, Budget Gourmet, JFC. III. The frozen segment. IV. The canned/packaged segment: Sauce sales now over $100 million and soy sauce nearly 3/4 of all sauce sales. V. The tofu segment (detailed below). VI. The dry soup segment: Nissin number one. Appendix: Company profiles: BCI Holdings Corp., Nestlé S.A., Nissin Foods Co., Kikkoman International (in American since 1956). ConAgra, Sanwa Foods, Others (Kraft, Benihana, JFC International).

Section V is "The Tofu Segment" (p. 153-178). Contents: I. The products: Brief history. A protein staple in the Orient. The Miracle food. Tofu high in protein. Calcium content can be high. How it is made. Raw tofu the most common form. Other forms found in specialty stores. How tofu is used.

II. The market: Tofu sales reach $71 million in 1988 (Gives dollar volume in millions from 1984 [$57] to 1988 [$71]. Source: Packaged Facts). III. Factors in future growth: Popularity of Oriental cuisine. Tofu adopted by dieters and health conscious. Consumers attracted by low price. Dinners and entrees being introduced. Tofu helpers (Betty Crocker's Oriental Classics Dinners [General Mills] call for the addition of tofu, chicken, or meat). Tofu substitutes are proliferating (value-added tofu based ice creams, puddings, burgers, cheese, hot dogs, salad dressings, etc.). Interest by corporate giants (Pillsbury and Carnation). Tofu used in U.S. National School Lunch Program (it is estimated that 50 million lb of soy proteins are used each year in school lunches). IV. Projected sales: $119 million market by 1995 (7-8% dollar increase annually). V. Market composition: Raw tofu over half of sales. Supermarkets account for 60% of sales. V. The Marketers: Field narrowed to 150 or fewer marketers. Four major marketers (Hinoichi, Azumaya, Morinaga, Nasoya; produce 100,000+ weekly). The second echelon (Northern Soy, Quong Hop, White Wave, Island Spring; produce 15,000–30,000 lb/week). VI. The competitive situation: Precise market shares unavailable. Hinoichi, Azumaya, Nasoya, and Morinaga lead. Tomsun, failing with Jofu [tofu yogurt], files for Chapter 11. Watch out for Kikkoman. VII. Advertising and promotion: No measurable expenditures (except by Tofutti). VIII. Packaging: Plastic and foil. IX. Distribution and retail: Distribution. 60% of raw tofu sold in supermarkets. Pricing includes higher margins. Assortment. Most tofu shelved with produce. Pricing data at the retail level: In its *Key Price Book,* Marketing Services Corporation publishes detailed information on tofu products sold in California supermarkets. This includes data on package sizes, case sizes, competitive pricing, margins, and promotional discounts. Figures for Kikkoman Kinugoshi, and two textures of Morinaga were

compiled on 1 Feb. 1989. X. The consumer: Size of user base unknown. Roper poll reveals a dislike of tofu. Those most likely to use. Address: New York. Phone: 212-645-4500.

1280. Park, Yang-Ho; Lee, Choon-Soo. 1989. Yield increasing of soybean on the newly reclaimed hillside land through phosphorus fertilizer management. In: A.J. Pascale, ed. 1989. World Soybean Research Conference IV. Buenos Aires: Continuing Committee. xxviii + 2152 p. See p. 734-39. [18 ref]
• ***Summary:*** "Soybean is one of the most important upland crops in Korea. But the total production of soybean and Korea's self-sufficiency have been decreasing every year. The yield per unit acreage is very low, only 1,320 kg/ha. In 1987, domestic production of soybean was 203,878 metric tons (tonnes) on 153,744 ha, and it was 14.2% in total self-sufficiency. Thus this grain has had to be imported from other countries. Korea imported 1,131,000 tonnes in 1987 and more every year. To solve these problems, the government has tried to find out all the possible measures to increase soybean production." Address: Agricultural Sciences Inst., Rural Development Administration, Suweon 440-707, Korea.

1281. Shanmugasundaram, S.; Tsou, S.C.S.; Cheng, S.H. 1989. Vegetable soybeans in the East. In: A.J. Pascale, ed. 1989. World Soybean Research Conference IV. Buenos Aires: Continuing Committee. xxviii + 2152 p. See p. 1979-86. [12 ref]
• ***Summary:*** "Soybeans harvested and used green, between the R6 and R7 growth stages are termed vegetable soybeans. Japan, Korea, China, Thailand and Nepal currently grow and consume vegetable soybeans... For the Japanese consumer, vegetable soybeans have two or more seeded pods, bright green pod wall after blanching or cooking, large seed, gray pubescence, colorless hilum, specific pod length and width and no more than 175 pods per 500 gm. The outer pod coat should be devoid of any blemishes. After boiling, the taste should be slightly sweet and not oily. A number of seed companies, especially in Japan breed vegetable soybeans. AVRDC is currently developing vegetable soybeans that are adapted to the tropics and subtropics...

"The whole plant is harvested and the leaves are stripped; the stems with pods are bundled and sold in Japan and Thailand. In Taiwan, Nepal, China and Korea, the pods are stripped from the plant and marketed... The majority of the vegetable soybeans in Taiwan are frozen in the pod and exported to Japan...

"In terms of nutrient content, the vegetable soybean can be considered as an excellent source of thiamine, a good source of protein, riboflavin, iron and phosphorus. It has adequate vitamin C; it is fair in calcium, but poor in vitamin A.

"In Japan, the area devoted to vegetable soybean increased from 6,980 hectares in 1967 to 14,000 hectares in 1986 including those planted in vinyl houses... The total vegetable soybean requirement in Japan is about 130,000 to 150,000 tons of green pod per annum. The production in Japan varies from 110,000 to 120,000 tons. To meet the domestic demand, Japan imports about 30,000 to 50,000 tons... The amount of frozen vegetable soybeans exported from Taiwan in 1981 was worth US $21 million and reached almost US $63 million in 1987. The domestic Taiwanese consumption of vegetable soybean also steadily increased from 4,700 tons in 1984 to more than 13,000 tons in 1987...

"At present, there are 27 frozen food processing companies in Taiwan which process frozen vegetable soybeans... Five major processors handle 2,713 tons to 11,552 tons per annum...

"In Japan, vegetable soybean varietal development is conducted by the private seed companies. During the past 30 years the seed companies in Japan developed more than 50 new vegetable soybean varieties. Currently, the most popular ones to name a few are: Tsurunoko, Ryokkoh, Kegon, Hatsutaka, Taisho shiroge, Nakate Kaori, Suzumo, Enrei, Fukuda, Raityo, Shirobato, Tamasudare, Hakutyo and Shiratsuyu." Address: 1-2. Asian Vegetable R&D Center, P.O. Box 205, Taipei 10099, Taiwan; 3. Council of Agriculture, 37 Nan-Hai Rd., Taipei 10728, Taiwan.

1282. Xu, Bao; Lu, Qinhua; Zhuang, Bingchang. 1989. Analysis of ecotypes and their geographical distribution of wild soybean (G. soja) in the world. In: A.J. Pascale, ed. 1989. World Soybean Research Conference IV. Buenos Aires: Continuing Committee. xxviii + 2152 p. See p. 98-103. [8 ref. Eng]
• ***Summary:*** "The analytical data show 343 germplasm lines (China 292, Japan 32, South Korea 14, and USSR 5), seven ecotypes and their geographical regions and 13 sub-regions were divided... Typical wild soybean is an annual herb, twining around companion plants. Its main stem and branches are almost identical. The leaflets are ovate, oblong or lineolate in shape. The flowers are dark, light or reddish purple. The pods are about 2 cm in length, containing 1-5 seeds. The seeds are black with brown or black bloom. The weight of 100 seeds is about 1-3 gm... Since 1978, about 5,000 accessions of wild soybean have been collected in China. Characters as high protein content, good adaptability are considered superior." Address: Soybean Inst., Jilin Academy of Agricultural Sciences, Gongzhuling, Jilin province, China.

1283. Thompson, Jay. 1989. Early work with tofu at Rochester Zen Center (Interview). *SoyaScan Notes.* April 11. Conducted by William Shurtleff of Soyfoods Center. [1 ref]
• ***Summary:*** "The Zen Center of Rochester was founded by Kapleau roshi in 1966. In about 1974 we started by

© Copyright Soyinfo Center 2021

importing tofu from Toronto. I would go to a Korean [Chinese?] shop named Yet Sing at #11 Baldwin Street. It looked like a normal residential home near a popular dress store named Morningstar. But when you descended to the basement it looked like a scene out of Dante's inferno. Everybody had hip boots on. There was ankle deep water, steam everywhere, and you could just see these laboring bodies through the mist. It seemed like there were 20-30 people in the basement working very hard. You had to clamber over huge bags of soybeans on pallets. No one spoke English. You used fingers with the front man to say how much you wanted. They only had one product as far as I could tell. I carried the tofu away in about eight number 10 cans filled with water. I would take the bus back across the Canadian border and many a time I was given a hard time by the customs officials. I hauled tofu down from Toronto once or twice a month for several years. When Zen students from Toronto came down for sesshin, we always asked them to bring tofu. One reason we wanted to start making our own tofu was that this trip was so difficult."

Jay first got in touch with William Shurtleff when he read a small letter Shurtleff had written to the *East West Journal* (15 June 1975, p. 3). In about August 1975 he wrote Shurtleff in Japan and got back a typed sheet describing how to make tofu on a home scale. In a second letter he requested instructions for making tofu on a larger scale.

"We made tofu in the kitchen a few times, realized we couldn't make enough at that scale, then used the instructions to build a small shop in the basement of Zen Center. We got a beam with a weight on it for pressing, installed a candy stove and a big pot. Greg Mello built the shop. Being in charge of the kitchen, and since this was a kitchen project, I was actively involved. Mello and Greg Weaver eventually took that small shop to a larger shop on North Goodman Street. The basement shop existed for several years. Once the commercial shop began, our kitchen bought tofu from them rather than making it ourselves. Mello left the Zen Center staff when the tofu shop went commercial. Andy Schecter and Norman Holland soon joined the shop.

"There were two favorite ways of serving tofu at the Zen Center: Tofu with Tahini Sauce, and Tofu Sticks, which were somewhat like fish sticks, make by baking breaded tofu, then serving it with tartare sauce." Address: Rochester, New York. Phone: 716-275-6779 Office.

1284. Thompson, Martha Gifford. 1989. Early work with tofu at Rochester Zen Center (Interview). *SoyaScan Notes.* April 11. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** The staff of 30-50 people in the Zen Center kitchen prepared strictly vegetarian meals. Kapleau roshi at that point had a dairy allergy, so very few dairy products were used in the meals. The diet was almost a vegan one. The Toronto Zen Center, was an affiliate group nearby in Canada. In Toronto, which has a large Asian population, were at least three tofu shops: one very small family-run Korean shop on Baldwin Street (which is no longer there), one on Avenue Road (perhaps Chinese run), and a third on Dundas Road. A member of the kitchen staff would make the 2½ hour trip to Toronto, go the shop on Baldwin Street (which had no name) to buy tofu. "The first room was stacked to the ceiling with soybeans. Down in the basement were many people slogging around making tofu. It was quite a scene, and nobody spoke any English. At that point we realized that we could make tofu ourselves. The trip to Toronto was always a hassle. You always got stopped at the border; they always thought you were smuggling something. Jay Thompson took the lead in setting up tofu making facilities. Kapleau roshi was very excited about and supportive of the project, in part because he had practiced for so long in Japan, and in part because he likes projects, right livelihood, and soyfoods. Once the shop was set up in the basement, we also made a lot of soymilk, yuba, and soy yogurt, and served spicy curds; we tried everything! The tofu shop of course never received any financial support from Zen Center." Address: Rochester, New York. Phone: 716-461-5388 Home.

1285. *Soybean Update.* 1989. Another record in Korea. April 24. p. 3.

• ***Summary:*** "Commercial feed production in Korea was 9.6 million tonnes, an increase of 6.6% over the previous record set in 1987."

"Korea is the world's sixth-largest importer of U.S. soybeans, consuming about 73 million bushels annually."

collection: Maturity groups 000 to IV (PI 65.549 to PI 483.464). *USDA Technical Bulletin* No. 1761. 25 p. May.
• ***Summary:*** "This report contains data on the origin, descriptive characteristics, agronomic performance, and seed composition for 200 wild soybean (*Glycine soja* Siebold & Zucc.) accessions in maturity groups 000 to IV from the USDA Wild Soybean Germplasm Collection. These accessions (PI 65.549 to PI 483.464) were introduced from China, Japan, South Korea, and the Soviet Union into the United States from 1925 to 1984. A total of 38 categories of data is presented for each entry. These accessions were evaluated at Urbana, Illinois, in 1984 and 1985."

Note: This report consists mostly (about 90%) of full-page tables. The rest is definitions and explanations of abbreviations. Address: 1. USDA-ARS, agronomist, GRIN (Germplasm Resources Information Network), Beltsville, Maryland.

1289. Park, Kun-Young; Lee, E.S.; Moon, S.H.; Cheigh, H.S. 1989. [Effects of browning products and charcoal on the degradation of aflatoxin B1 in Korean soy sauce (kanjang) and its model system]. *Korean Journal of Food Science and Technology* 21(3):419-24. June. [19 ref. Kor; eng]
• ***Summary:*** "The effects of browning products (BP) from Kanjang (soy sauce) and charcoal on the degradation of aflatoxin B1 (AFB1) in Kanjang and its model system were studied. Approximately 60% of AFB1 was degraded in the presence of 0.05% BP at pH 7 of phosphate buffer after 2 days of incubation at 30 ºC. The mutagenicity of the APB, which reacted with the BP was decreased to about 50% and 70% in Salmonella typhimurium TA98 and TA100 strains, respectively ($p<0.05$). When a few pieces of charcoal were added to home made Kanjang, AFB1 was quite stable for 5 days at 30ºC, however, about 80% of AFB, was removed when the charcoal was either in distilled water or in 20% of NaCI solution after 2 days of incubation. Activated carbon instead of the charcoal removed AFB1 completely in the all samples under the same conditions." Address: Dep. of Food Science and Nutrition, Pusan National Univ., Pusan [Korea].

• ***Summary:*** Volume 1 of this two-volume set was published in Aug. 1987 as INTSOY Series No. 30. The title page states: "Information on the origins of soybean and wild soybean germplasm acquired from 1945 to 1985, identified by PI numbers between PI 150.000 and PI 500.000, and maintained by the United States Department of Agriculture."

Contents: Foreword. Curator staff. The USDA soybean germplasm collection: Introduction, history, PI numbers, maintenance of the collection, statistical summaries of the collection, source and identification of individual strains, appendixes, abbreviations, Germplasm Resources Information Network (GRIN). Statistical tables: Number of strains introduced from 1945 to 1985 by maturity group, number of wild soybean strains introduced from 1925 to 1985 by country of origin, number of soybean strains introduced from 1945 to 1985 by country of origin, number of soybean strains introduced by year, major sources of introduced soybeans. Source and identification of individual strains: Soybean strains (1945 to 1985), wild soybean strains (1925 to 1985). Appendixes: 1. Soybean strains summarized by country and year, 1945 to 1985. 2. Wild soybean strains summarized by country and year, 1908 to 1985. 3. Chinese location names. 4. Korean location names. INTSOY Publication series. Address: Univ. of Illinois.

• ***Summary:*** "The prototype of miso was introduced to Japan from Korea at least 1,300 years ago. Misho (the original type of miso) was first cited in *Taihouryou* in 701 A.D. Although the production method for misho was not described, it probably resembled soybean miso today. In the northeast district of China, it was called 'misun,' and in Korai (located in north Korea 935 to 1392 A.D.) 'misso' and in south Korea 'mijo.' The process includes pounding and mashing of cooked soybeans, shaping into balls, wrapping in rice straw, hanging the wrapped materials under the eaves and mixing with salt and water and often was seen at farmhouses in prewar Japan... Miso originally was made at Buddhist monasteries for internal and use in aristocratic circles.

"Another route of introduction was from China to Japan by Buddhists and envoys who produced fermented soybean foods such as Kinzanji-miso. The difference of this process from the Korean process was to make koji from cooked whole soybeans with barley or wheat without pounding.

"The industrial production of soybean miso was started in Aichi prefecture in 1625 and that of rice miso in 1645 at Sendai as the original of Sendai miso today... Thereafter, the number of miso factories increased gradually in the Tokugawa period (1600-1867) and rapidly up to about 5,000 at the end of World War II. Recently, miso factories introduced many advanced facilities and equipment for economical and hygienic production. The number of miso factories was reduced to about 1,700, amalgamating to large scale factories of which capacity was over 3751 tons in 1984. They produced 353,000 tons equivalent to 59% of total industrial production. Employing 182,000 tons of soybeans, 104,000 tons of rice, 23,000 tons of barley and 72,000 tons of salt, *ca.* 568,000 tons of miso were produced by all factories in 1985. In addition, the amount of home-made miso is roughly estimated as 60,000 tons. The amount of miso supplied per capita was 4.9 kg in 1987...

"Ninety per cent or more of miso is used as an ingredient of soup in Japan... Daily per capita consumption was 28 to 30 g during the years from 1951 to 1959. From that time until 1985, it gradually decreased to the level of 16 g which is enough to prepare one bowl of miso soup." Address: Hanamaruki Inc., 4-22-10 Himonya, Meguro-ku, Tokyo 152, Japan.

1294. Karta, Susani K. 1989. Traditional Chinese soyfood. In: Thomas H. Applewhite, ed. 1989. Proceedings of the World Congress on Vegetable Protein Utilization in Human Foods and Animal Feedstuffs. Champaign, IL: American Oil Chemists' Society. xii + 575 p. See p. 382-87. [18 ref]
• ***Summary:*** Contents: Abstract. Introduction. Variables in manufacturing tofu: Soybean variable, processing variable, maceration and extraction (soaking and grinding) stages, filtration and heating stages, coagulation stages, types and concentration of coagulants used in tofu manufacturing. Tofu products.

Tables: (1) Chinese nonfermented soy food products. Five columns show: Food items, Chinese names, organisms used, description, uses. The soy foods are: Fresh green soybeans (*mao-tou*). Toasted soy powder (*tou-fen*) (Description: "Ground toasted dry soybeans, nutty flavor"). Soy sprouts (*huang-tou-ya*). Soy milk (*tou-chiang*). Soy milk film / yuba (*tou-fu-pi*). Soybean curd (*tou-fu*).

(2) Chinese fermented soy food products. Five columns (same as table 1) The soy foods are: Fermented whole soybeans (*tou-shih*). Soy sauce (*chiang-yu*). Soy paste (*chiang*). Fermented tofu (*so-fu* [*sic*]). Actinomucor or Mucor molds are used. Description: Creamy cheese, mild flavor, salty. Uses: Relish, also cooked with meat or vegetable.

(3) 1987 consumption of soybeans as foods in Asian countries. The results are presented here in descending order of per capita consumption: Per capita soybean consumption, country (population), total soybean consumption in 1,000 tonnes. Taiwan 13.3 kg/capita, (19.6 million), 260,000 tonnes; Japan 9.3 kg/capita, (122.2 million), 1,141,000 tonnes; Indonesia 9.0 kg/capita, (175 million), 1,575,000 tonnes; South Korea 7.8 kg/capita, (42.1 million), 330,000 tonnes; Singapore 7.7 kg/capita, (2.6 million), 20,000 tonnes; China 6.9 kg/capita, (1,062 million), 7,325,000 tonnes; Malaysia 3.4 kg/capita, (55 million), 55,000 tonnes; Thailand 2.2 kg/capita, (53.6 million), 118,000 tonnes; Philippines 0.3 kg/capita, (61.5 million), 18,000 tonnes. (4) Nutritional composition of traditional nonfermented foods: Fresh green soybeans, toasted soy powder, soy sprouts–raw, soy milk, soy milk film / yuba, tofu (Source: *Food Composition Table for Use in East Asia,* 1978). (5) Nutritional composition of traditional fermented foods: Fermented soybeans [tou-shih], soy sauce, soy paste [doujiang], fermented tofu (Source *Food Composition Table for Use in East Asia,* 1978).

In China, fried tofu is called Tou-Pok. Address: American Soybean Assoc., 541 Orchard Rd., #11-03 Liat Towers, Singapore 0923, Republic of Singapore.

1295. Kim, Seung Ho; Kwon, Tai-Wan. 1989. Vegetable protein foods in Korea. In: Thomas H. Applewhite, ed. 1989. Proceedings of the World Congress on Vegetable Protein Utilization in Human Foods and Animal Feedstuffs. Champaign, IL: American Oil Chemists' Society. xii + 575 p. See p. 439-42.
• ***Summary:*** A superb article, perhaps the best ever seen in English on soyfoods in Korea.

© Copyright Soyinfo Center 2021

Contents: Abstract. Introduction. Situation of traditional protein foods. Situation of vegetable proteins. Traditional protein foods in Korea: Soy sauce (*kan jang*), hot soy paste (*ko chu jang*), *chung kuk jang* (a kind of soy paste made by mixing natto [*naap doo*] with seasonings [salt, red pepper, and garlic], and grinding then aging the mixture), soybean sprouts (*kong na mool*).

Note 1. This is the earliest English-language document seen (June 2021) that uses the term "ko chu jang" to refer to Korean-style red pepper and soybean paste (miso).

Note 2. This is the earliest English-language document seen (June 2021) that uses the term "chung kuk jang" to refer to Korean-style natto.

Tables: (1) Domestic Korean production and import of soybeans from 1982 to 1987. Domestic production rose to 250,000 tonnes from 233,000 tonnes. Imports for food uses rose to 144,000 tonnes from 104,000 tonnes. Imports for feed uses rose to 936,000 tonnes from 479,000 tonnes. Total supply rose to 1,330 tonnes from 816 tonnes, up 63% in 5 years.

(2) Consumption of soybeans in traditional Korean foods, in 1,000 metric tons, from 1982 to 1987 (1982/1987). Figures in parentheses are for home production. Soy sauce (*kan jang*) 69(50)/70(51). Soy paste (*doen jang* [Korean soybean miso]) 51(41)/50(40). Hot soy paste (*ko chu jang*) 5(4)/5(4). Soybean curd (*doo bu*) 60/114. Soy milk (*doo yoo*) 7/14. Others: Homemade soybean curd and soy milk, *chung kuk jang, choon jang* (kinds of soy paste), soybean sprouts (*kong na mool*), and whole soybeans 145/141. Total 337/394, or an increase of 19.9% in 5 years.

Note 3. This is the earliest English-language document seen (March 2009) that uses the term "choon jang" to refer to Korean-style soybean paste (miso).

(3) Domestic production and import of soybeans in Korea (Estimated for 1987, in metric tons): Soy protein–Textured vegetable protein (domestically made) 4,500. Soy protein isolate (import) 1,800. Soy protein concentrate (import) 150. Wheat protein–Textured vegetable protein (domestic) 900. Vital gluten (domestic) 150. Gluten (wet & dry) (import) 409. Total 7,909.

(4) Nutritional composition of soybeans and soybeans sprouts (per 100 gm).

Figures show: (1) Manufacturing method for rice hot soy paste (*ko chu jang*) (flow sheet). Numbers represent typical ratio of ingredients in volume. (2) Manufacturing method for chung kuk jang (a type of soy paste {Korean-style natto}) (flow sheet). Numbers represent typical ratio of ingredients in volume. Note 4. In Fig. 2 (p. 441), 3.6 units of salt are added with 0.36 units of garlic and 0.54 units of red pepper. Also: A Korean version of Japanese natto is named *naap doo*. This is the earliest English-language document seen (June 2021) that uses the term *naap doo* to refer to natto.

A photo shows one of the authors. Address: Korea Food Research Inst., P.O. Box 131, Chongryang, Seoul, South Korea.

1296. Housman, Bob. 1989. Eastern Foods Corp. becomes Mainland Express (Interview). *SoyaScan Notes.* Sept. 25. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Eastern Foods Corp., founded by Mr. Lee R. Lee, a Korean, was a leading U.S. manufacturer of tofu and soy ice cream (Tofulicious). Lee's company declared bankruptcy, then it was foreclosed on by a venture capital group. On March 3 Bob's group, Goods, Inc., bought the assets and inventory (but not the accounts payable or accounts receivable) and created a new subsidiary named Mainland Express. The new principals are Bob and Scott Housman. They moved the plant and started making tofu again in late April or early May of 1989. They never stopped production. They made an extra's week's inventory, moved the equipment to Goods, Inc.'s location at Spring Park, and were back in operation within a week.

The company has 5 other food manufacturing businesses in Spring Park. They grow and sell alfalfa sprouts, make pickled and flavored mushrooms, grow 5 million pounds/year of fresh mushrooms, make Kennedy label salad dressings, and pack portion-pack juices and novelty bottles for amusement parks. He bought Eastern Foods in part because he was already selling products to most EF's customers. So it was a good tie-in; now he is selling more to those same customers. And tofu can go national with the pickled and flavored mushrooms. Mainland Express now makes 3 types of tofu (soft, firm, and extra firm), plus Tofulicious. Even in Minnesota, a dairy state, there is a lot of interest in tofu. Bob has no idea where Mr. Lee is. A lot of investors are looking for him. Some people say he took off with some of the money. Eastern Foods had a poor accounting system and poor cost control. Address: P.O. Box 405, Spring Park, Minnesota 55384. Phone: 612-471-8034.

1298. *SoyaScan Notes.* 1989. Influence of Japanese and Japan on soyfoods in America (Overview). Dec. 7. Compiled by William Shurtleff of Soyfoods Center.

• ***Summary:*** The Soyfoods Center's SoyaScan database presently contains 30,790 publications and commercial products related to soya. Of these, 876 (2.9%) concern the influence of Asian-Americans (Japanese, Chinese, Koreans, or Indonesians) or their home countries on soyfoods. Of these 876 records, 638 (73%) concern Japanese influence, compared with 178 (20%) that concern Chinese influence–including Chinese from Taiwan, Hong Kong, Singapore, etc. Thus Japanese influence on soyfoods in America is much greater than that of any other Asian cultural group. We can identify at least seven major areas of influence:

1. Soyfoods Terminology. It is interesting to note that many of the most popular soyfoods in America are most widely known by their Japanese names. We say tofu (not doufu or bean curd), miso (not jiang or soybean paste), natto, okara (not soy pulp), yuba (not doufu-p'i or soybean skin). Even "soy" (as in soy sauce) is derived from the Japanese word "shoyu." Increasingly Americans interested in natural foods also use the terms shoyu and tamari to distinguish them from HVP soy sauce.

2. Kikkoman. By far the most influential Japanese soyfoods company in America today is Kikkoman, just as soy sauce is by far the most important soyfood product. Kikkoman was also the first Japanese company to introduce soyfoods to America. In 1868 the first Japanese immigrants to Hawaii took kegs of Kikkoman brand shoyu with them. In 1879 Kikkoman brand shoyu was registered in California, where it was exported to Japanese immigrants. Exports rose steadily, until between 1949 and 1954 exports of Kikkoman shoyu to the U.S. ranged from 213,000 to 305,000 gallons a year. Kikkoman's first real attempt to reach any foreign market dates from 1956 when, during the U.S. presidential elections, Kikkoman ran television ads to promote its product to mainstream American audiences as a seasoning for meat, fish, and poultry. In 1957 Kikkoman International Inc., a new sales company was established in San Francisco. Sales skyrocketed. In 1973 Kikkoman opened a huge modern shoyu plant at Walworth, Wisconsin. In 1976 Kikkoman passed La Choy to become America's best-selling soy sauce.

3. Introducing Soyfoods to Hawaii. The first Japanese who arrived in Hawaii in 1868 brought shoyu and miso with them. The earliest known soyfoods company there was a shoyu brewery started in 1891 in Honolulu by Jihachi Shimada. This was also the earliest known soyfoods company started by a Japanese anywhere in the Western world. Hawaii became part of the USA in 1898 by annexation. Hawaii and California were the first two areas in the U.S. where soyfoods became widely available. During the 20th century, Japanese started roughly 183 companies in Hawaii making shoyu, miso, and tofu–far more than Chinese (6) or Koreans (2). They developed innovative new products–such as sweet Hawaiian-style shoyu and miso. These products profoundly influenced the food life of Hawaii.

4. Soyfood Manufacturers in the USA. The earliest known soyfoods manufacturer in the Continental USA was a company (the name is unknown) run by the wife of Chieko Hirata that started making tofu in Sacramento in about 1895. The second earliest was Yamamori Jozo-sho, which started making shoyu in San Jose, California, in 1897. Many of the earliest soyfoods companies in America were run by Japanese Americans. By 1942 at least 158 soyfoods manufacturing companies had been started in America by Asian Americans; of these, 143 (91%) were run by Japanese Americans. When *The Book of Tofu* was published in 1975, it listed 55 tofu companies in America, all run by Asian-Americans; 39 were Japanese- and 16 were Chinese-run. Today America's two largest tofu companies are both run by Japanese Americans: Azumaya Co. in San Francisco, and House Foods & Yamauchi Inc. in Los Angeles. Hawaii's three largest tofu companies are also run by Japanese Americans: Aloha Tofu Co., Kanai Tofu Factory, and Hawaii Tofu. Morinaga Nutritional Foods in Los Angeles and Kikkoman Foods in San Francisco both import large amounts of aseptically packaged long-life silken tofu from Japan.

Another major manufacturer is San-Jirushi Corp. of Kuwana, Mie-ken. In the late 1970s San Jirushi started exporting tamari and soybean miso to America. They set up an office in the early 1980s and began to promote their product as "real" tamari to industrial food processors and the natural foods market. In Sept. 1987 the company opened a state-of-the art tamari plant in Richmond, Virginia, with a capacity of 1 million gallons a year. The company now has 75% of the industrial soy sauce market in America.

In Oct. 1986 a major new joint stock company named American Soy Products began producing Edensoy soymilk in Clinton, Michigan. It was a joint venture between Eden Foods and 4 Japanese companies: Marusan Ai, Kawatetsu Shoji, Muso Shokuhin, and Seikensha. Edensoy has since become America's best-selling soymilk. Prior to 1986 much of the soymilk sold in America was made in Japan.

Finally, three of America's 4 largest miso manufacturers are run by Japanese-Americans. The largest is Miyako Oriental Foods in Los Angeles. The other two are located in

© Copyright Soyinfo Center 2021

Hawaii.

5. Soyfoods Imports from Japan. The first importers of shoyu and miso were Japanese distributors such as Japan Foods Corp., Mutual Trading Co. and Nishimoto. But starting in 1962 American macrobiotic and natural foods companies started to import large amounts of shoyu and miso. Pioneers were Chico-San, Erewhon, Eden Foods, Westbrae, Edward & Sons, Tree of Life, and Great Eastern Sun. U.S. imports of soy sauce from Japan jumped from 1.7 million lb (174,400 gallons, worth $317,000) in 1949, to 18.6 million lb (1,897,000 gallons, worth $3,116,000) in 1972, an 11-fold increase in quantity during only 23 years.

6. Teachers and Information. Many Americans first learned about soyfoods from Japanese teachers, especially macrobiotic teachers, such as George and Lima Ohsawa, Michio and Aveline Kushi, Herman and Cornellia Aihara, and Noboru Muramoto. All have written many influential books and lectured and taught extensively since the 1960s. In addition, many young Americans learned how to *make* soyfoods from these macrobiotic teachers. Moreover, Japan is Asia's best source of information about soyfoods. For example, the Soyfoods Center's SoyaScan database contains 5,095 publications and products about soya and Japan, compared with 1,867 on soya and China or Taiwan.

7. Tofu Equipment Manufacturers. Hundreds of tofu companies have started in America since the mid-1970s. The majority of these are run by Caucasian Americans and most use specialized tofu equipment made in Japan by Takai Tofu & Soymilk Equipment Co., or by Sato Shoji.

1299. **Product Name:** Tofu.
**Manufacturer's Name:** Han Yang Oriental Food Manufacturing.
**Manufacturer's Address:** 3819 94th St., S.W., Tacoma, WA 98499. Phone: 206-588-7303.
**Date of Introduction:** 1989.
**New Product–Documentation:** Talk with Ed Elkin. 1991. Feb. 8. About 12-15 months ago Boo Han changed hands; it is now named Hang Yang, owned by Mr. Choy, a Korean-American, who does not speak English–although his brother does. Hang Yang is very aggressive and doing well; he just upgraded to a new tofu system. The company is at the same location it was when he purchased it from Boo Han. He makes tofu, rice cakes, and kimchi. In Feb. 1991, the phone directory has a listing for Han Yang Oriental Food Manufacturing, 3819 94th St. S.W., Tacoma, Washington 98499. Phone: 206-588-7303.

Form filled out and faxed by John Choi, owner. 1998. July. Han Yang Oriental Food Mfg., 3819 94th St. S.W., Tacoma, WA 98499. Phone: 253-588-7303. Company began making and selling tofu on 1 March 1989.

1301. Park, Kun-Young; Lee, E.S. 1989. [Effect of ammonia and pH on the degradation of aflatoxin B1 during the storage of Korean soy sauce (kanjang)]. *J. of the Korean Society of Food Science and Nutrition* 18(1):115-122. [17 ref. Kor; eng]
• ***Summary:*** "The mechanisms of aflatoxin B1 (AFB1) degradation by ammonia and alkaline pH during the storage of Korean soy sauces were studied. In the 0.05%, 0.1% and 0.5% of ammonia solutions, almost all of AFB1 (96-100%) was degraded after 2 to 24 hrs of incubation at 30ºC. Increased levels of ammonia in both home made soy sauce (HMSS) and commercial soy sauce (CSS) caused slow increases in pH, The pH change was higher in CSS than in HMSS." Address: Dep. of Food Science and Nutrition, Pusan National Univ., Pusan, Korea.

1302. Sahm Yook Korean Foods. 1989. [Sahm Yook Soymilk Products (Leaflet)]. Chunwon-gun, Choongchungnam-do, South Korea. 1 p. One sided. 19 x 25 cm. Color photo. [Kor]
• ***Summary:*** A photo on the front shows 5 packages of soymilk and a glass of soymilk surrounded by fresh green vegetables and mikan oranges. The back shows a young lady with a Western-style hairdo holding a Tetra-Brik carton of Sahm Yook Soy Milk. The three foil pouches are displayed nearby. Ways of using the product are described with cartoons below. Other photos show two cans of gluten products, Vegeburger, and Vegemeat. Address: 320 Panjeong-ri, Jiksan-myun, Chunwon-gun, Choongchungnam-do 333-810, South Korea.

1303. **Product Name:** [Nulife / Nülife Malted Soybean Drink].
**Manufacturer's Address:** Korea.
**Date of Introduction:** 1989?
**Ingredients:** Incl. malt.
**Wt/Vol., Packaging, Price:** 250 ml.
**New Product–Documentation:** Photocopy of Label sent by Anders Lindner. 1989. Illustration on the front panel shows a house with two trees to its left.

1304. Howard, Clare. 1990. Soybean growers target tofu: Farmers see market sprouting for soy-based foods. *Journal Star* (*Peoria, Illinois*). Jan. 2. [1 ref]
• ***Summary:*** The article opens with a photo of the produce manager at a supermarket in East Peoria, Illinois, holding up 2 packs of Mori-Nu Tofu. "Soybeans could achieve a $1 billion niche in the food industry by the mid-1990s, and Illinois farmers stand to make additional inroads in the Asian tofu market." Jim Shearl, manager of the Illinois Crop Improvement Assoc., worked with a team of agricultural researchers at the Univ. of Illinois to develop "Illinois Tofu No. 1," a new soybean variety with all the characteristics ideal for making tofu. These soybeans, which should earn

© Copyright Soyinfo Center 2021

a premium of $0.10 or more per bushel, must be stored and shipped separate from other soybeans. Neither Argentina nor Brazil nor other U.S. states have developed such a bean. Lowell Hill, agricultural economist at the Univ. of Illinois, noted "This is a significant steppingstone. Traditionally farmers produce and then find a market. We've turned that around and determined what the market wants and then set out to produce a soybean to meet that need." Hill said the Koreans import about 300,000 tons of soybeans for tofu manufacturing, representing a $61.7 million market.

1305. Soejono, Irlan; Kagatsume, Masaru. 1990. Shifts and development in trade of various food crops in East Asia, 1960-1984. *CGPRT Working Paper* No. 5. xviii + 168 p. Feb. 28 cm.

• ***Summary:*** For each country discussed, this book gives information on: Production and supply of coarse grains, pulses, and root and tuber crops. Consumption and demand. Trade and trade elasticities. Forecast and policy implications: Prediction on import demand, indication of policy implications.

The countries are: Japan (p. 1-28). People's Republic of China (p. 29-42). Republic of Korea (p. 43-62). Taiwan (p. 63-79). The Territory of Hong Kong (p. 81-92). Appendixes (p. 95-165). References (p. 167-68).

Summary: As people in the East Asia subregion become more affluent and westernized, they consume less food grains directly and more livestock products.

Japan: Japanese rice production peaked in 1963 at 13.42 million tons, but surpluses have continued to grow. The government has tried various schemes to induce farmers to switch from rice other crops, including soybeans. Graphs show: (I-6, p. 6) "Soybean production, area and yield, 1960-1984." Soybean production in Japan dropped from 418,000 tonnes in 1960 to 100,000 tonnes in 1976. Because of the Rice Farming Diversification Policy, soybean production since 1976 has increased, rising to 238,000 tonnes in 1984. The graph also shows harvested area and yield during this period.

(I-13a+b, p. 13, 14) "Total demand for soybeans its components [in Japan], 1960-1984." The total demand has increased steadily from 1.517 million tonnes in 1960 to 4.814 million tonnes in 1984. About 80% of this demand (3.952 million tonnes in 1984) was for soybeans to be processed. About 90% of these (3.765 million tons in 1984) were crushed into oil and meal. Small and relatively static amounts were processed to make miso (182,000 tonnes) and soy sauce (5,000 tonnes) in 1984.

(I-21a, p. 21) "Volume of soybean (grain) imports, import values and import prices, 1960-1984.

(I-21b, p. 22) "Volume of soybean oil imports, import value and import prices, 1960-1984.

(I-22, p. 22) "Volume of soybean cake imports, import values and import prices, 1960-1984.

Table I-2 "Projected import quantities (1,000 tons) of selected CGPRT crops in Japan, 1984-1999.

For the People's Republic of China, Fig. II-6 (p. 33) shows soybean production, area and yield, 1974-1984.

For Korea, Fig. III-5 (p. 47) shows soybean production, area and yield, 1960-1984.

For Taiwan, Fig. IV-5 (p. 67) shows soybean production, area and yield, 1971-1984.

For the Territory of Hong Kong, Fig. V-5(a) (p. 87) the volume of soybean grain imports, import values and import prices, 1960-1984.

The various appendices (p. 95+) give the data lists for each country used in creating the previous graphs. Address: 1. Senior Agricultural Economist, CGPRT Centre, Jl. Merdeka 145, Bogor 16111, Indonesia; 2. National Research Inst. of Agricultural Economics and the Ministry of Agriculture, Forestry and Fisheries of Japan.

1306. Fehlberg, Eric C. 1990. Recent Seventh-day Adventist work with soymilk (Interview). *SoyaScan Notes.* March 7. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** So Good soymilk from Australia has had remarkable success since it was launched in April 1987. Sanitarium Health Food Co. was the first to make soymilk in Australia. It caught on rapidly, and soon prompted 4-5 competing brands to be launched, but none of them have sales nearly as large as So Good. The main problem has been the company's inability to produce enough to keep up with demand. It was launched in about April 1987. In Oct. 1989 they sold 1,738 long tons (2,240 lb/ton, thus 3,893,120 lb). The equipment used to produce the soymilk is Adventist technology, not that purchased from Alfa-Laval, STS, etc. although in the last 6 months Sanitarium Foods purchased a pilot plant from Alfa-Laval which they plan to use in their laboratory. Originally So Good was packed under contract by a nearby dairy company in Combibloc cartons. After a year or so they purchased their own Combibloc packaging machine. Australia started to make soymilk after DE-VAU-GE in West Germany. The latter is very happy with their STS system, and Fehlberg is now seriously considering ordering one or two more turnkey soymilk plants for other countries in the near future. Sanitarium Foods has a very strong research lab.

The Seventh-day Adventist food company in South Korea, Sahm Yook Foods, now makes a Tetra Pak soymilk. The company was established in 1978, but did not begin food production until Sept. 1981. It began to make Sahm Yook Soy Milk in May 1985. Only a plain soymilk is produced–no flavors. After launching soymilk, the company began to grow dramatically, as that product grew. Last year they built a very large, now soymilk plant (based on Adventist technology) and they are now about the 2nd or 3rd largest soymilk maker in Korea. Address: Director, International Health Food Assoc., Seventh-day Adventist General Conference, 12501

1307. Shimizu, Teruo. 1990. Recent developments at Miyako Oriental Foods (Interview). *SoyaScan Notes.* April 17. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Miyako is presently making about 900 metric tons/year of miso, making them the largest miso manufacturer in America. This is up 30% compared with three years ago (when the dollar/yen exchange rate changed dramatically), but there has not been much increase during the past 2 years. About 80% of sales are to the Asian-American market (including small exports to Japanese in Mexico), and 20% to the natural foods market. Westbrae, a former customer, is now buying their miso from Canada. They are now trying to increase their sales to the Korean-American market. The younger generation of Korean-Americans finds the flavor of Korean miso to be too strong. They (and some Korean restaurants) like to mix equal parts of Miyako rice miso with Korean miso. Some Korean restaurants have switched to using only Japanese miso. One reason is that the quality of Korean miso is inconsistent.

They are selling quite a bit of dry koji to Grainaissance and to Cedarlane, both of whom use it to make amazake. Two years ago Miyako purchased an expensive, automatic, computer-controlled rotary koji fermenter from Nagata Brewery Machinery Co. (the biggest company; they also sold such a machine to Takara USA, the sake maker). It is working very well for them. The only other manufacturer of such fermenters is Fujiwara in Okayama. Address: Vice President, Miyako Oriental Foods Inc., 4287 Puente Ave., Baldwin Park, California 91706. Phone: 818-962-9633.

1308. Bates, Jonathan. 1990. West Coast tofu industry: Soybean market outlook for Malheur County, Oregon. Oregon State University, Corvallis, Oregon. 33 p. [12 ref]
• ***Summary:*** Contents: Introduction. Soybean market: World and domestic. The low technology soyfoods industry. Processor requirements. Assessment of producing soybeans in Malheur County. Conclusion. West Coast tofu and soyfood processors: California, Oregon, Washington. Bean warehouses and cleaners. Selected soybean brokerages and growers. Other information. Literature.

"There is interest in Malheur County, Oregon in introducing soybeans as an alternative rotation crop in place of wheat." Research is being done at the Malheur Experiment Station. These would be food grade soybeans destined for the West Coast soyfood processing industry. "The purpose of this report is to investigate the west coast food grade soybean market. Particular emphasis is placed on the tofu market in Portland and western Oregon, Seattle (Washington), and San Francisco (California). The main objectives of the study are: 1. To determine the requirements and/or preferences of soyfoods processors in regards to soybean quality, bean variety, growing regimes (organic or regular), packaging and delivery, and method of purchase. 2. To determine the economic feasibility of using soybeans as a rotational crop in the county in place of wheat. 3. To consider the competitive advantages, if any, of growing soybeans in Malheur county as opposed to the more traditional growing areas of the Midwestern and Southeastern United States.

Information on soybean consumption is given for the following tofu and soyfoods manufacturers, ranked here in descending order of soybean usage. All produce tofu and/or soymilk unless otherwise noted.:

Pacific Foods Inc., Tualatin, Oregon (57,700–77,000 lb/week [expressed as 3-4 million lb/year] of nonorganic and organic soybeans from midwest brokers, bulk and bagged, for soymilk. "Growth is expected to slow unless soymilk can be marketed to the general public").

Azumaya Inc., San Francisco, CA (48,000–60,000 lb/week of Vinton and Corsoy purchased from broker. Market growing at 3-4% annually).

House Foods & Yamauchi, Los Angeles, CA (54,000 lb/week of nonorganic Corsoy and Vinton purchased from broker-grower association. Steady growth. Expanded capacity in 1987).

Mighty Soy, Los Angeles, CA (11,000–12,400 lb/week of mainly Corsoy and Vinton, half organic and half not, purchased from brokers or growers associations).

Wy Ky, Los Angeles, CA (7,800–9,000 lb/week of nonorganic Corsoy, purchased from growers. 5% annual growth).

Island Spring and Soy Resources Inc., Vashon, WA (5,400–6,000 lb/week of organic Corsoy, purchased broker. 3-5% annual growth).

Surata Soyfoods, Eugene, Oregon (3,000–4,200 lb/week of organic Vinton and Corsoy purchased from broker-grower).

Silver Sprout, San Francisco, CA (3,000–3,600 lb/week of nonorganic Corsoy and Vinton purchased from broker, bagged or bulk).

Dae Han & Co., Portland, Oregon (2,400–3,000 lb/week of organic Vinton purchased from Midwest grower association. Steady growth).

Turtle Island Soy Dairy, Husum, WA (2,100–2,400 lb/week of organic Corsoy and Vinton purchased from Iowa broker for tempeh. 5% annual growth).

Arcata Soyfoods, Arcata, CA (1,200 lb/week of organic Corsoy purchased from grower).

Fuji Tofu Co., San Jose, CA (1,200 lb/week of organic varieties purchased from broker).

Ashland Soy Works, Ashland, Oregon (1,800 lb/week of organic Vinton and Corsoy, purchased from growers. Steady growth).

Hoven Foods Co., Seattle, WA (1,655 lb/week of Lee 74 purchased from Jacob Hartz Seed Co. 5% annual growth).

Tacoma Soyfoods, Tacoma, WA (1,200 lb/week of

© Copyright Soyinfo Center 2021

Vinton, Corsoy, Davis, Lee, and Holland, organic and inorganic, purchased from Midwest Soy International [grower assoc.]. 5% growth last year).

Kobayashi's Soybean Products, Ontario, Oregon (420–540 lb/week of Corsoy purchased from Midwest growers). Address: Graduate research asst., Oregon State Univ., Corvallis, Oregon.

1309. Cheigh, Hong-Sik; Park, K.S.; Moon, G.S.; Park, K.Y. 1990. [Antioxidative characteristics of fermented soybean paste and its extracts on the lipid oxidation]. *J. of the Korean Society of Food and Nutrition* 19(2):163-67. April. [16 ref. Kor; eng]

• ***Summary:*** "Antioxidative effects of soybean paste (SP) on the lipid oxidation were studied with the model systems of ground cooked meat (GCM)-SP or ground cooked fish (GCF)-SP and model systems of linoleic acid mixture (LA)-SP powder (SPP) or LA-SP extract fractions during oxidation reaction. SP played a role as an antioxidative substance in the system employed, especially in GCM-SP and the antioxidative activity was increased with the increase of SP addition in the system of GCF-SP during storage at 6ºC, SPP also exhibited some antioxidative activity during the oxidation reaction of LA. The activity was increased as the concentrations of SPP increased in the range from 0.1% to 0.5%. Considerable antioxidative activities have been observed in both water soluble and lipid soluble fractions from SP on LA reaction system." Address: Dep. of Food Science and Nutrition, Pusan National Univ., Pusan 609-735, Korea.

1310. Fehlberg, Eric C. 1990. Re: List and activities of Seventh-day Adventist health food companies worldwide. Letter to William Shurtleff at Soyfoods Center, May 24. 6 p. Typed, with signature on letterhead.

• ***Summary:*** For each for the following companies is given the date of founding, date manufacturing started, and the soy products presently manufactured: Granovita, Spain (1985). Nutana, Holland (1986). Nutana, Norway (marketing agency for Nutana, Denmark). Nutana name changes. Austrian Food Company (a restaurant, 1976). DE-VAU-GE, West Germany. Sahm Yook Foods, Korea (1978->1981). Sanitarium Health Food Company, Australia (3 pages).

Lists (with addresses) the following companies: Sanitarium Health Food Company in Wahroonga, NSW, Australia; DE-VAU-GE Gesundkostwerk GmbH in Lueneburg, West Germany; San-iku Foods in Sodegaura-machi, Kimitsu-gun, Chiba-ken, Japan; Korean Food Factory (Sahm Yook Foods) in Choongchungnam-do, South Korea; Alimentos Integronaturales y Panificadora la Carlota in Montemorelos, N.L., Mexico; Produtos Alimenticios Superbom Industria e Comercio Ltda. in Sao Paulo, Brazil; Alimentos Granix in Florida, Buenos Aires, Argentina; Nutana Health Food Company in Bjaeverskov, Denmark; AB Svenska Nutana in Rimbo, Sweden; Granose Foods Ltd. in Newport Pagnell, Bucks, England; Pur-Aliment Food Factory in Clichy–Cedex, France; PHAG Food Factory in Gland, Switzerland (Note: PHAG is an acronym for Produits Hygièniques Alimentaires Gland); Egypt Food Factory in Heliopolis, Cairo, Egypt; Glaxo India Limited in Bombay, India; Westico Foods Ltd. in Mandeville, Jamaica; Industrias Covac S.A. in Alajuela, Costa Rica; South China Island Union Mission in Hong Kong (3 pages). Address: Director, International Health Food Assoc., Seventh-day Adventist General Conference, 12501 Old Columbia Pike, Silver Spring, Maryland 20904. Phone: 301-680-6674.

1311. Loh, Michael. 1990. An overview of export opportunities in the new markets. In: Ontario Ministry of Agriculture and Food, ed. 1990. Soybean Buyers Mission from New Markets, July 1-7, 1990. Tokyo, Japan: Ontario Ministry of Agriculture and Food. 61 p. July. See p. 10-12. [Eng]

• ***Summary:*** It has been almost 20 years since the first container load of soybeans grown in Ontario was shipped to Japan. By the end of 1989, Ontario was exporting more than $25 million worth of soybeans to Japan, Hong Kong, Malaysia, and Singapore. Now the new markets for Ontario soybeans are Korea, Taiwan, the Philippines, and Indonesia.

In Korea, trade restrictions have eased on soybeans and other agricultural products. With hefty trade surpluses, Korea is under pressure to balance trade. Korea soybean imports jumped from only 428,000 tons in 1979 to 1,100,000 tons in 1989. About 120,000 tons of the imported soybeans are for food use, as follows: Tofu 100,000 tons (83% of the total), soymilk 17,000 tons, and soy sprouts 2,000 tons. Nearly all of Korea's soybean imports come from the USA.

Taiwan ranks second, after Japan, in terms of best prospects for agricultural exports. The strong Taiwanese currency has made exports less expensive. Burgeoning trade surpluses have led to increasing pressures from trading partners, like the USA, to balance trade. So Taiwan has liberalized imports by lowering tariffs and eliminating non-tariff barriers. "U.S. soybean exporters took advantage of their dominant market position in Taiwan to expand sales. Backed by aggressive trade negotiators, the American soybean industry has enhanced its competitive position by securing a 5-year supply agreement contract with the Government of Taiwan. The agreement calls for the purchase of 5.7 million tons of U.S. soybeans over a five-year period from July 1, 1986 to June 30, 1991. As a result the United States has over 75% of the market share. Taiwan's annual requirements of food soybeans are estimated at 250,000–300,000 tons. With recent market opening measures announced by the Taiwanese government, direct sales of food soybeans to end-users are now permitted."

Philippines: In Feb. 1987 Michael led a mission to the Philippines, and contacted a buyer. Ontario soybeans were

© Copyright Soyinfo Center 2021

first shipped to that country later in 1987. The Philippines import about 10,000 to 15,000 tons/year of soybeans for food use, and this is expected to increase in the near future. Filipro, Inc., which is the Philippines' licensee for Nestle S.A., reported increasing market acceptance of its re-launched powdered soya milk product Vita (chocolate flavor), and a soy-based baby cereal named Ceresoy.

Indonesia: Ontario soybeans (worth $4.2 million) were first sold to Indonesia in 1980 after Canada's first mission there that year. 90% of the 1.7 to 2.0 million tons of soybeans required by Indonesia are used for food. Tempeh is a delicious Indonesian food and Indonesia requires over 750,000 tons/year of soybeans to make tempeh. Address: Senior Representative, Asia/Pacific Region, Ontario Ministry of Agriculture and Food (OMAF), Tokyo, Japan.

1312. Ontario Ministry of Agriculture and Food. 1990. Soybean buyers mission from new markets, July 1-7, 1990. Tokyo, Japan: Ontario Ministry of Agriculture and Food. 61 p. 30 cm. Saddle stitched. [Eng]

• ***Summary:*** This conference took place in Ontario, Canada. On the mission were two buyers each from Indonesia (P.T. Indofood Interna Corp., BULOG), Philippines (Universal Robina Corp., Paritas Trading Corp.), and Taiwan (Sun Ford Mfg. Corp, Great Wall Enterprise Co.). Michael Loh of OMAF/Tokyo was the mission leader. Contents: Background and purpose. Mission members. Itinerary. Seminar agenda. Canada's soybean industry, by Fred Brandenburg of OSGMB. An overview of export opportunities in the new markets (Korea, Taiwan, Philippines, Indonesia), by Michael Loh of OMAF, Tokyo. Role of Taiwan Soybean Importers, by Laurence Hsiao of Sun Ford Conglomerate Corp. Soybean market in Indonesia, by A. Saifullah of BULOG, Indonesia. The market prospective for tempeh in the year 2000, by Ms. Susani K. Karta, manager, P.T. Indofood Interna Corp. (Indonesia). Appendix: 1. Ontario soybean suppliers (directory of 15 exporters). 2. Useful contacts. 3. Ontario soybean oil crushers (ADM, Victory Soya Mills, Central Soya of Canada). 4. Role of the Ontario Soybean Growers' Marketing Board. 5. Development of soybean varieties (incl. Harovinton for tofu; Canatto, Nattawa, and Nattosan for natto). 6. Market trends in the development of traditional soyfood, by Susani K. Karta (ASA, Singapore; Originally presented at the ASEAN Food Conference, Oct. 1988, Bangkok, Thailand). 7. Reference materials for doing business in Asia/Pacific.

"Natto soybean variety development at Agriculture Canada in Ottawa has also received considerable support from the OSGMB. Ottawa's Dr. Harvey Voldeng has been extremely successful at breeding Canada's top natto varieties (Canatto, Nattawa, and Nattosan) as well as incorporating higher protein levels into other early maturing varieties."

"Soybean breeders are selecting for high protein and white hilum whenever possible" (p. 40). Address: Tokyo, Japan.

1313. Fehlberg, Eric C. 1990. Re: Seventh-day Adventist health food companies worldwide. Letter to William Shurtleff at Soyfoods Center, Aug. 17. 4 p. Typed, with signature on letterhead.

• ***Summary:*** "Nutana of Holland do not manufacture the five products that are listed in my letter of May 24. Each of the products does contain soya as an ingredient, and it is my understanding that they are manufactured by Nutana of Denmark.

"Nutana of Norway, established in 1970, and you are right, it was formerly known Dagens Kost, but was renamed Nutana Norge, in 1982. In Norway they are strictly a marketing branch and do not manufacture any foods at all."

Sahm Yook Foods is the official name of the Korean Food Factory.

Alimentos Colpac is the official name of the food factory in Navojoa, Sonora, Mexico; it was established in 1969. The Montemorelos Branch is known as Alimentos Integronaturales y Panificadora la Carlota; it was established in 1981.

Granose Foods Ltd. of England moved from Stanborough Park, Watford, Herts, to Howard Way, Newport Pagnell, Bucks., in Jan. 1989. The official opening date was 9 July 1989.

PHAG (of Switzerland) is written in all upper-case letters; it is not an abbreviation of anything.

Glaxo Ltd. India has nothing to do with the Seventh-day Adventist church.

DE-VAU-GE was primarily responsible for setting up the Adventist food industry in Spain and the Kolett's brand is packed specifically for the Spanish market. DVG has two brand names which are manufactured for the reform or natural foods market in Europe: Granovita and Bosen. The products under the Bosen label were originally made in their bakery.

Pan American Health Service in Honduras still produces soymilk. Mountain View College in the Philippines is still making meat analogues and perhaps soya milk–but only for their own use. Bandung College (now called Bandung Academy) in Indonesia is still in operation and they may be making soya products. Two years ago they wanted very much to start a food factory, but it did not happen. The Hong Kong Hospital is still operating and they still manufacture small amounts of food, basically for their own use. South China College has a long history. It was established in 1903 as Bethel Girls' School, but underwent several name changes and changes of location due to political turmoil and the Sino-Japanese war of 1937, followed by the violence of the Second World War.

"Eventually it was re-established at Clear Water Bay in Kowloon, in 1958 and a college curriculum introduced in 1962. Its name was changed to South China Union College

© Copyright Soyinfo Center 2021

in 1964. In 1981 they officially adopted its name and has been called Hong Kong Adventist College since then. It still operates today, and possibly manufactures small quantities of food, basically for their own use." Address: Director, International Health Food Assoc., Seventh-day Adventist General Conference, 12501 Old Columbia Pike, Silver Spring, Maryland 20904.

1314. Business Trend Analysts, Inc. 1990. The market for salad dressings, sauces and condiments. 2171 Jericho Turnpike, Commack, NY 11725. 275 p. Price: $895.
• ***Summary:*** This is an update of the 1988 edition. Sauces include the following table sauces: Ketchup, meat (incl. steak, worcestershire, vegetable, and seafood sauces), barbecue, Mexican (incl. chili, taco, enchilada, etc.), prepared mustard, and soy and teriyaki. Gravies, dips, and dry sauce mixes are not included. Ketchup is the largest segment. Address: Commack, New York.

1315. Takai Seisaku-sho. 1990. Modern soymilk plant: Makes delicious dairylike soymilk with no beany flavor. 1-1 Inari, Nonoichi-machi, Ishikawa-ken 921, Japan. 4 pages. Nov. Catalog. With 1-page color insert. 30 cm. [Eng]
• ***Summary:*** Page 2 is a flow chart of the modern soymilk production process. Page 3 shows modern soymilk plant layouts, floor plans, and specifications. The color insert, which is titled "Modern soymilk plant: Makes delicious dairylike soymilk with off-beany flavor," is printed on both sides. The front shows 3 packaged soymilk products: Ah Soy, Hai-Meeru Soyalac (Made by San-iku Foods in Japan), and Soya Bean Milk (made by Guilin Sweets and Food Factory, Guangxi, China). Companies that make soymilk using Takai equipment include: Chung's Foods and Nam Yang Industries in Korea. Jinan Huifeng Bean Milk Product Factory in China. "One of our plants makes 1,000 liters of 5,000 x 200 ml packs of soymilk; another makes 10,000 or 20,000 packs of soymilk per hour. EMUL is a healthy soy-based frozen dessert. Contact Takai for an EMUL production plant." On the back is a plant layout. Address: Kanazawa, Ishikawa-ken, Japan. Phone: 0762-48-1355.

1316. Bureau of the Census, U.S. Department of Commerce. 1990. The Asian population of the United States in 1990 (Overview). *SoyaScan Notes*. Compiled by William Shurtleff of Soyfoods Center. [1 ref]
• ***Summary:*** According to the 1990 census, the population of the United States was 248.7 million, up 9.8% from 1980. The Asian population is as follows: Total Asian and Pacific Islander 7.273 million (2.9% of the total, up 107.8% from 1980). Total Asian from traditional soy-consuming nations 5.524 million (2.2% of total, up about 100% from 1980!). Chinese 1.645 million (0.7%, up 104.1%). Filipino 1.407 million (0.6%, up 81.6%). Japanese 847,562 (0.3%, up 20.9%). Korean 798,849 (0.3%, up 125.3%). Vietnamese 614,547 (0.2%, up 134.8%). Hawaiian 211,014 (0.1%, up 26.5%).

1317. USDA Foreign Agricultural Service, Information Systems Management Div., Database Administration Branch. 1990. The world's leading soybean crushing countries: Statistics by country, 1964-1990. FAS USDA Oilseeds/ Products, Room 5638 South, 14th and Independence Ave. S.W., Washington, DC 20250-1000. 9 p. 28 x 38 cm computer printout.
• ***Summary:*** A search by Debby Pumphrey of the FACTS (Foreign Agricultural Commodity and Trade Statistics) database, for the amount of soybeans [commodity code: 2222000] crushed for domestic consumption by various countries worldwide, gives the following results, with all countries that crushed more than 500,000 tonnes ranked in descending order of amount of soybeans crushed. All figures are in metric tons (tonnes):

For the year 1990: USA 32,523,000, Brazil 13,700,000, Argentina 7,250,000, China 4,400,000, Japan 3,550,000, Netherlands 2,760,000, Germany, 2,550,000, Spain 2,300,000, Italy 2,025,000, India 1,785,000, Mexico 1,670,000, Taiwan 1,650,000, USSR 1,445,000, Belgium-Luxembourg 1,180,000, Canada 1,100,000, South Korea 840,000, Romania 789,000, Portugal 610,000, and United Kingdom 605,000.

In 1990 a total of 88,515,000 tonnes of soybeans were crushed worldwide. Of this total, the USA crushed 36.7%, Brazil crushed 15.5%, and Argentina crushed 8.2%.

For the year 1964/65: USA 13,036,000, Japan 1,460,000, China 1,304,000, West Germany 1,290,000, Canada 528,000. In 1964/65 a total of 21,357,000 tonnes of soybeans were crushed worldwide. Of this total, the USA crushed 61.0%, Japan crushed 6.8%, China crushed 6.1%, Brazil crushed 1.3%, and Argentina crushed 0.02%.

Note: At the top of the computer report is printed: Global Economic Data Exchange System [GEDES]. CP [Commodity Program] Subsystem–Commodity/Attribute Model. Crushing statistics are given for 175 countries from 1964/65 to 1990. Address: Washington, DC. Phone: 202-382-8232 or 202-447-4989.

1321. Lee, Sung-Woo. 1990. [Study on the origin and interchange of dujang (also known as soy bean sauce) in ancient East Asia]. *Korean Journal of Dietary Culture* 5(3):313-16. [12 ref. Kor]

• ***Summary:*** "Soybean was originated from the regions of Manchuria where it was processed into Dujang, the fermented soybean sauce. It was not until the Han dynasty in China that 'Shi', one type of Dujang, was introduced. 'Shi', which is also known as 'Sanguk' (loose soybean Meju), is made by first boiling and then fermenting the kernel of cooked soybean. It was admitted by the Chinese scholars that the 'Shi' which was used in China was introduced from Manchuria, the neighboring people to China at that time and the ancestor of Korean. 'Maljang' is a form of caked-shaped 'Meju' which is made by fermenting cooked and mashed soybean. The 'Maljang' of Manchuria was introduced to China, where it was called 'Maldo'. This fact is stated in a book, 'Saminwolyong', written during the 2nd century. 'Maljang' is presently used in Korea, but China has abandoned the use of 'Maljang' since the 6th century. It was introduced to Japan from Korea around the 7th century, and is remained in a few local regions. Although the term 'Jang' is representing all sort of fermented soybean products, including 'Shi' and 'Maljang', today, the definition of 'Jang' differs between China and Korea. According to the Chinese definition of 'Jang'. it is fermented soybean mixed with other cereal Koji. 'Jang' was first mentioned in 'Jaeminyo sool' in China and it was later introduced to Japan However, in Korea, the Chinese type of 'Jang' was not commonly used due to the popularity of 'Maljang'." 1324. **Product Name:** [Tofu].
**Foreign Name:** Tofu.
**Manufacturer's Name:** Hanyang Sojaprodukte GmbH.
**Manufacturer's Address:** Hermannstr. 31, D-6078 Neu Isenburg, West Germany. Phone: 06102/21956.
**Date of Introduction:** 1990?
**New Product–Documentation:** Letter from Bernd Drosihn. 1990. May 10. This is the biggest Asian-German tofu company in the south of Germany. Note: The company is probably run by Korean-Germans.

1325. Golbitz, Peter. 1991. Soyfoods consumption in the United States and worldwide: A statistical analysis. Bar Harbor, Maine: Soyatech, Inc. 26 p. *

• ***Summary:*** The National Cancer Institute, through Prospect Associates (a subcontractor), asked Mr. Golbitz to compile this report, largely from published sources. It contains 12 numbered pages of information and text summary and 14 unnumbered pages of tables. It contains retail soyfoods information for the past 10 years, FAO published data (Soybeans and Products Food Balance Sheets; published every 3 years), tons of soybeans used to make tofu in major Asian nations, number of U.S. manufacturers of soyfoods products 1984 and 1989, where the various soyfoods are sold in America (health/natural food stores, Asian-American food stores, supermarkets, institutional foodservice). It is not clear whether or not the report is in the public domain.

The estimated annual per capita consumption of soybeans, directly and indirectly as soyfoods, is as follows: Taiwan 13 kg, Japan 10.8 kg, Korea 9.0 kg, Indonesia 6.3 kg,

© Copyright Soyinfo Center 2021

and China 3.4 kg. Address: P.O. Box 84, Bar Harbor, Maine 04609.

1326. **Product Name:** Korean Style Vegetarian Potstickers.
**Manufacturer's Name:** Shin-Sun Foods.
**Manufacturer's Address:** 2551 W. Winton Ave. #6-0, Hayward, CA 94545. Phone: 510-887-6140.
**Date of Introduction:** 1991 January.
**Ingredients:** Filling: Cabbage, tofu, zucchini, onion, sesame oil, garlic, ginger, sea salt, black pepper. Wrapper: Unbleached flour, rice flour, water, egg.
**Wt/Vol., Packaging, Price:** 12.5 oz. for 10 potstickers.
**How Stored:** Frozen.
**New Product–Documentation:** Leaflet (8.5 by 11 inches, 3 color). "New! Shin-Sun Foods. Fresh, healthy, and delicious." "Each potsticker is individually hand wrapped in our kitchen. Hand wrapping takes a little longer than machine manufactured foods, but the appearance is greatly improved, and the product is more stable. All the ingredients used are fresh, and not frozen. Using fresh produce is more costly, but we think the taste and quality is well worth it."

Talk with Susannah Yang of Shin Sun. These potstickers were launched in Jan. 1991. They were the company's first product.

1327. Lesser, Peter; Elkin, Ed. 1991. History of Pacific Soyfoods in Olympia, Washington (Interview). *SoyaScan Notes.* Feb. 8. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Pacific Soyfoods was started by Peter Lesser in 1981. Initially it was run out of the kitchen a collective restaurant named Café a la Mode, located on 4th Avenue in Olympia, Washington. They made tofu from scratch, and used the okara from the tofu to make soysage, using a version of the recipe published in *The Farm Vegetarian Cookbook.* Initially these products were served in the restaurant (the okara was used in sandwiches), but by about June 1981, they had started delivering the Soysage to the local food co-op and to 1 or 2 local grocery stores in Olympia. When the restaurant was closed after a year of operation, the wholesale accounts still wanted Soysage, so Peter decided to keep the soy operation going and at that time, in Feb. 1982, he coined the term "Pacific Soyfoods."

Peter stopped making tofu and bought his okara from a Korean-American tofu manufacturer named Boo Han in Lakewood, Washington. In the spring of 1982, Pacific Soyfoods' landed its first wholesale account, Pacific Rim (formerly known as something like C.C. Grain), a collective wholesaler in Seattle, that delivered to the Puget Consumers Co-op (PCC) in Seattle. Soon thereafter he started selling to natural foods wholesalers, the first one based in Seattle and the second one based in Portland, Oregon. Then in 1983 he expanded his product line by adding to the Original Soysage, Italian and Mexican flavor, and changed from a fresh Saran wrap packaging to vacuum packaging. He expanded his distribution into the San Francisco Bay Area, first through Pacific Trading Co. (Mark Brawerman), then after he folded [sic, relocated], Ben Lee at Quong Hop & Co. took over the distribution. At one point, Quong Hop offered to set up at plant in the state of Washington with Peter overseeing it, in order to reduce freight to Washington. Island Spring also distributed Peter's products, and he would sometimes get okara from them.

In about Nov. 1985 he introduced his first tofu burger, the Earthling Tofu Vegetable Burger. He bought the tofu for this burger from Boo Han.

On 1 April 1988 Peter sold Pacific Soyfoods to Ed Elin. At that time the company made four soyfood products: three flavors of Soysage, and Earthling Tofu Vegetable Burgers. Peter left and started Northwest Natural Foods, which makes Medallions, salmon or halibut patties/burgers with wild rice. He tried many times to make a salmon & tofu burger but was unable to get the right texture. (His phone number is now 206-866-9681.) Elin purchased his tofu and okara from Boo Han's, just up the road in Tacoma, Washington. About 12-15 months ago Boo Han changed hands; it is now named Hang Yang, owned by Mr. Choy, a Korean-American, who does not speak English–although his brother does. Hang Yang is very aggressive and doing well; he just upgraded to a new system.

Ed continued to make the same four products, and will be getting new labels (with some color changes) next week for two new flavors of burgers. To the Original Earthling, they will add a Barbecued Earthling and a Teriyaki Earthling. The Barbecued flavor should be on the market in late Feb. and the Teriyaki in March. His business is "growing so fast I can't believe it." His bestselling product is the tofu burger. He has also become distributor for other companies outside the region; he brings up and distributes Quong Hop's entire Soy Deli line. He plans to take on some tofu wieners and the JSL line of egg roll wraps and won-ton skins. By mid-summer he plans to have three of his own styles of tofu (soft, medium, and firm) private labeled by Han Yang.

He fully services his own products in about 175 supermarkets on a weekly or bi-weekly basis. His big accounts are Q.F.C. [Quality Food Centers, the big market in Seattle], and Safeway. He sells only in supers, no natural/health food stores. But he does sell his products to companies that distribute to natural/health food stores, such as NutriSource and the Mountain People's Warehouse down south. The business in natural food stores is too small. Address: 2948 29th Ave. S.W., Building 2C, Olympia, WA 98502. Phone: 206-943-6234.

1328. *Toyo Shinpo* (*Soyfoods News*). 1991. Beikoku de daizu origo-to. Karupisu, Mitsubishi Shôji to kyôdô [Soybean oligosaccharides in the USA. Calpis and Mitsubishi joint venture with Central Soya]. Feb. 21. p. 13. [Jap]

© Copyright Soyinfo Center 2021

• ***Summary:*** It has been announced that Calpis Food Co. (Shokuhin Kogyo; maker of a very popular Japanese non-alcoholic beverage) and Mitsubishi Shoji are going to establish a jointly owned company with Central Soya (Indiana) to produce and sell soybean oligosaccharides in 3 of Central Soya's plants in America. Oligosaccharides, which have the ability to condition the intestines, have been produced by several food companies in Japan. But Calpis got safety approval from the U.S. Food and Drug Administration as the first company in Japan. They are planning to sell the product aggressively overseas, to Unilever in Europe, and also in Korea. They are trying to capture the growing awareness of health. They are hoping to reach 5,000 million yen [about $39.3 million] sales during the first three years, selling mainly to confectionery manufacturers as a sweetener. They hope to begin shipping to Unilever this year for use in boosting the nutrition of infant formulas.

In Korea, they plan to supply the largest tofu maker and food manufacturer, Purumuwon in Seoul, with a powdered soy oligosaccharide sweetener, private labeled.

Oligosaccharides promote the growth of Bifidus (Bifidobacterium; beneficial bacteria) in the intestinal tract. In Japan, the market for products that include oligosaccharides is estimated at 150,000 million yen ($1,195 million), growing at about 20% a year due to consumer health awareness. But this concept and the resulting products are not yet popular overseas. There are several types of oligosaccharides. The one Calpis developed from soybeans is widely available in these beans and is getting the most attention. Their product has about 20% of the Japanese market. Calpis established a company named Soya Oligo Japan (president, Mr. Kôkichi Sato) with Mitsubishi in 1989 and has been preparing for overseas expansion.

A shorter, similar, follow-up article was published in *Toyo Shinpo* on 21 March 1991, p. 3. Address: Japan.

1329. Fehlberg, Eric C. 1991. The sale of Granose Foods to the Haldane Foods Group and British Arkady Ltd. (Interview). *SoyaScan Notes.* April 30. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** The sale of Granose took effect from 1 Jan. 1991. At the time of the sale, Granose was doing very well financially. The only year that they didn't break even or make a profit was 1990. At the beginning of 1990 they moved from their old building into the new one; the expenses connected with the move took up most of their profits. In all other recent years they have been making good money, and a portion of that money has been contributed to the church. Mr. Fehlberg cannot understand why the church would sell such a thriving company.

But the board of the directors of the British Union of the Seventh-day Adventist church got an offer (which was a little bit of back-door work) that was too good to refuse, so they looked at it in their committee meeting and decided to accept it. They have a good understanding of all aspects of the company. This is the second long-established Seventh-day Adventist food company that has been sold by the church during the last 2 years. Loma Linda Foods was sold to Worthington Foods in Jan. 1990. Most of the employees of Granose have stayed with the company after the sale. Peter Archer, the former general manager, has stayed but is no longer the general manager. He is now marketing manager. The church no longer has any involvement with Granose at all.

We cannot say that these two sales are the start of a trend, but he is quite sure that the four Scandinavian Adventist food companies (Nutana in Denmark, Sweden, Norway, and Finland) will be the next to be sold. Nutana-Sweden is in considerably better financial shape than the other three, and Nutana-Finland is in pretty good shape. Nutana in Denmark and Norway are losing money and are very much in trouble. But he thinks that can easily be corrected if they get their costing straight and price their products based on their real costs. The man who has gone in to make these changes, Jan Paulsen, has as good a chance of succeeding as anyone, but he works out of London, England and does not have a much time for the health food work. He feels that the church should not be in the business of selling healthy foods. He influenced the board of the British Union in their decision to sell of Granose.

After the Scandinavian Nutana companies, the Egypt Food Factory, run by Mokhtar Nashed in Helipolois, Cairo, Egypt may well be the next to go, probably within the next few months. They used to make soymilk but he thinks they no longer are making it. Their products are "sub-standard" but still good. Superbom in Brazil is also having a hard time because of the adverse exchange rate and the desire to borrow money from the church. Superbom Chile is also having some problems.

But many of the Adventist food companies definitely will not be sold by the church in the foreseeable future. In fact, in the Far Eastern Division, a new food company in Hong Kong, run by Mr. Menzies, is scheduled to start selling products in early June of 1991. A new company is also starting in Thailand. Sahm Yook in Korea is also very successful, as is DE-VAU-GE in Germany and Sanitarium Foods in Australia. The food companies in Central America (Mexico, Costa Rica) and the Caribbean (Trinidad) are all doing well.

There are various administrative "Unions" within the Seventh-day Adventist Church. There are 4-5 unions in North America, 4 in Australia, many in South America, etc. The South American ones report to one central office in Brasilia, Brazil. The Central American food companies report to Miami, Florida. Sometimes a company manager and the head of the Union (a church official to whom he reports) have different ideas of what needs to be done at the company. These two men live in two different worlds, yet

© Copyright Soyinfo Center 2021

both have input in running the company. This can be a cause of business problems. The Mormon church owns some food companies and has the same type of problems. Address: Director, International Health Food Assoc., Seventh-day Adventist General Conference, 12501 Old Columbia Pike, Silver Spring, Maryland 20904. Phone: 301-680-6674.

1330. Shurtleff, William; Aoyagi, Akiko. comps. 1991. Bibliography of soy sprouts: 655 references from 3rd century A.D. to 1991, extensively annotated. Lafayette, California: Soyfoods Center. 185 p. Subject/geographical index. Author/company index. Language index. Printed July 12. 28 cm. [655 ref]

• ***Summary:*** This is the most comprehensive bibliography ever published on soy sprouts. It is also the single most current and useful source of information on this subject available today, since 71% of all references (and most of the current ones) contain a summary/abstract averaging 172 words in length.

This is one of more than 40 bibliographies on soybeans and soyfoods being compiled by William Shurtleff and Akiko Aoyagi, and published by the Soyfoods Center. It is based on historical principles, listing all known documents and commercial products in chronological order. It features: 27 different document types, both published and unpublished, every known foreign language publication on the subject, extensive translations of many Japanese and European works, and many original interviews Thus it is a powerful tool for understanding the development of this subject and related products from its earliest beginnings to the present, worldwide.

Compiled one record at a time over a period of 17 years, each reference in this bibliography features (in addition to the typical author, date, title, volume and pages information) the author's address, number of references cited, original title of all non-English publications together with an English translation, month and issue of publication, and the first author's first name (if given).

It also includes details on 40 commercial soy sprout products, including the product name, date of introduction, manufacturer's name, address and phone number, and (in many cases) ingredients, weight, packaging and price, storage requirements, nutritional composition, and a description of the label. Sources of additional information on each product (such as references to and summaries of advertisements, articles, patents, etc.) are also given.

Details on how to use the bibliography, a complete subject and geographical index, an author/company index, a language index, and a bibliometric analysis of the composition of the book (by decade, document type, language, leading periodicals or patents, leading countries, states, and related subjects, plus a histogram by year) are also included. Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549. Phone: 510-283-2991.

1331. Ashraf, Hea-Ran Lee. 1991. Work with soyfoods in Zambia and Illinois (Interview). *SoyaScan Notes.* Aug. 14. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** Hea-Ran is Korean. After 2 years studying groundnut flour in India at CFTRI on an FAO scholarship, she came to the USA in 1976. At Iowa State Univ., working under Dr. Harry Snyder, she wrote her PhD degree thesis on the flavor of soymilk.

While in Zambia, she worked with home economics extension people, teaching them how to fortify Nshima (pronounced "SHEE-muh; a popular thick non-fermented cornmeal mush that is often eaten with the fingers) with either roasted soy flour, or with okara from soymilk. She and Ellen Jayawardene from Sri Lanka also taught the local people to make and use soymilk. They did not teach about tofu, since no coagulant was readily available. The Lee Yeast Co., a bread company or bakery owned by Mr. Limbada, uses soy flour in their breads. Several other companies were in the process of buying Wenger- or low-cost extrusion cookers for processing soybeans. People from the University of Illinois were helping them to set up this equipment.

The key man working with soyfoods in Zambia is Fred Javaheri. He has worked in Zambia for about 20 years, initially with the USDA. An Iranian by birth, he and his family have permanent Canadian residence (but not citizenship) status but they live in Zambia. Because his religion is Baha'i, he fled from Iran after the Iranian revolution, when many of his non-Moslem faith were persecuted or killed. The Baha'i faith originated in Iran (Persia) in the 19th century and emphasized the spiritual unity of all human beings.

In 1979 she went to the Univ. of Illinois at Carbondale, where she now does mainly teaching; there is not much time or funds for research. Many of her students have do research on tofu. Address: Asst. Prof., Animal Science, Food & Nutrition, Southern Illinois Univ., Carbondale.

1332. Takai Seisaku-sho. 1991. [Takai corporate guide]. 1-1 Inari, Nonoichi-machi, Ishikawa-ken 921, Japan. 8 panels. Nov. 1. 30 cm. [Jap; eng]

• ***Summary:*** This color brochure, containing 5 color photos, is written in both Japanese and English. It notes that (as of 1 Nov. 1991) Takai has exported its tofu and soymilk equipment to 140 cities of 30 countries, including Bhutan, Bolivia, Brunei, Burkina Faso, Egypt, Finland, India, North Korea, Mexico, Nepal, Philippines, Spain, Sri Lanka, Sweden, Switzerland, and Thailand.

A chronology of the company states that in July 1917 Kamejiro Takai, a former president, founded Takai & Brothers Co. It was renamed Takai Sesakusho in Jan. 1946. Address: Kanazawa, Ishikawa-ken, Japan. Phone: 0762-48-1355.

1333. Food and Agriculture Organization of the United Nations (FAO), Statistics Div., Basic Data Unit. 1991. FAO food balance sheets, bilans alimentaires, hojas de balance de alimentos, 1984-1986 average. 00100 Rome, Italy. xx + 384 p. No index. 30 cm. [Eng; Fre; Spa]

• ***Summary:*** This book is written in 3 languages: English, French, and Spanish. Prepared by the Statistics Div. of the Economic and Social Policy Dept. of FAO in Rome, it gives food balance sheets for 3-year periods (e.g. 1961-63, 1964-66, 1986-88, etc.) for 145 countries (including mainland China but not Taiwan). The introduction discusses: Food balance sheets–what they are and how to use them. Accuracy of food balance sheets. Concepts and definitions: Commodity coverage, supply and utilization elements (production, imports, stock changes, exports, processed trade, domestic supply, feed, seed, food manufacture, other uses, waste, food, per caput supply), Population coverage. Units and symbols. Country coverage: Statistics are given for the world, developed countries as a group, developing countries as a group, 34 individual developed countries, and 111 individual developing countries.

Soybeans are included under the heading "oilcrops" (*oléagineux, semillas oleaginosas*), along with 8 other individual oilcrops plus "others." Soybean oil is included under the heading "vegetable oils" along with 11 other individual vegetable oils plus "others."

For each country, two tables are given. In the first table, per capita food supply, foods are divided into the following commodity groups: grand total, vegetable products, animal products, cereals (excluding beer), starchy roots, sweeteners, pulses, nuts and oilseeds, vegetables, fruit (excluding wine), meat and offal, eggs, fish and seafood, milk (excluding butter), oils and fats (subdivided into vegetable oils, and animal fats), spices, stimulants, alcoholic beverages, miscellaneous. For each 3-year period the following statistics are given for each commodity group: kilograms/year, calories/day, protein (grams/day), and fats (grams/day). Thus, for the Japan (for example), we can see that grams of protein per day from "nuts and oilseeds" increased from 9.8 in 1961-63 to 10.3 in 1986-88. This is the closest we can get to a figure for soyfoods consumption from this table.

The second table gives average annual domestic supply for the period 1984-86 (broken down into production, imports, stock changes, exports, processed trade, total), domestic utilization (broken down into feed, seed, food manufacture, other uses, waste, food), and per caput supply (broken down into kg/year, grams/day, calories/day, protein [gm/day], and fat [gm/day]), for specific foods within each of the major commodity groups. Thus, for Japan, we see that for soybeans during 1984-86, production was 237,000 tonnes (metric tons), imports 4,747,000 tonnes, stock changes 35,000 tonnes, exports 0, processed trade 2,000 tonnes, total domestic supply 4,947,000 tonnes. For domestic utilization, 67,000 tones were used for feed, 8,000 tonnes for seed, 3,636,000 tonnes for food manufacture, 0 for other uses, 89,000 tonnes for waste, and 1,158,000 tonnes for food. The per capita supply was 9.6 kg/year or 26.3 gm/day. Each day this provided 98 calories, 8.9 gm of protein, and 3.7 gm of fat.

For many countries (including the USA and Brazil) no statistics are given for food use of soybeans or for any parts of per caput supply.

A ranking of the countries (not including Taiwan) with the highest per caput supply of soybeans (kg/year) and soybean protein (gm/day) is as follows: Japan 9.6, 8.9. North Korea 9.0, 8.5. Indonesia 7.2, 6.8. South Korea 6.4, 6.1, Hong Kong 3.9, 3.6. China (Mainland) 3.1, 2.0. Singapore 0.2, 0.1. Address: Rome, Italy.

Taller Regional Centroamericano y Consulta Sobre Planificacion de Investigacion Horticola, Programa II. AVRDC and IICA. See p. 297-306. Held 5-8 Nov. 1991 at Instituto Interamericano de Cooperation para la Agricultura (IICA), Costa Rica. [52 ref]

• ***Summary:*** Contents: Abstract. Introduction. History: China, Japan, Korea, North America. Quality. Variety selection. Production. Current research. Summary. Address: East Asian Crop Development Program, Dep. of Crop and Soil Sciences, Washington State Univ., Pullman, WA 99164-6420.

1335. Packaged Facts. Subsidiary of FIND/SVP. 1991. The Oriental foods market. 581 6th Ave., New York, NY 10011. Nov. *

• ***Summary:*** "The Oriental Foods Market covers the $1 billion retail market for prepared Oriental foods, which is broken down into four categories–canned / packaged,... frozen, dry soups, and tofu.

Tofu is discussed briefly on page 16, and in depth on pages 180-205. Soy sauce is discussed in numerous places (incl. p. 54-57, Kikkoman, La Choy, Chun King, p. 102).

Talk with David Weiss, president of Packaged Facts. 1991. Nov. 26. This is an update of the Feb. 1989 edition of this company's market study of the same title. It was "completely rewritten by a different author, Linda Linton." They have added new statistics and even went back and changed some sales figures from the previous report. He does not know how the author gathered statistics on U.S. tofu production and sales, but he knows that she did not contact individual companies, one by one. "That is a very difficult way to get the information because (1) you don't know if you're getting the right information and (2) there may be something you are missing. We don't use SIC codes. Our figures are undoubtedly guesstimates. A little of it came from the Public Relations Dept. of Nielsen Marketing Research; they don't cover it all but they are good on packaged goods.

© Copyright Soyinfo Center 2021

A little also came from SAMI. There is nobody measuring the tofu market. This study only covers tofu sold as tofu, not including second-generation products. Some figures may have come from a tofu association, if there is one. Most of our reports are written from secondary published data. We just compile the figures. We are planning to do a report on the whole soy market–not just tofu." Address: New York. Phone: 212-627-3228.

1336. Chung, Gyu Hwa; Kim, Kwang Sik. 1991. Obtaining interspecific hybridization between *Glycine max* and *G. latifolia* through embryo culture. *Korean J. of Plant Tissue Culture* 18(1):39-45. [22 ref. Eng; kor]
• ***Summary:*** Spraying 100 ppm of gibberilic acid on the pollinated buds was found to prevent early abcission of the pod resulting in a success rate of 5.9%.

"Wild relatives of crop plants have been effectively employed in various breeding programs as additional sources of genetic diversity (Stalker, 1980). In fact, the best hope for future crop improvement lies in the exploitation of abundant gene pools of crops' wild relatives (Feldman and Sears, 1981)." Address: Korea Agri. Product & Seed Co, Ltd. 600 Karak-Dong, Songpa-Ku, Seoul 138-701; Dep. of Biol. Eng., Yosu National Fisheries College, Chunnam, 550-749.

1337. Kwon, Chung Sook; Chang, Kwon Yawl. 1991. [*In vitro* germination of young hybrid embryos between *Glycine max* and *G. tomentella*]. *Korean J. of Breeding* (*Han'guk Yukchong Hakhoe Chi*) 22(4):379-83. [16 ref. Kor; eng]
• ***Summary:*** "Embryo and ovule culture was carried out to investigate a suitable condition for growth and germination of young hybrid embryos between soybeans as female and a wild perennial relative *G. tomentella.* Hybrid pods and ovules were readily distinguished from the selfed in their small, wrinkled appearance." Address: 1. Graduate School; 2. College of Agriculture. Both: Gyeongsan National Univ., Chinju 660-701, Korea.

1338. Hymowitz, T.; Bernard, R.L. 1991. Origin of the soybean and germplasm introduction and development in North America. In: H.L. Shands and L.E. Wiesner, eds. 1991-1992. Use of Plant Introductions in Cultivar Development: Proceedings of a symposium sponsored by Division C-1 of the Crop Science Society of America in Las Vegas, Nevada, 19 Oct. 1989. 2 vols. Part 1. CSSA Special Publication Number 17. Madison, Wisconsin: Crop Science Society of America (CSSA). 164 p. See p. 147-64. Chap. 9. Crop Science Society of America Special Publication No. 17. [34 ref]
• ***Summary:*** Contents: Introduction. Origin of the genus *glycine.* Origin of the soybean. Introduction of the soybean to North America (by Samuel Bowen in 1765). Experiment stations and technology. Introduced soybean germplasm. Cultivar development. *Glycine soja.* Wild perennial *glycine* species.

"The genus *Glycine* Willd is divided into two subgenera, *Glycine* and *Soja* (Moench) F.J. Herm. The subgenus *Glycine* contains 15 wild perennial species (Singh et al., 1988; Tindale and Craven, 1988). Thirteen of the species [*G. albicans* Tind. and Craven, *G. arenaria* Tind., *G. curvata* Tind., *G. canescens* F.J. Herm., *G. clandestina* Wendl., *G. curvata* Tind., *G. cyrtoloba* Tind., *G. falcata* Benth., *G. hirticaulis* Tind. and Craven, *G. lactovirens* Tind. and Craven, *G. latifolia* (Benth.) Newell and Hymowitz, *G. latrobeana* (Meissn.) Benth. and *G. microphylla* (Benth.) Tind.] are indigenous to Australia. All carry 2*n* = 40 chromosomes (diploid) except for *G. hirticaulis* which is tetraploid, 2*n* = 80.

"*Glycine tabacina* (Labill.) Benth. with 2*n* = 40 or 80 chromosomes, has been found in Australia, Taiwan, south Pacific Islands (New Caledonia, Fiji, Tonga, Vanuatu, Niue) and west central Pacific Islands (Mariana, Ryukyu). All accessions of *G. tabacina* collected outside of Australia are tetraploid (2*n* = 80) and even within Australia, tetraploids predominate over diploid forms. *Glycine tomentella* Hayata has been found in Australia (2*n* = 38, 40, 78, or 80), Papua New Guinea (2*n* = 40, 78 or 80), Indonesia (2*n* = 80), Philippines (2*n* = 80), and Taiwan (2*n* = 80). Singh et al. (1987, 1989) demonstrated that the complexes of *G. tabacina* and *G. tomentella* evolved through allopolyploidization in Australia."

"The soybean was first introduced to North America in 1765 by Samuel Bowen, a seaman employed by the East India Company. Bowen brought soybean from China via London to Greenwich, his residence in the province of Georgia. Situated a few kilometers east of Savannah, the 180 ha of Greenwich (now a cemetery) became the center of his farming and manufacturing enterprises.

"By the late 1850s, soybean was evaluated for forage potential by many farmers throughout the USA (Hymowitz, 1987). However, the scientific approach for evaluating the crop had to wait until the emergence of the agricultural experiment stations at land grant institutions during the latter part of the nineteenth century."

Table 9-1 (p. 154-57) shows "Ancestral cultivars and their occurrence in pedigrees of U.S.- Canadian publicly developed grain-type soybean cultivars (excluding backcross-developed isolines covered in Table 3). Part A of this table is a summary by maturity group and part B is a summary by decade of release. Each part is divided into number of descendant cultivars, northern ancestors, southern ancestors, ancestors chosen for pest resistance, other, and number of ancestral cultivars. The ten most important northern ancestors (in descending order of importance with the number of occurrences in pedigrees in parentheses) are: Mandarin (143), Manchu (121), Richland (119), A.K. (108), Dunfield (83), Mukden (73), No. 171 (30), Pakota (27), L37-1355 (25), and Manitoba Brown (14). The 13 most important

© Copyright Soyinfo Center 2021

southern ancestors are: CNS (118), Tokyo (109), PI54610 (108), S-100 (82), Roanoke (42), Haberlandt (40), Arksoy (40), Palmetto (34), Biloxi (9), PI 60406 (7), Otootan (7), Laredo (4), Mammoth Yellow (5).

Table 9-2 (p. 158-59) shows the "Origins of major ancestral cultivars of the 221 cultivars developed at public institutions in the USA and Canada." For each cultivar is given: Descendant cultivars, maturity group, year of introduction, country and locality of origin, and original cultivar name.

Table 9-3 (p. 161) shows "Sources of genes backcrossed into domestic public soybean cultivars." The named varieties are Kanro, Mukden, Arksoy, Higan, Kingwa, and CNS. All 8 of the most important northern cultivars originated in China. Of the 12 most important southern cultivars, 9 originated in China, 2 in Korea, and 2 or 3 in Japan. Address: Univ. of Illinois, Urbana, Illinois.

1339. Loewen, Nancy. 1991. Food in Korea. Vero Beach, Florida: Rourke Publications, Inc. 32 p. Illust. (color photos). Index. 26 cm. Series: International Food Library.

• ***Summary:*** Juvenile literature: An introductory book for junior high school students. Text by Nancy Loewen. Recipes compiled by Judith A. Ahlstrom.

Contents: 1. An introduction to Korea. 2. A common heritage. 3. North and South Korea. 4. Agriculture and industry. 5. Holidays in Korea. 6. Food customs in Korea. 7. Korean foods. 8. A festive meal. 9. A red-meat meal. 10. A white-meat meal. 11. An everyday meal. Glossary of cooking terms. Korean cooking.

The Japanese took control of Korea in 1910 and remained in power until 15 Aug. 1945, when the country was liberated by allied forces. That didn't make Korea a free country, however. After 35 years of Japanese rule, Korea's political system was weak and the northern half of Korea was soon occupied by communist forces. The country was divided and in 1948 two new governments–one for the North and one for the South, were established. Then in 1950 North Korea invaded South Korea; the Korean War had begun; it lasted until 1953 with Korea still divided at Panmunjom–as it is today.

Korea still uses two calendars: the Gregorian calendar (used in the USA and in most other countries) and the ancient Chinese lunar calendar. Korea's older holidays are still observed based on the lunar calendar.

Common foods in Korea include rice, soy sauce, tofu, kimchi, and soybean sprouts.

1340. Passmore, Jacki. 1991. The encyclopedia of Asian food and cooking. New York, NY: William Morrow. 320 p. Illust. by Jan Smith. Index. 24 cm. [44 ref]

• ***Summary:*** The most complete book of its type seen to date (May 2010), with many helpful cross references (although sometimes flawed). Soyfoods are mentioned throughout. Unfortunately, for Chinese foods, the author does not distinguish between Mandarin and Cantonese, or between pinyin (newer) and Wade-Giles (older) styles of romanization. For some of the "Also known as" it is not clear to which of several previous entries this refers (see "Soybean"). Sometimes she gives standard transliterations (azuki, miso, tofu, yakidofu) yet at other times she writes phonetically (ah meh)–as an aid to correct pronunciation.

Ame (ah meh, Japan): A sweet jelly made from millet.

Azuki bean (*Phaseolus angularis*). Native to China; used in China since the Han Dynasty (206 BC–AD 220): An [or anko] (Japan): A sweetened paste of ground azuki beans available in smooth (koshi-an) and crunchy [chunky] (tsubu-an or tsubushi-an). Sarashi-an: A flour of ground azuki beans. Also known as hong dow (China), dried red beans, red beans [adzuki beans, aduki beans]. See also: Red bean paste, sweet.

Bean curd: Also known as dou-fu, dow foo (China); tahu (Indonesia), momen tofu, tofu (Japan); ta hu, ta hua (Malaysia); tahure ([fermented tofu] Philippines); tauhu kau (Thailand); dau hu, dau hu chung (Vietnam); bean custard, soybean cake.

Note 1. This is the earliest English-language document seen (April 2013) that uses the term *ta hu* to refer to Malaysian-style tofu.

Illustrations of: Fried bean curd, pressed bean curd. Almond bean curd (non-soy). Bean curd "brains": Also known as doufu nao (China); taho (Philippines). "Cotton" bean curd: Also known as momen tofu (Japan). Freeze-dried bean curd [dried-frozen tofu]: Also known as koya tofu (Japan). Fried bean curd: Also known as char doufu, doufu pok (China); agedofu, atsu-age, nama-age (Japan); tauhu tod (Thailand), dau hu chien (Vietnam). Fried bean curd pouches: Also known as aburage, usuage (Japan). Gan modoki. Grilled bean curd: Also known as doufu kan [sic], gone (China); yakidofu (Japan). Instant bean curd. Okara. Pressed bean curd: Also known as doufu kan (China), taukwa, tauhu kuning (pressed yellow bean curd) (Indonesia, Malaysia); tokwa (Philippines); tauhu leong (Thailand); dau hu ki (Vietnam). Silk bean curd: Also know as kinugoshi tofu (Japan), shui doufu (China), taho (Philippines).

Note 2. The author seems to be confused about "Silk bean curd." Japanese kinugoshi is made from relatively thick soymilk, which is "set" using a coagulant but without any separation of curds and whey. Yet on page 26 we read: "In China the name [for silk bean curd] translates as 'water bean curd,' It has a very smooth, delicate texture achieved by straining the coagulated liquid through fine mesh, then allowing the strained curds to settle without pressing." This is not a description of silken tofu, but rather of Japanese regular tofu (*momen-goshi*) made without any pressing weights.

Contains a recipe for homemade "Bean Curd" plus 3 bean curd recipes.

Bean curd by-products: Bean curd skin [yuba], bean

© Copyright Soyinfo Center 2021

curd sticks: Also known as fu jook pin, gee jook (China), yuba (Japan), forng ta ohu [tauhu] (Thailand); rolled bean curd, second bamboo.

Fermented bean curd: Also known as foo yu, fu-ru, narm yu (China), tahoe, tahu (Indonesia, Malaysia), tausi (Philippines), bean curd cheese, Chinese cheese, pickled bean curd, red bean curd, soybean cheese.

Moldy bean curd. Bean curd cheese: See bean curd by-products (fermented).

Bean pastes and sauces: Shih and jiang from China: (1) Bean sauce (jiang) also known as taucheo or tau sa (Malaysia, Nonya and Singapore cooking), mien see [mian shi] (China), taoco [Pron. = tao-cho] (Indonesia), tuong ot (Vietnam), bean paste, brown bean sauce, yellow bean sauce. (2) Black bean sauce (a recent addition to the family of Chinese sauces. A major ingredient is puréed fermented black beans with a hint of garlic and star anise. It tastes best when freshly made). (3) Chili bean paste (in addition to chopped dried chilies, it sometimes contains fermented black beans): Also known as lat chu jeung, as lat chu jeung yau (Garlic) (China); kochujang (Korea); bean paste with chili; hot bean paste; Sichuan hot bean paste. (4) Dhwen-Jang (Korea). See also miso. (5) Hoisin sauce (China): A sweet, thick, reddish brown sauce. One ingredient is fermented soybean paste. Not to be confused with the Chinese barbecue sauce called sha cha jang. Also known as hoi sin cheung (China); barbecue sauce. (5) Soybean paste. Also known as mean see jiang (China). (6) Sweet bean paste. In this context it is not the sweet bean paste made from azuki beans, but rather a sweet, thick, dark brown sauce made of ground fermented soybeans and sugar. Its salty-sweet flavor is used in marinades and roast meats. Also known as tim mean jiang (China).

Bean sprout: Mung bean sprouts, silver sprouts (mung bean sprouts with the roots and seed pods removed), soybean sprouts (They "are large, up to 5 inches {12.5 cm} in length, a deep, almost yellow color and strong in flavor..."). Also known as: Daai dau nga choy (soybean sprout), ngunn nga choy (silver sprouts), nga choy, sai dau nga choy (mung bean sprout) (China); tauge (Indonesia); moyashi (Japan); kacang ijo, kacang djong, kacang padi (Malaysia); togue (Philippines); taun gawk (Thailand); gia (Vietnam); bean shoots.

Beijing duck sauce (recipe with ½ cup sweet bean paste). Vietnamese-style Beijing duck sauce (with ½ cup sweet soy sauce–kecap manis).

Black bean: See Fermented black bean. Black bean sauce: See Bean pastes and sauces. Fermented black bean sauce. Black soybean: See soybean.

Broad bean paste. Broad bean sauce: "The best is made in Pixian, a city in Sichuan province, where it is used instead of soybean-based seasoning sauces."

Brown bean sauce: See Bean pastes and sauces.

Che hau sauce (Che how, China): See Bean pastes and sauces (Hoisin). Chick-pea.

China: Has the "oldest and most well-documented cuisine in the world." Chinese cheese: See Bean curd by-products (fermented). Chinese hot bean paste: See Bean pastes and sauces.

Dau hu (Dow hoo, Vietnam): See bean curd. Dau hu chien (Dow hoo chee-ian, Vietnam): See Bean curd, fried. Dau hu chung (Dow hoo chee-ung, Vietnam): See Bean curd. Dau hu ki (Dow hoo kee, Vietnam): See Bean curd, pressed.

Dengaku (plus recipe).

Dhwen-jang (Dwen-jang, Korea). Similar to Chinese soybean paste or Japanese akadashi miso. Also known as Korean bean paste. Doufou Kan [doufu gan], China: Bean curd (grilled, pressed). Dou-fu (Dau-fu, China). See Bean curd. Doufu nao (Daufu-nou, China): See Bean curd "brains." Doufu pok (daufu pork, China). See bean curd, fried. Dow foo (dau fu, China): See Bean curd.

Edamame (e dah ma meh, Japan): See soy bean.

Fermented bean curd: See Bean curd by-products. Fermented bean curd cake. See Bean curd by-products; tempe.

Fermented black beans (Shih, China). With recipe for "Fermented black bean sauce" (p. 106). Also known as dau see (China), black beans, dried black beans, preserved back beans.

Fermented red rice. Flours and thickeners: Kuzu (Japan). Mung bean flour. Soy flour (incl. kinako, which "is used in confections and to make noodles... In China, a thick, nutty-tasting noodle is made from soy flour"). Foo yu (Fu you, China). See Bean curd by-products (fermented). Forng Tao Hu (Fong tao huu, Thailand). See Bean curd by-products, bean curd sticks. Fu jook pin (Fu juk pin, China): See bean-curd by-products, bean curd skin. Fu-ru (Fu yue). Gee Jook (Ji Juk, China): Bean curd sticks.

Gluten: Kau fu, kohana fu, matsutake fu, mein jin pau, nama fu, su tang, yaki fu. Also known as: Kau fu, mianjin, mein jin pau, su tang (China), kohana fu, yaki fu (Japan).

Gochujang (Korea). See also: Chili paste, chili sauce. Korean barbecue sauce.

Grilled bean curd: See Bean curd, grilled.

Hatcho miso: See miso, Hatcho. Hot bean paste. Hot black bean sauce. Inaka miso: See miso.

Japan: "Japanese cooks revel in the artistry of their craft. The Japanese love of nature is a challenge to present each ingredient as reminder of its origins: to bring nature to the table...," Regional cuisines are not of great importance in Japan; cooking methods (incl. Dengaku), salting (incl. Teriyaki), cutting and slicing techniques.

Kecap asin (Ket-chup a-seen, Indonesia): See Soy sauce, sweet and salty. Kecap cair (cha-ear, Malaysia): See soy sauce, light. Kecap hitam (Indonesia): See soy sauce, sweet and salty. Kecap ikan (Indonesia): See Fish sauce. Kecap manis (mah-niece, Indonesia): See Soy sauce, sweet and salty. Kecap petis (pet-is, Indonesia): See fish sauce.

Kinugoshi tofu (Japan): See Bean curd, silk.

Kochujang (go-choo jang, Korea): See Bean pastes and sauces; chili pastes.

Koikuchi shoyu (Japan): See soy sauce. Continued. Address: Author of several books on Asian cuisine.

1341. Passmore, Jacki. 1991. The encyclopedia of East Asian food and cooking (Continued–Document part II). New York, NY: William Morrow. 320 p. [44 ref]

• ***Summary:*** Continued from p. 153: Korean bean paste: See Dhwen jang. Koshi-an (Japan): See Azuki beans (an). Koya tofu (Japan): See Bean curd, freeze-dried [sic].

Kuzu (Japan): See Flours and thickeners. Lentil (*Lens esculenta*)*:* Red lentil, Red mung beans.

Light soy sauce: See Soy sauce.

Lu soy (lo shui, China): See soy sauce.

Maltose: Made by fermenting germinated grains of barley. When used to glaze foods, may have soy sauce and red food coloring added. Also known as: Malt sugar, [barley malt syrup].

"Ma-po" dofu [Mabo-dofu]: See beef.

Mean see jiang [mian shi jiang] (min see jiang, China): See Bean pastes and sauces.

Mein jin pau [mien jin pau] (China): See Gluten.

Mianjin (China): Gluten.

Mien see (mien-si [mian shi], China): See Bean pastes and sauces.

Miso (Japan): (1) Hatcho-miso. (2) Inaka miso or Sendai miso. Also known as Red miso. (3) Shinshu miso. (4) Shiro miso.

Mochi. Monosodium glutamate. Also known as: Mei jing (China); aji-no-moto (Japan); servuk perasa (Malaysia); ve tsin (Vietnam), M.S.G., taste essence, taste powder.

Moyashi (Japan): See Bean sprout.

Mung bean. Also known as moong ke dal (India); kacang djong, kacang eedjo [hijau, katjang idjo] (Indonesia); kacang hiau (Malaysia); tau ngok (Thailand); dau xanh (Vietnam); green gram.

Nama-age (nah-mah ah-geh, Japan): See Bean curd, deep fried.

Nama fu (Japan): Raw / uncooked wheat gluten.

Natto (Japan). See soybean.

Noodles: (1) Bean curd noodles (China). Also known as Soy noodles, soy vermicelli.

Oils and fats: Soybean oil. (2) Bean curd skin noodles (China) [yuba noodles].

Peanut (with many foreign names and recipes).

Preserved black beans: See Fermented black beans. Pressed bean curd: See Bean curd (pressed).

Red bean paste, sweet: "An important ingredient in Chinese and Japanese cooking, sweet red bean paste is made by boiling the red azuki bean and mashing it to a paste with lard or oil, then cooking it until it is fairly dry or thick. In Japan, red bean paste is made in two textures: the smooth purée is koshi-an and the chunky version, with the beans only partly crushed, is tsubushi-an. It is a filling for cakes and sweet buns, and is used in several desserts." Also known as hong dow sar (China), an (Japan). Contains a recipe for Sweet red bean paste.

Red rice: See Fermented red rice.

Rice: Many type of glutinous and non-glutinous.

Rolled bean curd: See Bean curd sticks [dried yuba].

Seaweed: Many different types. Seaweed gelatin or Seaweed jelly: See agar agar.

Sendai miso (Japan): See miso.

Sesame seed: Black sesame seed, sesame oil, sesame paste, white sesame seed.

Shinshu miso (Japan). Shui doufu (China): See bean curd (silk). Silk bean curd: See Bean curd (silk).

Soybean (*Glycine max*)*:* (1) Black soybeans. (2) Fresh soybeans [edamame]. (3) Yellow soybeans. Soybean cheese: See Bean curd, fermented [fermented tofu]. Soybean condiment: See Bean pastes and sauces. Soybean milk. Also known as tau cheing, tau ni (China). With homemade soymilk recipe. Soybean noodle: See Noodles, bean curd. Soybean oil: See fats and oils. Soybean paste: See Bean pastes and sauces. Soybean sprout: See bean sprout. Soy flour: See Flours and thickeners.

Soy sauce: "An ancient seasoning, first used in China more than 3,000 years ago. Known in its original form as *shih*, it was a thin salty liquid in which floated fragments of fermented soybeans." "Soy sauce is to Chinese and Japanese cooking what the pungent, salty fish sauce known as nam pla or nuoc mam is to Thailand and Vietnam respectively." (1) Dark soy sauce. Also known as jang yau, see yau (China); koikuchi shoyu, tamari (Japan), kecap pekat (Malaysia); mushroom soy. (2) Light soy sauce: Thinner, saltier, and lighter in color and flavor. It is used in cooking where its light color will not spoil the color of the ingredients. Also known as sang chau, see yau (China), shoyu, usukuchi shoyu (Japan), kecap cair (Malaysia), toyo (Philippines), nam siew (Thailand), xi dau (Vietnam), thin soy sauce. (3) "Lu soy (China) is a 'master sauce' based on soy sauce with sugar, ginger, and five-spice, It is used for simmering poultry and other meats to give a rich flavor and to color the food a deep brown. Also known as lu shui (China)."

Soy sauce, sweet and salty: (1) "Kecap asin (Indonesia) is a thick, salty, dark soy-based sauce used to impart a strong color and flavor. Its sweet counterpart is *kecap manis.* It is similar to, but thicker than, several dark soy sauces used in Chinese cooking." (2) Kecap hitam (Malaysia) is a sweet dark soy sauce. Slightly less spicy than kecap manis. (3) Kecap manis (Indonesia) is a sweet, dark, thick, aromatic soy sauce, especially widely used with satay. "It is similar to, though finer in flavor than, Chinese sweet soy sauce" [tian mian jiang]. Also known as kecap bentang manis (Indonesia); sweet soy sauce. (4) "Sweet soy sauce (China) is a dark, sweet sauce combining soy sauce, sugar, and malt

© Copyright Soyinfo Center 2021

sugar. Its distinctive malt-like taste goes well as a dip for fried snacks, poultry, and seafood." It appears frequently on the table in homes and restaurants in Fukien province, opposite Taiwan on the coast of south-eastern China. For a recipe, see Sweet soy sauce pork (p. 230). Note: This is not generally a commercial product. (5) Tim cheong (Malaysia) is a thick, sweet, black soy sauce, similar to that used in China. In Malaysia it is served with poh pia. Its flavor is closer to that of kecap hitam than to kecap manis.

Sprouts, soybean. See Bean sprout, soybean. Sushi (describes many types, with recipes). Sweet bean paste or Sweet bean sauce: See Bean pastes and sauces.

Taho (Philippine bean curd brains). Tahoe (Indonesia or Malaysia, fermented bean curd). Tahu (Malaysia bean curd). Ta hua (Malaysia bean curd). Tahure (Philippine bean curd).

Tamari (Japan): See soy sauce. Taucheo (Malaysia or Singapore, bean pastes and sauces). Tauge (Indonesia bean sprout). Tauhu kao (Thailand bean curd). Tauhu kuning (Indonesia and Malaysia bean curd pressed). Tauhu leong (Thailand bean curd, pressed). Tauhu tod (Thailand bean curd, fried). Taukwa (Indonesia and Malaysia bean curd pressed). Tau sa (Malaysia bean paste and sauces). Tausi (Philippines, bean curd products [sic, fermented black soybeans], fermented).

Tempe (Indonesia, Malaysia): Fermented soybean cake [tempeh]. Oncom [Ontjom]. Tokwa (Philippine bean curd pressed).

Tosa soy sauce (Japan): The classic sashimi accompaniment. Recipe given.

Tsukemono: Takuan, umeboshi.

Usu-age (Japan): See Bean curd (fried) purses.

Winged bean. Yuba (Japan).

Brief biography: "For more than twenty years she has been professionally involved with Asian food as a writer, teacher, publicist, researcher, consultant, and, of course, cook. She has traveled extensively in Asia and lived in Hong Kong for more than ten years, working as a food writer on a number of newspapers and magazines, which led to a career as a food consultant. Her most recent book, *Asia the Beautiful Cookbook* was listed by *Publishers Weekly* as one of the best books of 1987." Address: Author of several books on Asian cuisine.

• ***Summary:*** Contains a great deal of very interesting information. Contents: 1. Introduction. 2. Fermented soybean foods in East and Southeast Asia: A. Douchi (China), Hama-natto (Japan), and in-yu (Taiwan). B. Shuidouchi (Shandong province, China), thua-nao (Thailand), kinema (Nepal), and natto (itohiki natto) (Japan). C. Tempe [Tempeh] and Oncom [Onchom] (Indonesia) (Making soybean tempe, volatile flavor of tempe, chemical composition and nutritional value of tempe, tempe bongkrek). D. Fermented tou-fu (soybean curd) products: Sufu (China and Taiwan), Tofuyo (Okinawa, Japan).

3. Fermented salty condiments in a slurry or paste made from soybeans and cereals: A. Doujiang (touchiang) (China) and Tauco [taucho] (Southeast Asia). B. Doubanjiang (Toupanchiang). C. Tianmianjiang (Tienmienchiang). D. Gochujiang and Doenjang (Korea). E. Hishio (Japan). F. Miso (Japan) (Production and consumption of miso, making rice miso and barley miso).

4. Fermented salty liquid condiments made from soybeans and cereals: A. Japanese shoyu (Manufacture of koikuchi and usukuchi shoyu, manufacture of tamari shoyu). B. Soy sauce produced in east and southeast Asian countries other than Japan (Korea, Taiwan, Hong Kong, Singapore, Malaysia, Indonesia, Thailand, People's Republic of China {the process, acid hydrolysis, was illegal until recently}, chijhi or whole soybean soy sauce still made in the basins of the Zhujiang {Pearl} River and the Huanghe {Yellow} River).

5. Biochemistry involved in shoyu and miso manufacture: A. Selection of raw materials. B. Contribution of improved cooking methods of raw materials to increase the enzymatic protein digestibility. C. Selection and improvement of koji molds. D. Improvement in koji making. E. Microbial and chemical control of salty mash fermentation. F. Flavor evaluation of koikuchi shoyu. G. Stability of color of pasteurized shoyu. H. Nutritional concern about shoyu and miso (salt content). Safety of koji molds and shoyu (aflatoxins).

6. Conclusion.

Tables show: (1) Chemical composition of kinema, thua-nao, and douchi. (2) Changes in nitrogenous compounds during natto fermentation. (3) Changes of nitrogen compounds in sufu making. (4) Constituents of some types of miso. (5) Chemical composition of various kinds of genuine fermented shoyu in Japan. (6) Effect of cooking conditions of thoroughly moistened defatted soybean grits on the enzymatic digestibility of protein. (7) Differences between *A. oryzae* and *A. sojae* used for shoyu fermentation. (8) Proteinases produced by *Aspergillus sojae.* (9) Enzyme composition of koji as influenced by the difference of material. (10) Various metabolic patterns by lactobacilli in shoyu mash. (11) Digestiblilities of protein in shoyu, miso, natto, and tempe fermentations. (12) Results of quantitative analysis of flavor constituents in koikuchi shoyu.

Figures show: (1) Flow sheet of tempe making. (2) Flow diagram of sufu making from 1 kg soybeans (with all quantities of ingredients, temperatures, and times). (3) Flow diagram of rice-miso fermentation from 1,000 kg soybeans and 600 kg milled rice. (4) Flow diagram of koikuchi

© Copyright Soyinfo Center 2021

shoyu fermentation from 330 kg defatted soybean meal (or 400 kg whole soybeans) and 340 kg wheat kernels. (5) Flow diagram of tamari-shoyu fermentation from 800 kg defatted soybeans, 346 kg wheat, 20 kg roasted barley flour, and 439 kg NaCl. (6) Microflora changes in shoyu mash fermentation. (7) Classification of Aspergilli. (8) Fermented foods and condiments made from soybeans mixed with or without cereal grains or flour.

Hama-natto in Japan (p. 332): The Taiho Laws, which took effect in 701, mention an office in Japan's imperial court that dealt with several fermented soyfoods including *"douchi* [2 Chinese characters given] or *kuki* (1 Cc): in Japanese, miso and jiang (1 Cc) or hishio (1 Cc)..." "The method of preparing salted and unsalted *douchi* [fermented black soybeans] is described in the book *Yoshufushi* (1686) and elsewhere. According to the oldest record about douchi in Korea, in 683, the product apparently was not an important food commodity in that country.

Salted douchi [fermented black soybeans, which originated in China] appeared in Central Japan with names such as "Hama-natto, Daitokuji-natto, and others, and in Taiwan as *In-si."*

Concerning *shuidouchi* (*Chinese salted natto with minced ginger. p. 332-35*)*:* This unusual product can be considered an intermediate form between *douchi* (salted fermented soybeans / fermented black soybeans) and the itohiki-natto family of foods; unlike *douchi* it is fermented with a *Bacillus* bacterium rather than with an *Aspergillus* mold, but unlike natto it is a salted product and has ginger added. To make *shuidouchi:* Boiled soybeans are naturally inoculated with *Bacillus subtilis* and incubated at high humidity and at 30-40ºC. This preference for a high temperature may be why the *Chi-min yao-shu* (6th century China) recommended that, when making douchi [fermented black soybeans], the temperature during incubation be kept rather low. In Shandong, China, *shuidouchi* are made as follows: Clean, soak, and boil soybeans until soft. Place in a cloth bag and cover with straw, which is the best natural source of *B. subtilis.* After incubation for 1-2 days at 25-30ºC the soybeans will be covered with viscous substances. Mix the sticky soybeans with minced ginger and salt, then pack tightly into jars, and age for one week. They are now ready to consume (See references 5 and 6). Address: Research Div., Kikkoman Corp., Noda City, Chiba prefecture, Japan.

1343. Roller, Ron. 1992. The U.S. soymilk market (Interview). *SoyaScan Notes.* Feb. 26. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** During the past 3-4 years, the U.S. soymilk market seems to be growing at about 10% a year. Sales slowed during and after the Gulf War, but overall the current recession has had little effect on Edensoy, soymilk and on the natural foods industry as a whole. There has been a proliferation of new products and package sizes. Most of Edensoy's volume is sold in liters. The ASP plant is now nearing capacity. Many people who used to have no interest in soymilk are now showing a strong interest. Concerning the size of the market, American Soy Products does not try to keep statistics, but he doubts that it is any larger than Soyatech says it is.

In terms of market share by volume of soymilk sold, Ron thinks that Edensoy has the largest share, Vitasoy is second (including their sales to the Asian-American market), Westbrae is third, and Pacific Soy is a distant fourth. No other companies have significant sales.

One interesting product is a soy & azuki milk, which Marusan launched in about 1982; Ron is not sure if it is still on the market.

Ron has heard from a fairly reliable source that a company has purchased soymilk equipment (he does not know from whom) to build a soymilk plant somewhere in the United States. It might be Vitasoy. Someone from Dr. Chung's in Korea (makers of Vegemil and Woorean) is planning to come to the USA to look for companies to market their Korean soymilk or for potential co-packers. Address: President, American Soy Products, 1474 N. Woodland Dr., Saline, Michigan 48176. Phone: 313-429-2310.

1344. Whiteman-Jones, Michael. 1992. Soyfoods poised for growth: New mass-market interest, product development and consumer interest are driving sales higher than ever. *Natural Foods Merchandiser.* Feb. p. 18-19.

• ***Summary:*** Last year soyfoods were introduced to mass-market consumers by two of America's corporate giants. (1) Archer Daniels Midland Co. (ADM of Decatur, Illinois) introduced the vegeburger to show that a delicious food product could be made from soy. ADM marketing specialist Lee Lensch says the soy burger is doing very well in test markets in Indiana, Illinois, and Minnesota. Versions of the product are being advertised nationally in corporate TV spots and on local TV in test markets. Buyers who gave the products shelf space at chains such as Kroger, SuperValue and Cub Foods now report brisk sales. (2) Protein Technologies International in St. Louis, Missouri, a subsidiary of Ralston Purina, is test marketing a soy-based beverage named First Alternative in Phoenix, Arizona.

Peter Golbitz, president of Soyatech Inc., a consulting company in Bar Harbor, Maine, notes that since the 1980s, Japanese companies (such as Nichii Co.) have invested at least $50 million in soyfoods manufacturing plants in the U.S.

"Retail sales of soyfoods are growing in America by about 5 to 7 percent a year, increasing to about $657 million in 1990, Golbitz says. The most rapid expansion is for soy milk, which is growing at a rate of about 20% a year, and second-generation soyfoods which are growing at a rate of about 15%... Soy milk consumption in Australia, where it is

© Copyright Soyinfo Center 2021

sold in grocery stores like milk, is about 10 times what it is in this country."

Worldwide, consumption of soyfoods now averages about 1.7 kg/person/year, and is expected to rise to 2 kg or more by the year 2000. Taiwan is the world leader with 15.5 kg/capita/year of soy, followed by Japan at 11.1 kg. A world map and table (largely compiled from FAO Food Balance Sheets) shows "Soyfood consumption: Yearly average per capita (Amount of change from 1979 to 1988)." The following countries are listed in descending order of consumption in kg/capita: Korea 17.1 kg (2.4%). Taiwan 13.0 (37.0%). Japan 10.8 (6.7%). Indonesia 6.3 (57.4%). Hong Kong 3.8 (-22.0%). Saudi Arabia 3.6 (342.9%). China 3.4 (-5.6%). Paraguay 2.8 (50.0%). Malaysia 2.3 (102.2%). Thailand 1.6 (162.5%). Zimbabwe 1.6 (22.2%). United States 1.4 (33.3%).

1345. Monaghan, Charles. 1992. At Koreana at the Mall at IV, Paramus. *Record* (*The*) (*Hackensack, New Jersey*). March 13. p. 91.

• ***Summary:*** "Historically Korean culture was much influenced by China, but a Japanese occupation lasted from 1910 to the end of World War II, so the food bears some resemblance to both Chinese and Japanese cuisine."

At the mall in Paramus: "The star of the evening was the *doen jang*, based on a rich broth (probably beef), enhanced with a chili-flavored bean paste, and containing tofu and vegetables. It had a dense, lingering, unforgettable flavor."

There is no area for non-smokers.

1346. Yamawaki, Teijirô. 1992. Edo jidai shôyu no kaigai yushutsu [Exports of shoyu from Japan during the Edo Period]. In: 1992. Noda Shishi Kenkyu (Studies of Noda History), Vol. 3. Noda, Japan: Shishi Hensan (Noda City History Editorial Committee). See p. 63-93. March. 30 cm. [50 ref. Jap]

• ***Summary:*** This is one of the best sources known on the subject, which includes much information on the export of shoyu from Japan to other parts of Asia and to the Netherlands by the Dutch East India Company (VOC).

Chronology and basic concepts: Almost all shoyu (soy sauce) exported from Japan during the 1600s and 1700s (and all soy sauce exported officially or legally) was exported from a tiny man-made island named Dejima in Nagasaki Harbor. Most of it was exported by the Dutch East India Company (VOC), which was the only European company allowed to trade with Japan during this period of isolation from 1600 to 1854. The Japanese government classified all soy sauce exported from Deshima into two basic types: (1) Official trade freight (*motokata nimotsu*, also called *compania nimotsu*), and (2) Private trade freight (*waki nimotsu*, also called *yakusha / sojya* {staff / sailor} *nimotsu*). Official trade freight was the kind engaged in by the Dutch East India Co.; this freight was recorded in the Nagasaki Trading Firm Journal. Private trade freight referred to the goods traded privately by Dutch sailors and by the chief and staff working at the Nagasaki Trading Firm.

Note: In about 1600 the Chinese obtained an official trade permit and settled in Nagasaki. At the peak of Chinese activity there, about a century later, as many as 190 Chinese ships a year were visiting Nagasaki, and one-sixth of the town's population hailed from the East Asian mainland.

1609-1641–The Dutch East India Co. (VOC) maintains a trading post at Hirado, a small island off the northwest coast of Kyushu.

1634–Dejima (literally "protruding island," also spelled Deshima), a small artificial island in Nagasaki Harbor is constructed as ordered by shogun Iemitsu; it originally accommodated Portuguese merchants.

1638-1639–The Portuguese (and other Catholic nations) are expelled from Japan for suspected complicity in the Shimabara Revolt of 1637.

1641 May–The Dutch East India Co. is moved from to Hirado to Dejima, where they were kept almost like prisoners on the tiny island. For 200 years, Dutch merchants were generally not allowed to cross the little bridge from Dejima to Nagasaki, and Japanese were likewise banned from entering Dejima. From 1641 to 1853 the Dutch are the only Western nation allowed to trade with or to enter Japan, but solely on Dejima. Chinese and Korean traders are still welcome, but their movements are restricted.

Dutch ship arrivals: From 1641 to 1671 an average of 7 ships per year. From 1671 to 1715 about 5 per year. From 1715, only 2 ships were permitted each year; this was reduced to 1 ship in 1790 and again increased to 2 ships in 1799.

1647–Exporting of shoyu (soy sauce) to Asia from Japan (as official trade freight) began. The first shipment was 10 kegs (*taru / balien*) sent to Amping, on today's Taiwan, by the VOC's Taiwan Trading Firm. From 1647 to 1720, this shoyu was exported from the Nagasaki Trading Firm to each regional trading firm in Asia, including today's Hanoi, Vietnam (1652); Ayuthaya, Thailand (1657), Jakarta, Indonesia (1659), Malacca, Malaysia (about 1660), 250 km northwest of Phnom Penh, Cambodia (1665), Paliacatta, 40 km north of Madras, India (1666), Bengal region. India (1666), Colombo, Sri Lanka (1670), Surat, northwest coast of India (1672), Amboina, Banda, and Ternate, in the Moluccas, Indonesia (1693), Sulawesi Island (Celebes), Indonesia (1693).

Note: This document contains the earliest date seen (March 2021) for soybean products (shoyu) in Cambodia (1665); soybeans as such had not yet been reported by that date.

1685–The Shogunate at Edo limits the amount of "private trade freight" to 400 *kan* (1 kan = about 3.75 kg), or about 1,500 kg or 3,300 lb.

1669 March 31–20 kegs of shoyu are shipped from

© Copyright Soyinfo Center 2021

Japan to Batavia on a Chinese ship (Source: Diary of Casteel Batavia). This is the earliest document seen (March 2021) showing a Chinese ship exporting shoyu from Japan.

1687–20 kegs of shoyu made in Kyoto (1 keg = about 29.104 liters) is shipped to the Ceylon (today's Sri Lanka) trading headquarters. It is believed to have been made by a sake brewer in Kyoto. At that time, Sakai city, a southern suburb of Osaka city, was located on the edge of Osaka Bay at the mouth of the Yamato River. It is one of the largest and most important seaports in Japan during the Medieval era, and is also famous in the Kyoto/Osaka area (along with Kyoto) for its soy sauce production. During the period 1764-1780 shoyu was made in Sakai by 4 manufacturers, including Shobei Hosoya. Soy sauce made in Sakai was transported by ships along the Inland Sea (north of Shikoku), through the narrow straight between northern Kyushu and Shimonoseki, around the north and west sides of Kyushu, to Nagasaki. These ships from Sakai were called the "Sakai Raw Silk Carrier Boat" or *Sakai Bune.* They had been authorized to ship imported silk from Nagasaki since the Keichô period (1596-1611) of Edo era. The ship was empty going back from Sakai to Nagasaki and the space was used for soy sauce exports. Much of the shoyu exported from Japan to the Netherlands is thought to have been made in the Kyoto / Osaka area. It was probably made mainly in Sakai, while that made in Kyoto was exported in small amounts for special occasions. Extremely low priced shoyu is thought to have been made in Kyushu, and exported to China. None of the shoyu exported during the Edo / Tokugawa period (1600-1867) was made in the Edo / Tokyo (*Kanto*) area.

1711–In the Chinese and Western Freight Log it is recorded that 61 kegs of shoyu (56 large kegs and small kegs) as well as 40 kegs of miso were exported as "official trade freight," whereas 867 kegs were exported as "private trade freight." Thus, the private freight (in this rare year where records exist) was about 8 times as much as the official freight.

1712–Some 999 kegs of shoyu and miso are exported as "private trade freight," Unfortunately we are not told how many of these contained shoyu and how many contained miso.

1721-1792–The VOC exports Japanese shoyu only to its trading headquarters at Batavia (today's Jakarta, Indonesia); from there it is transferred to each regional trading firm.

1737–The VOC first exports Japanese shoyu to the Netherlands, from its Batavia headquarters. Thus, Japanese soy sauce first arrived in the Netherlands (and in Europe) in 1737. All this shoyu was exported as "official trade freight." This export route was used until 1760. During the 24 years from 1737 to 1760, approximately 46,000 liters of soy sauce were exported from Dejima to the Batavia headquarters, and 15,600 liters (about 1/3 of the total) were then shipped from Batavia to the Netherlands. In 1742 and 1743, no shoyu was transshipped from Batavia to the Netherlands. Thus, during the 22 years that shoyu was transshipped from Batavia to the Netherlands as "official trade freight" was about 707 liters/year. The amount exported was calculated based on the capacity of the "large keg" (29.104 liters); the small keg held exactly half this capacity (14.552 liters). In addition, a substantial amount of shoyu was presumably exported from Batavia to the Netherlands as "private trade freight."

Also in 1737 the limit of 400 *kan* on "private trade freight" is abolished, so that any amount can be exported in this way.

1790–Shoyu is first exported from Japan in comprador bottles; these bottles, made of grey / white porcelain, were recorded as "sterilized soy sauce" and 550 of them were used this year to export shoyu.

1795–The book titled *Travels in Europe, Africa, and Asia, Made between the Years 1770 and 1779...*, by Charles Peter Thunberg (a Swede) is published in English. An entry from about the year 1776 (Vol. 4, p. 107), in the chapter on Commerce, reads: The traffic in *Soy* [sauce]... is more considerable [than that of tea. Japanese] soy is much better than that which is brewed in China. For this reason, soy is not only exported to Batavia [Jakarta], in the wooden kegs in which it is made, but likewise sold from thence to Europe and to every part of the East Indies. In some places in Japan too the soy is reckoned still better than in others; but, in order to preserve the very best sort, and prevent its undergoing a fermentation, in consequence of the heat of the climate, and thus being totally spoiled, the Dutch at the Factory [at Desima / Dezima / Dejima] boil it up in iron kettles, and afterwards draw it off into bottles, which are then well corked and sealed [by applying bitumen / coal tar to the stopper]. This mode of treatment renders it stronger and preserves it better, and makes it serviceable for all kinds of sauce.

Note: This early discovery of pasteurization and sealing in porcelain bottles explains how the Dutch were able to keep this soy sauce from spoiling or becoming overfermented while it was being shipped from tropical Japan, to Batavia [Jakarta], across the Equator, around the Cape of Good Hope (south of Africa), then all the way to the Netherlands.

1799–The Dutch East India Co. (VOC) is dissolved.

1804-1829–A total of 2,672 kegs of shoyu is exported in Chinese ships during most of these 26 years from Japan. About 153 kegs/year are exported (range: 12 to 322 kegs, but with no exports in 1805, 1816-18, 1824-28).

1854–Japan's policy of self-imposed national isolation is abolished / ended. Shoyu can be exported freely, without limits.

Some 670 liters a year went to Holland. The soy sauce to be sent to Holland was put in a special container with special outside packaging. The shoyu that was exported was made mostly in Kyoto. In 1765 the famous French-language *Encyclopedia*, by Denis Diderot, had a section on soy sauce.

1347. **Product Name:** Toffle (Eggless Tofu Waffle).
**Manufacturer's Name:** Dae Han, Inc.
**Manufacturer's Address:** 737 S.E. Alder St., Portland, OR 97214. Phone: 503-233-8638.
**Date of Introduction:** 1992 April.
**New Product–Documentation:** Talk with Judy Krizmanic of *Vegetarian Times*. 1992. May 27. She saw this product at the Natural Foods Expo in Anaheim, April 1992. Spot in Vegetarian Times. 1992. Aug. p. 82. Tofu, a main ingredient, holds the waffle together, so eggs are unnecessary.

1348. Gemignani, Janet. 1992. Pancakes for the serious diner: smart dining. *Record* (*The*) (*Hackensack, New Jersey*). May 16. p. 28.
• ***Summary:*** At The Koreana there is a no-smoking section. "Three types of omeletlike pancakes arrive with The Koreana combination, which also includes... an incredibly good *doen jang* (a beef broth enriched with chili-flavored bean paste, tofu, and vegetables),..."

1349. **Product Name:** Tofu, and Soy Sprouts.
**Manufacturer's Name:** Manna Foods Inc.
**Manufacturer's Address:** 2030 Will Ross Court, Chamblee, GA 30341. Phone: 404-454-7569.
**Date of Introduction:** 1992 July.
**New Product–Documentation:** Talk with James Kim, owner. 1993. Nov. 18. He bought this company in May 1993 from Mr. Wang of Manna Foods at the same address. He currently makes tofu, soy sprouts, and mung bean sprouts. Mr. Wang started the company about two years ago at the same address and he made the same foods.

Talk with an employee at Calco of Atlanta. 1993. Nov. 18. Mr. Wang was a Chinese-Korean who was born in Korea. He first/given name in Chinese was something like Wei-Gan. He closed his business (without filing for bankruptcy) in about the summer of 1992 after he had been in business for only about 3 months. He sold or tried to sell his equipment. He definitely did not run the business for 2 years. The people at Calco (which has been in business for 10 years) know him well and feel strongly that he was a sneaky man with no integrity. He developed a bad reputation in Atlanta, where he was widely known in the Korean community. For example, he posed as a real estate agent and said that he had a client who wanted to buy Calco for a very high price. Then he said before he could finalize the sale he wanted a list of customers, statistics on how much Calco sold to each account, credit references, etc. Calco gave him that information before they found out that he was an imposter. Then Mr. Wang took 6 of Calco's employees to establish his own business. After Mr. Wang went out of business, most of these employees came back to Calco because they had not been properly paid. They wanted their jobs back, but Calco was able to hire only 2 of them.

1350. Krizmanic, Judy. 1992. Savvy new soyfoods. *Vegetarian Times*. Aug. p. 82-83.
• ***Summary:*** Highlights, with color photos, Living Lightly non-dairy soy ice cream from Turtle Mountain, Toffle (eggless tofu waffle) from Dae Han, Tofutti Better than Cream Cheese, Westsoy Lite Non Dairy Creamer, Pita Melts from Health in Wealth, Meatless Tofu Steaks from White Wave, Ken & Robert's Veggie Pockets.

• ***Summary:*** "In order to optimize the taste of traditional soybean paste, the constitution of taste components was analysed by multiple regression between the original data transformed with square root sensory scores of the soybean paste. This way explained the sensory evaluation best score." Address: Dep. of Food Science and Technology, Shinil Junior College, Taego 706-060, Korea.

1352. Housman, Bob. 1992. Mainland Express now makes only 360 lb/week of tofu (Interview). *SoyaScan Notes*. Sept. 11. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Several years ago the FDA came into supermarkets and surrounding states and found that the temperature at which tofu was being stored was too warm. The supermarkets said that they could not keep the temperature in the refrigerated cases low enough, so virtually all dropped Mainland's tofu and switched to Mori-Nu, which is aseptically packaged. Hinoichi also sells a little tofu in the area. Mainland still has a large tofu factory but they use it only one day a week to make tofu.

University of Minnesota in St. Paul told him that Eastern Foods no longer makes tofu. Address: P.O. Box 405, Spring Park, Minnesota 55384. Phone: 612-471-8034.

1353. Griffis, Gil; Wiedermann, Lars. 1992. Marketing food-quality soybeans in Japan: A manual on how to profit from the niche market in Japan for value-added soybeans. 5th ed. St. Louis, Missouri: United Soybean Board. 25 p. Nov. 28 cm.

• ***Summary:*** Contents: Introduction. Japan: Desired soybean characteristics, tofu (procedure for making tofu, desired soybean characteristics, color of hilum, seed size {the larger the better, preferably more than 20 grams/100 beans}, color of cotyledons, hull, composition, special notes, American interpretation), miso (same categories of information as tofu), natto (ditto; seed size: The smaller the better, with a maximum of 5.5 mm diameter. Round shape is preferred to oval in order to limit swelling during the soaking and boiling processes), food quality soybean varieties (name or code-name of 42 varieties, maturity zone, release year, used to make what soyfoods), distribution channels, marketing channels, protocol, pricing, organically-grown soybeans.

Taiwan: Introduction, list of 4 major buyers, users, and trade associations. Korea. Southeast Asia. United States.

Appendix I. Distribution systems for soybeans used for food in Japan: Tofu (23,000 tofu shops of which 13,000 are members of the Tofu Association), natto, miso.

Appendix II. Food soybean imports by country of origin, 1984-1991. USA is the largest supplier (845,000 tonnes in 1991), followed by China (279,000), then Canada (28,000). Total imports, which have stayed about constant during this period, were 1,152,000 tonnes in 1991.

Appendix III. Distribution by usage of soybeans used for food–1991, direct use only in tonnes (metric tons). Tofu: 607,000 tonnes total, of which 562,000 come from the USA and Canada, 25,000 from China, and 40,000 from Japan. Up 2% from 1989.

Miso: 171,000 tonnes total, of which 38,000 come from the USA and Canada, 121,000 from China, and 12,000 from Japan. Up 0.5% from 1989.

Natto: 147,000 tonnes total, of which 87,000 come from the USA and Canada, 50,000 from China, and 10,000 from Japan. Up 9% from 1989.

Other: 39,000 tonnes total, of which 20,000 come from the USA and Canada, none from China, and 19,000 from Japan. Total food use of 964,000 tons is up 2% from 1989. Source: Japanese trade newspapers and trade associations. These figures do not include a estimated 492,000 tonnes of soybeans used indirectly (in the form of defatted soybean meal) for soy sauce, 222,000 tonnes used for soy protein, and 20,000 tonnes for other indirect uses.

Appendix IV. Directory of direct importers of food-quality soybeans for each is given: Home office in Japan. Representative office in the U.S.

Appendix V. Traders of food-quality soybeans (3 companies).

Appendix VI. Soy food organizations in Japan (tofu, miso, soymilk, packaged tofu, natto). Appendix VII. Helpful contacts.

Food quality soybean varieties (with maturity group / zone, and year released; table, p. 5): Chico (00, 1983), Grande (0, 1976), Proto (0, 1989), Minnatto (0, 1989), NattoKing [Nattoking] (I, 1988), Disoy (I, 1967), Vinton (I, 1978), Vinton 81 (I, 1981), King Natto (I, 1985), Kato (I, 1989), Magna (II, 1967), Prize (II, 1967), Marion (II, 1976), LS201 (II, 1989), Provar (II, 1969), Beeson (II, 1969), Kanrich (III, 1956), Kim (III, 1956), LS301 (III, 1989), Verde (III, 1967), IL2 (III, 1989; from Illinois), Hawk (III, ?), Emerald (IV, 1975), Vance (V, 1986), Camp (V, 1989), Hartz 936X (VI, 1981), Hartz 914 (VI, 1989), Hartz 922 (VI 1989), Merrimax (?, 1986).

Note: This report was originally published in Sept. 1989, mainly for use by the American Soybean Association office in Tokyo. Address: 1. Division Director for Asia; 2. Country Director for Japan. Both: American Soybean Assoc.

1354. Kolak, Ivan; Henneberg, R.; Milas, S.; Radosevic, J.; Satovic, Z. 1992. Soybean breeding and seed production in Croatia–Current status and perspectives. *Eurosoya* No. 9. p. 76-84. Dec. [31 ref]

• ***Summary:*** "Soybean seed was introduced from China by sailors from Dubrovnik for the first time in 1800 and, the same year it was planted in Dubrovnik, Konavle, Slano and Ston under the name 'Chinese yellow beans' (p. A. Buconjic 1804 cit. according to fra. I. Simic, 1826). Soybean was spread from Dubrovnik to the Neretva Valley (Opuzen, Metkovic, Caplijna, Mostar) and the seeds were used for human consumption and as poultry feed. The Franciscans from Dubrovnik selected the best plants from crops and the seed was sold on markets. As early as 1804 the seed selected within soybean population was sold under the name "Dubrovnik yellow beans" and since then individual selection of soybean population began. During the 19th century, by constant selection of the best and healthiest plants, soybean production began to be based upon domesticated and well adapted indigenous populations and selected lines. Soybean was grown mainly in gardens and rarely as a major crop. It was used for human consumption and as feed for livestock.

"A planned introduction of soybean to Croatia was initiated by the Austrian biochemist Friedrich Haberlandt (lived 1826-1878) after the seed exhibition in Vienna in 1873. He introduced about 20 cultivars from China, Japan, Korea, Tunisia and Transcaucasia and carried out several multicultivar adaptation trials from Bohemia to Dubrovnik. Unfortunately his intentions were misunderstood and that was the main reason why soybean did not spread significantly in Croatia at that time.

© Copyright Soyinfo Center 2021

"More comprehensive work on the introduction of soybean in Croatia was carried out by Stjepan Cmelik in Korija near Virovitica. The lack of cattle feed in 1921 stimulated him to import several cultivars from China and Manchuria. He tested them and selected only those plants which reacted favourably to agroecological conditions. In this way he started soybean selection in Croatia and after several years the so-called 'Cmelik's soybean' was developed and largely extended over the regions of Posavina and Slavonija region (maturity group 1). Friedrich Reiner continued to grow 'Cmelik's soybean' on his farm near Osijek selecting the best plants and he created his own improved cultivar named 'Osjecka'. Between 1931 and 1934 seed yield of the cultivar 'Osjecka' varied from 1.6 to 2.2 tons/hectare and that was the reason why it was extended over Podunavlje, Posavlje, Romania and Bulgaria.

"Academician Alois Tavcar brought Manchurian soybean populations from Prague [Czechoslovakia] in 1918 and began his research work at the Faculty of Agriculture and Forestry in Zagreb. By individual selection of the best plants from introduced populations he released the first domestic soybean cultivars M 7, M 14 and M 60 (M stands for Maksimir, experimental field near the Faculty of Agriculture in Zagreb). These cultivars had shorter vegetation than Cmelik's and Osjecka and were spread in the production of the northwest region of Croatia, as well as in Slavonia and Srijem.

"During the second world war the old genotypes were saved. After the war more intensive soybean introduction and breeding started in Croatia. The new young generation of plant breeders–Tavcar's successors–continued to work on soybean breeding and seed production: V. Milinlkovic (1946-1950) and Ruzica Henneberg (1952-1953 and 1958-1992)–Tavcar's assistants at the Faculty of Agriculture in Zagreb; D. Palaversic (1946-1950) at the Institute for Plant Breeding and Crop Production in Botinec near Zagreb; M. Budisic (1945-1970), Marija Vrataric (1970-1992) and M. Krizmanic (1973-1978) at the Institute of Agriculture in Osijek; I. Vicic (1960-1980), F. Satovic (1960-1980) and I. Kolak (1973-1987) in the Croatian Agricultural Centre in Zagreb–Sesvete. During this period a considerable number of cultivars and lines were released...

Note: As of Sept. 2015, Osijek is the 4th largest city in Croatia.

"The world-wide gene-collections were established at the Faculty of Agriculture in Zagreb–Maksimir (Milinkovic, Henneberg), Zagreb–Botinec (Palaversic), Zagreb–Sesvete (Satovic) and Osijek (Vrataric). In the 1950s D. Palaversic started to work on maize breeding and the soybean gene-collection from Botinec was transferred to the Faculty of Agriculture, Zagreb–Maksimir. The same thing happened in 1987 with the gene-collection of the Croatian Agricultural Centre when I. Kolak came to work at the Faculty of Agriculture from the Centre. In 1982 Jasna Radosevic started to work on the soybean breeding programme at the Faculty of Agriculture.

"From 1950 to 1980 many introduced and domestic cultivars were examined in a network of small-plot multicultivar trials at various locations arranged in conjunction with the Agricultural Extension Service. From 1979 to 1989 the Faculty of Agriculture in Zagreb and Institute of Agriculture in Osijek joined the European network on soybean."

Graph 1 shows soybean area and yield from 1947 to 1990. Prior to 1981 soybean area was less than 5,000 ha; it reached about 5,000 ha in 1949, 1950, and 1973. During the 1980s soybean area grew rapidly from about 2,000 ha in 1980 to 27,000 ha in 1990. Yield rose steadily from about 600 kg/ha in 1947 to 2,000 kg/ha in 1959 to 2,750 kg/ha in 1989. Table 1 shows cultivars released in Croatia from 1804-1991, including the breeder's name, cultivar name, maturity group, year of release, production region, and range of yields. The earliest variety was Chinese Yellow Beans, Maturity Group 1, in 1804, grown in Dubrovnik and Hercegovina.

Table 3 shows minimal and maximal yields of Croatian soybean cultivars in small plot trials from 1980 to 1990. The record yield of 4.5 tonnes/ha was attained by the cultivar named Tisa at Darda in 1988.

Note: This document contains the 2nd earliest date seen (June 2015) for soybeans in Croatia, or the cultivation of soybeans in Croatia (1800). The source of these soybeans was China. Address: Faculty of Agriculture, Univ. of Zagreb, Svetosimunska 25, 41000 Zagreb, Croatia.

• ***Summary:*** Reported that the range of sugar content for 1,087 local soybean lines was 8.3-12.5% with a mean of 10.1%.

1358. Asian Vegetable Research and Development Center. 1992. Annotated bibliography of soybean rust (*Phakopsora pachyrizhi* Sydow). Shanhua, Taiwan: AVRDC. 160 p. Author index. Subject index. Geographical index. 26 cm. AVRDC Library Bibliography Series No. 4-1. [480 ref]
• ***Summary:*** This publication supersedes an earlier edition published by AVRDC in 1987. It includes an additional 160 citations covering the period 1985 to May 1991.

Compiled by P.L. Hwang, F.C. Chen, and C.C. Wei, this bibliography contains abstracts of documents about soybean rust which are available in the AVRDC Library. Contents: Explanatory note, general information, pathogen morphology and taxonomy, physiology and biochemistry, epidemiology, pathogenic specialization, etiology, yield loss, and disease management (incl. general, chemical control, biological control, host resistance, cultural control).

Countries or continents mentioned in the index at geographical distribution of soybean rust: Africa, Asia, Australia, Brazil, Cambodia, China, Columbia, Costa Rica, Cuba, Guatemala, India, Indonesia, Israel, Japan, Korea, Latin America, Malaysia, Nepal, Papua New Guinea, Philippines, Puerto Rico, Soviet Union, Sri Lanka, St. Thomas, Suriname, Taiwan, Thailand, Togo, United States, West Indies, Venezuela, Vietnam, Zambia. Address: P.O. Box 42, Shanhua, Tainan 74199, Taiwan.

1359. Buswell, Robert E., Jr. 1992. The Zen monastic experience: Buddhist practice in contemporary Korea. Princeton, New Jersey: Princeton University Press. xiii + 264 p. + [8] p. of plates. See p. 120-21. Illust. Index. 25 cm. [190+* ref]
• ***Summary:*** The section titled "Meals" (p. 120-25) notes that there are many similarities between the diet in the monasteries and that in the homes of the local agricultural peasants. "The major difference is that all meals served in the monasteries are vegetarian [actually vegan]. The bodhisattva precepts of the Mahayana branch of Buddhism forbid monks from eating the flesh of any sentient being." Cereal grains provide 70-80% of the caloric intake. "In addition to steamed rice, meals always include some kind of soup (*kuk*)... The soup is generally based on toenjang, a fermented bean paste like Japanese miso and flavored with soy sauce (*kanjang*) and sesame salt."

"Bean products constitute one of the largest components of the monastic diet during all seasons. The basis of many bean products is *meju*, a fermented bean paste somewhat like the Japanese *nattô* [more like the Japanese *miso-dama*, or soybean koji]. *Meju* is used as a major ingredient in producing soy sauce, red-pepper paste, and *toenjang*. Cooked black [soy] beans, seasoned with soy sauce, sugar, and white sesame, are served at least once a day. Tofu (*tubu*), or bean curd, frequently appears on this menu, but this is always purchased from a professional maker, who delivers it to the monastery on the back of his motorcycle. When the tofu is especially fresh, it is served steamed in whole blocks, to be dipped into a sauce made of soya, sesame oil, and red-pepper sauce."

Because of Mahayana Buddhism's dietary restrictions, monks don't eat garlic or onions, so widespread in the diets of regular Koreans. Those foods are considered "to be mild aphrodisiacs, something celibates can do without. To compensate for the blandness of the food, the kitchen staff replaces the garlic and onions with lots of red pepper (*koch'u*), along with red-pepper paste (*koch'ujang*)," brown sesame and white sesame. At the ceremonial dinner on festive days, white rice is replaced by glutinous rice and special dishes such as fried tofu and nori (*kim*) are served.

Note: The author was privileged to spend five years as a Buddhist monk in Korean monasteries between 1974 and 1979, primarily at Songgwang-sa. He made two additional trips to Songgwang-sa in Nov. 1987 and July 1988. The monastery is in Suncheon near the southern coast of Korea.

• ***Summary:*** Contents: Introduction. Environment. Chronology and prehistory: China, Korea, Japan. Initial speculations (Japan). Archaeobotany and recent research. Northeast spread of plant husbandry. The cultigens: Barley (*Hordeum vulgare*), barnyard millet (*Echinochloa utilis*), broomcorn or common millet (*Panicum miliaceum*), foxtail millet (*Setaria italica* ssp. *italica*), rice (*Oryza sativa* [*Oryzae sativa*]), wheat (*Triticum aestivum*), adzuki and mung beans (*Vigna angularis* and *Vigna radiatus*), hemp (*Cannabis sativa*), melon (*Cucumis melo*), (), beefsteak plant and *egoma* (*Perilla frutescens*), other cultigens (incl. buckwheat, soybean, pea). Discussion and directions for future research. Acknowledgments.

The time span covered by this chapter ranges from about 8500 B.P. to 100 B.P. The origin of agriculture in China can be dated from about 7000 B.P. "The prevailing view is that agriculture began in Korea and Japan in the third millennium B.P. with the initiation of rice-based agrarian societies by both the diffusion of crops and ideas and the migration of people. Evidence is mounting, however, for earlier archaeological origins in these two areas" (p. 7).

In China, any cite with ceramics and no evidence of

© Copyright Soyinfo Center 2021

metallurgy is considered Neolithic. Pottery-bearing sites before 8500 B.P. are termed early Neolithic (p. 13). During the Neolithic, dependence on food production gradually increased.

Illustrations show: (1) Map of 10 vegetation zones of East Asia. (2) Diagram summarizing Northeast Asian chronology in northern China, Korea, southwest Japan, and Northeast Japan, from 8000 B.P. to 500 B.P. Arrow width is roughly proportional to the degree of dependence on food production. (3) Map showing location of 59 East Asian sites [archaeological, in China, Korea, and Japan] mentioned in the text. Address: Assoc. Prof. and Chair of the Dep. of Anthropology, Univ. of Toronto, Canada.

1366. Ontario Soybean Growers' Marketing Board. 1993. [Canadian soybean seminar]. 32 p. Held 15 Feb. 1993 in Seoul, Korea. [Kor]
• ***Summary:*** Contains Korean translations of papers presented by Tino Breuer and Gary R. Ablett, plus a statement about soybean grading and grades in Canada.

1367. *SoyaScan Notes.* 1993. The world's most active countries with respect to soybeans and soyfoods, as of 1 April 1993 (Overview). April 1. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** A tally by country on the SoyaScan database (which currently contains 42,087 bibliographic references relating to soybeans and soyfoods) shows the following countries to have the largest number of listings relating to soya (over 200): United States of America 21,459, Japan 5,599, Germany 2,053 United Kingdom 1,986, China 1,844, France 1,601, India 1,222, Canada 1,112, Indonesia 993, Brazil 873, Netherlands 809, Manchuria 733, USSR 665, Italy 596, Australia 467, Korea 463, Taiwan 460, Belgium 400, Austria 375, Mexico 371, Switzerland 353, Sri Lanka 341, Philippines 323, Yugoslavia 321, Nigeria 312, Sweden 289, Argentina 244, Israel 240, Czechoslovakia 237, Denmark 225, Bulgaria 219, Malaysia 214, Thailand 214, South Africa 207, Spain 204, Russia 203.

1368. Leneman, Leah. 1993. 365 plus one vegan recipes: Delicious meals and ideas for every day of the year. Hammersmith, London, England: Thorsons–An imprint of HarperCollins Publishers. 144 p. April. Index. 24 cm.
• ***Summary:*** Chapter 1 of this book, titled "The Vegan Dairy," gives recipes for homemade soya milk, mock cream (from soya milk), soya flour cheese, yogurt cheese (from soya yogurt). There are also recipes for cashew or almond milk, cashew cream, and cashew cottage cheese.

Chapter 11 (p. 85-100), titled "Tofu and other Soya Foods," contains a long introduction plus the following recipes: Home-made tofu. Tofu and onions. Sweet and sour tofu and vegetables. Sea-flavored crisp tofu slices. Mushroom stroganoff. Tofu kebabs. Tofu casserole. Warming winter stew (with tofu). Korean-style kebabs (with tofu and miso). Tofu and green pea bhajia. Tofu 'scrambled eggs.' Scrambled tofu and mushrooms. Tofu piperade. Spicy tofu scramble with red pepper and tomato. Tofu knishes. Tofu and pea curry. Tofu burgers. Swiss steak (with frozen tofu). Savoury tofu 'mince' (with frozen tofu). Crispy fried sea-flavoured frozen tofu. Tofu goulash. Smoked tofu stew. Smoked tofu, courgette and sweetcorn risotto. Smokey duvec (with smoked tofu). Pease pudding and smoked tofu bake. Smoked tofu pasties. Steamed savoury smoked tofu pudding. Smoked tofu charlotte. Lek and smoked tofu au gratin. Smoked tofu and mashed potato cakes. Tempeh croquettes with mushroom sauce. Tempeh hash with potatoes. Indonesian-style tempeh. Tempeh stroganoff. Japanese-style tempeh kabobs. Tempeh burgers. Tempeh chilli. Mock 'ham' (with dried bean milk sheets [yuba]). Mock 'chicken' (with yuba). Mock chicken cooked Indonesian style.

Chapter 13 is entirely about sea vegetables, and a number of the recipes contain tofu, tempeh, miso, or soya milk. A number of other recipes throughout the book also use soyfoods as an ingredient. Address: 19 Leamington Terrace, Edinburgh EH10 4JP, Scotland.

1369. **Product Name:** Tofu, and Soy Sprouts.
**Manufacturer's Name:** Lotte Oriental Foods Inc.
**Manufacturer's Address:** 2030 Will Ross Court, Chamblee, GA 30341. Phone: 404-454-7569.
**Date of Introduction:** 1993 May.
**New Product–Documentation:** Talk with James Kim, owner. 1993. Nov. 18. He bought this company in May 1993 from Mr. Wen Wang of Manna Foods at the same address. He currently makes tofu, soy sprouts, and mung bean sprouts. He plans grow shiitake as well. Mr. Wang started the company in about Nov. 1991 at the same address and he made the same foods.

Talk with James Kim. 1998. July 30. He is no longer making tofu or soy sprouts or any other soyfoods. His business is now retail.

1370. Goh, H.G.; Choi, J.S.; Uhm, K.B.; Choi, K.M.; Kim, J.W. 1993. [Spatial distribution pattern of beet armyworm, *Spodoptera exigua* (Hubner), larvae in the Welsh onion field]. *Korean J. of Applied Entomology* 32(2):134-38. June. [9 ref. Kor; eng]
• ***Summary:*** Host plants include soybean, adzuki bean, and peanut. Address: 1, 3-4. Agricultural Science Inst., RDA, Suwon 441-707, Korea.

1371. Executive Committee Secretariat. 1993. The Roots of Biotechnology in Monsoon Asia: The Third Asian Symposium on Non-Salted Soybean Fermentation and International Soybean Food Fair. Akita Cultural Center, Akita City, Japan: 4-6 June 1994 (Leaflet). Akita, Japan. 2 p. July.
• ***Summary:*** The executive committee for this event is: Chair: Prof. Tadao Watanabe. Vice-Chair: Prof. Fumio Yamauchi. Indonesia Advisor: Dr. Darwin Karyadi. United Nations University (UNU) Food and Nutrition Programme Advisor: Dr. Abraham Besrat.

The symposium hopes to focus on South-South cooperation for technical transfer of soybean technologies (koji, tempe, natto) to Africa in order to alleviate an impending protein crisis beyond the year 2000.

Program outline: Part I: International Soybean Food Fair–Industrial/commercial exhibition and cooking demonstration of ethnic cuisine using soybean products.

© Copyright Soyinfo Center 2021

Part II: Public Symposium–World soybean overview with perspectives for international technical cooperation in Africa. Part III: The Third Asian Symposium on Non-Salted Soybean Fermentation. Session 1. Koji for fermented soybean (Kikkoman, Nagano Miso Institute, China, Korea, Akita). Session 2. Natto in Asia–Microbiology, enzymology, health-medical studies. Kinema of Nepal, Tuanao [Thua-nao] of northern Nepal, Bhutan. Session 3. Tempe (Overview by Dr. Darwin Karyadi, contributions from Indonesia, Germany, USA, Japan and others–on microbiology, biochemistry, nutrition, physiology, medical studies, cooking, and industrial development). Part IV: The Role of Soybeans in Africa–The Perspective beyond 2000 (organized in cooperation with UNU Food and Nutrition Program). Sessions: Agriculture of Sub-Saharan Africa and soybean development (World Bank, IITA, JICA). Tofu technology adapted to West Africa (Dr. Nakayama, IITA). Indigenous fermented legumes in West Africa. Introduction of soy into Sub-Saharan African diet. Achievements of UNU Tempe Training Program (Indonesia/UNU; with Poster presentation of UNU funded research). Proposal on South-South cooperation.

Technical tours will be organized from three participating countries: Indonesia, USA, Germany. Address: c/o Akita International Assoc., Aidex Building 8th floor, 2-1-60 Sanno, Akita City, Japan 010. Phone: 0188-64-1181.

1372. Tenuta, Albert. 1993. Soybean cyst nematode. *Ontario Soybean Growers' Marketing Board Newsletter.* Aug. p. 2.
• ***Summary:*** "The soybean cyst nematode (SCN) has been a major pest of soybeans for at least a century and maybe much longer. It was first reported in Japan in 1915 and since has been found in Egypt, Korea, China, Taiwan, Columbia, Argentina, Brazil (unconfirmed), the United States and Canada. In 1954, the nematode was found for the first time in North America in Hanover County, North Carolina. This particular area has a history of growing flower bulbs imported from Japan. The first report of soybean cyst nematode in Canada occurred in two fields in Kent County in 1987 and has since been identified in five other counties."

"What is soybean cyst nematode?... It is called a cyst nematode because the swollen, egg-filled adult female (200-600 eggs) is referred to as the 'cyst stage'." Address: Ridgetown College of Agricultural Technology, Ridgetown, ONT, Canada.

1373. Todd, Daniel; Zhang, Lei. 1993. Political and technical factors impinging on port operations: The case of Manchuria. *GeoJournal* 30(4):441-54. Aug. [28 ref]
• ***Summary:*** "Five key events have shaped port-hinterland relations in Manchuria, and accordingly, have dictated the scale and scope of port operations. They are, in chronological order: (1) The Treaty of Tientsin and the attendant opening of Newchang (Yingkou) to foreign trade in 1862. (2) The lease to Russia in 1898 of the tip of the Liaodong peninsula and the founding thereon of the port of Dalny (Dalian). (3) The seizure of Dalian by Japan in 19O5. (4) The closure of Manchuria's ports to foreign trade with the accession of communist rule in China in 1949, and (5) The reversal of that policy in no uncertain terms during the 1980s consequent upon China's conversion to "open port" thinking.

"Scarcely acknowledged because less perceptible, changes in the technology governing the characteristics and employment of ships have been equally critical in regulating port operations in this part of northern China. In particular, the twin driving forces leading to ship enlargement and specialisation have induced fundamental reorganisation of both waterfront and inland transfer facilities."

In 1907, the Japanese opened two ports on the Yalu river: Dandong and its outport of stillborn Tatungkow. Dandong, by far the larger of the two, was designed to take small steamers of 2,000 tons and as a transshipment point for Yalu River junks. Yet it was constrained from the outset by its location 40 km from the mouth of the Yalu. By 1917 it exported mostly [soy] beans and bean cake.

Figures show: (1) Map of contemporary Manchuria with major ports, cities, railroads, provincial boundaries, and mineral-rich areas. (2) Early port trade of Yingkou and Dalian. Dalian trade began in 1907 and passed Yingkou in about 1912. (3) Today's port facilities of Dalian. (4) Port throughput of Dalian and Yingkou after 1952; Dalian has grown rapidly to 49.5 in 1990, compared with 2.37 for Yingkou. (5) Map of hinterlands of Dalian and Yingkou ports. Address: Dep. of Geography, Univ. of Manitoba, R3T 2N2 Winnipeg, Manitoba, Canada.

1374. Richardson, Al. 1993. Companies using Nichii Soy Flakes, and new developments (Interview). *SoyaScan Notes.* Oct. 14. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** The main American user of Nichii's soy flakes is White Wave of Boulder, Colorado, which uses the flakes in only one product–its reduced fat tofu. White Wave also makes a private label reduced fat tofu for Tree of Life in Florida. Other users are: Ashland Soy Works (Ashland, Oregon), which will be introducing a reduced fat tofu, made from 100% soy flakes, this month; Sacramento Tofu uses soy flakes only in their firm-style tofu; Calco of Dallas, Texas, uses flakes in their firm-style tofu. They buy a truckload about every 5 months. They also use whole soybeans; Dorothy Hwang, a PhD chemist, of Michigan Soy Products Co., Inc. (in Royal Oak, Michigan) uses both soy flakes and soybeans. Dr. Les Wilson made the very valuable discovery that soy flakes can be used to make reduced fat tofu.

Quong Hop recently put a sticker on their Nigari Firm Tofu that says "The original reduced fat tofu," which is in violation of FDA regulations. At the new Whole Foods Market store in Palo Alto, Al recently saw Wildwood's firm tofu with a little sticker on the front that said "Low fat," also

© Copyright Soyinfo Center 2021

a violation. The real problem is that Wildwood's tofu retails for $0.99, Quong Hop's is $1.29, and White Wave's tofu, the only real reduced fat tofu is $1.49.

Nichii has just landed a big agreement with Korea and is now shipping them about 60 tons/month of soy flakes from the plant in Iowa. They are expected to be buying 100 tons/month at the end of this year. Those flakes are being used entirely to make tofu and soymilk. They are buying it for the convenience in dealing with rush orders, and the water and space savings–not for the reduced fat properties.

Nichii's plant in Iowa is now producing a little less than 1,000 tons/month. 95% of this is non-organic soybeans and 5% is organic. There is an increase in demand from Japan for organic flakes. The plant runs a little less than 4 days a week, 10 hours a day.

95% of all soy flakes make in this plant are sold outside America, mainly to Japan and Korea. Al visited Japan earlier this year. All of the flakes in Japan are used for making tofu; none is used in meat products. Nichii/Mycal has about 250 retail stores but just a few of them make fresh tofu in the store using Mr. Chikaarashi's tofu-making machine; yet that number is increasing. 90% of the tofu sold is purchased from outside tofu manufacturers, many of them very large. Nichii sells three types of tofu, each clearly labeled: That made soybeans, that made from a mixture of soybeans and Nichii soy flakes, and that made entirely from Nichii soy flakes. Nichii says "We'll buy your tofu if you use our flakes." None of tofu sold in Japan and made from flakes is promoted for its low fat content. Address: Nichii Company of America, Inc., 23440 Hawthorne Blvd., Skypark 2, Suite 140, Torrance, California 90505. Phone: 310-791-0010.

1375. Lukoskie, Luke. 1993. Some history of and update on activities at Island Spring (Interview). *SoyaScan Notes.* Oct. 16. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** David Sucher was one of the original investors in Island Spring. He has been a close friend of Luke's for 20 years, and it was his investment that got the company going at its original location.

Luke now works half time with Island Spring; he and his wife, Suni, literally make tofu. Suni manages the people and products. Yvonne Kuperberg is still there. He lets other people run the business side of things. The company has a solid base of consumers in the northwest who support its products. Though sales are still strong, Island Spring is not yet out of the hole on the debts it incurred when the principals at Pacific Soy said "either give us complete control of the company or we're going to leave." At that time, Luke had accounts payable of $485,000, and he lost $300,000 in extracting the company from the position it had been in. He had raised $110,000 before the fire with the help of Harold Hopkins, who knows a lot about capital in the Pacific Northwest.

He soon realized that the only way to get out of the $300,000 hole was to tighten the belt at Island Spring. He cut his and Suni's salary to zero for 3 years. They got personal income from personal investments, such as 4 housing units that they rent. They have worked the debt down to $60,000 and they are now starting to pay themselves. In one more year they will be competitive again.

Their competition is Azumaya, Nasoya (from time to time), White Wave, Ohta Tofu, Sea Asia, Boohan (of Tacoma), and Tacoma Tofu. Island Spring's main products are now tofu burgers, soymilk in quarts and half gallons, traditional firm tofu (Korean-style, water pack), and extra firm tofu (vacuum pack).

Talk with David Sucher. 1993. Oct. 20. One day Luke called David from Los Angeles, California, to ask if he could borrow (or exchange for stock) about $1,000 to $1,500 to buy a grinder/mill for making tofu. At the time Luke's company was in its original small building near the ocean and had not yet started commercial tofu production. At a later date Luke asked David to invest in the company, which he did; he now owns about 5% of the company's stock. Address: P.O. Box 747, Vashon, Washington 98070. Phone: 206-622-6448.

1376. Wilson, Don. 1993. The pioneering work of Aqua Agra in Florida with sprouts and soyfoods. Part I (Interview). *SoyaScan Notes.* Nov. 24. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Don is a Seventh-day Adventist who was a sergeant with a type of special forces (Force Recon) for 2 years in the U.S. Marine Corps during the Vietnam War. He joined the marines in 1964, several years before the U.S. got involved in Vietnam. He lived in a Vietnamese village with the local people for 18 months as part of his assignment, and he learned to speak Vietnamese. After he returned to America, many Vietnamese refugees came into the Orlando, Florida, area. The company for which he was working sponsored 10 families and because he spoke Vietnamese he "got volunteered" to help the refugees. He got irritated because the woman who owned the one Oriental food store in Orlando was selling nuoc mam at an exorbitant markup, buying it for $0.50/bottle and selling it for $5.00 a bottle. "I tried to persuade her to lower her prices, and when she wouldn't do it, I got mad and opened a store named the Oriental Grocery store. I sold everything at cost. We finally signed a peace treaty and I sold the store to her, on the agreement that she wouldn't gouge these Vietnamese refugees. My wife is Korean. I met her in Atlanta, Georgia, after Vietnam, where she was a nurse in a hospital. We have been married for 21 years.

"While we were running our Oriental Grocery, my wife and her mother decided they could grow mung bean sprouts in the bathtub and sell them in our store. One day a man from Superfoods (the Albertson's buying arm for fresh produce) called and said he wanted to buy bean sprouts from us. I

© Copyright Soyinfo Center 2021

went and talked to the buyer whose name was Tom Kern. Their offices were 60 miles away. They wanted 15 x 10 lb bags 3 times a week. I talked to my wife and we decided that I should turn our garage (at 1521 Avalon Blvd., Castleberry, Florida), into a bean sprout growing room. In Oct. 1976 we started growing mung beans in our garage and 2-3 weeks later he asked us to start growing soybean sprouts. One day the city came by and informed me that we must have a huge water leak on our property because we used 190,000 gallons of water. I got nervous and let them walk all around the outside of the house looking for the leak. They never found it. I was running the water off into a shallow well."

Next Don got his sprouts into Winn Dixie, a huge chain. In Orlando he visited Bill Bowman, who was a typical Winn Dixie produce buyer at that time. Don took him a sample of bean sprouts to which Bowman responded, "My God, them look like white worms. There's times when my huntin' dog gets them things crawlin' out his butt, and I take him to the doctor." Having taken enough abuse, Don was about to leave when Mr. Bowman said, "I'll tell you what. I figger anybody's got enough guts to come into my office with something this damn weird, I'm gonna have to order from you just one time. But you ain't gonna get no second orders. That way it won't be a waste of your time. We've got 120 stores out of this division so I'll want one 10-pound bag for every store. How many weeks do you need to get ready for this? You've got to grow the damn things don't ya?" It was Friday and Don replied he'd have the sprouts ready in about 3½ days. "He looked at me like I was totally crazy. Then he said, 'Do you mean to tell me you can deliver a crop to me next Wednesday and you haven't even got it planted yet?" Don said, "Yes sir." Bowman replied, "This is gonna be worth the price of admission 'cause there ain't nobody gonna plant no damn crop and have it ready by Wednesday." When Don delivered the sprouts at the agreed time, Bowman was out waiting on the dock. He said, "They ain't never gonna sell. Don't you dare expect no extra orders." Two days later Don got an enthusiastic phone call: "Don, this is R.D." "R.D. who?" asked Don. "R.D. Bowman, you know, Winn Dixie. Don, can you bring me some more of them white things over here?" Apparently Asian-Americans and hippies were surprised and delighted to find fresh sprouts at a local supermarket in Florida. Thus were sprouts (mung bean, soy and alfalfa) introduced into mainstream American supermarket chains–one of Don's pioneering contributions. Don needed more space to grow his sprouts, so they moved into a 4,000 square foot commercial location on Seminola Blvd., Castleberry, Florida. Then they introduced alfalfa sprouts. Soon they were sprouting just about everything that would sprout. In the beginning, the company was mainly a sprouting company.

Soon Don got a call from Winn Dixie's national buyer in Jacksonville, who said Mr. Bowman had spoken very highly of Don and his products. By this time he was selling the Orlando division's 120 stores in central Florida about 300 ten-pound bags a week of mung bean sprouts and 150 to 175 ten-pound bags a week. Don had no idea how big Winn Dixie was. While Don was waiting in the buyer's office in Jacksonville, the man ordered 35 railroad carloads of potatoes and 20 carloads of onions. "I began thinking. I am in trouble. There is no way I can grow this amount of sprouts. But he told me that my company and Winn Dixie could grow together, adding on divisions one at a time. You couldn't ask for a better company to do business with than Winn Dixie. They paid every bill before it was due. They even sent their trucks by to pick up the sprouts. Soon we were shipping our sprouts to all the different Winn Dixie divisions." Continued. Address: 2321 Virginia Dr., Altamonte Springs, Florida 32714.

1377. Kim, Jong-Kyu; Chang, H.G.; Seo, J.S.; Lee, S.T. 1993. Character impact compounds in flavors of Korean soy sauce manufactured with the traditional and improved meju. *J. of Microbiology and Biotechnology* (*Korea*) 3(4):270-76. Dec. [20 ref. Eng]

• ***Summary:*** "Traditionally, Korean soy sauce has been manufactured with a traditional Meju which was molded with the cooked and crushed soy bean in a global or hexahedron form and then exposed to natural strain conditions. From 1960 to 1970, there has been a trend toward making soy sauce with improved Meju made with Aspergillus oryzae and other strains."

"We characterized the character impact compounds of flavors of the fermented Korean soy sauce manufactured with both the traditional and the improved Meju made with different strains. The whole flavor samples were obtained by extracting each volatile flavor phase from both the traditional and the improved soy sauce. To get more detailed information, each whole volatile flavor was further fractionated into the basic, acidic, phenolic and neutral fractions. Each separated peak from the whole and fractionated flavor samples on gas chromatogram was identified by GC/MS and Kovat's retention index, and likewise the aroma of each peak was investigated by a sniffing test with the exercised panel. We were able to identify 15 groups of ingredients with the characteristic soy sauce aroma from the soy sauce made with the traditional Meju and 6 groups from the soy sauce manufactured with the improved Meju made with *Aspergillus oryzae.* The character impact compounds the two soy sauces were different from each other." Address: Dep. of Applied Microbiology, Yeungnam Univ., Kyongsan 712-749, Korea.

1380. Bensky, Dan; Gamble, Andrew; Kaptchuk, Ted. comp. and trans. 1993. Chinese herbal medicine–Materia medica. Revised ed. Seattle, Washington: Eastland Press. xxv + 556 p. Illustrations adapted by Lilian Lai Bensky. Index. 29 cm. [112* ref]
• ***Summary:*** The soybean is discussed and illustrated on p. 45-46. The illustration shows several clusters of fresh soybean leaves, with flowers and pods. The pharmaceutical name of the preparation is Semen Sojae Preparatum Chinese: *dan dou chi.* Japanese: *tantôshi*. Korean: *tamdugo.* English: Prepared soybean. Properties: sweet, slightly bitter, cold or warm (depending on preparation). Channels entered: Lung, Stomach. Text in which first appeared: *Treasury of Words on the Materia Medica* (*Ben Cao Hui Yan*). [Ming dynasty (1368-1644)].

Note: Ted Kaptchuk was born in 1947 and Andrew Gamble in 1946. Address: 1. Seattle, Washington.

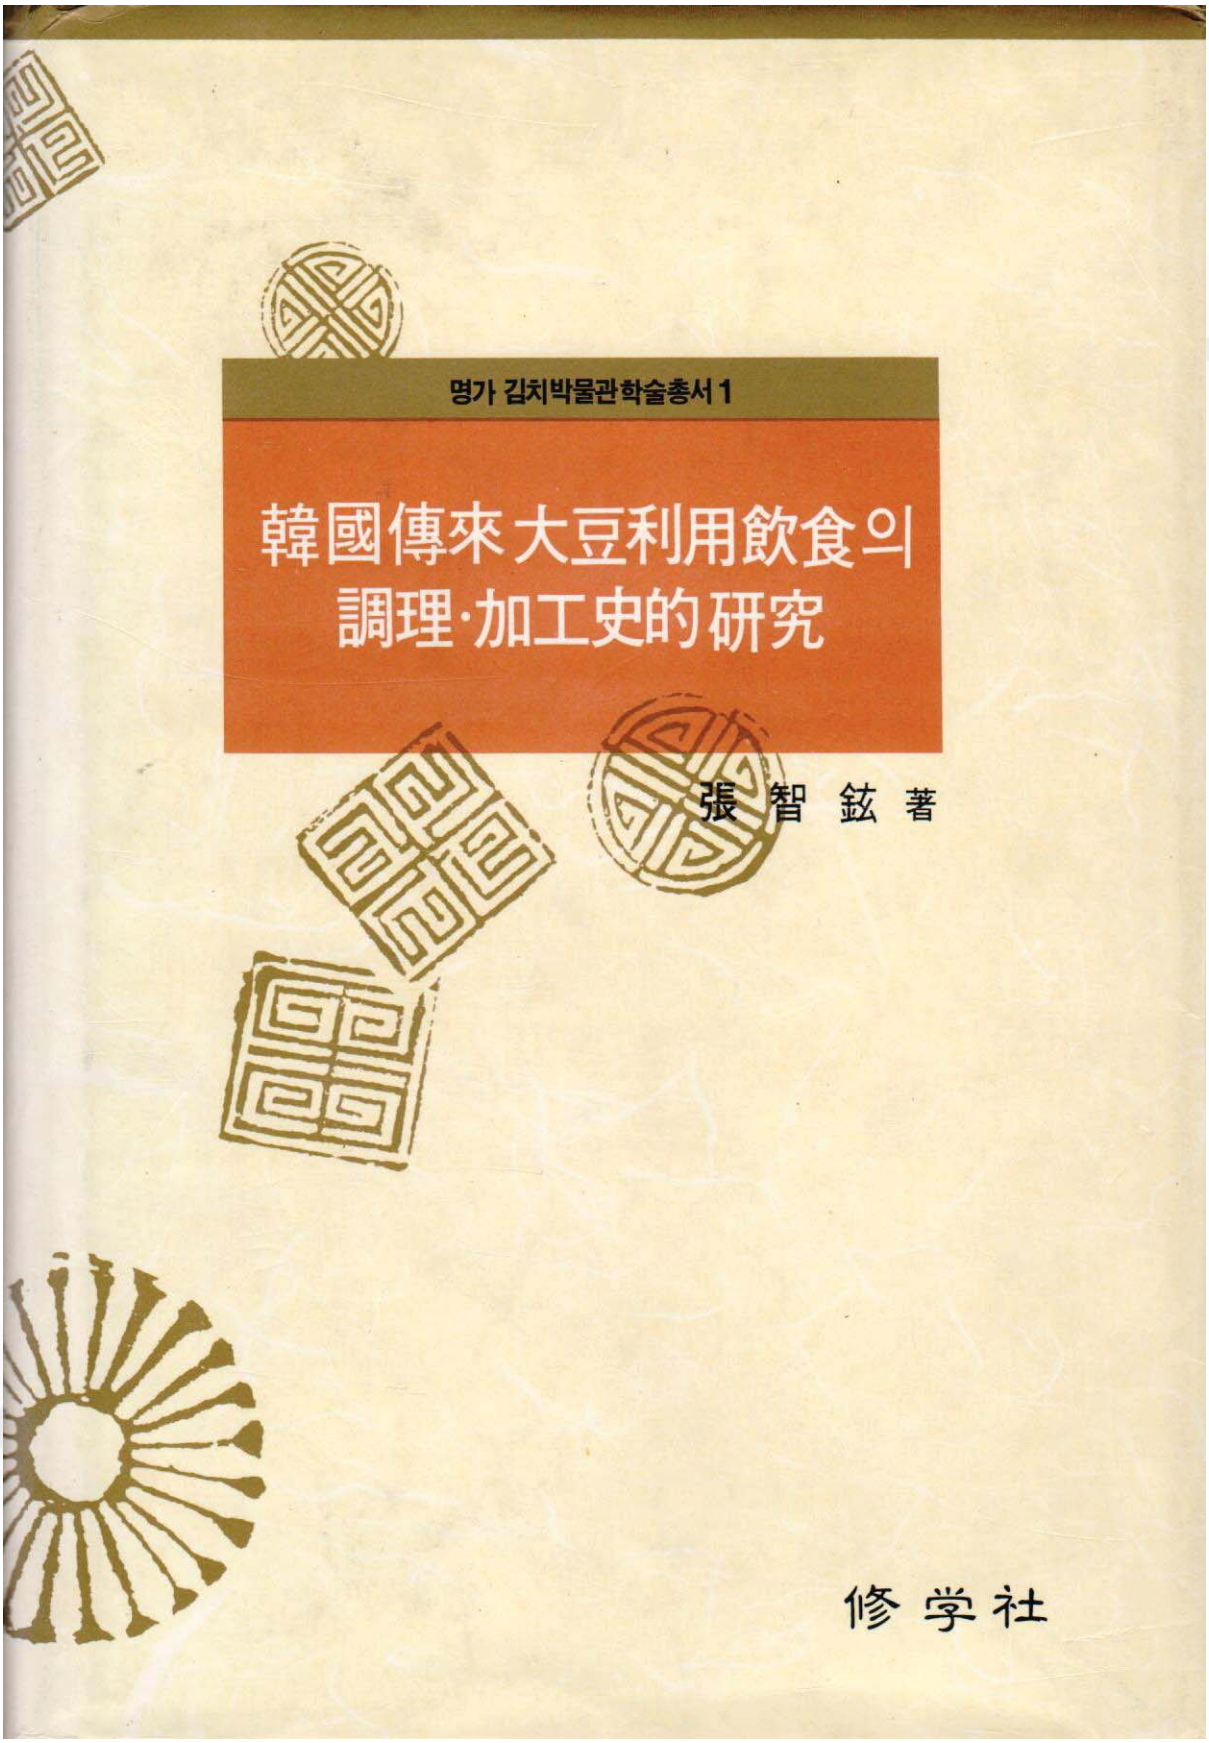
1381. Chang, Jihyun. comp. 1993. Hankookjeonrae Daeduiyongeumsikeu Jorigagongsajeok Yoengu [A study on the cooking and processing history of traditional soybean foods in Korea]. Seoul, Korea. 359 p. [58 ref. Kor]
• ***Summary:*** See next page. Dr. Cherl-Ho Lee of Korea says this is the earliest known book written in Korean that is only about soybeans. It discusses each of the major Korean soyfoods. Dr. Lee adds: The Korean alphabet, Hangul, was invented in King Sejong's period in the 15th century, but used mainly by women. Scholars in the Joesun Kingdom preferred to use Chinese characters, much as European scholars preferred to use Latin in medieval times. The Korean alphabet has been used as the official way of writing only since the Republic of Korea was founded in 1948. Address: Professor of food science at Seongsim Womens Univ., and Director of Kimchi Museum in Seoul, Korea.

1382. Chomchalow, Narong; Laosuwan, Paisan. eds. 1993. Soybean in Asia: Proceedings of the planning workshop for the establishment of the Asian Component of a global network on tropical and subtropical soybeans. Bangkok, Thailand: FAO Regional Office for Asia and the Pacific. viii + 218 p. Held 2-7 March 1992 at Chiang Mai, Thailand. RAPA Publication (FAO), No. 1993/6. Illust. No index. 25 cm. [76 ref]
• ***Summary:*** Preface. List of contributors. Acronyms and abbreviations. Part I–Opening session: Welcome address. Remarks, Inaugural address.

Part II–Endorsement and recommendations: Endorsement of network. General recommendation.

Part III–Country reports: Australia, Bangladesh, China, India, Indonesia, Japan, Malaysia, Myanmar, Nepal, Pakistan, Philippines, Republic of Korea, Sri Lanka, Thailand, Vietnam.

Part IV–Institutional Parts: AVRDC, CGPRT Centre, FAO, INTSOY.



Part V–Special Reports: Oilseed crops development project, achievements on soybean research and development. The history of soybean in the Orient. Soybean processing, utilization and marketing in the Philippines. Soybean production, utilization, research and development in Taiwan. Biotechnological research on soybean at Kasetsart University. Address: 1. Regional Plant Production Officer (Industrial Crops); Both: FAO / RAPA (Regional Office for Asia and the Pacific), Bangkok, Thailand.

1383. Chomchalow, Narong; Kueneman, E.A.; Hicks, P.A. 1993. Institutional report 3–FAO. In: N. Chomchalow & P. Narong, eds. 1993. Soybean in Asia: Proceedings of the Planning Workshop for the Establishment of the Asian Component of a Global Network on Tropical and Subtropical Soybeans. Bangkok, Thailand: FAO Regional Office for Asia and the Pacific. viii + 218 p. See p. 164-172. RAPA Publication (FAO), No. 1993/6.
• ***Summary:*** Contents: (1) Introduction. (2) FAO's involvement in soybean research and development in Asia. (3) The FAO-executed projects: National projects (Sri Lanka, Vietnam, Philippines), regional projects. (4) Other FAO-supported activities: Networking (Global Soybean Research Network, Asian Soybean Network), evaluation (Buhler's Full-fat soybean processing technology, Plenty's soymilk production in Sri Lanka, Danish Turnkey Dairies' soymilk plant).

Tables: (1) Soybean production, area harvested, and yield in developing and developed countries in Asia: Developing countries: Bhutan, Cambodia, China, DPR Korea (north), India, Indonesia, Iran, Laos, Malaysia, Myanmar, Nepal, Pakistan, Papua New Guinea, Philippines, Rep. of Korea (south), Sri Lanka, Thailand, Vietnam. Developed countries: Australia, Japan, New Zealand. (2) Activities involving soybean sponsored by RAS/82/002 (1983-89). (3) Activities involving soybean sponsored by RAS/89/040 (1990-93).

Regional projects RAS/82/002: "During the period of 1983-89, an FAO-executed and UNDP-funded project, RAS/82/002, entitled "Research and development of Food Legumes and Coarse Grains {FLCG} in the Tropics and Sub-Tropics of Asia" was operated. This project involved Bangladesh, Indonesia, Lao PDR, Nepal, Pakistan, the Philippines, Republic of Korea, Sri Lanka, Thailand, and Vietnam. The project was planned in two phases; the duration of Phase I was 2 years, and activities began in September 1983. The proposed UNDP contribution for this phase was US $450,000 and the actual expenditure was

© Copyright Soyinfo Center 2021

© Copyright Soyinfo Center 2021

US $454,394. Phase II was approved in August 1985 but implemented in July 1987 and concluded in June 1989. Total UNDP contribution for both phases was US $1,331,453.

"The long-term objective of the project was to increase production of FLCG in the participating countries in order to bridge the gap between the demand for protein-rich food for domestic needs and export markets and the actual production. One of the main goals of the project was to establish a network of national institutions, linked with international institutions capable of advancing the relevant development objective of participating countries through coordinated research and extension activities."

RAS/89/040: "A follow-up project of RAS/82/002, entitled 'Regional Cooperative Programme for the Improvement of Food Legumes and Coarse Grains in Asia', funded by UNDP, is being executed by FAO. It became operational in April 1990 and has a termination date of December 1993. Four more countries (China, India, Myanmar, and Malaysia) joined the network in this follow-up phase. The Government of Indonesia continues to provide the Secretariat."

Table 1: Bhutan: Soybean production increased from 900 tonnes (metric tons) in 1981 to 1,300 tonnes in 1991.

Cambodia: Soybean production increased from 1,100 tonnes in 1981 to 16,000 tonnes in 1991–growing at 28.0% a year on average.

North Korea: Soybean production increased from 350,000 tonnes in 1981 to 460,000 tonnes in 1991–growing at 2.5% a year.

Iran: Soybean production increased from 62,000 tonnes in 1981 to 105,000 tonnes in 1991–growing at 0.8% a year.

Laos: Soybean production increased from 3,900 tonnes in 1981 to 4,200 tonnes in 1991–growing at 1.3% a year.

Papua New Guinea: Either had no soybean production or no information was available.

New Zealand: Soybean production decreased from 300 tonnes in 1981 to 100 tonnes in 1991–decreasing at -11.0% a year. Address: 1. Regional Plant Production Officer (Industrial Crops), 2. Regional Agricultural Engineering and Agro-Industries Officer: Both: FAO/RAPA, Bangkok, Thailand; 3. Senior Officer, Plant Production and Protection Div., FAO, Rome, Italy.

• ***Summary:*** Korea is a peninsula surrounded by water (including the Yalu River that marks the border between China and Korea). There an estimated 200 varieties of kimchi such as cabbage, cucumber, eggplant, white radish, turnip, etc. The glossary (p. 7-13) includes: Denjang paste (a fermented soybean paste and flavor enhancer). Gochu Jang (hot fermented chili paste; Gochu means chili). Seaweed: Kelp (*Ulva conglobata*, laver (*Porphyra umbilicalis*, sold in very thin sheets [nori]), *miyuk* (*Undaria pinnatifida* [wakame]). Soy sauce (with directions for making it at home). Soybean curd (Two types: Chinese is a firm square about 4 inches on a side and 1 inch thick; Japanese is soft and creamy, about 2 inches thick).

Concerning Gochu Jang: This is the main seasoning in Korean cooking. It has been prepared at home for centuries and stored in the many black pottery pots so conspicuous on Korean rooftops or gardens. Each year on March 3, an auspicious date, the householder starts to prepare enough gochu jang to last all year. Ingredients: Glutinous rice (cooked to a pudding consistency), fermented soybean cake (*meju*), hot red chilis, salt, and barley malt syrup mixed with water. These are mixed and allowed to ferment [outdoors] in a pottery jar for at least 3 months. In early May, as the weather warms, the [woven conical bamboo] cover of the storage jar is removed early each day "so that the sun can strike and warm the contents to accelerate fermentation. At night the cover is replaced." The fermentation process eventually reduces gochu jang to a smooth, jamlike consistency with a many-dimensional flavor; it adds a lively sting and rich red color to any food with which it is used. "Korean cooking without this indispensable condiment is unthinkable."

Recipes include: Beef shreds in soy sauce (p. 48). Fried spiced bean curd (p. 57, *Tubu choerim*). Stuffed bean curd (p. 58, *Tubu gui*). Crushed bean curd salad (p. 70, *Tubu sang she*). Bean curd and pork patties (p. 96). Assorted stuffed fritters (p. 100-01, *Jon*). Seasoned dipping sauce (p. 109, *Yang yeum kanjang*). Simple bean curd soup p. 117, *Tubu kook*). Bean curd soup with clams (p. 125, *Sundubu*). Vegetable soup with soybean curd (p. 135, *Tubu jigae*). Soybean sprout soup (p. 136, *Kongnamul kook*). Address: 1. Food historian; 2. Dr. (Mrs.), expert on history, science, and preparation of kimchi.

• ***Summary:*** "One half of the world's poor live in Asia. The total population of Asia is around 2.8 billion and it is increasing unabated. Agriculture is the mainstay for the livelihood in most countries in Asia. Agriculture in many of the countries is at the mercy of the monsoon. A preponderance of vegetarians depend on plants for their protein source. Protein, calories, vitamin and mineral deficiencies in the diet predominate in the Region. Soybeans with diverse, direct and processed products could help alleviate nutritional deficiencies by complementing the carbohydrate diet.

"Soybean is native to Asia. However, it is ironic that Asia imports substantial quantities of soybean for food, feed and fat uses. Can Asian countries produce enough soybeans to be self-sufficient? Is there a potential? Based on the area, production, and import the Asian countries can be broadly divided into at least three groups; the first group is the major soybean producers which have substantial research effort but some of them still import limited quantities of soybean or meal or oil. They are China, India, Indonesia, Thailand and Australia. The second group of countries import millions of tons of soybean but still produce some for domestic food uses. In this category are Japan, Republic of Korea and Taiwan. The last group of countries uses soybean or tries to promote soybean but production and research are yet to make any significant progress. The Philippines, Nepal, Bangladesh, Bhutan, Myanmar, Sri Lanka, Pakistan, Malaysia and Vietnam belong to this group.

"In the past two decades, AVRDC has partnered with many countries in the Region and assisted in sustaining soybean production through development of improved varieties and facilitated them to undertake research efforts to improve soybean production. Trained human resources have also been increased. Other centres in the Region such as ACIAR and ESCAP/CGPRT Centre have also contributed to strengthening research capability.

"In Asia, AVRDC, IRRI and IITA with the participants from Asian countries expressed their interest to establish an Asian Soybean Improvement Network (ASDIN) in 1987. Again in 1989 at the IV World Soybean Research Conference in Argentina, the participants from various countries expressed a need to organize a Global Network for Soybean. FAO has been asked to catalyse the establishment of such Network. FAO has already organized consultations in Africa and Latin America and has developed the project document for those regions.

"Asia is different from Africa and Latin America. I am sure the background papers that all of you have prepared will bring out the strengths, weaknesses, constraints, national priorities, policies, resource availability and resources needed. Utilizing the background information by the end of our six-day deliberations, we should be able to come up with a draft project document for an Asian Soybean Network.

"AVRDC is represented by plant breeders, plant pathologist, entomologist and economists to show our commitment, interest and willingness to work jointly with all of you in the region. We hope that AVRDC will be strengthened through this Network so that AVRDC can serve the region better on behalf of the Network in the specific sub-region. On behalf of our Director-General, Dr. Javier and my colleagues, I extend you a warm welcome and wish successful deliberations to come up with a meaningful project document." Address: Director, International Cooperation Program, The Asian Vegetable Research and Development Center (AVRDC), Shanhua, Tainan, Taiwan, Republic of China.

• ***Summary:*** Contents (each accompanied by tables and charts; each section covers the years 1991-1994): Imports of soya beans for sowing (almost all come from the USA, followed by Chile and Japan). Imports of soya beans for oil extraction (almost all come from the USA). Imports of soya beans, nes [meaning unclear] (almost all come from USA, followed by Taiwan, China, and Japan).

Imports of soya-bean oil crude, whether or not degummed (almost all comes from the USA, followed by France). Imports of soya-bean oil and its fractions, refined but not chemically modified (almost all comes from the USA, followed by Singapore). Imports of veg fats & oils & fractions hydrogenated, inter or re-esterified, refined or not (almost all comes from the USA followed by UK and Netherlands). Imports of animal or veg fats & oils...

Imports of soya bean flour and meals. Imports of soya sauce (main suppliers are: USA, China, Japan, Hong Kong, Taiwan, Philippines, South Korea). Imports of protein concentrates and textured protein substances (almost all comes from USA). Imports of Soya-bean oil-cake and other solid residues, whether or not ground or pellet (almost all comes from USA). Imports of bran, sharps and other residues of leguminous plants, pelleted or not (almost all comes from USA).

Exports of soya beans for sowing (most goes to USA,

followed by France, Germany and Austria). Exports of soya beans, for oil extraction (most goes to Netherlands, followed by France, Portugal and Spain). Exports of soya beans, nes (most goes to USA, followed by Hong Kong and Singapore). Exports of soya bean flour and meals (almost all goes to USA). Exports of soya-bean oil crude, whether or not degummed (almost all goes to the USA). Exports of soya-bean oil and its fractions, refined but not chemically modified (almost all goes to Pakistan, followed by USA). Exports of veg fats & oils & fractions hydrogenated, inter or re-esterified, refined or not (almost all goes to the USA). Imports of animal or veg fats & oils... (almost all goes to USA).

Exports of soya sauce (main buyers are UK, Japan, United States, Finland, Cuba).

Exports of protein concentrates and textured protein substances (almost all goes to USA). Exports of Soya-bean oil-cake and other solid residues, whether or not ground or pellet (almost all goes to USA). Exports of bran, sharps and other residues of leguminous plants, pelleted or not (almost all goes to USA). Address: Trade Evaluation and Analysis Div., International Markets Bureau, Markets and Industry Services Branch, Agriculture Canada, Ottawa, Ontario, Canada.

1392. *Agri-Book Magazine* (*Exeter, ONT, Canada*). 1994. Far East market can double. 20(5):29. Feb.

• ***Summary:*** Canada is selling more and more soybeans for food uses to East Asia. Thailand is the only country in the region that is self-sufficient in soybean production. Japan (population 123 million) imports more than 1 million tonnes per year, Taiwan imports 250,000 tonnes, Indonesia 150,000 tonnes, Korea 120,000 tonnes, and Malaysia 100,000 tonnes. Singapore and Hong Kong import all the soybeans they use.

In 1993 Ontario produced a record 1.7 million tonnes. Only 500,000 tonnes of this (29.4%) was exported, and only a fraction of that was suitable for making soyfoods such as tofu, natto, soymilk, Taiwanese fermented tofu (*foo yee*), etc. A large color photo shows ladies in Taiwan packing fermented tofu in jars.

Ontario has captured 56% of the Hong Kong market, and about 14% of the Malaysian market. But the Asian market is becoming more competitive because exporters from the USA are beginning to offer soybeans in bags as well as bulk shipments. Michael Loh, the OSGMB coordinator for export development, thinks Canada can achieve its goal of doubling soybean exports by the year 2000.

1393. Badani, Bernard. 1994. Edible soybean mission report, Indonesia, Taiwan, Korea, February 1994. Ottawa, Ontario, Canada: Agriculture and Agri-Food Canada. 23 p. 28 cm. Spiral bound.

• ***Summary:*** Contents: Foreword: Mission objective, countries visited, main goals, conclusion. Acknowledgments. Names of the 8 mission members. Visit to Indonesia (Jakarta): Background, visits (Nestle soymilk plant in Surabaya, BULOG), conclusions, market potential (short, medium, and long term). Visit to Taiwan (Taipei, Taichung, Tainan, Kaohsiung): Background (the pro-American soybean lobby), visits (Taiwan Tofu Manufacturers Assoc., Tet Union Corp., Great Wall Enterprises, Herng Yih), conclusions, market potential (short and medium term). Visit to Korea (Seoul): Background, visits (Hyosung Corp., AFMC, Korean and Seoul Tofu Manufacturing Co-operatives, conclusions, market potential (short and medium term). List of contacts by country (photocopies of business cards). Note: Mr. Badanai works for this federal organization in Ottawa.

This mission, whose coordinator was Michael Loh, took place between Feb. 25 and March 10, 1994; it was organized by OSGMB with assistance from the Canadian Embassies in Jakarta and Seoul, and the Canadian Trade Office in Taipei. The overall objective of the mission was to open these 3 markets to the sale of Special Quality White Hilum (SQWH) soybeans from Canada for use by their soy food industries.

Indonesia imports about 700,000 tonnes of soybeans each year, mostly grade #1 from the USA, to supplement its local production of about 1.3 million tonnes. About 250,000 tonnes of the imports are used to make soyfoods such as tempeh (which accounts for about 80% of the total), tofu, taucho (Indonesian miso), and soybean milk. The majority of their domestically grown soybeans are also used to make soyfoods. All Indonesian soybean imports are handled by BULOG, a government agency which determines yearly requirements and allocates the resulting imports to various companies under a complex price structure formula apparently designed to maintain the competitiveness and full utilization of the domestic crop whose internal prices are very high by international standards. Sarpindo is the largest Indonesian soybean crusher. Nestle operates a soymilk plant in Surabaya that makes 12,000 tonnes/year and is completing a second one of 20,000 tonnes capacity in Jakarta. Much of Nestle's production, especially for the new Jakarta plant, is oriented toward the export market, with the Philippines as their top priority.

Taiwan grows only 12,000 tonnes of soybeans domestically, but they import 2,400,000 tonnes per year. Their main suppliers are the USA (1,938,000 tonnes, 80.8% of the total), China, 297,000 tonnes), and Argentina (6,000 tonnes). Imports are handled mostly by a small number of major crushers, which then select a portion of the #2 soybeans imported, bag them, and sell them to Taiwanese soyfood manufacturers. About 8% of the total imports (200,000 tonnes) are handled in this way. Tofu is by far the most important soyfood in Taiwan, with consumption of 49.79 kg/capita/year. Most tofu is made by very small companies. The main problem facing Canadian exporters is the almost total control that the pro-American soybean lobby has shown so far in Taiwan. This lobby includes the

© Copyright Soyinfo Center 2021

main local crushers/importers of U.S. soybeans (which have a strong interest in maintaining the present import and distribution systems that make local tofu manufacturers dependant on them), and the American Soybean Association (ASA) office (with a staff of 15) in Taipei. Tet (Ttet) Union Corp. in Tainan is the largest crusher in Taiwan. Fwusow (Fwu Sow) is a large edible oil company. Taiwan's largest tofu manufacturer is Herng Yih Food Industrial Co. of Kaohsiung. The 13 year old company has two plants, 14 minutes drive apart.

Korea imports between 1 and 1.1 million tonnes of soybeans a year to supplement domestic production of about 200,000 tonnes. Approximately 200,000 tonnes of the total imports and 20,000 tonnes of domestically grown soybeans are used to make soyfoods, mostly tofu. All soybeans destined for this purpose are purchased by AFMC, the Agricultural and Fisheries Marketing Corporation, a state-owned corporation and government monopoly under the Ministry of Agriculture. that resells soybeans to food processors according to their needs, charging a very high markup over the import purchase price. This markup, in turn, allows AFMC to subsidize purchases of domestic soybeans which it buys at prices close to 5 times the international price but which it resells to tofu manufacturers at the same price as the imported soybeans. It is expected that AFMC will loose its importing monopoly on food grade soybeans by 1997 due to the GATT agreement. An immediate market potential for Canadian soybeans seems to exist for sprouting soybeans, of which Korea purchases about 6,000 tonnes a year. Address: Grains and Oilseeds Div., International Markets Bureau, Agriculture and Agri-Food Canada, Ottawa.

1394. *Canadian Export Soybeans* (*OSGMB, Chatham, Ontario, Canada*). 1994. Export market development. 7(2):1. May.
• ***Summary:*** "Ontario's soybean exporters are reaching into new markets in the Asia / Pacific region in an effort to expand sales for food use. Three Ontario companies traveled with representatives of the Ontario Soybean Growers' Marketing Board and Agriculture Canada to Indonesia, Taiwan and Korea, February 27-March 8, 1994.

"Ontario companies have been exporting food quality soybeans to Japan, Hong Kong, Malaysia and Singapore for almost 20 years. Soybean exporters are optimistic about prospects of doing business in the region since the economies of these new markets are booming and showing a willingness to lower trade barriers and thereby improve our access to their markets."

1395. *Ontario Soybean Growers' Marketing Board Newsletter.* 1994. Korean soybean curd manufacturers visit. Aug. p. 3.
• ***Summary:*** "Eleven representatives of the Korean Soybean Curd Manufacturers Federation toured southern Ontario in late May to get a first-hand look at the soybean industry. The group included the chairman of the federation, Mr. Chang Ye-Kyu and representatives of regional associations."

"Korea imports over 1,000,000 tonnes [metric tons] of soybeans annually, mostly from the United States. Approximately 130,000 tonnes or 5,000,000 bushels are used to manufacture tofu. All imports are handled through a government agency which has made a practice of buying crush quality soybeans and re-cleaning for sale to soyfoods manufacturers. Soyfood manufacturers would like to be able to buy higher quality soybeans but they have not been available in the Korean marketplace.

A large photo shows four Koreans comparing samples of #1 grade white hilum soybeans and #2 crush quality soybeans during their tour of the Sarnia grain terminal. Address: Box 1199, Chatham, ONT, Canada N7M 5L8.

1396. Soft Tofu Restaurant. 1994. August. New soyfoods restaurant or deli. 9542 Chapman Ave., Garden Grove (near Los Angeles), California.
• ***Summary:*** Article by Max Jacobson. 1994. Los Angeles Times (Orange County edition). Aug. 18. "There's no tofu like Soft Tofu." This Korean restaurant, which has a menu printed almost entirely in Korean, aims for a Korean clientele. The author described his meal there as "our best Orange County meal of the year." His favorite dish was the soft tofu ("delicate little clouds of tofu"). Address: Garden Grove, California. Phone: (714) 539-4511.

1397. Han, Sallie. 1994. Korean Thanksgiving is here: for centuries, it has been the biggest day on their national calendar and this Sunday it will be the festive event at Flushing Meadows. *Daily News* (*New York, New York*). Sept. 21. p. 522.
• ***Summary:*** It is called "Chusok" in Korean. Two recipes are given. One, "Kalbi Gui (Broiled Rib Steak)" states: "Serve warm, with white rice or wrapped in romaine or Boston lettuce leaves, with *denjan* [also spelled doenjang] or *gochu jan* (Korean hot sauces, available at Korean grocery stores)." Address: News editorial staff.

1398. Mann, Sue. 1994. Tempeh, tofu, and soymilk in Ecuador (Interview). *SoyaScan Notes.* Sept. 23. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Sue, who has lived in Quito for 6 years, is interested in making tempeh commercially in Ecuador, South America. She went to Ecuador originally as a teacher in an American school. Some people at Ambato Votec College [a Vocational-Technical College about 3 hours bus ride from Quito] in Ecuador are making quinoa tempeh, supposedly on a commercial scale; they sell it mostly in Quito.

© Copyright Soyinfo Center 2021

Also some Chinese or Korean people make tofu in Quito and sell it at one stall of an outdoor Oriental foods market. They make the tofu somewhere else and sell it twice a week fresh, from a bathtub, at the stall. They also make a pressed tofu. A lot of the health food stores in Quito occasionally sell fresh tofu; she has never asked where it is made.

She also knows a Baha'i person who makes soymilk in Ecuador. Address: c/o Donna Lewen, Cassilla 17-12-578, Quito, Ecuador. Phone: 593 2-570-600.

1399. Park, K.Y.; Moon, S.H.; Rhee, S.H. 1994. [Antimutagenic effect of doenjang (Korean soy paste)–inhibitory effect of doenjang stew and soup on the mutagenicity induced by aflatoxin B1]. *Environmental Mutagens and Carcinogens* 14:145-52. Sept. [Kor]*

1400. Gupta, Rajendra ("Raj") P.; Daller, Frank. 1994. Update on ProSoya Inc. and the SoyaCow Centre (Interview). *SoyaScan Notes.* Nov. 21. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** ProSoya Inc. (named ProSoya Foods International until late 1993) is the company that developed and owns SoyaCow, which is a machine that makes soymilk. The name SoyaCow was intended originally for smaller machines for developing countries, but now it is used also for the larger, more expensive systems.

In 1985 ProSoya had no manufacturing capability, so Raj talked with APV about developing equipment for ProSoya. APV did some research and development work for ProSoya but no money changed hands. ProSoya was considering giving APV a license to manufacture the machine, but APV found eventually that there are not many companies in the soyfoods market that are big enough to afford APV equipment, and most who could afford a large system might buy it from STS, which APV acquired in 1986. STS also looked at making the SoyaCow, but decided that the market was too small. APV has never owned ProSoya, and ProSoya never licensed any technology or equipment to APV.

The hard part was finding the right people. Once ProSoya found the right people, they chipped in some money, got some bank financing, and some small money from some shareholders. Only 15% of the company is owned by outsiders. So ProSoya is a corporation with about 8 shareholders, of which 4 are principal shareholders; the rest are relatives, accountants, etc. Raj still has the controlling interest. Frank Daller has raised all the outside capital within the last 1-2 years but most of it came in early in 1994. This has allowed ProSoya to construct a building where they do final manual assembly of SoyaCows, to publish a newsletter, and to market its SoyaCow very effectively. Most of the new funds have been used to build this assembly building, which does not have an assembly line and does not manufacture any of the SoyaCow's component 200 parts; they are custom fabricated by various other companies. ProSoya has 15-30 SoyaCows made at a time–built to order; each takes only 2-3 hours to assemble, and they inventory only a few at a time. In the building there is also a pilot plant, where potential customers can see how the SoyaCow works and taste the finished product.

ProSoya has not gone to any large companies for capital, and has not had to make any compromises as to its goals. In fact, they have been very selective about bringing in capital, desiring only investors who share Raj and Frank's views and goals. Frank invested money, and they have brought in outside money from only one other significant source, which is their West Coast licensee. This is a new entity in Vancouver, British Columbia, named Pacific ProSoya, which has acquired the license to produce soymilk in bulk, using ProSoya technology, for the western part of Canada and the northwest USA. The milk, made in a plant which ProSoya is building for them, will be sold to food processors. It is sort of joint venture and licensing deal. ProSoya holds equity in their company and they hold equity on ProSoya. The relationship began about 2 months ago, though they have been discussing this for the last 9 months.

Another new development is that ProSoya in Ottawa is starting to make bulk soymilk for food processors. They will be serving cow's milk dairies which will be test marketing Pure-Pak cartons of soymilk, as well as an ice cream company and a yogurt company and a Tetra Pack filler.

ProSoya is aggressively looking for a company to manufacture their SoyaCow assembly-line style in East Asia (especially in China, Taiwan, or Korea) for about half the price they can make it for in Canada. They see a large potential market in China and throughout the less developed countries if they can reduce the price to end users.

How much does a SoyaCow cost? The SC-20, the smallest machine which makes 20 liters of soymilk per batch, is extremely compact, uses a patented airless cold-grind process to produce a very good-tasting soymilk, and retails for US$7,000. The SC-100, which can produces 100 liters per batch and can make up to 400 to 500 liters/hour, retails for a minimum of US$175,000, not including the boiler, chiller, and clean-in-place system. They are about to introduce a continuous-process machine.

People learn about the SoyaCow mostly through word of mouth and from the *SoyaCow Newsletter,* which is written mostly by Raj and Frank. It goes out to several hundred people.

The Russians have translated Mark Messina's book, *The Simple Soybean and Your Health* into Russian. They want to print 10,000 copies. Address: The SoyaCow Centre, 9 Veery Lane, Ottawa, ONT, K1J 7W7, Canada. Phone: 613-745-9115.

Chef Gary Robins, age 29, "combines ingredients as diverse as barley and 'gochu jang' (a Korean red chili paste) is cross-cultural food that may be exotic but makes sense."

1405. *Ontario Soybean Growers' Marketing Board Newsletter.* 1995. 1994 Annual Meeting highlights. Feb. p. 3.
• ***Summary:*** More than 300 soybean growers, industry and government representatives, and suppliers attended the Dec. 1994 Annual Meeting of the Ontario Soybean Growers' Marketing Board. Bernard Leung (photo shown) of Harcan Kingsoya spoke on soyfood opportunities. Garth Baxter of Maple Leaf Foods expressed his belief that the miso market holds the best potential for expansion of Canada's food soybean exports to Asia. New markets with good potential include Taiwan, South Korea, Indonesia, and the Philippines.

"Frank Daller of ProSoya reported that his company is setting up soymilk production facilities in several locations across Canada. Their strategy is to sell bulk soymilk to dairies for processing and packaging."

The Board reported a financial operating surplus of $311,225 for the year ending 31 August 1994, and a reduction in Board fees from 90 cents per tonne to 80 cents for the 1994 crop. Address: Box 1199, Chatham, ONT, Canada N7M 5L8.

1406. Azevedo, Chris; Gallagher, Paul. 1995. Trends in Japan's soybean market. Paper presented at a conference titled "Producing Soybeans for the Soyfoods Market." 8 p. Held 2 March 1995 at Ames, Iowa. [6 ref]
• ***Summary:*** The pages and most tables in this report are unnumbered. One table shows per capita annual consumption (in lbs) of soybeans in selected Pacific Rim countries in 1974, 1984, and 1994, as follows, in descending order of pounds consumed per capita in 1994: Indonesia: 9.2, 14.0, 23.2. South Korea: 21.4, 18.8, 20.1. Japan 11.0, 15.3, 16.7. North Korea: 11.8, 12.2, 11.2. Malaysia: 2.9, 5.2, 10.3. China: 14.7, 13.0, 9.7. Thailand: 1.2, 3.9, 3.9. Philippines: 0.4, 0.5, 0.8. Sources: (1) USDA; (2) U.S. Bureau of the Census, World Population Profile, 1994 and 1984; (3) Statistical Yearbook, Statistical Office of the United Nations, New York, NY.

Another table shows annual soybean consumption in million metric tons in 1974, 1984, and 1994, as follows, in descending order of amount consumed in 1994: China: 5.237, 6.193, 5.350. Indonesia: 0.546, 1.072, 2.105. Japan: 0.716, 0.830, 0.950. South Korea: 0.328, 0.358, 0.410. North Korea: 0.083, 0.109, 0.117. Thailand: 0.023, 0.092, 0.105. Malaysia: 0.015, 0.036, 0.090. Philippines: 0.007, 0.013, 0.025. Source: USDA.

A final table shows the amount of soybeans used (in thousand metric tons) in Japan, by product and total, each year from 1978 to 1993, as follows: Use of soybeans for tofu rose from 486 in 1978 to a peak of 531 in 1984, falling to 492 in 1993. Use for natto rose from 71 in 1978 to a peak of 109 in 1993. Use for miso rose from 182 in 1978 to a peak of 185 in 1980, falling to 173 in 1993. The total rose from 750 in 1978 to a peak of 927 in 1992, falling to 920 in 1993. Address: Iowa State Univ. Phone: 515-294-0160.

1407. Hayes, Keri. 1995. Feeding their own: Cubans turn to soy as an alternative protein source. *Bluebook Update* (*Bar Harbor, Maine*) 2(1):1, 3-4. Jan/March.
• ***Summary:*** Pam Montanaro of Global Exchange (San Francisco, California) explains how Cubans–led by Alberto Ortega Jhones–have turned to soy and developed a host of delicious products, especially soymilk yogurt drink (in five flavors), which are now being produced in factories that formerly made dairy products. These factories are also manufacturing hard cheese from soymilk, soymilk cream cheese, and soymilk ice cream.

Some of the soybeans used to make these soyfoods are now being grown in Cuba; however most are imported from Canada and Brazil.

The USA, which has a trade embargo against Cuba, also holds embargoes against Iraq, North Korea, Libya, Serbia, and Montenegro. However the "Cuban embargo is the only one, at this time, that denies the right to trade for food and medicine." A photo shows two men at work in one of the dairy factories that has been converted to include a soyfoods processing section.

1408. Lee, Sang Sun. 1995. [*Meju* fermentation for a raw material of Korean traditional soy products]. *Korean J. of Mycology* 23(2):161-75. March. [36 ref. Kor; eng]
• ***Summary:*** "Meju is a raw material used to make Korean soy. sauce (*Kanjang*) and soybean paste (*Doenjang*), both of them rich in plant protein. Twenty-nine fungal and a bacterial species were identified from twenty-three traditionally homemade meju cakes. Out of them, only a few species were found to be involved in the actual fermentation process of meju; The other species were contaminants during the improper subprocesses of meju fermentation." • ***Summary:*** In the '94 Soya Bluebook is a listing for this famous Korean soymilk manufacturer at 960 Massachusetts Ave., Boston, Massachusetts 02118. Phone: 617-427-1507. Contact Rob Martel, Sales Manager. They may be planning to make soymilk in North America and it is said that they have a co-packing contract with Pacific Foods of Oregon. They are now constructing a soymilk plant in Australia.

1410. **Product Name:** Tofu [Firm, Soft, or Extra Soft].
**Manufacturer's Name:** Pulmuone U.S.A., Inc.
**Manufacturer's Address:** 4585 Firestone Blvd., South Gate, CA 90280. Phone: 213-564-2000.
**Date of Introduction:** 1995 June.
**Ingredients:** Tofu-Soft: Water, soybean, calcium sulfate, glucono delta lactone, magnesium chloride.
**Wt/Vol., Packaging, Price:** Firm and soft in 18 oz water pack. Extra soft in 10.5 oz (300 gm) sausage shape.
**How Stored:** Refrigerated.
**New Product–Documentation:** Talk with Jeannie U. Sim of Pulmuone. 1996. Aug. 6. Pulmuone (pronounced PUL-mu-wun) is the "the largest natural foods manufacturer and the largest tofu manufacturer in Korea." They are known primarily for tofu in Korea, where the company name is the same. They have built a tofu factory in southern California and began making water pack tofu in June 1995. The Korean tofu market used to be dominated by Japanese-American tofu makers, but now Pulmuone has captured about 70% of it. The word "Tofu" is written on the front panel in Roman letters only, and also in larger Korean characters. The firm and soft tofu each weigh 18 oz and are packed in tubs. The extra soft comes in a sausage-shaped tube. The company is planning to launch an aseptic tofu in a Tetra Brik carton, and perhaps a soy yogurt-like dessert.

Products with Labels sent by John Sim. 1997. June 23. (1) "Tofu-Soft" is sold water-packed in a square plastic tub. The curds are pressed in cloths. Since GDL is one of the 3 coagulants used, the tofu is very soft, with a high yield. The product is marketed primarily to Korean Americans, since the three largest blocks of text are all in Korean. Label for "Tofu-Soft": 5 inches square. Black, gold, green, and blue on white. "No preservative." Contains 16 gm protein per 200 gm of tofu = 8.0% protein. (2) "All Natural Tofu Firm" is similar to Tofu-Soft except that: There are no Korean characters on the label, but there are several Chinese characters. It contains 18 gm protein per 171 gm of tofu = 10.5% protein. GDL is used as a coagulant, but is the least predominant ingredient. The circle in the upper right corner is orange instead of blue. (3) "Tofu-Extra Soft" comes in a plastic sausage-shaped pack about 7 inches long and 2 inches in diameter. The soymilk is coagulated by GDL in the sealed package using heat. The two largest blocks of text are written in Korean. Ingredients: Water, soybean, glucono delta lactone, magnesium chloride. Contains 6 gm protein per 140 gm tofu = 4.3% protein.

Note: This is the earliest record seen (May 2019) concerning Pulmuone in the USA.

1411. Pulmuone U.S.A., Inc. 1995. [The difference of Pulmuone tofu: The tofu without preservatives and full of nutty flavor] (Ad). *Korean Journal* (*Los Angeles, Calif.*). July.
• ***Summary:*** The top half of this full-page Korean-language contains a photo showing two types of tofu in square plastic tubs and two types is sausage-shaped packs. On the bottom half are eight photos of other Pulmuone products. Address: South Gate, California. Phone: 1-800-287-3838.

1412. Han, Sallie. 1995. A Seoul train of eateries: Korean restaurants bring do-it yourself barbecue and a hot of other regional specialties to 32d St. Korean restaurants spice up the city. *Daily News* (*New York, New York*). Aug. 30. p. 205, 215.
• ***Summary:*** Jay Kim, manager of Won Jo restaurant on 32nd St., says that where Chinese use chopsticks, Koreans use chopsticks and a spoon.

"Another popular choice is *hae mul denjang*, a bubbling hot pot of spicy seafood and tofu."

Mul means "water." "'Koreans tend not to use a use a lot of oil in their cooking. They will cook with water instead of oil.'" Address: Daily News staff writer.

1413. Orthoefer, Frank T.; Liu, Keshun. 1995. Soybeans for food uses. *International Food Marketing & Technology* (*Germany*) 9(4):4-8. Aug. [5 ref]
• ***Summary:*** Contents: Introduction. Traditional soy foods: Soy milk, tofu, toasted whole soybeans and full-fat soy flour ("The toasted flour is often used in rice recipes or for the preparation of flavored bakery snacks. The toasted powder may be mixed with plastic fats and sugar to be used as a filling for confectionery and bakery products"), soybean sprouts, yuba, soy sauce, tempeh, natto, miso. Soy protein ingredients: Soy grits and flour, soy protein concentrates, soy protein isolates. Soy nutrition: Soy protein, fat and calories, phytochemicals. Food bean market. Summary.

Two "different types of soybeans have emerged: oil beans and food beans. This is particularly true in the US soy market..."

Of the fourteen phytochemicals, seven are present in soybeans. These seven are phytates, isoflavones, carotenoids, coumarins, triterpenes, lignans, and phenolic acids. Phytochemicals have been shown to affect human health as much as vitamins and minerals, and many of them have

© Copyright Soyinfo Center 2021

anti-cancer properties. The discovery of phytochemicals may change how the nutritional value of food is assessed.

The world market for soybeans for food use is estimated at about 1 million metric tons (tonnes). In Japan alone about 830,000 tonnes are made into soyfoods as shown in a pie chart as follows: Tofu (552,000 tonnes, 63.4%), miso (180,000 tonnes, 21.5%), natto (90,000 tonnes, 10.7%), soymilk (10,000 tonnes, 1.2%), soy sauce (5,000 tonnes, 0.6%), and others (22,000 tonnes, 2.6%). In the USA the food bean market is estimated at 50,000 tonnes. Other major markets for food beans are in Korea, China, Taiwan, Hong Kong, Singapore, Malaysia, and Thailand. Food-grade soybeans can be sold by the growers at a premium of 5-20% above the base price. The demand for food beans is increasing steadily. Address: 1. Vice President, R&D, Riceland Foods, Stuttgart, Arkansas; 2. Project Leader, Soy Food Lab., Jacob Hartz Seed Co., Stuttgart, Arkansas.

1414. *Soya Bluebook Plus.* 1995-1997. Serial/periodical. Bar Harbor, Maine: Soyatech, Inc. Peter Golbitz, publisher and editor. Frequency: Annual.

• ***Summary:*** Preceded by Soya Bluebook. A directory and information book for the soybean processing and production industries. One of the most valuable sources of worldwide information on soybeans. The first issue (shipped Sept. 1995) is titled "Soya Bluebook Plus: the annual directory of the world oilseed industry." Crops featured on the front cover are "soya, corn, cottonseed, palm, canola, rapeseed, and sunflower." Contents (most sections are marked with a fold-out tab): Organizations and government agencies: White pages, yellow pages. Oilseed product processors and marketers. Equipment supplies and services. Oilseed statistics. Oilseed reference: Oilseed glossary, standards and specifications, oilseed technical charts and tables. Indexes: Comprehensive index, advertiser index.

Concerning the year: The edition published in mid-1994 was titled '94 Soya Bluebook. The edition published in mid-1995 was titled '95-96 Soya Bluebook. The edition published in Sept. 1996 (the 50th edition) was titled '97 Soya Bluebook. The change was made to give the company extra time (16 months) to market the latest edition before the next year arrived. Address: 318 Main St., P.O. Box 84, Bar Harbor, Maine 04609. Phone: 207-288-4969.

1415. Wilson, Lester A. 1995. Soy foods. In: D.R. Erickson, ed. 1995. Practical Handbook of Soybean Processing and Utilization. Champaign, Illinois: American Oil Chemists' Society Press; St. Louis, Missouri: United Soybean Board. viii + 584 p. See p. 428-59. Chap. 22. [41 ref]

• ***Summary:*** Contents: Introduction. Soybean chemical composition. Unfermented soy foods: Soymilk, tofu (momen, kinugoshi or silken, packed tofu, aseptically packaged tofu, deep-fried tofu, kori tofu or dried-frozen tofu), other nonfermented soy foods (yuba, kinako or roasted whole soybean flour, fresh {edamame} and canned soybeans, texturized soy protein-based foods). Fermented soy foods: Miso, shoyu (soy sauce), natto, tempeh, sufu. Japanese Agricultural Standards. Identity preservation and transportation. Soybean quality characteristics: Overview, judging quality (tofu, miso, natto). Note: This is the earliest English-language document seen (Nov. 2012) that contains the term "roasted whole soybean flour."

Tables: 1. Nonfermented soy food products and common names by country. 2. Fermented soy food products and common names by country. 3. Chemical composition of soy foods. 4. Per capita annual consumption of soybeans (kg) in selected Asian countries (China, Indonesia, Japan, Korea, Malaysia, Philippines, Thailand; for the years 1968, 1978, 1988, 1994).

Figures: 1. Flowchart of refrigerated and shelf-stable soymilk production. 2. JAS seal of approval. 3. Diagram of equipment used in large scale tofu production (each piece of equipment is numbered and labeled). 4. Flowchart of regular tofu production. 5. Graph showing percent transmittance of whey versus coagulant concentration for soymilks at 6% solids made from Weber, Vinton, and Amsoy soybeans. A concentration of 0.023 N was selected as the optimum coagulant concentration, since it gave the most transparent whey. 6. Graph showing percent transmittance of whey versus coagulant concentration for Amsoy soymilk at concentrations of 4, 5, and 8% solids. Concentrations of 0.018N, 0.019N, and 0.035N, respectively, were selected as optimum coagulant concentrations. 7. Flowchart of kinugoshi (silken) tofu production. 8. Flowchart of packaged tofu production. 9. Flowchart of aseptically packaged tofu production. 10. Flowchart of kori (dried-frozen) tofu production. 11. Diagram of equipment used in large scale production of dried-frozen tofu (each piece of equipment is numbered and labeled). 12. Flowchart of miso production. 13. Diagram of the interactive factors producing the characteristic attributes of miso. 14. Flowchart of tempeh production. Address: Iowa State Univ., Ames, Iowa.

1416. Reigler, Susan. 1995. Pacific rim to the brim. *Courier-Journal* (*The*) (*Louisville, Kentucky*). Oct. 14. p. 55.

• ***Summary:*** A restaurant review of Kim's Asian Grill, 2354 Frankfort Ave. "Bee-beem bop ($7.25) was served in a big bowl, Seasoned vegetables and beef are piled atop rice and garnished with a fried egg. The proper way to eat it is to stir it all up and dig in This particular bee-beem bop also featured a dollop of gochu-jang sauce. This is a somewhat salty, traditionally mild chili paste. But if you are like one of my friends, who seems to have a high pain threshold, you can request the sauce hotter."

1417. Lang, Paul. 1995. Roasting and milling full-fat soy flour (Interview). *SoyaScan Notes.* Nov. 28. Conducted by William Shurtleff of Soyfoods Center.

© Copyright Soyinfo Center 2021

• ***Summary:*** Natural Products Inc. dry roasts whole soy flour to five different degrees of darkness. He basically custom roasts for each customer, to get exactly the color and other characteristics they need. The most popular of these is the lightly roasted soy flour, which has a light creamy, beige color; it is not dark-roasted like kinako. This is one of the few light-colored full-fat soy flours on the market that is processed with dry heat. Yet when the beans come out of the roaster, their outside looks dark. When applied to soy flour, "roasted" implies that the product was processed with dry heat, whereas "toasted" implies steamed with moist heat. Paul runs PDI, trypsin, and urease tests to be sure that he is roasting sufficiently. The main buyers of this product are American bakers, who want the flour to be no darker than it has to be. Getting this exact degree of roasting is more of an art than a science.

Paul also makes a "chocolate roast," but he has signed an agreement not to advertise it. Only one company presently uses this product and they don't want anyone else in the industry to know that they are using a $0.35/lb product rather than a $1.35/lb product–the so-called "spray-dried tofu powder" that has become the subject of controversy. Paul thinks that "spray-dried tofu powder is a big hoax that will be going by the wayside." In most applications, Paul's roasted soy flour, roasted to the desired degree, will work just as well for only 26% the cost. He has saved one company over $100,000 in one week. Yet Paul does not really come out ahead, because he also sells the soy flour to the people who make the "spray-dried tofu powder."

Koreans in America mix a dark-roasted soy flour with honey and make it into a traditional drink, which they consume only in hot weather. Paul does not know what this drink is called, but he will try to find out.

Paul's roasting process is unique. First, he uses a continuous process. Second, he uses a roasting medium (such as salt or sand), which is confidential. He bought his patent and equipment from HiPro Food Products Co, owned by Bob Olsen and Bob Cross, in Minnesota. The man who invented Cheerios sold out to General Mills; he had an idea for a roaster and spent about 12 years trying to perfect it. Three years ago the inventor of Cheerios died and the brains behind the idea, the engineer, got cancer. Olsen and Cross were both in their upper '70s and they had a great little roasting system but they didn't develop the market. The patent is 17 years old and it expired one month after Paul bought the company. The process has changed so much over the years that reading the original patent would give almost no idea of the current process. Paul believes the secret to his success lies in making an inactivated flour, with no beany flavor, that keeps its creamy color. Paul built a separate building that houses his roaster; nobody sees it (though a photo appeared in *Bluebook Update*, Oct/Dec. 1995, p. 4). The original patent used gas with salt as the medium; now they use electricity and a different medium. His process is totally unique.

One of Paul's options is to go into the business of selling roasters. He has had a request to sell one company five roasters for $2 million–and his company is presently only worth $500,000. But at this stage he wants to focus on making soy flour. Address: Natural Products, Inc., 798 Hwy 6, Grinnell, Iowa 50112. Phone: 515-236-0852.

1418. Attwood, Charles R. 1995. Spelling trouble at an early age. *Nutrition Advocate* (*Dr. T. Colin Campbell with News of the Cornell China Project*) 1(5):5. Nov.
• ***Summary:*** In 1953, the vast majority of apparently healthy young American soldiers killed in the Korean War–their average age was 22 years–were found to have coronary artery fatty deposits. Their Asian counterparts had none.

"Today, 42 years later, nearly 50 million American children have abnormally high blood cholesterol levels, which have led to fatty deposits within their coronary arteries as early as age 3. These deposits grow thicker during the teens, and virtually all young adults have them by the age of 21. By the age of 12, two-thirds of all children,... have the beginning stages of coronary disease, which eventually accounts for a third of all adult deaths."

"Next month, I will introduce a step-by-step program for greatly reducing dietary fat in your children's meals. Remember, the key to a healthy adult body begins when lifelong eating habits are just starting to form." Address: M.D., F.A.A.P [Fellow of the American Academy of Pediatrics].

1419. **Product Name:** SoyaDeli FiberPro.
**Manufacturer's Name:** Miwon Co. Ltd.
**Manufacturer's Address:** 720 Banghak-Dong, Dobong-Ku, Seoul 132-020, Korea. Phone: +82 2 992 1191.
**Date of Introduction:** 1995 November.
**Ingredients:** Incl. soy protein and soy fiber.
**How Stored:** Shelf stable.
**New Product–Documentation:** Soyafoods (ASA, Europe). 1996. Spring. p. 6. "New soya products at FiE '95." This product, exhibited at the Food Ingredients Europe Exhibition, is a bland tasting powder of soy protein and soy fiber, which can also be used as a fiber source and a thickening agent. With a high water holding capacity and fat binding, emulsifying, stabilizing, and gelling properties, it is recommended for meat products, frozen foods, pasta and noodles, baked products, snacks, sauces, soups and yogurts.

1420. **Product Name:** SoyaDeli PeptiPro.
**Manufacturer's Name:** Miwon Co. Ltd.
**Manufacturer's Address:** 720 Banghak-Dong, Dobong-Ku, Seoul 132-020, Korea. Phone: +82 2 992 1191.
**Date of Introduction:** 1995 November.
**Ingredients:** Incl. soy protein isolate.
**How Stored:** Shelf stable.
**New Product–Documentation:** Soyafoods (ASA, Europe).

© Copyright Soyinfo Center 2021

1996. Spring. p. 6. "New soya products at FiE '95." This product, exhibited at the Food Ingredients Europe Exhibition, is a soy protein hydrolysate made by enzymatic treatment of soy protein isolate. It consists mainly of oligopeptides and amino acids. It is claimed to have good solubility and organoleptic properties over a broad pH range. It can reduce the allergenicity and accelerate the absorption rate of the nitrogen source. As a protein supplement it can be used in nutritional foods and drinks, infant formulas, sports drinks, and enteral feeding products.

1421. **Product Name:** SoyaDeli FlavorPlus, and FlavorBase.
**Manufacturer's Name:** Miwon Co. Ltd.
**Manufacturer's Address:** 720 Banghak-Dong, Dobong-Ku, Seoul 132-020, Korea. Phone: +82 2 992 1191.
**Date of Introduction:** 1995 November.
**Ingredients:** Incl. soy sauce, amino acids, sugar, nucleotides, and salt.
**How Stored:** Shelf stable.
**New Product–Documentation:** Soyafoods (ASA, Europe). 1996. Spring. p. 6. "New soya products at FiE '95." These two products, exhibited at the Food Ingredients Europe Exhibition, can be used to improve the flavor of a wide variety of food products. FlavorPlus is a dehydrated enzymatic soy sauce post-formulated with amino acids, sugar, nucleotides, and salt. It can be used as a flavor enhancer or flavor base in a wide range of savory applications. FlavorBase is an enzymatically hydrolyzed soya protein used to improve flavor in processed products; it can be used to make soy sauce and in various fermentation media.

1422. *Honolulu Star-Bulletin* (*Hawaii*). 1995. Classified ad: Cook, Korean style food. Dec. 22. p. 24.
• ***Summary:*** "Prepare Korean cuisine for lunch and dinner including but not limited to Korean soup, meats & vegetable side dishes desserts and appetizers...

"Utilize Korean ingredients, spices, and sauces (hot sauce, bean paste, barbecue sauce, dressed soy sauce) to cook food. Supervise a kitchen helper. 40 hr/week. 10:30 am–6:30 pm/ $10.01 per hour Min. Reqmnt: High School graduate + 2 yrs experience in job offered. Must have knowledge and understanding of Korean Language specifically to recognize and know Korean names of certain entrees, ingredients and menus, e.g. Kalbi, Bul Go Gi, Kim Chee, Man Doo, Chop Chae,... Kochu Jang, Daen Jang, etc.

1423. *SoyaScan Notes.* 1995. Chronology of major soy-related events and trends during 1995 (Overview). Dec. 31. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** Spring–A small number of farmers grow Monsanto's Roundup Ready soybeans (see Holmberg, Oct. 1995).

June–Pulmuone (pronounced PUL-mu-wun), the largest natural foods manufacturer and the largest tofu manufacturer in Korea, builds a tofu factory in South Gate, California and begins to manufacture firm soft, and extra soft tofu. The company name here is Pulmuone U.S.A., Inc.

Aug. 3–Article titled "Meta-analysis of the effects of soy protein intake on serum lipids," by James W. Anderson, PhD, and coworkers (Univ. of Kentucky) is published in the prestigious *New England Journal of Medicine* (p. 276-282). A summary of 60 scientific studies, it is probably the most significant and influential article on the health / medical benefits of soyfoods ever to be published. It receives widespread media coverage and leads to a large jump in soyfoods consumption in the USA during the following years.

Aug. The first issue of the *U.S. Soyfoods Directory* is published by Jane Ade Stevens and Roger Stevens for the Indiana Soybean Development Council. Subtitle: "A listing of over 270 companies in the U.S. who produce foods made from soybeans." An important, much-needed innovation. Contents: Glossary of the different soyfoods and soy ingredients (alphabetical). Soyfoods companies by product (e.g., names of all companies that make miso). Company directory (alphabetically by company name, with address, phone, fax, contact person, names of products made, and classification {e.g. "Consumer products"}). Soyfoods companies by state (California has by far the most). Professional associations and industry information resources. U.S. soybean facts. Soyfoods directory survey. The fourth and list printed and bound issue was published in 1999.

Oct. The Higher Taste (Maker; Portland, Oregon), and Turtle Island Foods (Distributor; Hood River, Oregon) introduce Tofurky–a meat alternative resembling turkey. However the history of the product is amazingly complex and goes back (sort of) long before this date. The following number of Tofurky Roasts were sold: 800 in 1995, 1,500 in 1996, 18,000 in 1997, 45,000 in 1998, and 63,000 in 1999. As of 2019 the product continues to thrive; 400,000 sold in 2018.

Nov.–The first issue of *SIN Newsletter* is published by the Soy Information Network of Whangerei, New Zealand (editor: Dave Woodhams. Funded by Richard and Valerie James). This Newsletter deals largely with issues related to phytoestrogens in soybeans, misinformation about them, and attempts by the U.S. soy industry to prevent critics from pointing out possible health dangers. Issue no. 2 was published in Feb. 1996.

1424. *Korea Times* (*Los Angeles edition*). 1995. [Pulmuone tofu sweeps Korean-American market: Captures 80% of Hinoichi market share. Tofu dessert under development and pushing into general market]. Dec. [Kor]

• ***Summary:*** A large photo shows a person holding a cake of tofu in a plastic tub against the background of the Pulmuone tofu packaging line inside their plant.

1425. **Product Name:** Soymunch (Snack Bars) [Sesame, Green Bean, Flax].
**Manufacturer's Name:** Jamae Natural Foods Inc.
**Manufacturer's Address:** 5958 West Pico Blvd., Los Angeles, CA 90035. Phone: 323-937-3670.
**Date of Introduction:** 1995.
**How Stored:** Shelf stable.
**New Product–Documentation:** Talk with Crystal Yu of Jamae. The company name is pronounced jah-MAY. She introduced this product about 5 years ago and has been selling it only locally since that time. She is Korean American.

1426. Lee, C.H. 1995. The mystery of chongkukjang. Seoul, Korea: Shinkwang Publishing Co. *
• ***Summary:*** Note 1. The is the earliest document seen with the word "chongkukjang" [Korean natto paste] in the title.

Note 2. The author of this book is not the well-known Korean food scientist and technologist Cherl-Ho Lee.

1427. Shin, Z.I.; Ahn, C.W.; Nam, H.S.; Lee, H.J.; Lee, H.J.; Moon, T.H. 1995. [Fractionation of angiotensin converting enzyme (ACE) inhibitory peptides from soybean paste]. *Korean J. of Food Science and Technology* 27(2):230-34. [16 ref. Kor]*

1428. Duus, Peter. 1995. The abacus and the sword: The Japanese penetration of Korea, 1895-1910. Berkeley, California: University of California Press. xiv + 480 p. Plus [13] pages of plates. Illust. Index. 24 cm. [400* ref]
• ***Summary:*** A very important, profound, and very readable book containing much original research. The Introduction, "The origins of Meiji imperialism," asks several very interesting questions. "Why did Japan begin to acquire an overseas colonial empire in the late Meiji period? (Note: The Meiji period was 1868-1912). After all, there was little precedent in Japanese history for a deliberate program of overseas territorial expansion. Throughout most of their recorded past the Japanese had remained in splendid isolation from their continental neighbors, making few attempts to expand their political power abroad." Yet: "Within a generation after the Meiji Restoration, the Japanese leadership had shifted from a traditional policy of peaceful and passive isolation to a radically new policy of active expansion."

The international context for this new policy was European colonial expansionism–worldwide. "Between 1800 and 1900 the Europeans acquired control over territory eight or nine times the size of Europe itself... The global reach of Western imperialism could not help but influence both the character of Meiji modernization and the thrust of Meiji foreign policy. It provided the context in which the Meiji leaders acted and a model for them to follow."

After the 'opening' of Korea by Japan in 1876, the Japanese first began to settle in a number of treaty ports that were soon opened for trade.

The number of Japanese residing on the Korean peninsula increased from less than 1,000 in the 1880s to over 170,000 in 1910, the year that Japan annexed Korea as a colony. In 1944, Japanese population of Korea has surpassed 700,000 (p. 290).

Page 247: "In East Asia, Japan's chief market was China, a sprawling society of several hundred million people. To some extent trade with China involved an exchange of primary goods–iron products, copper, and coal from Japan in return for soybeans and soy flour [sic, soybean cakes] from China. But trade revolving around the new Japanese cotton spinning and weaving industry steadily grew in importance. Not only was China a major source of raw cotton, but it also became the chief market for Japanese machine-spun cotton yarn."

Page 255: "During the period 1876-82, Western-made goods, mainly cloth and woven goods but other cheap manufactures as well, accounted for 88 percent of Japanese exports to Korea, and Japanese only 12 percent. Profits on these goods were lower than on the Japanese-made handicraft items like silk, sake, lacquer, and matches, but there was an insatiable demand for them.

"The Japanese carried home mainly products of primary industry–rice, soybeans, and leather. Most of the rice, which was extremely cheap in comparison to Japanese rice, went to urban consumers at home, and demand eventually grew to the point that Korean rice prices were quoted in the market at Osaka, its main destination. The rice trade, however, was volatile, with volume and prices fluctuating markedly from year to year, depending on harvest conditions at home and in Korea. An abundant harvest in Korea and a poor crop at home meant big profits, but the reverse situation depressed the trade. Until 1882 rice was the biggest Korean export to Japan, but a sudden fall in Japanese rice prices, caused by the Matsukata deflation, hurt the trade. Soybeans, by contrast, were a sturdier crop, less susceptible to changing weather than rice. Similar to domestically grown Japanese beans in quality and moisture content, Korean soybeans were also easy to process into tofu. As the cheapness and quality of Korean soybeans became known at home, the demand grew, and when Korean farmers discovered that Japanese merchants were willing to pay a good price, they began to put more land into the crop. When Japanese demand for rice slackened in the mid-1880s, soybeans became the most important staple exported from Korea to Japan" (with 4 footnotes).

Page 270: "Following the Sino-Japanese War [1894-95] the overwhelming bulk of all Korean exports went to Japan.

© Copyright Soyinfo Center 2021

Perhaps 80 to 90 percent of this export trade was accounted for by rice and soybeans."

Page 278: "The trade in rice and other agricultural staples like soybeans doubtless had an important economic impact on the hinterlands of the ports, often prompting a shift in local production patterns."

Page 331. "Although Wônsan remained a port of call for coastal shipping and shipped out the best soybeans in Korea, it remained a commercial backwater." Footnote: "Its small Japanese community was attractive to foreign visitors."

Pages 347-48 tell the story of a Japanese merchant named Okuda in his 30s with no prospects at home who emigrates to Inchon, Korea. In 1898 he began trading soybeans from Inchon to Chefoo. His perseverance "won him a considerable reputation among the still tiny Japanese community in Inchon."

Note: Peter Duus earned his B.A. at Harvard College and his Ph.D. at Harvard University. He has been a professor of Japanese History at Stanford University since 1973. Address: Stanford, Tokyo, and Seoul.

1429. Garcia Uriarte, Alvaro; Ortega, Alberto. 1996. Recent history of soyfoods in Cuba. Part V (Interview). *SoyaScan Notes.* Jan. 9. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** At this point we were invited for lunch at a nice hotel on the Food Industry Research Institute (FIRI) compound. There we were served various flavors of three dairylike soy products developed at FIRI. Our group of two Cubans and three Americans was invited to taste each product and offer our comments. (1) A set soy yogurt in cups in six flavors: Caramel, coconut, banana, orange, vanilla, and strawberry. Caramel, the most widely distributed flavor in Cuba, comes, of course, from Cuba's abundant sugar supply. The soy yogurt's acidity is 0.4 to 0.5 (half that of cow's milk), and it contains 3.2% protein and 1.6% fat. By comparison, dairy yogurt contains 3.0% protein and 3.4% fat when made from whole milk, or 3.4% protein and 1.7% fat when made from low-fat milk. This set soy yogurt is now sold in all provincial capitals in Cuba.

The soy yogurt plant at Santiago de Cuba had an original capacity of 2,000 liters/hour. The plant was briefly shut down to double its capacity to 4,000 liters/hour. During this period, children in Santiago de Cuba were supplied with dairy yogurt and this caused them to complain, as they objected to the more acid flavor.

(2) Soymilk ice cream (caramel flavored). The ingredients are soymilk, sugar, soy oil, caramel (for flavor), and a stabilizer. (3) Soy Cream Cheese. This is like the traditional Cuban *queso crema,* with much the texture of American Philadelphia cream cheese. Spread on crackers, it is delicious. Our group of five tasters gave each of these three products excellent marks for flavor, texture, and color. Shurtleff (who has the most experience with soyfoods of the five) noted that this is the best soy yogurt he has tasted anywhere, one of the best soy ice creams, and the first fermented soy cream cheese. Also served at this tasting was *queso blanco,* which resembled the traditional non-fermented white cheese but made from whole buffalo's milk. No soymilk was added. It was served in slices about ½ inch thick and 4 inches square, to be enjoyed on toast or crackers. This delicious product might also be made some day from soy.

Alvaro says in summary that his team of researchers is proud of three major achievements: (1) Making soymilk with no beany flavor; (2) Producing it at relatively low cost on equipment designed and constructed in Cuba using middle-level technology; and (3) Making soymilk with a high protein yield (The figure for protein yield is a top secret).

What are the big lessons to be learned from Cuba's bold and very successful experiments with soyfoods? (1) Cuba is the world's first country (outside of the traditional soy countries in East Asia) to fully grasp and realize the potential of soyfoods, and specifically dairylike soy products. Countries with high population densities in East Asia (such as China, Indonesia, and Japan) have known for centuries that it makes much more sense in terms of economics, land use, the environment, and good health to get protein directly from plants (specifically soybeans and cereal grains) than to feed those plants to animals and then eat the animals. Since the 1960s experts in the field of Third World development and food resources have stated repeatedly that soybeans are the protein source of the future. Not only are they the world's lowest cost source of high-quality protein, but they are now known to contain a host of beneficial phytochemicals, not found in any animal products, that appear to protect humans from cancer, heart disease, osteoporosis, and many of the unpleasant symptoms of menopause. Yet it took a major crisis to prompt Cuba to make the switch. (2) Cuba switched from dairy products to dairylike soy products largely for economic reasons and to make the country's food economy more efficient. The fact that Cuba has a centrally controlled economy probably facilitated the swift change. Yet with rapidly growing populations and declining incomes, many Third World countries may soon find it necessary or wise to follow Cuba's lead. Cuba has also become the world leader among Third World countries in sustainable, organic agriculture. Introducing a good food to a country under hardship conditions can pose a threat to that food's future. Will the people associate it so strongly with memories of the hard times that they want to get rid of it when good times arrive? (3) Cuba made the transition to dairylike soy products without constructing any new buildings, and with a relatively modest investment in locally designed, appropriate technology that actually revitalized flagging dairy processing plants. (4) By approaching the challenge with "beginner's mind" and plenty of creativity, Cuba was able to develop exciting new soy products especially suited to Cuban tastes

© Copyright Soyinfo Center 2021

and unknown in other countries. (5) Cuba's new soyfoods technology and processes offer the possibility of a new category of exports, which could earn badly-needed foreign exchange and, perhaps more important, offer new hope in the fight against malnutrition and hunger throughout the Third World.

Wm. Shurtleff was given (1) A list of soymilk plants (converted dairies) in Cuba, with the name and location of the plant, the capacity in liters per hour (mostly 2,000 or 4,000), the date each plant started making soymilk (from April 1994 to May 1995) and any observation (such as "Under construction").

(2) A graph of commercial production of soymilk (all kinds) from 1978 to 1985 in Japan, Thailand, Hong Kong, Korea, Taiwan, Malaysia and Singapore. Address: 1. Ing., Director; 2. Vicedirector. Both: Food Research Inst. (*Instituto de Investigaciones para la Industria Alimenticia*), Carretera Guatao Km 3½, La Lis 19200, Havana City, Cuba. Phone: 21-6986 or 21-6742.

1430. Zibart, Eve. 1996. The very fertile vegan field. *Washington Post.* Jan. 26. p. N24. Weekend section.
• ***Summary:*** The article begins: "It's not unusual anymore for non-vegetarians to eat at such green hot spots as the Health Zone, Food for Thought or Planet X (which is turning into the caterer-of-choice for veggie and vegan alternative rock types). Likewise, its easier and easier for vegetarians to find foods they like at new nutrition-conscious restaurants such as Felix, Greenwood, etc.–as well as at mainstream spots.

Today, more and more restaurants are offering vegan dishes, which contain no animal products whatsoever. A vegan diet precludes not only meat, poultry and seafood, but dairy products, eggs, butter, lard and other animal fats, cream sauces, cheese, etc. Yet that still leaves plenty of room for fine dining.

Most Asian cuisines (except Korean and Filipino) limit the use of dairy products and eggs. Malik, a downtown Thai restaurant, has a dozen vegetarian / vegan entrees, "including several featuring that heart-healthy favorite tofu" in various sauces such as red curry, black bean sauce, and peanut curry.

The Vegetable Garden in Rockville is the only wholly vegan Chinese restaurant in the area, although most Chinese eating places have a good variety of choices. The key words are "mock" and "Buddha." Mock chicken and mock pork are nicknames for tofu and other soy-based meat alternatives. The word "pork" sometimes refers to seasoned tempeh dishes. Since Buddhists are also vegans, correctly labeled "Buddhist delights" contain no animal products.

Most Japanese restaurants offer hot or cold tofu and "lightly salted soybean pods called edamame."

Ends with a directory of ten restaurants in the Washington, DC, area that offer a good selection of vegetarian or vegan dishes.

1431. Doidge, Brian. 1996. Canadian soybean export prospects for 1996. *Canadian Export Soybeans* (*OSGMB, Chatham, Ontario, Canada*) 9(1):3-4. Jan.
• ***Summary:*** "The recent formation of the Canadian Soybean Export Association (CSEA), serves to focus attention on this rapidly growing sector of the Canadian soybean industry." The 1994/95 crop set a new record with soybean exports of 524,254 tonnes (19.26 million bushels). Another strong year is projected for 1995/06.

Note: The CSEA is an association of major Canadian soybean exporters; the association does not itself export. One of its major objectives is to lobby the Canadian government for funding and promotional support.

Talk with Michael Loh of Canada. 1996. Jan. 24. Members of CSEA include W.G. Thompson, Maple Leaf Foods, Cargill, etc. Nutrisoya, Inc. will also be a member.

A half-page table (p. 3) shows Ontario soybean supply and demand for 4 years from 1992/93 to 1995/96. Under soybean supply, statistics show: Acres harvested, beginning stocks, production, imports, and total supply. Under soybean supply are: Crush, export, seed, other domestic use, and total use. Plus ending stocks and average price per bushel.

A full-page table (p. 4) lists Ontario soybean exports for 4 years from 1991/92 to 1994/95. Ontario's top four export customers in Asia in 1994/95 were: Japan (25,988 tonnes), Hong Kong (23,311), Singapore (22,502), and Malaysia (16,231). Others are Indonesia, North Korea, Philippines, and Taiwan. The top 4 customers in Western Europe in 1994/95 were: Netherlands 73,654 tonnes, Spain 61,134, France 51,119, Belgium 15,428. In Eastern Europe, Poland bough 10,000+ tonnes in 1993/94 and 1994/95 and Uzbekistan bought 7,117 tonnes in 1993/94. Total exports have grown steadily from 238,809 tonnes in 1991/92 to 495,772 tonnes in 1994/95. Address: Education and Business Manager, Ridgetown College of Agricultural Technology.

1432. Pulmuone U.S.A., Inc. 1996. [Pulmuone USA–Successful business: Putting tofu on the dinner table of Americans. Korean product–Bridge to a global market (Ad)]. *Korean Journal* (*Los Angeles*). Jan. p. 64.
• ***Summary:*** Photos show: (1) An executive sitting behind a desk. (2) A panoramic view of the inside of the Pulmuoune tofu factory in Los Angeles. Address: 4585 Firestone Blvd., Southgate, California 90280. Phone: 1-800-287-3838.

1433. Chung, Woo Kyung; Hwang, I.K. 1996. [Quality characteristics of vegetable soybeans at different harvesting time]. *Korean J. of Crop Science* 41(1):103-08. Feb. [10 ref. Kor; eng]
• ***Summary:*** "The 100-seed weight of vegetable soybean had a tendency to increase before 43 days after flowering, but decrease slightly after then. After 37 days after flowering, the sucrose content of Douya had a tendency to decline and in

© Copyright Soyinfo Center 2021

case of Shirofusa, total sugar content was sharply decreased at 40 days after flowering. The total vitamin C content of Douya and Shirofusa was dramatically increased at 37 days after flowering and then got the plateau, otherwise the total vitamin C content of Shirofumi and Hwaeomputkong was the highest level at 43 days after flowering." Address: 1. National Crop Experiment Station, RDA, Suwon.

1434. Green, Aliza 1996. Side show: when you dine Korean-style, side dishes make the meal. *Philadelphia Daily News* (*Pennsylvania*). March 6. p. 77, 80.
• ***Summary:*** "The Philadelphia area has the fifth-largest Korean community in the country [Los Angeles has the largest by far], between 50,000 and 60,000 people, concentrated in the Upper Darby and the Olney / Cheltenham area.

*Denjang* is a fermented soybean paste.

"The hot flavor is more than fire. It comes from a complex layered combination of ground red pepper, black pepper and the fermented red pepper sauce called *gochu jang."*

Page 80. After the recipe for "Korean Barbecued Beef (Bulgoki)" we read: "Eat the meat and onion rolled up in a lettuce leaf. If you like, top the meat with *gochu jang*, fermented red pepper sauce, sold at Korean groceries."

1435. *Korea Times* (*Los Angeles edition*). 1996. [Tofu recipe contest]. April 23. [Kor]
• ***Summary:*** A large photo shows a Korean women standing in front of a blackboard on which Korean characters are written.

1436. Chung, Woo Kyung; Kim, Yong Ho. 1996. Functional properties and composition of tofu flours. In: Alex Buchanan, ed. 1996. Proceedings of the Second International Soybean Processing and Utilization Conference: 8-13 January 1996, Bangkok, Thailand. Bangkok, Thailand: Printed by Funny Publishing Limited Partnership. Distributed by The Institute of Food Research and Product Development, Kasetsart University. xviii + 556 p. See p. 206-09. [9 ref]
• ***Summary:*** To make tofu flour, fresh tofu (coagulated with either calcium chloride or GDL) is soaked for 10 minutes, the dried at 60ºC in an oven dryer, then ground to pass through a 60-mesh screen. The product was then compared with soy protein isolate (SPI). "The calcium content and phytate content of tofu flours were higher than that of SPI. The solubility was maximum at 3% NaCl. The emulsifying activity of tofu flours was higher than that of SPI at 3% NaCl. The emulsion stability of tofu flours was higher than that of SPI. It will be possible to substitute high calcium tofu flour for SPI."

Tables: (1) Proximate analysis of flours: Soy flour, Ca-tofu flour, and GDL-tofu flour. (2) Emulsion stability of SPI, Ca-tofu flour, and GDL-tofu flour.

Figures: (1) Preparation of tofu flour (flow chart). (2) Solubility profiles of SPI, Ca-tofu flour, and GDL-tofu flour by Bluret method at various NaCl concentrations. (3) Turbidity of emulsion of SPI, Ca-tofu flour, and GDL-tofu flour at various NaCl concentrations.

Note: We are not told the comparative costs of making SPI and these two tofu flours. In what applications would tofu flour outperform SPI? Address: Soybean researchers, National Crop Experiment Station, RDA, Suwon, Rep. of Korea.

1437. Kim, Kil-Hwan; Kim, Don-Man. 1996. Improved soy food products through food science and nutrition application. In: Alex Buchanan, ed. 1996. Proceedings of the Second International Soybean Processing and Utilization Conference: 8-13 January 1996, Bangkok, Thailand. Bangkok, Thailand: Printed by Funny Publishing Limited Partnership. Distributed by The Institute of Food Research and Product Development, Kasetsart University. xviii + 556 p. See p. 300-08. [35 ref]
• ***Summary:*** Contents: Introduction. New approach to functionality of soybeans and their products: Nutrient contribution of soy food, soy fibre, soy protein, trypsin inhibitor, phytic acid, saponins and phytosterols, isoflavones. Improved processing technology for soy products: Off flavor of soybean protein foods, soy milk flavour (in fermented soyfoods, off-flavour is not a problem), gel hardness of soybean curd, soy sauce bioreactor, soy products by membrane technology. Address: Korea Food Research Inst., Baekhyun-dong, Bundang-gu, Songnam-si, Kyonggi-do, 463-420, Korea.

1438. Kim, Yong-Ho; Kim, Seok-Dong; Hong, Eun-Hi. 1996. 11S and 7S globulin fractions in soybean seed and its soycurd characteristics. In: Alex Buchanan, ed. 1996. Proceedings of the Second International Soybean Processing and Utilization Conference: 8-13 January 1996, Bangkok, Thailand. Bangkok, Thailand: Printed by Funny Publishing Limited Partnership. Distributed by The Institute of Food Research and Product Development, Kasetsart University. xviii + 556 p. See p. 210-13. [10 ref]
• ***Summary:*** "Soybean seed consists of two major storage proteins, the 7S and 11S globulins. For improving the quality of soybean seed protein, an increase of 11S/7S ratio would be a desirable objective because the 11S globulin contains more of the sulphur-containing amino acids than the 7S globulin. In this study, some soybean varieties were used to investigate the analyzing method for 7S and 11S globulins. 7S and 11S globulins could be fractionated by their different solubilities in tris buffers.

"Adjusting the pH and tris concentration were major factors affecting the precipitation of the two globulins. It was possible to screen the soybean genotypes having aberrant subunit compositions of the two globulins by a sodium

© Copyright Soyinfo Center 2021

dodecyl sulphate polyacrylamide gel electrophoresis (SDS-PAGE) in total soybean proteins. The ratio of 11S to 7S globulin ranged from 1.29 to 1.38. The soycurd from crude 11S was remarkably harder than that from crude 7S, and springiness and cohesiveness were slightly higher in soycurd having a high proportion of 11S. The proportion of protein components in soybean seed can be an important factor in the suitability for soycurd or other foods."

Note: "Tris" is an organic compound that forms a corrosive solution in water and is widely used as a buffer and emulsifying agent. Address: National Crops Exp. Station, RDA, Suwon, 441-100, Korea.

1439. Kwon, T.W.; Song, Y.S. 1996. The role of soybean in Oriental food systems. In: Alex Buchanan, ed. 1996. Proceedings of the Second International Soybean Processing and Utilization Conference: 8-13 January 1996, Bangkok, Thailand. Bangkok, Thailand: Printed by Funny Publishing Limited Partnership. Distributed by The Institute of Food Research and Product Development, Kasetsart University. xviii + 556 p. See p. 20-32. [19 ref]

• ***Summary:*** Contents: Introduction. Direct uses of soybeans. Nutritional significance of soybeans. Concluding remarks.

Page 22: "Most traditional soybean foods described so far are known to have originated in China, and then gradually have been introduced or have spread into other Asiatic countries. Of course, there are a few exceptions, such as soy sauce and Tempeh. As a matter of fact, ancient Chinese records indicate that soy sauce is not indigenous to China, but rather was introduced from Korea during the era of the Koguryo Dynasty (2nd century BCE to 668 CE). Another typical example is Tempeh, which was developed in Indonesia then introduced to neighbouring countries."

Tables: (1) Traditional nonfermented soybean food products: Fresh soybeans (*Put kong* in Korea; Edamame in Japan), toasted soy powder (*Kong ka ru* in Korea; Kinako in Japan), soy sprouts (*Kong na mool* in Korea; *Daizu no moyashi* in Japan), soymilk (*Kong kook, Doo yoo* in Korea; *Tonyu* in Japan), soymilk film (Yuba in Japan; Tou-fu-pi in Chinese), soy curd (*Doo bu* in Korea; *Tofu* in Japan).

(2) Traditional fermented soybean food products: Fermented whole soybeans (*Tempeh* in Indonesia and Malaya; Natto in Japan; Hamanatto in Japan) soy sauce (*Kang jang* in Korea; Shoyu in Japan), soy paste (*Ko chu jang* in Korea; *Miso* in Japan), fermented soy curd (Sufu in China), fermented soy pulp (Tempeh gembus [okara tempeh] in Indonesia; Oncom ampas tahu in Indonesia).

(3) Essential amino acid composition of rice and soybean and FAO/WHO reference pattern of amino acids (mg/gram of Nitrogen).

(4) Per capita daily soybean consumption for soyfood use in selected countries:

Taiwan 54.89 gm.
Korea 27.62 gm.
Japan 20.82 gm.
China 12.88 gm
Indonesia 11.51 gm.
Singapore 7.40 gm.
Malaysia 4.38 gm.
Thailand 1.64 gm.
Philippines 0.55 gm.

(5) Nitrogen balance data when feeding mixtures of beef protein and Supro isolated soy protein.

(6) Nutrient content of soyfoods (per 100 grams): Soybean, soy sauce, ko chu jang, soy paste. natto, chongkuk jang, tempeh, soy curd (tofu), soybean sprout.

(7) Major causes of mortality in selected countries (per 100,000 people). Countries: Korea, Japan, Singapore, America, Germany, Hungary. For the period 1991-1994 Cardiovascular disease is the leading cause of death in all of these countries, however the death rates are higher in Western countries.

(8) Animal and isolated soy protein foods used in study with hypercholesterolemic men in Canada.

(9) Isoflavone contents of soy varieties of Korean soybeans: The isoflavones are genistein, daidzein and daidzein+genistein. The highest is the Danyop variety with 2317 mg/kg. The lowest is the Hwaum variety with 458 mg/kg. Thus, there is a huge range of variation among soybean varieties.

(10) Breast-cancer and prostate-cancer mortality in soyfood-consuming countries compared to the United States, per 100,000 people (age adjusted).

Korea is 2.6 and 0.5
China is 4.7 and unknown.
Japan is 6.0 and 3.5
Hongkong is 8.4 and 2.9.
United States is 22.4 and 15.7.

Source: American Cancer Society (Atlanta, Georgia). 1992. "Cancer facts and figures."

Figures show: (1) The effect of dietary proteins on plasma cholesterol in rabbits. Source: Carroll et al. 1975. Plant proteins lower blood cholesterol.

(2) Cytotoxicity of genistein–it kills cancer cells. Address: 1. Director, Inst. of Food Sciences; 2. Associate Prof., Dep. of Food and Nutrition. Both: Inje Univ., South Korea.

1440. *Soyafoods* (*ASA, Europe*). 1996. New soya products at FiE '95. 7(1):6-7. Spring.

• ***Summary:*** "Every year the Food Ingredients Europe Exhibition seems to get bigger and bigger, with more exhibitors and more visitors." Last year's FiE, held 7-9 November 1995 in Frankfurt, Germany, was no exception, and many soy products–especially soy sauces and related seasonings–were on display.

Miwon Co. Ltd. (Seoul, Korea) has developed a range of ingredients under the brand name SoyaDeli. Products include

© Copyright Soyinfo Center 2021

FiberPro, PeptiPro, FlavorPlus, and FlavorBase.

Kikkoman Trading Europe GmbH (Heerdter Lohweg, Germany) introduced FVP Paste, made by enzymatic hydrolysis and concentrated in a vacuum.

Wan Ja Shan International (Middletown, New York) is one of the largest makers of naturally brewed soy sauce and Oriental sauces in the USA. Their products include soy sauce, preservative-free soy sauce, stir-fry sauce, hoisin sauce, teriyaki sauce, tamari soy sauce, dehydrated soy sauce, dehydrated teriyaki sauce, and clear soy sauce.

Ajinomoto Europe Sales GmbH (Hamburg, Germany) was selling San-J Tamari in both liquid and dried forms.

Nikken Foods (Tokyo, Japan) is a large maker of natural food flavors. Exported mainly in powdered form, these include a wide array of soy sauce, natural flavor enhancers, and other fermented products, including white miso powder and red miso powder.

Inproba BV (Baarn, Netherlands) offers a wide selection of about 160 Oriental products, both at retail and to the food industry. These include various soy sauces and other soy products, and they can also develop custom recipes for their customers.

Upcoming FiE exhibition and conferences: 1996 Nov. 12-14 at Paris, France; 1997 at London, UK; 1998 at Frankfurt, Germany.

1441. Hymowitz, Theodore. 1996. Evaluation of wild perennial *Glycine* species and crosses for resistance to *Phakopsora. National Soybean Research Laboratory, Publication* No. 1. p. 33-37. J.B. Sinclair and G.L. Hartman, eds. Proceedings of Soybean Rust Workshop, 9-11 Aug. 1995. (College of Agricultural, Consumer and Environmental Science, University of Illinois at Urbana-Champaign). [28 ref]

• ***Summary:*** "The genus *Glycine* Willd. is currently divided into two subgenera, *Glycine* and *Soja* (Moench) F.J. Herm. (Table 1). The subgenus *soja* includes the cultivated soybean, *G. max* (L. Merr.) and the wild soybean, *G. soja* Sieb. and Zucc. Both species are annual, diploid with 2n = 40, and hybridized readily. The soybean grows only under cultivation while *Glycine soja* grows wild in China, Japan, Korea, Taiwan, and Russia. *Glycine max* and *G. soja* form the primary gene pool for the cultivated soybean. Evidence from several sources, including morphology, cytogenetics, seed proteins, phytoalexins, restriction endonuclease fragment analysis of mitochondrial DNA, ribosomal RNA, and chloroplast DNA supports the hypothesis that *G. soja* is the wild ancestor of the soybean."

"In 1976 the subgenus *Glycine* contained six wild perennial species, that is, *Glycine canescens, G. clandestina, G. falcata, G. latrobeana, G. tabacina,* and *G. tomentella.* At present the subgenus consists of 16 wild perennial species (Table 1)." Address: Dep. of Crop Sciences, Univ. of Illinois at Urbana-Champaign, Urbana, Illinois.

1442. Kim, Wonkeuk; Choi, K.H.; Kim, Y.T.; Park, H.H.; Choi, J.Y.; Lee, Y.S.; Oh, H.I.; Kwon, I.B.; Lee, S.Y. 1996. Purification and characterization of a fibrinolytic enzyme produced from *Bacillus* sp. strain CK 11-4 screened from chungkook-jang. *Applied and Environmental Microbiology* 62(7):2482-88. July. [42 ref. Eng]

• ***Summary:*** The fibrinolytic enzyme (CK) was purified from supernatant of Bacillus sp. strain CK 11-4 culture broth and showed thermophilic, hydrophilic, and strong fibrinolytic activity. The optimum temperature and pH were 70 degrees C and 10.5, respectively.

The first 14 amino acids of the N-terminal sequence are identical to those of subtilisin Carlsberg and different from that of nattokinase, but CK showed a level of fibrinolytic activity that was about eight times higher than that of subtilisin Carlsberg. • ***Summary:*** "Conditions for making traditional Korean soy sauce and soy bean paste are the same until the end of the first fermentation..."

"We identified volatile components of traditional Korean soy sauce and soybean paste which had been manufactured with the same traditional Meju with a view to improving the quality of traditional Korean soy sauce and soybean paste. All of the volatile components were extracted by simultaneous steam distillation-extraction (SDE) apparatus." Address: Dep. of Applied Microbiology, Yeungnam Univ., Kyongsan 712-749, Korea.

1445. Pulmuone U.S.A. Inc. 1996. Pulmuone (Catalog). South Gate, California. 16 p. 28 cm.

• ***Summary:*** This is a very attractive, full-color catalog describing the company and its products. Contents: Cover (with a green photo of Korean countryside). Bring nature to your life: a message from Pulmuone. "Pulmuone begins with nature. We strive to bring nature to your door steps. Our job is a process to create a balance between nature

© Copyright Soyinfo Center 2021

and technology. The most advanced technology is applied in developing our products. Seek the balance. Taste our promise." Tofu: Good as meat without the fat (3 tofu products). Pasta from Asia? Instant noodle, fresh noodle, dried noodle. Authentic taste from home: Tea, soybean paste (6 types of Korean-style miso), oil and vinegar, organic beans and grains [brown rice, sweet brown rice, whole barley, pressed barley, soy bean, black [soy] bean, kidney bean], mineral water. Health food: What if you don't have time to eat the right food? Multi-complex health supplements, diet supplements, concentrated health supplements. Cosmetic: Isslin skin care program. About Pulmuone. Important dates in the history of Pulmuone: May 1981–Pulmuone Organic Foods founded (direct distribution of Organic farm products). Oct. 1982–Pulmuone Fermented Foods founded. April 1983–Pulmuone Fermented Foods opens production facility in Pochun (begins production of supplementary foods). May 1987–Pulmuone Kimchi Museum opens. May 1988–Pulmuone R&D Center opens. Jan. 1989–Pulmuone Scientific Committee founded, Dietary Life Research Center opens. Jan. 1990–Doan Soybean Past Plant opens. Jan. 1991–Pulmuone USA Inc. founded. June 1991–Doan Noodle Plant opens. Sept. 1992–Doan Supplementary Foods GMP Plant opens. Aug. 1993–Korean-Chinese joint venture, Ilsongjung Foods Ltd. founded. June 1995–Tofu Plant opens in U.S.A.

"Pulmuone was founded in 1981 with forty employees. It has grown to become a multi-national company of 2,000 employees with annual sales volume of $250 million.

"The secret to their success lies in their uncompromising commitment for better foods and better life.

"Pulmuone's 'Research and Development Center' opened in 1988 to continue the search for more advanced technology in ensuring the quality of food and life. Together with 'Pulmuone Science Committee' organized with the outstanding scholars in the field, our challenge to science and technology for the future will be succeeded."

Photos show: Sliced and packaged tofu (p. 4-5). Six varieties of Korean soybean paste (p. 9). The outside of Pulmuone's tofu plant at South Gate, California (p. 14). A tofu production line in the USA plant (p. 15).

Letter from John Sim, marketing director of Pulmuone. 1997. June 17. This brochure was printed in September 1996. Concerning the statement that Pulmuone uses only organic materials: "Pulmuone Tofu manufactured here in the U.S. is made from Vinton 81 soybeans from Minnesota. Products such as bean paste are manufactured in Korea using only certified organic soybeans." Address: 4585 Firestone Blvd., South Gate, California 90280. Phone: 213-564-3000.

1446. Gest, Emily. 1996. How to break up breakfast routine: start your day by exploring a tasty world of possibilities, from kimchee to crullers. *Daily News* (*New York, New York*). Nov. 6. p. 756.

• ***Summary:*** "Korean: The beauty of breakfast at Chung Ki Wa Restaurant is that it's served 24 hours a day. Favorite dishes among the regulars include... *doen jang jige*, bean paste casserole with bean curd, pork and onion ($7.95)." Address: New York Daily News.

1447. Goch, Georgia. 1996. Korea Garden's grilled fare and filling soups are a pleasure. *Daily Herald* (*The*) (*Chicago, Illinois*). Nov. 8. p. 78 (Section 6, p. 19).

• ***Summary:*** Bibimbop ($8.85) is a large bowl of mounded steamed rice topped with juicy beef Bulgogi, assorted vegetables and fried egg. This is served with spicy bean paste [*gochujang*] on the side for those wishing to add a little fire to their lives.

"A vegetarian miso and tofu soup, Doen-jang Jigae, is also available for $8.95."

"Aljigae ($10.95) is a hot and spicy fish, vegetable and tofu soup." Address: New York Daily News.

1448. *ASA Today* (*St. Louis, Missouri*). 1996. Soy ink gaining favor in Europe and Asia. 3(1):2. Oct/Nov.

• ***Summary:*** "Trenal, S.A., the pioneer of soybean oil printing inks in Belgium and Europe, recently announced a new investment in order to satisfy the increasing demands for soybean oil newsprint inks. A brand new building with three fully automatic production lines (for yellow, magenta and cyan) should be finished by the end of the year." Before the spring of 1997 the new facility, based on Trenal's own design and ingenuity, is expected to be producing ten tons of each color per day. This represents an annual use of approximately 3,500 tons of soybean oil.

In Korea, two of the three largest daily newspapers have begun using environmentally-friendly soy ink in their printing.

1449. Pulmuone U.S.A. Inc. 1996. Update on Pulmuone (Brochure). South Gate, California. 3 p. 28 cm.

• ***Summary:*** This 3-page black-and-white brochure was inserted into the color Pulmunoe catalog in June 1997. Contents: Background. Situation analysis. Pulmuone's future. Why Pulmuone tofu for the general market? Sales and trade promotions. Distribution. Media plan. "Background: The success of Pulmuone in Korea stems from the original philosophy of naturally produced foods with respects to mother nature. This corporate culture is prominent in its employees and product line. From delivery personnel to the board of directors, Pulmuone identity is imbedded in the corporate and personal lives of all employees.

"In 1991, Pulmuone's dedication expanded across the Atlantic Ocean to the United States. Pulmuone had a far reaching dream to provide Korean Americans with natural ethnic products they could not find in the U.S. Pulmuone bean paste [miso] and pepper paste were the first products to come into the U.S. and minerals and supplemental foods

© Copyright Soyinfo Center 2021

followed thereafter. Then in June of 1995, Pulmuone opened its first tofu plant in South Gate, California.

"Thus began the history of Pulmuone USA.

"Situation Analysis: Currently, Pulmuone USA holds 70% of Korean tofu market. A market held for over 3 decades by a single Japanese company in the U.S., Pulmuone boldly and aggressively captured the Korean American market within 14 months. Once Pulmuone tofu was introduced to the market, Korean Americans immediately recognized the superior quality of Pulmuone Tofu over other brands.

"Pulmuone has also enjoyed success in the Japanese American market within a short span of time. Pulmuone currently produces private label tofu for Marukai, which is a very popular wholesale type market amongst the Japanese Americans. In the past, they carried two of the most popular brands, Hinoichi and Aloha. However, within a 3 month period, Marukai brand tofu sold both brands by a ratio of 3 to 1.

"We have a state of the art facility with complete automation. Our current production rate is 20,000 pounds of tofu per day running at single shift.

"Pulmuone Tofu's obvious superior qualities are attributed to the following: 1. Use of highest quality pure Vinton 81 soybeans; Vinton 81 soybeans are 30% more expensive than regular soy beans. 2. Quick Chill System for optimum freshness and flavor. 3. Lower pasteurization temperature without compromising taste or shelf stability. 4. Complete Manufacturing Plant Sanitation System on a daily basis."

The company has scheduled advertisements in *Vegetarian Times, Los Angeles Times Magazine* (in Korean), and *Super Market Business* for late 1996 and early 1997.

Letter from John Sim, marketing director of Pulmuone. 1997. June 17. This insert was printed on 17 Nov. 1996. Address: 4585 Firestone Blvd., South Gate, California 90280. Phone: 213-564-3000.

1450. Vita Mix. 1996. Vita-Mix TNC and soy help lower your risk of breast cancer, heart disease, osteoporosis and menopause symptoms (Ad). *Vegetarian Times.* Nov. p. 101.
• ***Summary:*** This full-page color ad begins: "Americans have 8.6 times more breast cancer and 31 times more prostate cancer than Koreans. Koreans eat 19.9 grams of soy per day. Americans eat virtually none. (Cancer Facts & Figures).

"Soy contains phytochemicals called isoflavones which have been found to contain beneficial disease-prevention properties-that most Americans will never benefit from-until they eat significant amounts of soy on a regular basis."

The ad goes on to discuss: "Soy outsmarts cancer." "Soy normalizes breast cell growth." "Genistein starves cancer cells." "The fastest way to make soy delicious: Using our NEW Soy Recipe Book with the NEW Vita-Mix TNC [Total Nutrition Center] enables you to add the protective powers of soy to over 100 Vita-Mix recipes–including our delicious and nutritious desserts."

1451. Kluis, Alan. 1996. Global soybean demand continues to increase: A price rebound likely in 1997. *Soybean Digest.* Dec. p. 54.
• ***Summary:*** A table shows U.S. soybean exports to leading nations and regions from 1990/91 to 1995/96, with Northstar estimates for 1996/97. China began importing U.S. soybeans in 1995/96 with 12 million bushels, projected to rise to 26 million in 1996/97.

Europe is the largest market: European imports of U.S. soybeans rose from 212 million bu in 1990/91 to 339 million in 1995/96.

Japan is the 2nd largest market. Japan's imports of U.S. soybeans rose from 131 million bu in 1990/91 to 149 million in 1995/96.

Taiwan is the 3rd largest market. Taiwan's imports of U.S. soybeans rose from 69 million bu in 1990/91 to 96 million in 1995/96.

Mexico is the 4th largest market. Mexico's imports of U.S. soybeans rose from 59 million bu in 1990/91 to 95 million in 1995/96.

South Korea is the 5th largest market. South Korea's imports of U.S. soybeans rose from 32 million bu in 1990/91 to 51 million in 1995/96.

Indonesia's imports of U.S. soybeans rose from 3 million bu in 1990/91 to 25 million in 1995/96.

Israel's imports of U.S. soybeans rose from 15 million bu in 1990/91 to 16 million in 1995/96.

Total imports of U.S. soybeans rose from 557 million bu in 1990/91 to 845 million in 1995/96. Address: President, NorthStar Commodity Co.

1452. *Ontario Soybean Growers' Marketing Board Newsletter.* 1996. Canadian soybean exports and imports. Dec. p. 2.
• ***Summary:*** Gives comparative soybean statistics in metric tons (tonnes) for crop year 1994/95 and 1995/96.

Total soy [soybean] imports: Increased 12% from 62,539 to 69,900.

Exports to East Asia: Increased 11% from 110,251 to 122,176. The leading importers, in descending order of thousand tonnes imported in 1995/96, are: Japan (36.5), Hong Kong (31.2), Malaysia (21.3), Singapore (19.7), Indonesia (3.6), South Korea (2.5).

Exports to Europe: Increased 27% from 262,163 to 333,412. The leading importers, in descending order of thousand tonnes imported in 1995/96, are: Spain (100.7), Netherlands (88.2), Portugal (48.2), Belgium (44.0), Norway (28.3).

Exports to USA: Decreased 16% from 150,757 to

© Copyright Soyinfo Center 2021

136,903.

Total soybean exports: Increased 11% from 528,102 to 586,621 tonnes.

• ***Summary:*** The antimutagenic effect of doenjang on various carcinogens in *Salmonella typhimurium* strains TA98 and TA100 were studied. Address: Dep. of Food Science and Nutrition, Pusan National Univ., Pusan 609-735, Korea.

1458. Palmer, R.G.; Hymowitz, T.; Nelson, R.L. 1996. Germplasm diversity within soybean. In: D.P.S. Verma and R.C. Shoemaker, eds. 1996. Soybean: Genetics, Molecular Biology, and Biotechnology. Wallingford, England: CAB International (Commonwealth Agricultural Bureaux). x + 270 p. See p. 1-36. Chap. 1. [234 ref]
• ***Summary:*** Contents: Introduction. Germplasm–Subgenus *Soja.* Germplasm–Subgenus *Glycine.* Germplasm–Characterization of diversity: Soybean breeding and loss of diversity, diversity for 'yield' traits within *G. max*, diversity for value-added traits within *G. max*, diversity for pest resistance/tolerance within *G. max*, diversity for physiological traits within *G. max*, soybean breeding and use of *G. soya*, diversity for cytogenetic and molecular traits within *G. max* and *G. soja.* Conclusions.

The introduction states: "There are more than 100,000 *Glycine max* accessions, probably less than 100,000 *Glycine soja* accessions, and approximately 3,500 accessions of perennial *Glycine* species in germplasm collections throughout the world. Inasmuch as the only worldwide survey of soybean collections is a decade old (Juvik et al., 1985), the exact numbers are unknown. Major *Glycine* collections exist in Australia, Brazil, China, Germany, India, Indonesia, Japan, Russia, South Korea, and the United States. Many other smaller but important collections exist throughout Asia and Europe."

Tables show: (1.1) List of species in the genus *Glycine* Willd., three-letter code, 2n, standard (PI), genome symbols and distribution. (1.2) Origin and number of accessions of *Glycine soja* in the USDA Soybean Germplasm Collection from China. (1.3) Origin and number of accessions of *Glycine soja* in the USDA Soybean Germplasm Collection from Japan. (1.4) Origin and number of accessions of *Glycine soja* in the USDA Soybean Germplasm Collection from South Korea. (1.5) Origin and number of accessions of *Glycine soja* in the USDA Soybean Germplasm Collection by country and maturity group. (1.6) Origin and number of accessions of *Glycine max* in the USDA Soybean Germplasm Collection. (1.7) Number of accessions of *Glycine max* in the USDA Soybean Germplasm Collection by maturity group. (1.8) Representative examples of plant introductions and their descendants used in pest reaction studies in soybean (19 references from 1951-1992). (1.9) Representative examples of plant introductions and their descendants used in qualitative genetic studies in soybean (34 references from 1918-1992). (1.10) Representative examples of plant introductions and their descendants used in protein and isozyme studies in soybean (13 references from 1977-1992).

Figures show: (1.1) Summary of genomic relationships based on cytogenetics and seed protein profiles among 11 of the 16 wild perennial species of the subgenus *Glycine.* Address: 1. United States Dep. of Agriculture, Agricultural Research Service, FCR and Dep. of Agronomy and Zoology/Genetics, Iowa State Univ., Ames, IA 50011; 2. Dep. of Agronomy, Univ. of Illinois, Urbana, IL 61801; 3. USDA-ARS and Dep. of Agronomy, Univ. of Illinois, Urbana, IL 61801.

• ***Summary:*** This 2nd edition is about 108 pages longer

© Copyright Soyinfo Center 2021

than the original 1983 edition. Contents: Introduction to indigenous fermented foods. (1) Indonesian tempe and related fermentations: Protein-rich vegetarian meat substitutes. (2) Indigenous fermented foods involving an acid fermentation: Preserving and enhancing organoleptic and nutritional qualities of fresh foods. (3) Indigenous fermented foods involving an alkaline fermentation (p. 349-62). (4) Indigenous fermented foods in which ethanol is a major product: Type and nutritional significance of primitive wines and beers and related alcoholic foods (incl. Chinese koji (big *qu* {bricklike in shape and made from barley or wheat and soybeans, inoculated with *Aspergillus*} molds), and small *qu* ({spherical, plate-circular or rectangular in shape and made from rice or rice bran with various herbs, inoculated with *Mucor* and/or *Rhizopus* molds}, p. 449), Japanese amazake (p. 480-81).

(5) Indigenous amino acid / peptide sauces and pastes with meatlike flavors (p. 509-654): Introduction.

(A) Soy sauces: Japanese shoyu: Koikuchi, usukuchi, and tamari; Chinese chiang-yu, by Tamotsu Yokotsuka (p. 511-17). Biochemistry of *Saccharomyces* (*Zygosaccharomyces*) *rouxii*, by Steinkraus, Franta, and Ayres (p. 517-24). Umami flavor, by Kawamura and Kare (p. 524-28). Chinese fermented products related to soy sauce (big *qu*, small *qu*, and jiang, by Chen & Ho, p. 528). Taiwanese soy sauce, by Liu (p. 528-33). Malaysian soy sauce: Kicap, by Ong, Mercian, Poesponegoro and Tanuwidja (p. 531-39). Indonesian soy sauce: Kecap, by Saono, Poesponegoro and Tanuwidja (p. 539-43). Korean soy sauce, by Chang (incl. homemade kanjang and meju, p. 543-44). Taiwanese black bean sauce: Inyu, by Jan et al. (p. 544). Philippine taosi, by Steinkraus (p. 544-45).

(B) Fermented soybean pastes: Japanese miso, by Ebine, Shurtleff and Aoyagi (p. 545-56). Indonesian tauco, by Saono et al. and Winarno (p. 556-59). Korean Doenjang and kochujang, by Chang, Shurtleff and Aoyagi (p. 559-64).

(C) Fermented fish-shrimp sauces and pastes (p. 565-606).

(D) Fish-soy sauce and fish-soy paste, by Ismail, p. 607-11).

(E) Miscellaneous Oriental fermentations. Japanese natto (itohiki natto), by Hayashi and Ota (p. 611-24). Japanese Hama-natto (hamanatto) and related products (incl. yukiwari natto, p. 624-26). Chinese red rice: Anka (Ang-kah), by Lin, Su and Wang, Sooksan and Gongsakdi, and Pichyangkura (p. 626-33). Chinese sufu, by Su and L.-P. Lin (p. 633-41). Preserved duck eggs / Century eggs, Chinese pidan (p. 641-42). Pidan are made by a chemical process, not by fermentation. Note: Chapter 5 contains about 240 references. Much of the text in this chapter is similar to that in the original 1983 edition, although this chapter is 7 pages longer and contains 3-4 new sections.

(6) Mushrooms: Producing single-cell (microbial) protein on lignocellulosic or other food and agricultural wastes.

(7) General papers related to indigenous fermented foods. Address: Inst. of Food Science, Cornell Univ., Geneva, New York.

1460. Na, Shin; Breen, Michael; Gustavson, John. 1997. Korea: Insight guides. 6th ed., updated. Singapore: Apa Publications. Houghton Mifflin. 297 p. Illust. (some color). 23 cm.

• ***Summary:*** The section on "Food and drink" (p. 98-99) states: "More common table vegetables–such as mung and soy beans, spinach, lettuce, and black sesame leaves–as typically grown in the backyard,... Especially popular is *twoengjang-guk*, fermented soybean paste soup... A spicy hot seafood soup, called *mae-un-t'ang* "usually includes a good portion of firm, white fish, vegetables, soybean curd (*tubu*), red pepper powder, and an optional poached egg."

The working man's brew (p. 102): The Korean counterpart of Japanese *doburoku* is *makkolli*, "a milky liquor that most households ferment at home from rice." Side dishes (*anju*) served with this mildly alcoholic beverage include soybean curd (tofu).

The city of Chonju (p. 207-08) is famous for *Pi pim pap* made of boiled rice mixed with soy sprouts and topped with many delicacies.

The "Yellow pages" at the back, titled "Travel tips," includes a section on "Eating out" (p. 278-79) that lists seven types of restaurants. Foods they serve include soy sauce (*kan-jang*), soybean curd, fried soybean curd, and soybean paste.

1461. Brown, Lester R.; Flavin, C.; French, H.; et al. 1997. State of the world 1997: A Worldwatch Institute report on progress toward a sustainable society. New York, NY: W.W. Norton & Co. xiii + 229 p. Index. 24 cm. [300* ref]

• ***Summary:*** This 14th edition takes a realistic look at our progress toward sustainable development since the 1992 Rio Earth Summit. It shows how pervasive resource loss is at the root of the "new world disorder" and argues that if unsustainable trends continue, "the pressure on the earth's natural limits will undermine food security–now already evident in the decline of marine fisheries and the shrinking grain harvest per person. Indeed, food scarcity may be the first major manifestation of our environmentally unsustainable global economy.

"To reverse this situation, *State of the World 1997* calls for us to take urgent measures to build an environmentally sustainable economy, slow population growth, value the nonmonetary services nature provides, adopt the best of simpler and less consumptive lifestyles, and abandon tax-payer subsidies that encourage the consumption of natural resources such as water and fossil fuels."

Contents: A special tribute. Acknowledgments. List of tables and figures. Foreword. 1. The legacy of Rio, by Christopher Flavin: The road from Rio, eight environmental heavyweights, stabilizing the climate, conserving biological wealth, limiting human numbers and consumption, Rio plus five... and counting. 2. Facing the prospect of food scarcity, by Lester Brown: Food security trends, land and water scarcity, the fertilizer factor, the carrying capacity question, food security–the next generation, responding to the challenge. Graphs show: World grain production, 1950-96. World grain production per person, 1950-96 (it peaked in 1984 at 346 kg). World grain carryover stocks as days of consumption, 1961-96 (they have fallen from a peak of about 100 days in the mid-1980s to about 50 days consumption). World irrigated area, 1950-93. World fertilizer use, 1950-95 (after 1989 it began to decline). World grain harvested area and fertilizer use per person, 1950-95. World grain yield per hectare (it has grown steadily at about 2.3% a year, from 1.06 tons in 1950 to 2.54 tons in 1990).

3. Preserving global cropland, by Gary Gardner: Trends–from surplus to scarcity, expanding cities, degrading our future, import dependence–the case of Asia, a land-scarce world, land for the next generation. A graph shows: Grain harvested area per person and imports as a share of consumption in Japan, South Korea, and Taiwan, 1960-95. Imports now account for about 75% of consumption in these 3 countries! 4. Preventing chronic disease in developing countries. A graph shows Total dietary oils per capita in selected regions, 1965-95. North America is the highest, rising from 11 to 28. South Asia is the lowest, rising from 3 to 8. 5. Tracking the ecology of climate change. 6. Valuing nature's services. 7. Transforming security. 8. 1464. House Foods America Corporation. 1997. House Foods America Corporation. Garden Grove, California. 12 p. 28 cm.
• ***Summary:*** This color booklet is written in 4 languages: English, Japanese, Korean, and Chinese. Thus four blocks of text, each with the same message, appear on each 2-page spread. Contents: Introduction. House Foods products. Tofu & tofu products. Restaurant–Curry House. Factory.

"House Foods Corporation is the biggest spice manufacturer in Japan, selling processed foodstuffs such as curry mix and stew mix products. In 1981, we established the Los Angeles office to introduce Japanese style curry... In 1983 we opened a curry restaurant in Little Tokyo, where our customers enjoy cuisine created with a Japanese sensibility. We also [in 1983] started manufacturing tofu, the healthy food low in fat and high in protein. Tofu has become increasingly popular in the United States and most grocery stores carry it. In 1997, we established House Foods America Corporation by merging the three enterprises: House Foods Los Angeles Office, which is in charge of the sales of House Foods' products from Japan, Curry House Restaurant, and Hinoichi Tofu manufacturing. The new entity allows us to provide better quality products to our customers. House Foods America Corporation aims to bring the rich Japanese food culture to the United States by providing high quality food products to American customers."

The new factory in Garden Grove makes 3 types of tofu, natto, fried bean curd, and konnyaku. "This factory features state-of-the-art equipment which can produce 150,000 packages of tofu per day." As of March 1997 there are five Curry House restaurants in the Los Angeles area.

Contains many color photos including: Two views of the outside of the new tofu factory in Garden Grove, California. Curry and Chinese Mabo Tofu Sauce packages. Packages of 3 types of Hinoichi Tofu (regular, firm, and soft kinugoshi)

plus natto. The inside of a Curry House restaurant. Five views of the equipment in the new tofu factory, including an overview of the production area. Address: 7351 Orangewood Ave., Garden Grove, California 92841. Phone: (714) 901-4350.

1465. Sim, John. 1997. Tofu production statistics and philosophy at Pulmuone (Interview). *SoyaScan Notes.* May 23. Conducted by William Shurtleff of Soyfoods Center. Followed by a letter dated 14 July 1997.

• ***Summary:*** John Sim (brother of Jeannie Sim) is marketing director at Pulmuone (pronounced PUL-mu-wun) USA Inc. in southern California. This company is owned by a larger Korean company of the same name. John volunteered the following statistics: Pulmuone soaks 3,000 kg (6,613 lb) of soybeans a day. From these soybeans they make only tofu (no soymilk). This tofu is of four types: Soft, firm, silken, and "extra soft." The "extra soft" is actually unpressed soymilk curds, called *sun tubu* in Korean, and sold by Pulmuone in America as "Spiced Tofu Casserole."

Pulmuone sells all of its tofu water-packed. They think this is the packaging of the future, because water-packed tofu tastes best.

In response to some follow-up questions in a fax (dated 24 June 1997) from William Shurtleff, John replied (July 14): "1. The average retail price of firm, soft, and silken is $0.99 and two or three times a year the markets retail sale price is at 2 for $0.99. Extra soft (*sun tubu*) tofu sells at retail for $0.69.

"2. From one pound of soybean, we get three pounds of tofu (average). It is difficult to get a specific for each of the tofu. You can assume that firm requires more soymilk than soft and so forth.

3. Pulmuone's tofu is color coded: "Pink is for firm, blue is for soft, green is for silken. This seems to make things easier for our warehouse and markets for stocking purposes where the carton boxes indicate the appropriate colors as well.

4. Competitors for Korean-speaking consumers: "There are two other brands or competitors in the Korean markets. Hinoichi and Obok Foods. Hinoichi uses their own English version label and Obok uses their single, Korean label.

"5. Yes we are making *sun tubu* and currently distributing to Beverly sun tubu in Korea town. They are the second largest in Korea town next to So Kong Dong sun tubu. We are currently supplying them 100–5 gallon buckets of sun tubu per week. So you can imagine how much So Kong Dong uses." Address: Marketing Director, Pulmuone, 4585 Firestone Blvd., Southgate, California 90280. Phone: 213-564-2000.

1466. Sim, John. 1997. Re: Pulmuone brochure and tofu production statistics. Letters to William Shurtleff at Soyfoods Center, June 12 and June 17. 1 p. each. Typed, with signature.

• ***Summary:*** John encloses a handsome brochure on Pulmuone. "I hope you can utilize the information and include it in your database.

"You will be quite surprised at our current production rate." Pulmuone is currently making 20,000 pounds/day of tofu, and operating at only half of its tofu production capacity (one shift, 5 days a week); full capacity is 40,000 pounds of tofu per day (two shifts, five days a week).

Pulmuone began distribution to all 262 Ralphs Supermarkets in March of this year, and the company expects to have distribution to Vons by early August this year.

Update: June 17. Pulmuone makes 100,000 lb of tofu per week and 435,000 lb of tofu per month at its factory in Southern California.

Update: June 30. Talk with John Sim. About 80% of Pulmuone's tofu is sold the Korean-American market. The handsome labels are designed by the company's art department, which has won numerous awards, in Korea. Three companies now sell tofu in Korean-American food retail stores in Southern California; Pulmuone, House Foods, and Obok; only Pulmuone and Obok use Korean characters on the labels. Pulmuone's ads in the *Los Angeles Times* have been entirely in Korean.

Update: 1997. Dec. 29. John says that Pulmuone's main office is in the process of setting up a tofu factory in mainland China; it is expected to open in about December 1998. Address: Marketing Director, Pulmuone, 4585 Firestone Blvd., Southgate, California 90280. Phone: 213-564-3000.

1467. Nordquist, Ted. 1997. Re: Founding and early history of Aros Sojaproduktor KB in Örsundsbro, Sweden. Letter to William Shurtleff at Soyfoods Center, Aug. 4. 3 p. Typed, with signature on letterhead. Preceded by an interview on July 14.

• ***Summary:*** Ted Nordquist and William Shurtleff have been friends since Oct. 1975. In looking at the early history of Aros Sojaprodukter (1980-1992, Sweden's earliest known tofu manufacturer), Shurtleff was struck by the fact that three nice articles had been published about the company in Swedish during 1980, yet (according to a 1984 letter from Nordquist, its founder) the company had not started making tofu commercially until Feb. 1981. Shurtleff talked with Nordquist about this, then sent Nordquist a photocopy of all documents (16, in chronological order) in the Soyfoods Center library that were published (or written) before Jan. 1982 and asked Ted if he would please check that Feb. 1981 date. Ted did so, carefully and with interest, then wrote the following:

"Re: Aros Sojaprodukter KB. Dear Bill: Thank you for the call and the materials. Wow, how to bring back memories... and good ones to boot!

© Copyright Soyinfo Center 2021

"I was right the first time [about Feb. 1981 being the date the company started making tofu commercially]. You can't trust married men over 50 with instant truth about their pasts. Time is condensed into the Good Times, and the hard work is quickly forgotten. Your documentation pays off handsomely revealing that.

"1. We located the building in Örsundsbro in the fall of 1979, as revealed in Tim Öhlund's letter of November 26, 1979. We planned and talked money, floor plans, permits and whatnot.

"2. We formed the *kommanditbolag*, limited partnership, and raised $20,000." Prof. Ki Yong Kim and Ted each contributed $10,000, and 5% of the company shares were distributed to Tim Öhlund, Göran Sollenberg, Gunnar Karlsson [no relation to Ted's wife], and Lars-Oluv Kulin in return for time spent working on establishing the company. "I do not remember the exact date we received the papers and became official, but it was in 1979.

"3. We applied for loans from several banks during the beginning of 1980. We rented the locality in Örsundsbro from January 1980. The rent was 1,000 SEK per month, about $200/month.

"4. We did not get the money we asked for, about 800,000 SEK or about $160,000. By this time, we were famous! The local newspaper journalist, Göran Palm, interviewed us several times, and the Health Food Store in Uppsala owned by Birgitta Akerheden was used for Soy Product Presentations. So by the Spring of 1980, we still had a building, lots of enthusiasm, media coverage, but no money.

"In May (I think) of 1980, Gunnar Eriksson, the local bank manager of Nordbanken in Örsundsbro called me in to tell me that even his bank, Nordbanken, was not prepared to lend us the 800,000 SEK. Then he asked me how much money I could raise. I told him the $20,000 (100,000 SEK) was all that I could raise. He asked me if I could start the factory with a total of 200,000 SEK. I told him I would get back to him the next day with an answer.

"6. So we started on a shoe string. I called Anne-Marie's father, Gösta Karlson, and told him that if he would live with us during the summer of 1980, help me renovate the factory, and build the plant primarily with material from the stainless steel scrap-yard, then I would go for it. He accepted.

"I ordered the machinery through Birgitta Akerheden simply because I had no credit. I ordered a Takai grinder, hydraulic press, coagulation barrels, stainless steel pressing boxes, presses and two stainless rinsing tanks. The steam cooking process, pressing tables, etc., we built ourselves. I paid Takai about 46,000 SEK for this equipment.

"7. So Gösta and I built Aros Sojaprodukter KB and we completed the job by the end of 1980 (The article #3540 by Göran Palm dated 23 September 1980 shows me in the office using our tool chest as a coffee table). Tim, the other partners and I had an open house by the end of the year, beginning production in February of 1981. During the year of 1980, we were making tofu at home and presenting tofu dishes to people in Uppsala and Stockholm. We were basically doing what we could to build up an interest for the opening of our factory.

"8. By the summer of 1981, the lady living above the factory died, and the owners asked me if I wanted to buy the building. Again, Gösta helped me renovate the living quarters and we moved into the building from Uppsala in time for school, August of 1981. Again, Gunnar Eriksson of Nordbanken in Örsundsbro just granted me the loan to buy the building. He helped me throughout our development and also took up to 18% interest in our loans!

"10. I worked at Uppsala University at the History of Religion Institute until the summer of 1984. But my 18-hour days were catching up to me and I quit the academic life to work and pay back loans full time. Actually, I was not able to pay back my loans until after I founded Aros Sojaprodukter AB with a new partner named Erik Kennhed (in 1990), finished building the TAN Soy Base plant in Tinnsryd, made Tofuline glass [Tofu Line soy ice cream] a success in Sweden and Finland and then sold everything to Blekinge Invest in 1992. I started that project with Marc Ljungström, Trensums Musteri AB, in Tingsryd in 1982. We started making TAN Soy Base in 1987 but it was not until 1990 that the Tofuline glass started rolling off the production line.

"11. I agreed not to compete with Blekinge Invest for three years (in return for a percentage of Tofuline sales over three years)." Address: TAN Industries, Inc., 351 California St., Suite 1330, San Francisco, California 94104. Phone: 415-398-8007.

1468. Tobar, Hector. 1997. A world of surprises at Tofu Festival: Little Tokyo event includes twists on dishes from burgers to chocolate mousse that belie the food's bland image. *Los Angeles Times.* Aug. 10. p. B3, B7. Metro News section.

• ***Summary:*** The article begins: "To the uninitiated, tofu is synonymous with bland. It comes in funny white blocks that float in water. All by itself, it doesn't taste like much. But the people attending the Tofu Festival in Little Tokyo this weekend know better. They'll tell you what with some imagination and expertise–and a lot of spices–tofu is a culinary delight." More than 20,000 people were expected at the event, on Saturday and Sunday. Twenty-six restaurants served up a variety of tofu dishes. One favorite dish was the tofu cheesecake offered by Ryo Sato, the chef *de cuisine* and owner of Chez Sateau restaurant in Arcadia. The exact recipe is secret but the ingredients include tofu (50% of total), cream cheese, sour cream, egg, and lemon juice.

Talk with Margaret Endo of Little Tokyo Service Center. 1997. Sept. 10. This year's Tofu Festival was much bigger and better than the first one last year. Close to 20,000 people attended; roughly 70% of these were Asian Americans

© Copyright Soyinfo Center 2021

(with the majority of those being Japanese-Americans, but with also many Chinese- and Korean-Americans), and the remaining 30% were Caucasian-Americans. Pat Greenberg was very involved. A new edition of *The Four Seasons of Tofu* cookbook was prepared for the festival, and about 1,000 copies were sold. Address: Times Staff Writer.

1469. Myong, Jung. 1997. A Korean food manufacturing company named "Zion" plans to start making soy sauce, tofu, and soy sprouts in America (Interview). *SoyaScan Notes*. Aug. 21. Conducted by William Shurtleff of Soyfoods Center.

1471. Goloenko, Denis V. 1997. Re: Documenting the early history of soybean cultivation in Belarus. Letter (fax) to William Shurtleff at Soyfoods Center, Oct. 30. 2 p. Typed, with signature on letterhead. [4 ref. Eng]
• ***Summary:*** The article by Strazh and Myatel'ski (1930) did not state that soybean cultivation in Belarus began in the year 1880; rather, they said it began during the decade of the 1880s.

The earliest document we have seen that describes soybean cultivation in what is now Belarus was an article published in 1886, and titled "The experience of soybean cultivation," by G. Tupikova and V. Hodasevich. This article is cited by Strazh and Myatel'ski (1930, p. 68, footnote No. 3). According to this article, the soybean was first introduced to Belarus in 1885 and first cultivated that year in the Gorky Botanical Garden (Mogilev region) by Mr. V. Hodasevich. Unfortunately the author doesn't mention the source of these soybeans–but they may have been obtained from an agricultural exhibition held in 1884 in Odessa (which is now located in southern Ukraine). This supposition is based on a statement in "Soybeans and raw materials of the world industry" by Victor Popov (1927) in which he says that various soybean plants, seeds, and soyfoods were presented at this 1884 agricultural exhibition.

In 1885 Hodasevich planted a small plot of early yellow-seeded soybeans in the field and a similar plot in a green house. The soybean plants in the field did not mature. Thus, the first soybean trials in Belarus were not successful.

The second earliest attempt to cultivate soybeans in Belarus, as far as we can find, was in 1893. An article titled "The early soybean of Ovsinsky," published in 1899, states that in 1893 Mr. I.E. Ovsinsky brought some early soybean varieties from Asia; they were successfully tested in the Grodno and Mogilev regions. One of these varieties had a vegetation period of 118 days. Unfortunately no information was given about the areas planted or yields of these trials.

From the article "The early soybean," by Mr. L'ucian Yurkevich (1999) we found out that in 1894 the author brought some soybean seeds from North Korea; these also were tested in the Grodno and Mogilev regions, where they matured. There is no additional information about the areas planted or yields. Despite the test results, there was no real interest in soybeans in Belarus until 1930, when Strazh and Myatel'ski tested 17 soybean varieties at the Belarussian State Academy of Agriculture in Gorky (Mogilev region). In general, they were interested in cultivating soybeans for green fodder. They investigated the possibility of soybean cultivation in Belarus, optimum planting period, plant density, and influence of mineral fertilizers and chalk. The area of the trials was not more than 100 square meters. The majority of varieties matured. The average productivity was 60 seeds per plant. Address: Soya-North Co. Ltd., 220067, Belarus, Minsk, Zhodinskaya str. 14. Phone: (017) 263 58 27.

1472. Olson, Joan. 1997. Soy ink makes Asian news. *Ag Innovation News* (*AURI–Agricultural Utilization Research Inst., Waseca, Minnesota*) 6(4):14. Oct.
• ***Summary:*** "Leading printers and newspapers are switching to soy ink. Korea's two largest daily newspapers have made the switch; their combined readership is 4.7 million. Japan and Taiwan are also beginning to switch to soy ink. 'There is a tremendous opportunity for market growth,' says Jo Patterson, coordinator of the National Soy Ink Information Center, Des Moines, Iowa. American Soybean Association seminars in Asia have sparked overseas use of soy ink."

Source: Illinois Soybean Checkoff Board, Claudine Wargel, (309) 663-7692.

1473. Sonka, Steven. 1997. From the director's desk. *National Soybean Research Laboratory Bulletin* (*NSRL, Urbana, Illinois*) 4(3):5. Oct.
• ***Summary:*** Recently I participated in a meeting where the major topic was the growing world population and the future need for food. Considerable attention was devoted to various projections indicating that the world's population is poised to increase dramatically. The most conservative estimates indicated an increase of 2 to 3 billion people in the world population over the next 30 years.

"During the meeting, one person made a startling

© Copyright Soyinfo Center 2021

comment. In effect, he said, "... that we've been hearing about hungry people, growing populations, and world food needs for years. Yet the average soybean producer really isn't any better off because of these factors."

"This statement surprised me and I promised myself that I'd check into the data to see if we can get a better handle on what the growth of world food needs means to the soybean producer. I thought it might be interesting to identify some of the countries that currently lead in soybean consumption and compare their current import levels with those of 30 years ago.

"Soybean imports to Japan are an astonishing story. Already one of the major soybean importing nations in 1962, Japan's soybean imports have increased more than four-fold over the three decades since then. By 1993, those imports exceeded 184 million bushels. Of course, much of those imports come from the United States.

"But Japan is only part of the story. Other countries, such as Columbia, Costa Rica, Indonesia, Korea, Malaysia, Mexico, and Spain, also have dramatically increased soybean imports. Each of these seven countries is now in the top group of soybean importing nations. Their 1993 imports range from the level of about 5 million bushels for Costa Rica and Columbia to more than 75 million bushels for Spain and Mexico.

"These countries, however, are not, necessarily the largest importers even after Japan. Instead, what is particularly interesting is that 30 years ago, soybean imports into these nations were insignificant. Their total imports in 1962 were only slightly more than one million bushels, a pittance compared to their 1993 imports exceeding 250 million bushels. But do any of these numbers really matter to the average soybean producer? Just the increase in soybean imports by Japan and those other seven countries exceeds 388 million bushels. Using 1996 average yields in the U.S. at 37.6 bushels per acre, this increased level of imports alone equals the production from more than 10 million acres of U.S. cropland.

"Interestingly, soybean acreage in Illinois in 1996 was 9.9 million acres. So, without the increase in soybean imports of just these eight countries, we would need to find a new home for U.S. soybean production equal to that from the entire State of Illinois.

"Maybe hungry people, growing populations, and world food needs have indeed mattered to the average soybean producer over the last 30 years. And, if we are to maintain and increase the profitability of soybean production, it's likely that these global variables will be just as important over the next 30 years.

"Research efforts and discoveries, such as described in this and prior issues of the NSRL Bulletin, will be essential to maintain a competitive and dynamic soybean sector that can respond to the future challenges of a global economy. It is critical, however, that we understand the need to continually inform and educate decision makers throughout the soybean industry of the need for global perspectives that match the reach of that industry." Address: NSRL Director and Soybean Industry Chair for Agricultural Strategy.

• ***Summary:*** "Antioxidative characteristics of doenjang (fermented soybean paste) phenolics on the lipid oxidation systems were studied by the determination of the oxidative related activity including lipoxygenase (LOX) inhibition, metal chelating and free radical scavenging of doenjang phenolics. Manlikong variety containing the highest amounts

© Copyright Soyinfo Center 2021

of phenolic compounds among the soybean variety, was used for doenjang processing. Doenjang was prepared by the series of processes including soaking for overnight, cooking for 1 hr at 12 lb, first fermentation (3 days at 30±2ºC) for the preparation of meju (soybean koji) after inoculation of *Aspergillus oryzae*, and further fermentation (60 days at 30±2ºC) for the ripening after addition of salt 13% to meju. In order to investigate the antioxidative activity of phenolics in doenjang, the doenjang phenolics was extracted with methanol from freeze dried defatted doenjang. Antioxidative effects of methanol extract on linoleic acid oxidation systems were observed by the significantly decreased levels of peroxide and conjugated diene formation. In addition, methanol extract resulted in the inhibition of LOX activity. And also, metal (FeCl3) chelation and free radical scavenging activities were increased with increasing concentration of methanol extract." • ***Summary:*** RAPA stands for "Regional Office for Asia and the Pacific."

Table 2 (p. 438) shows the area of soybeans harvested (in 1,000 ha) in 27 developing and 3 developed Asian countries, in the following years: 1982, 1989, 1990, 1991, and 1991. The last columns shows the average annual growth rate in soybean area from 1982 to 1992. The countries, their 1992 area, and their growth rates are (NL = no values listed; F = FAO estimate):

Developing countries (Bangladesh NL. Bhutan 2.0F, -5.4%. Cambodia, 8.8, 20.1%. China 7,203.5, -0.8%. Cook Islands NL. North Korea 310.07, 0.5%. Fiji NL. India 2,500.0, 12.8%. Indonesia 1,667.0, 9.4%. Iran 60.0F, 1.5%. Laos 6.1, 1.5%. Malaysia NL. Maldives NL. Mongolia NL. Myanmar 34.8, 2.7%. Nepal 22.0F, 9.4%. Pakistan 1.4F, -11.4%. Papua New Guinea NL. Philippines 10.0F, -1.7%. Rep. of Korea 120.0, 3.9%. Samoa, Western NL. Solomon Islands NL. Sri Lanka 1.4, -20.8%. Thailand 380.0, 14.4%. Tonga NL. Vanuatu NL. Vietnam 113.0F, 1.5%. Sub-total 12,440.0, 2.2%).

Developed countries (Australia 30.0, -2.2%. Japan 141.0, 0.3%. New Zealand NL. Sub-total 171.0, -0.2%).

Asia-Pacific Total 12,611.0, 2.2%.

Rest of world 41,979.7, 0.6%.

World 54590.7, 0.9%. Address: FAO Regional Agricultural Engineering and Agro-Industries Officer, FAO, RAPA, Bangkok, Thailand.

1484. Jordan, Michele Anna. 1997. California home cooking: American cooking in the California style. Boston, Massachusetts: Harvard Common Press. xxv + 501 p. See p. 353-54. Illust. Index. 24 cm. [120+* ref]
• ***Summary:*** The recipe for Korean-style grilled steaks (p. 353-54) is an adaptation of *bulgogi*, the well-known Korean barbecue dish that features thin strips of beef. Both San Francisco and Los Angeles have large communities

© Copyright Soyinfo Center 2021

of Korean immigrants, with many Korean restaurants and markets. "Note: To make *samjan* sauce, mix 2 parts *dhwen-jang* [*doen-jang*], or Korean bean paste, with 1 part *gochujang,* or Korean barbecue sauce." Both are available in Asian food stores. Miso may be substituted for dhwen-jang and *sambal ulek* for gochujang.

Note: This is the earliest English-language document seen (March 2009) that uses the word "gochujang" to refer to Korean-style red pepper and soybean paste (miso).

Teriyaki recipes appear on pages 318 and 327.

Contains a good bibliography, and many sidebars, on the history of California cooking. Address: California.

1485. Kim, S.B. 1997. Cultura: History of Korea food life. Seoul, Korea: Kwang Moon Kak. See p. 146-260. *
• ***Summary:*** The *Samkukji,* written by a Chinese in the 3rd century A.D., reported that Koreans prepared fermented foods, especially from soybeans, very well. It praised the fermentation skills of the Koreans.

1486. Kittler, Pamela Goyan; Sucher, Kathryn P. 1997. Food and culture in America: a nutrition handbook. Belmont, California: West/Wadsworth. xiv + 535 p. Illust. (photos). Index. 26 cm. [100+* ref]
• ***Summary:*** What is American food anyway? Does it include sushi, soy sauce, miso soup, or tofu? How about Peking duck or pot stickers? How about enchiladas, chile rellenos, or tacos?

This excellent and original work is arranged in chapters by cultural groups or subcultures living in the USA.

The chapter on "Latinos" states under "Foreign influence" (p. 286) that the "demand for Asian ingredients by later immigrants resulted in the introduction of soybean products,..." Under "Regional variations" (p. 290) that Cubans like a chicken dish marinated in lime juice and soy sauce. Under "Meal composition and cycle" (p. 290) that West-African fritters are made from the meal of soybeans..."

The chapter on "Asians," under "Chinese," notes (p. 328-30) that "Soybeans are transformed into an amazing array of food products that are indispensible to Chinese cooking," including soy sauce, soy milk, bean curd or tofu, black beans ("made with cooked fermented soybeans preserved with salt and ginger. Black beans are usually added as a flavoring in dishes"), hoisin sauce, and oyster sauce. Soy oil is also used in Chinese cooking. The Hakkas enjoy tofu stuffed with meat (p. 332). Every Chinese meal aims for a good balance of *fan* (grain foods, such as rice or wheat) and *tsai* (side dishes). "The Chinese believe that a good diet is critical for physical and emotional harmony and necessary to strengthen the body against disease" (p. 334). During pregnancy, soy sauce may be avoided to prevent dark skin (p. 335). Chinese who avoid fresh dairy products because of lactose intolerance, may consume soybean curd and soy milk (if fortified with calcium) as alternatives.

Under "Japanese," soy sauce is a traditional food of Japan (photo, p. 341). Soybean products (p. 350) are an important part of the Japanese diet; they include tofu, shoyu (soy sauce), miso, and teriyaki sauce–to name just a few. Second-generation Japanese use more soy sauce than non-Asians (p. 354) but as their diet becomes Americanized, they fall prey to more diseases of affluence. The response to dairy products and lactose intolerance is similar to that of Chinese, with the use of tofu and soy milk.

Under "Koreans" (p. 363, 366) Soybean products are in important part of the diet; they include soy sauce, soy paste, and soybean curd or tobu [sic, *tubu*] (tofu).

Under "Southeast Asians and Pacific islanders." Adobo is a popular Filipino stew, seasoned with soy sauce (p. 389). Soy products include soy milk and tempeh (p. 399, 402, 404, 421-22).

The "Glossary of ethnic ingredients" mentions many soy products including (p. 490): "Black beans, fermented: Black soybeans salted and fermented to produce a piquant condiment. Used in Chinese cooking as a seasoning or combined with garlic, ginger, rice wine, and other ingredients to make black bean sauce." Address: 1. M.S., Food and nutrition education consultant; 2. Dep. of Food and Nutrition, San Jose State Univ., California.

1487. Lee, Kweon-Haeng; Kim, Nam-Dae; Yoo, Jin-Young. 1997. [Survey on the manufacturing process of traditional Meju for and of Kanjang (Korean Soy Sauce)]. *J. of the Korean Society of Food Science and Nutrition* 26(3):390-96. [68 ref. Kor; eng]
• ***Summary:*** "Meju is a basis for manufacturing Kanjang. Meju was traditionally prepared at home by different types of process depending on the regional area. It is necessary to standardize and simplify the process of Meju-preparation for Kanjang of good quality. For these purposes, the process of Meju and Kangjang making as well as analysis of commercial Kanjang, were compared. Generally, traditional Meju was prepared by steeping and dehulling the whole soybean. After steeping for 24 hr. soybean absorbed water up to 110-120% of its weight. The soaked soybeans were steamed for 2 hr. and cooled to 50ºC. Cooked soybeans were crushed down to the size of 10-15 mesh and molded. Molded soybeans were dried for 2 days in the air, hung up by rice straw and fermented for 20-30 days under natural environmental condition." Commercial soy sauce is Japanese-style shoyu, which contains roasted wheat. Address: 1. R&D Advanced Inst., Samho Co. Ltd., Seongnam, 462-120, Korea.

1488. Vavilov, Nicolay Ivanovich. 1997. Five continents. Translated from the Russian by Doris Löve. Rome, Italy: International Plant Genetic Resources Inst. xliii + 198 p. Illust. No index. 24 cm. [10 ref. Eng]
• ***Summary:*** This book, about the life and work of N.I.

© Copyright Soyinfo Center 2021

Vavilov (1887-1943), was published long after his death as a political prisoner. Unfortunately, the book has no index. The excellent introductory chapter titled "The Russian scientist Nicolay Vavilov," by Seymon Reznik and Yuri Vavilov (p. xvii-xxix) is a frank biography, including details of his conflict with arch-enemy Trofim Lysenko, his fall into disgrace by 1935, his arrest by the KGB on 7 Aug. 1940, and his death in prison in 1943.

In "The basic principle behind the expeditions" (p. 1-4) Vavilov notes that the seven basic geographical centers of origin, which cover only about 7% of the world's land area, are: (1) The tropical centre, in tropical India, IndoChina, and southern China. (2) The East Asiatic Centre, includes the central and western parts of China, Korea, Japan, and the major portion of Taiwan. (3) The Southwest Asiatic Centre. (4) The Mediterranean Centre, along the coast of the Mediterranean. (5) The Abyssinian Centre. (6) The Central American Centre, and (7) The Andean Centre. Maps show Vavilov's travels in each center. These centers were first outlined in his book *Centres of Origin of Cultivated Plants* (1926, Leningrad).

In the chapter titled "Expedition to Japan" (p. 58-61) he expresses his surprise at "the endless variety of plant types" including the "various preparations of soya beans and 'adzuki' beans (*Vigna angularis* [Willd. Ohwi & H. Obashi])." "There is perhaps no other country where the love of trees and flowers is so strongly expressed as in Japan. The care of flowers and plants has become a national characteristic of this country." "There is not a single weed in the fields or in vegetable gardens." In Japan he found "a multitude of dishes made of soyabeans (substituting for fat and including a cheese called 'tofu,' a soya product)..." He was impressed by the work of Ekiken Kaihara [Kaibara; 1630-1714]. A philosopher, man of letters, physician, geographer, historian, agronomist and naturalist, he wrote 270 volumes on 60 different themes, including a 5-volume work on garden plants and a 3-volume work on vegetable plants. In 1638 two gardens of pharmaceutical plants were established in Edo (Tokyo) and in 1720 another one in Komada.

In the chapter titled "Expedition in Korea" (p. 69-71) he again mentioned soyabeans and 'adzuki beans,' and noted: "Dozens of different foods are made from soyabeans, including the special cheese, tofu. Sprouts of soyabeans are rich in vitamins and are available in large amounts in all markets in Japan. Soya is used for seasoning meat and rice and of course, it produces an excellent oil, used for making margarine and for technical purposes. Although it is a crop exceptionally well suited to a monsoon climate, the soyabean has become the most important technical crop worldwide during the last couple of decades. Owing to the effect of European and American demands an enormous area has become planted to soyabeans. During the past two decades the plantations of soya in Manchuria have reached 7 million hectares and the world-wide area has exceeded 15 million hectares. It is difficult to imagine a more flexible plant in respect of the variation of both biological and other characteristics. The varieties of soyabeans can be counted by the thousands. The present American industry has introduced even more variety."

In Seoul, Vavilov unexpectedly met two colleagues, P.H. Dorsett and William Morse, known to him from Washington, DC. "Dr. Morse is the co-author of a well-known monograph on soyabeans, written by him and Dr. Charles Piper, another plant introducer from Vancouver, Canada. Morse was fanatically devoted to soyabeans throughout his life. In the course of some years, Piper studied in China, Korea, Manchuria and Japan on behalf of the U.S. Department of Agriculture, investigating crops of soyabeans, collecting seed material and forwarding it to the USA." Also discusses the agricultural explorations of Frank Meyer and Mark Carleton. Swingle "organized an extensive utilization of Chinese research, including the building up of a valuable library of Chinese literature and a whole staff of translators, who revealed the treasures of ancient Chinese agronomical science. The results of this endeavour have become obvious during the past couple of years. The similarity between the conditions of extensive parts of the territories of the USA and China make possible a wide utilization of soyabean crops, which during the last couple of years have amounted to as much as 1.5 million hectares."

"Quietly and modestly, Morse, who traveled with his family, wife and daughter, went from one city to another while staying in the best hotels."

Note: Soyfoods Center has a copy of the "Translator's Foreword" (p. xxx-xxxvi) which was typeset but later deleted from the book. Only the last two paragraphs were used. It tells the real story of Vavilov's work, his downfall at the hands of Trofim Denisovich Lysenko, several moving petitions by Vavilov asking that he be able to finish writing unfinished books, and details of his case history and death. Address: Head, All-Union Inst. of Plant Industry (VIR), Russian SSR.

1489. Yu, T'ae-jong; Yu, Young-nan. 1997. Korean foods. Seoul, Korea: Korean Cultural Research Center, Korea University. 200 p. Illust. (color). 22 cm. [30+ ref]
• ***Summary:*** *Chongguk-jang*, (fast fermented beans), which could be called Korean natto, is mentioned on pages 14 and 110.

Note: This is the earliest English-language document seen (Jan. 2012) that uses the word "Chongguk-jang" to refer to Korean-style natto.

Also on page 14: "Toenjang chige (Bean paste stew)."

1490. Ota, Eileen. 1998. Update on Ota Family Tofu in Portland, Oregon (Interview). *SoyaScan Notes.* Jan. 28. Conducted by William Shurtleff of Soyfoods Center.

© Copyright Soyinfo Center 2021

• ***Summary:*** Ota Family Tofu has tofu making equipment that Eileen would like to sell; it has hardly been used. In about 1981 the company moved to a new location, 812 S.E. Stark St.; it had more than twice as many square feet as their previous location. When they moved Ko went to a soy conference and met Eddie Okita, who was selling tofu manufacturing equipment. Ko decided to buy new equipment. Eileen objected at the time, suggesting that he try it before he buys it–to be sure you get the product that you want. Ko said "No." He just wanted to buy it. Coincidentally, at the same time, a competitor (Dae Han Tofu) began making tofu in Portland. Before that, there was a small tofu maker in Salem that didn't last very long. Dae Han was planning to deliver their tofu, which Ota had never had to do before. So Ota lost a large portion of the Portland tofu market to Dae Han.

Ko used the new equipment for a while, but then it became apparent that the tofu and the agé were not coming out the same. He had less control over the more automated equipment. Their customers noticed the difference and did not like the change. Moreover, Ota no longer had the volume to support the new equipment. So they went back to their old machines.

One of the early tofu-makers was Saizo Ohta (not Seizo), but he was not one of the founders. Two brothers apparently started the company. At the time of the "Spanish flu" epidemic in 1918-19, one or both of them became ill and the business went to Saizo Ota, Matsuno Ota's father. Matsuno was an only child, and in those days there was the tradition of sending Japanese children in America back to Japan for education. So when she was 4-5 years old she went to Japan. She did not return to America until after World War II. During the war her father, Saizo, had died. Matsuno returned to the USA in the early 1950s. The Grandmother, Shina, had a stroke after they arrived in Portland. At that point, in about 1956-57, Ko's father (Matsuno's husband) took over the tofu business. Ko's father was trained as a medical technician in Japan, but he couldn't get a job in the USA because his certification didn't transfer. So he worked for a while as a janitor and then spent a lot of time helping the grandmother, Shina.

After Ota Tofu moved to its present location, there was a huge influx of Vietnamese people who wanted soymilk, so the company started making it.

Shurtleff tells Eileen of an early listing for Ota Tofu in Portland in a 1922 Japanese-language directory of Japanese in the United States.

1491. Kluis, Alan. 1998. Currency woes threaten ag exports: Devaluations have hurt some of our best customers. *Soybean Digest.* Jan. p. 108-09.
• ***Summary:*** The USA now grows about 50% of the world's soybeans. One graph shows the world's top soybean producing nations and states (in hundred million bushels): USA (280), Brazil (110), Argentina (55), Iowa (50), Illinois (40), Minnesota (28). A second graph shows U.S. soybean exports by country (in million bushels): Japan (145), Netherlands (125), Mexico (122), Taiwan (75), China (68), Brazil (62), Korea (55), Spain (55), and Germany (43). Address: President, NorthStar Commodity Investment Co.

1492. Paolucci, Danny. 1998. How LEASA helped to build distribution for Swan Foods Corp. in Miami, Florida, then ended up destroying Sunshine Soy Co. and Swan Gardens (Interview). *SoyaScan Notes.* March 8. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** LEASA Industries Co. was (and still is) a food manufacturing and distribution company in Miami owned and run by a Korean-American family. They made and distributed [mung] bean sprouts and tofu. After Danny arrived at Swan Foods (in late 1977) they arranged to have LEASA distribute their products to grocery store chains. This was very beneficial for Swan Foods.

After Heartsong Tofu (run by Bob and Toni Heartsong in Miami) went out of business in about 1984, LEASA bought their equipment. Then they proceeded to put Swan Gardens out of business. Later they also killed Danny's company, Sunshine Soy Co. Address: 2219 S.W. 59th Ave., Miami, Florida 33155. Phone: 305-266-0830.

1493. Iderabdullah, Bisi. 1998. History of work with soybeans and soyfoods. Part I (Interview). *SoyaScan Notes.* April 6. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Bisi was born in Brooklyn right after World War II, and grew up there; her father was from Jamaica and her mother from the American South. After graduating from high school, Bisi's entrepreneurial spirit began to appear. She and her mother bought a Carvel ice cream franchise, and she began to make money. On her own initiative, she traveled to Europe three times–before she had even entered college! In 1968 she entered Brooklyn College in New York. During her first year as pre-med student, she was introduced to soyfoods and soybeans when she read Jethro Kloss' book *Back to Eden.* Her college friends were also exploring more natural lifestyles, including natural foods. Bisi liked to cook so she experimented with Kloss' recipes for soybean butter, soybean cheeses, etc. Also during her first year she met her husband-to-be. In 1970 he converted to Islam and changed his name to Mahmoud. As part of her medical program, she had to see an autopsy. "It really shook me up. When they peeled the person's skin back, it looked just like chicken. The only meat I could eat after that was hot dogs–and that got tiring after a while." She had taken the first steps to becoming a vegetarian.

In 1973, during her junior year at Brooklyn College, Bisi converted to formal Islam (she did not become a Black Muslim) and was married to Mahmoud in an Islamic wedding. "At that period in U.S. history Islam was strongly

© Copyright Soyinfo Center 2021

linked with Africa and African myths; many converted to Islam because they felt it was more African. It wasn't as much religion as it was traditional carriage." Mahmoud was a pre-med student studying to be a health educator. Three months later she won a scholarship to study abroad–anywhere in the world she wanted. She chose Africa. Bisi wanted to return to study her roots, to learn more about where she (as an African-American) had come from. So, leaving her husband studying in Brooklyn College, she flew to Zambia for 5 months and studied at the University of Zambia in Lusaka. When school was out there, she flew to Ghana, where she was joined by her husband. She studied archaeology at the University of Ghana in Legon for one year. When in Ghana, they tried unsuccessfully to study with a traditional natural healer.

Returning to the USA (Brooklyn), pregnant with their first child, she decided not to continue her pre-med education, because of its lack of emphasis on healthy lifestyles, nutrition, prevention, etc. They bought a house in Queens. Her husband was working at a clinic, but in 1974, one week before the birth of their first child, a boy, he lost his job. When the child was born, the delivery was extremely long, difficult and painful. In 1976, shortly after the birth of their second child. Bisi started making jewelry as a hobby, then professionally to earn money. They bought a camper, took their two kids, and began to travel all over America. "We became free spirits, traveling to wherever there was an art show, to enter our jewelry."

They ended up settling in an apartment in Fort Lauderdale, Florida. Expecting a third child in 1978, they decided to do the birth themselves–with a midwife. So they bought the book *Spiritual Midwifery,* by Ina Mae Gaskin, published by The Farm. They also bought one of the Farm's cookbooks. From these books Bisi learned about the many creative things done by The Farm–such as donating food and relief help to developing and poor countries.

They bought a house in Miami and decided, now with three kids, to end their itinerant life. First they opened a jewelry shop in Miami; soon it was thriving. Then they joined a co-op and many of their friends were Rastafarians–who are vegetarians. Soon they decided firmly to become vegetarians and soy became a large part of their diet. Bisi made her own tofu for her family, using *The Book of Tofu* by Shurtleff & Aoyagi. She also made her own whole-wheat breads and other natural foods. Bisi decided to start an alternative school in Miami to give her sons a better education. She incorporated the school and became the principal. Many Rastafarians sent their kids to the new school.

When she was in Ghana in 1973, Bisi decided that someday she definitely wanted to return to Ghana. Over the years she had worked hard to save her money for the return trip. One place in Africa she knew she didn't want to go was Liberia, where she heard the indigenous people were treated badly. Now she realized that if she waited any longer to return to Africa, their eldest son would resist the move. So they pulled up roots in Miami, rented their house in Queens, and Bisi flew to Africa to prepare the way for her family. She decided to settle–of all places–in Liberia, arriving in 1985. After finding a place to live, she returned to New York to bring her family back with her. Her goal was to do something to help the people of Liberia and to find a place where she and her family could pursue their own development.

In 1986 Bisi and her husband started the African Islamic Mission in Monrovia, Liberia, as a non-governmental organization (NGO). Its focus was to be on agriculture and education, helping the people of Liberia to feed themselves, and also on promoting Islam. Because of their lifestyle, they were very interested in organic, sustainable agriculture. But the local people became suspicious; who were these foreigners who were not connected with any known organization? When Bisi and Mahmoud finally got a permit to open their own school, they decided instead to teach at an existing Liberian school (pre-school to 9th grade) in Monrovia. Bisi taught there from late 1986 to 1990. Mahmoud taught there for one year, then got a private-sector job to earn needed money. In their spare time they started programs at their Mission–teaching literacy, English as a second language, and sex education for young girls. Their agricultural work was limited to a backyard garden.

In about 1985-86 Koreans started coming to Liberia to farm. They started selling small amounts of tofu in about 1989, and Bisi started buying it from them in Monrovia–but unfortunately the tofu didn't stay fresh very long. Bisi has no idea where they got the soybeans to make the tofu.

In about 1987 or 1988 the extension service at the University of Liberia in Monrovia tried to grow soybeans. They collected some statistics, but everything was lost during the civil war. Methodists in Liberia had experimented with growing soybeans just before the war, but the project was a total failure. A friend of Bisi's who is a vegan and a Methodist missionary, Bill Whitfield, convinced the Methodist Farm Project to grow soybeans, because he eats soyfoods in place of meat and dairy products–and he was having to import the soybeans. They did grow the soybeans successfully. Bisi bought a 50-lb bag from the Methodists, so that her African Islamic Mission could start making tofu again. But it was a failure because the farmers and the Liberian people weren't interested, and Bill Whitfield had left Liberia and didn't go to the extension service to show people how to use the soybeans. Continued. Address: Director, Imani House, 76A Fifth Ave., Brooklyn, New York 11217. Phone: (718) 638-2059.

1494. Ralston Purina Company. 1998. Agribrands International, Inc. St. Louis, Missouri. 95 p. April 1. 28 cm. • ***Summary:*** Ralston Purina Co. has decided to create a new company, Agribrands, by spinning off its international animal

© Copyright Soyinfo Center 2021

feeds and agricultural products operations. The company, whose stock symbol will be AGX, will be traded on the New York Stock Exchange. Shareholders of record of Ralston stock as of 1 April 1998 will receive one share of Agribrands Stock for every ten shares of Ralston stock they own. The spinoff will occur on April 1.

The production and sale of animal feed was the primary business of Ralston when it was established in 1894. Animal feeds and agricultural products continued to be the dominant business until the 1950s. "The development at that time of a new extruded dry dog food by Ralston revolutionized the pet food industry and transformed Ralston into primarily a consumer products company. Since then, the pet food business has continued to grow in importance to Ralston while the relative contribution of the animal feeds and agricultural products business declined. In the 1980's, Ralston's focus became increasingly directed away from the animal feeds and agricultural products business as Ralston acquired Continental Baking Company, the nation's largest wholesale baker, in 1984, and the worldwide Eveready battery business in 1986. The intention of Ralston's management to focus on consumer packaged goods and its stable of leading brands culminated in the sale of its U.S. animal feeds and agricultural products business to a subsidiary of British Petroleum in 1986. British Petroleum did not acquire Ralston's international animal feeds and agricultural products business, which became a non-core business, having limited synergies with Ralston's other international businesses."

"In 1994, Ralston spun-of Ralcorp Holdings, Inc., a subsidiary to which Ralston had contributed its breakfast cereal, baby food, cracker and cookie, coupon redemption and all-seasons resort businesses. In 1995, Ralston sold all of the capital stock of Continental Baking Company. In 1996, Ralston sold its assets associated with its cereal business in the Asia Pacific region (which it had retained in the Ralcorp spin-off), and terminated its European cereal operations. In 1977, Ralston sold its international soy protein technologies business. In line with this focus on its core businesses, Ralston attempted to sell its international animal feeds and agricultural products business to PM Holdings Corporation in 1994, but negotiations broke off as the parties were unable to agree on key terms of the transaction."

Agribrands' principal properties are its animal feed manufacturing facilities and property, which are located in the following countries: Brazil (7 plants), Canada (7), Colombia (6), France (7), Guatemala (1), Hungary (2), Italy (5), Korea (3), Mexico (8), People's Republic of China (4, incl. 3 joint ventures), Peru (3), Philippines (2), Portugal (2), Spain (7), Turkey (2), Venezuela (4, plus a hatchery) (p. 41-43; notes which are leased, joint venture, under construction, or to be divested). Address: Checkerboard Square, St. Louis, Missouri 63164.

1495. *SoyaScan Notes.* 1998. The worst famines in human history (Overview). May 1. Compiled by William Shurtleff of Soyfoods Center.
• ***Summary:*** The worst famine in human history, in terms of total famine-related deaths, was the Chinese famine of 1958-1962 that killed 30 million people (Source: 1998 April 30–Newshour with Jim Lehrer–Famine in North Korea).

Other major famines in China since 1875 (chronological): 1876-79 in North China–Drought for 3 years. Children sold and cannibalism. Estimated deaths: 9 to 13 million. 1892-94 in China. Drought. Deaths estimated at 1 million. 1920-21 in North China. Drought. Estimated ½ million deaths. 1928-29 in China (Shensi, Honan, and Kansu). Comparable in extent and severity to the great famine of 1877-78, but because of railroads, deaths were probably less.

Major famines in the USSR since 1875: 1921-22, especially in Ukraine and Volga region. Drought. U.S. assistance requested by Maksim Gorky. Despite relief efforts, deaths estimated at 1.25 to 5 million. 1932-34 in all USSR, caused by collectivization, forced procurement, destruction of livestock by peasants. Estimated deaths 5 million. 1947 in USSR (reported by Khruschev on 10 Dec. 1963). Caused by policies of Stalin and Molotov.

1496. Louie, Elaine. 1998. Vegetarian that's filling. *New York Times.* May 13. p. F8.
• ***Summary:*** Julie Sahni, cookbook author and teacher, says that vegetarianism has been an inextricable part of Indian culture since about 500 B.C., when Mahavira, a Hindu philosopher, developed the concept of ahimsa, or non killing. Although meat is scarce in Indian cookery, protein is not. A recipe for Indian chickpea ragout shows this.

A recipe for Bean curd sauté, adapted from Youngin Hyun, calls for "2 pounds extra-firm or firm bean curd" [tofu]. Hyun, a Manhattan [New York City] photographer and talented home cook, says that Koreans, which also have a long and rich tradition of vegetarian cookery, have used beans as a protein source since 107 B.C. In Korea, all beans, including soybeans, are called "the meat of the soil." Koreans began making bean curd (called *du bu*) during the late Koryo Dynasty (918-1392), according to Mrs. Hyun. Today bean curd comes in two consistencies, firm or silken. The silken type can be sliced then drizzled with a mixture of soy sauce, sesame oil, vinegar, sugar, and chopped scallions. The firm kind is used in stews and sautéed dishes. In the decade after the Korean war (which ended in 1953), Koreans ate lots of bean curd as the poor country rebuilt itself.

1497. Japan Tariff Assoc. 1998. Exports of miso (bean paste): No. 2103.90-000. *Japan Exports and Imports: Commodity by Country.* June. No. 618. p. 83. [Eng; jap]
• ***Summary:*** For each country, gives the quantity and value for the current month, and for the cumulative year to date.

© Copyright Soyinfo Center 2021

Countries to which Japan exports large quantities of miso are (year to date in kg): USA 1,127,052. Taiwan 168,941. Hong Kong 156,221. South Korea 104,743. Total exported this year: 2,235,149 kg. Address: 4-7-8, Kohji-machi, Chiyoda-ku, Tokyo 102-0083, Japan. Phone: 81-3-3263-7221.

1498. Lee, J.D.; Hwang, Y.H. 1998. Quality evaluation for vegetable use in local soybean cultivars with various seed coat color. *Korean J. of Crop Science* 43(2):83-88. June. [20 ref. Eng]

• ***Summary:*** "Abstract: From the evaluation of physical properties such as springiness, gumminess, adhesiveness, chewiness and hardness by the texture analyzer, vegetable soybean lines with green seed-coat were best as compared with those with black, brown, mixed, and yellow seed-coats. A panel test evaluated on the basis of taste, sweetness, chewiness, and total scores also indicated that soybean lines with green seed-coat were the best. The total scores of panel test was decreased in the order of green> yellow> black> brown seed-coat colored soybean.

"The mean value of sucrose content obtained by HPLC analysis was highest in black seed-coat colored soybean, and followed by green, yellow, and brown soybeans. The highest sucrose content (8.22%) was observed in 180362, a soybean line with green seed-coat. The full-season type soybeans showed much higher sucrose content than summer types which are mainly cultivated on farmer's fields for vegetable purposes.

"The final 13 lines selected from 300 colored soybeans showed nearly the same panel scores as Miwongreen. However, these lines had a great deal of variation in sucrose content, and much higher readings in texture analysis than Miwongreen, especially in chewiness and hardness which were the most important properties in vegetable soybeans." Address: Dep. of Agronomy, College of Agriculture, Kyungpook National Univ., Taegu 702-701, Korea.

1499. Tamang, J.P. 1998. Role of microorganisms in traditional fermented foods. *Indian Food Industry* (*Mysore, India*) 17(3):162-67. May/June. [32 ref]

• ***Summary:*** This article is mainly about the benefits of fermentation and fermented foods. Contents: Introduction (main microorganisms are filamentous fungi, yeasts and bacteria, especially LAB = lactic acid bacteria). Biopreservation. Bioenrichment. Microorganisms that produce enzymes. Microorganisms that destroy undesirable components. Enrichment of the diet. Mixed starter culture. Traditional fermented foods of medicinal value (koumiss, kvass). Conclusion.

The following fermented soyfoods are mentioned: Kinema, hawaijar, miso, natto, shoyu, tauco, and tempe [tempeh]. Koji is also mentioned.

"Fermented foods are defined as foods that have been subjected to the action of selected microorganisms by which a biochemically and organoleptically modified substrate is produced, resulting in an acceptable product for human consumption." Address: Microbiology Research Lab., Dep. of Botany, Sikkim Government College, Gangtok, Sikkim–737 102, India.

1500. Menez, Gene. 1998. Forget Tiger [Woods]–Pak is on the attack: 20-year old Korean just wants to be the world's best golfer, of any gender. *Fort Worth Star-Telegram* (*Fort Worth, Texas*). July 26. p. 35, (C1).

• ***Summary:*** Se Ri Pak is an amazing young woman golfer.

In Orlando, Florida she frequents the Shin Jung Restaurant three or four times a week for the Doen Jang Jigae (soybean paste stew) or Kim Chee Jigae (pickled spice cabbage stew). Address: Star Telegram staff writer.

1501. *SoyaScan Notes.* 1998. Chronology of Frank N. Meyer (1875-1918), USDA plant explorer in Asia. Compiled by William Shurtleff of Soyinfo Center.

• ***Summary:*** 1875 Nov. 29–Frans Meyer is born in Amsterdam, Netherlands. 1889–Meyer, age 14 becomes a gardener's helper, later a gardener at the Amsterdam Botanical Garden, and assistant to Prof. Hugo de Vries, the eminent Dutch botanist and geneticist, in his special experimental garden. Note: In 1900 de Vries was one of three scientists who, at a conference in London, England, "rediscovered" the work of Gregor Mendel, introducing modern genetics.

1901 Oct. 20–Meyer first arrives in the USA, in Washington, DC, with a letter of introduction from de Vries to Erwin F. Smith, one of the five plant pathologists who were working with Beverly T. Galloway at the USDA in 1889. Smith found Meyer a modest job as a gardener in the USDA greenhouses on the Mall at Washington, DC.; here Meyer worked from 23 Oct. 1901 to 31 Aug. 1902. He resigned 1 Sept. 1902. On 15 Sept. 1902 re-entered USDA service at the Plant Improvement Garden at Santa Ana, California. Resigned after 7 months on 1 April 1903 and became head gardener at a little nursery in Montecito, California.

1904 Jan. to March–In St. Louis, Missouri, attending the World's Fair and working at Armstrong's nursery. 1904 March to August–Made journeys of study in California (visited Luther Burbank in Santa Rosa), Mexico (took a steamer in March from San Francisco to San Blas, Mexico; walked across Mexico from San Blas to Guadalajara to Mexico City, then to Vera Cruz on the Gulf of Mexico), and Cuba. From Havana he took a ship to New Orleans, Louisiana, then on to St. Louis. 1904 Aug. 1–Began work at the Missouri Botanical Garden [called the Shaw Botanical Garden locally] in St. Louis. Was a member of the jury on Forestry at the World's Fair of 1904. Resigned Shaw Garden on 1 July 1905.

1905–In about early March, Adrian J. Pieters, a fellow

© Copyright Soyinfo Center 2021

Dutchman who had come to know and admire Meyer, tells Fairchild about Meyer's love of walking and deep interest in plants. On March 10 Fairchild asks Pieters to telegram Meyer to ask whether he would be interested in going to China as an agricultural explorer (Fairchild 1938, p. 315; Cunningham 1984, p. 21). The dream of Meyer's youth had come true. But 3 months passed before Meyer left St. Louis.

1905 July–Fairchild and Meyer first meet and instantly become mutual friends. For a detailed description of their first meeting see Fairchild 1938 (p. 314-16). On 10 July 1905 Meyer re-enters USDA service for the third time, now as an agricultural explorer in the Bureau of Plant Industry.

1905-1908–First expedition; mainly to China, but also to Japan, Korea, Manchuria, and Eastern Siberia. He collected nearly 2,000 plants and seeds. He left Washington, DC, on 27 July 1905 and returned on 7 July 1908.

1906 Feb. 23–Meyer's first soybean introduction, SPI 17852 from Peking was received in the USA; it was later named Peking.

1908 July 21–Meyer submits a Petition for Naturalization (now located at the U.S. Immigration and Naturalization Service, Dep. of Justice, Washington, DC).

1909-1912–Second Expedition.

1912-1915–Third Expedition.

1916-1918–Fourth Expedition.

1918 June 4–Telegram arrives in Washington at 4:00 p.m. from the Consul at Nanking "Frank Meyer, Department Agriculture, disappeared from steamer in this consular district en route Hankow to Shanghai, June 2nd." His death occurred at night. His body was recovered from the Yangtze River on June 5, about 30 miles above the little town of Wuhu, and buried on June 12 at the Bubbling Well Protestant Cemetery in Shanghai. His death remains a mystery to his friends; it is not known whether he died from accident or suicide. It was well known among his friends, and clearly indicated in his letters to David Fairchild, that he had been very much depressed by the wars in both Europe and China and by his long confinement in the city of Ichang.

In 1907 the U.S. only had 23 varieties of soybeans, whereas in 1919 the U.S. had 629 varieties; most of the new ones were introduced by the Office of Foreign Seed and Plant Introduction (OFSPI), many by Meyer. Named varieties introduced by Meyer (or selected directly from introduced by Meyer), in order of PI Number are: Meyer (PI 17852), Peking (17852 B, selected from the Meyer variety), Lexington (PI 17862), Wilson (PI 19183), Morse (PI 19186), Virginia (PI 19186 D, selected from Morse in 1909), Habaro (PI 20405), Chestnut (PI 20405 B, selected from Habaro), Duggar (PI 20798), and O.A.C. 211 (OAC 211, selected from Habaro), Biloxi (PI 23211, named by Dec. 1916), and Laredo (PI 40658, named by June 1920). Of these varieties Meyer introduced, Peking, introduced in 1906, proved to be the most important commercially in America.

1502. Nakatomi & Associates. 1998. L.A. Tofu Festival media clips (Portfolio). Santa Monica, California. 53 inserts. 28 cm.

• ***Summary:*** This is a portfolio of 53 newspaper clippings, advertisements, news briefs, and articles related to the L.A. Tofu Festival, which took place in Los Angeles on 15-16 August 1998 (Saturday and Sunday). The dates range from August 7 to 21. The most popular source was *Rafu Shimpo* (an English-language newspaper for Japanese Americans) with 21 clips, followed by the Los Angeles Times (Food section, calendar section), with 6 clips, and the Daily News (incl. L.A. Life Weekend, 4). But clips from many other newspapers, spanning many ethnic groups, also appear: *Asian Journal*, *Chi-Am Daily News* (*3*), *Chinese Daily News, Downtown News, Gardena Valley News, KoreAm Journal, Korean Journal, La Opinion* (*Spanish*), *Lighthouse* (*2*), *Los Angeles Magazine* (*2*), *New Times Los Angeles, Pacific Asian Current, Pacific Citizen, Sing Tao Daily* (*Chinese*), *Vecinos del Valle* (*Spanish*), *and Viet Bao Kinhte* (*Vietnamese*).

These clips show how the Festival was promoted through and covered by the media in the greater Los Angeles area. Clearly the great success of this year's festival was due, in part, to the excellent public relations work of Nakatomi & Associates. A number of the clips in *Rafu Shimpo* featured individual restaurants that would be serving their favorite tofu dishes at the festival. This concept, starting on July 31, spotlighted 12 restaurants. Address: 1301 Montana Ave., Santa Monica, California 90403. Phone: 310-656-1616.

1503. *Soya & Oilseed Bluebook.* 1998--. Serial/periodical. Bar Harbor, Maine: Soyatech, Inc. Peter Golbitz, publisher and editor. Frequency: Annual.

• ***Summary:*** Preceded by Soya Bluebook Plus. A directory and information book for the soybean processing and production industries. The first issue (shipped Sept. 1998) is subtitled "The annual directory of the world oilseed industry." On the cover, below a map of the world is printed the date "1999" in large letters, followed by "A Soyatech Publication." Crops featured on the front cover and inside are "soya, corn, cottonseed, canola, rapeseed, sunflowerseed, palm kernel, palm, coconut, and peanut."

Contents (the four main sections are marked with a fold-out tab): Translations of oilseed terminology (English, German, French, Spanish, and Portuguese). Organizations and government agencies: Complete listings by country. Oilseeds and oilseed products: White pages (Index, individual crops), catalog pages, yellow pages (complete company listing by country). Equipment supplies and services. Oilseed statistics. Oilseed reference: Oilseed glossary, standards and specifications, oilseed technical charts and tables. Indexes: Comprehensive index, internet address index, brand name index, advertiser index.

Soy-related terms appearing in the translation section (p. 9-15) are: (1) Oilseeds and products: dairy analogs, lecithin–

© Copyright Soyinfo Center 2021

edible, lecithin industrial, meat analogs, miso, organic soy products, soy distillate, soy fiber, soy flakes–defatted–edible, soy flakes–full fat, soy flour–defatted, soy flour–enzyme active, soy flour–full fat, soy flour–low fat, soy flour–roasted, soy flour–textured, soy grits, soy isoflavones, soy livestock feed, soy oil margarine, soy oil shortening, soy oil–crude, soy oil–edible, soy oil–hydrogenated, soy oil–industrial, soy oil–refined, soy oil-based fuel, soy protein concentrate, soy protein isolate, soy protein–hydrolyzed, soy protein–industrial, soy sauce, soy sterols & tocopherols, soy-based foods–other, soybean fatty acids, soybean hulls, soybean meal, soybean meal–full fat, soybean seed breeder, soybean seed (for planting), soybean soapstock, soybeans–food grade, soybeans genetically modified, soybeans–green vegetable, soybeans–identity preserved, soybeans–non-gmo, soybeans–organic, soybeans, whole dry, soymilk beverages, soymilk powder, soynuts, tempeh, tempeh starter cultures, textured vegetable protein, tofu & tofu products, tofu powder. (2) Equipment & services: Coagulants for tofu, soymilk & tofu processing equipment, sprouting equipment. Address: 318 Main St., P.O. Box 84, Bar Harbor, Maine 04609. Phone: 207-288-4969.

1504. Choi, Ung-Kyu; Son, Dong-Hwa; Ji, Won-Dae; et al. 1998. [Changes of taste components and palatability during chunggugjang fermentation by *Bacillus subtilis* DC-2]. *J. of the Korean Society of Food Science and Nutrition* 27(5):840-45. Oct. [22 ref. Kor; eng]
• ***Summary:*** "This study was conducted to produce the high quality of chunggugjang... In case of free sugars, raffinose was sharply decreased between 72 and 96 hours after fermentation. Free amino acid was increased by 20 fold at 48 hours after fermentation compared to that of steamed soybean. As a result of sensory test, it was founded that the chunggujang fermented by *Bacillus subtilis* DC-2 was suitable to produce for commercial purpose." Address: 1. Dep. of Food Science and Technology, Yeungnam Univ., Kyongsan 712-749, Korea.

1505. Kim, Jong-Sang; Kwon, Tai-Wan. 1998. Soy and cancer–Soybean anticarcinogens and anticancer mechanisms: Soybean extract induces quinone reductase activity in hepa1c1c7 cells and murine lung but suppresses arylhydrocarbon hydroxylase activity in murine organs (Abstract). *American J. of Clinical Nutrition* 68(6 Suppl):1527S. Dec.
• ***Summary:*** Note: *Merriam-Webster's Collegiate Dictionary* (1998) defines murine, a word first used in 1607, as "of or relating to the murid genus (*Mus*) or its subfamily (Murinae) which includes the common household rats and mice... especially the house mouse."

"Soybean intake has been reported to be associated with lowered incidence of some tumors, including human breast and prostate carcinomas."

"These findings support the notion that soy components including genistein have a potential to function favorably in preventing chemical carcinogenesis." Address: Food Science Inst., Inje Univ., Obang-dong, Kimhae, Kyongnam 621-749, Republic of Korea.

• ***Summary:*** The appearance of beans (Leguminosae, Papilionoideae) increased in Late Paleolithic remains.

Note: a hominin is a primate of a taxonomic tribe (Hominini), which comprises those species regarded as human, directly ancestral to humans, or very closely related to humans.

Hominins of Northeast Asia who lived in mountain caves at the beginning of the Paleolithic gradually moved to the lower plains and riverbanks by the Late Paleolithic (1,000 BCE). Since food was now abundant around their dwelling sites, they could reside longer in these areas. They did less hunting and more gathering, including of wild beans and shellfish.

1515. Ling, Kong Foong. 1998. Food of Asia: authentic recipes from China, India, Indonesia, Japan, Singapore, Malaysia, Thailand and Vietnam. Singapore: Periplus. 160 p. Illust (color). Index. 31 cm.

• ***Summary:*** A very attractive book printed on glossy paper with at least one color photo on almost every page. The introduction and essays are by Kong Foong Ling. The index, which is poor, makes the book hard to use if you are looking for particular foods found throughout Asia such as soybeans, soy sauce, miso, salted / fermented black beans, yuba [bean curd skin], etc.

Contents: The flavors of Asia. Ingredients. The Asian kitchen. China. India. Indonesia. Japan. Malaysia & Singapore. Thailand. Vietnam. Appendix.

The "Ingredients" section includes: Bean curd (incl. cotton or momen tofu, silken bean curd, deep-fried bean curd or aburage, grilled bean curd or yakidofu, fermented bean curd or nam yee). Bean curd skin [yuba]. Black beans, salted (and fermented). Hoisin sauce ("A sweet sauce made of soy beans, with spicy and garlicky overtones"). Miso (incl. red miso and white miso). Salted soy beans (incl. "yellow bean sauce"). Soy sauce (incl. light soy sauce, black soy sauce, red soy sauce, Kikkoman, tamari, thick sweet soy sauce (kecap manis–Indonesian)). Tempeh. Also: Red beans (dried azuki). Seaweed (incl. dried kelp, golden kelp, mozuku, salted dried kelp, laver or nori, wakame). Sesame (black and white seeds, tahina {tahini}). Sesame oil. Sesame rice crackers.

Beancurd or bean curd is mentioned on pages 12, 29-30, 34, 36, 88, 94, 101, 155.

Fermented bean curd: p. 25.

1516. Sinclair, Charles Gordon. comp. 1998. International dictionary of food and cooking. Chicago: Fitzroy Dearborn. 594 p. See p. 234. 24 cm. *

• ***Summary:*** Vietnamese: dau hu: Bean curd. dau hu chien: Fried bean curd. dau hu chung: Bean curd. dau hu ki: Dried [sic, pressed] bean curd (p. 161).

fu jook pin (Chinese): Bean curd sticks [dried yuba sticks] (p. 219).

*"gochujang* (Korean): A chilli paste similar to sambal olek" (p. 234).

Indonesian: Kecap asin is thick, salty, dark colored soy sauce used for coloring and flavor. Kecap bentang manis: See kecap manis. Kecap manis: A sweet, thick, dark colored aromatic soy sauce used as a seasoning and condiment, and for satay. "Also called ketjap sauce, kecap bentang manis, sweet soya sauce" (p. 292).

Ketjap (Ho [Holland, Dutch]) Ketchup. Ketjap sauce. See kecap manis.

The word "soya" appears on 100 pages in this book. For example: Aburage (Japanese): Soya bean pouches made by deep-frying slices of pressed bean curd.

For "soy bean" see "soya bean." For "soy bean oil" see "soya bean oil." For "soy sauce" see "soya sauce."

"Sweet bean paste. A thick brown sauce made from ground fermented soya beans mixed with sugar and brine. Popular in Taiwan as a condiment or seasoning" (p. 530).

1517. Solomon, Charmaine; Solomon, Nina. 1998. Charmaine Solomon's encyclopedia of Asian food. Boston, Massachusetts: Periplus Editions. xiv + 480 p. Color illust. ([28] p. of plates). 29 cm. [67* ref]

• ***Summary:*** An outstanding book; the color illustrations of many ingredients are spectacular and very informative. The

© Copyright Soyinfo Center 2021

author has an insatiable curiosity.

Contents: List of illustrations. Introduction. How to use the *Encyclopedia of Asian Food.* Acknowledgements. A-Z of Asian Food. Bibliography. Illustrated index of selective ingredients. Index of recipes. Index of alternative words and main entries.

Soy related entries: Bean curd (p. 26-28, incl. all the different types, yuba, deep-fried tofu types, fermented tofu incl. ch'ou doufu [chou doufu]: "Despite its overpowering aroma, slimy texture, unappetizing color and the unfortunate odor it leaves on the breath, those brave enough to partake of it consider it a delicacy").

Bean paste, sweet (p. 29. The three colors and types are red {from adzuki beans}, yellow {from mung beans, husked and split}, or black {from black soy beans}. "The pastes are usually available ready-made sweetened in cans. It is possible to make your own, starting out with dried beans." Name in Chinese: dow sa, tau sa {sweet bean paste}).

Bean paste, yellow (p. 29. Despite what the label says, this thick, salty condiment is brown, not yellow, in color).

Bean sauces (p. 29. "Made from fermented soy beans," they range in color from yellow to brown to black [sweet black bean paste]. Their consistency is more like pastes that must be spooned from the jar than pourable tomato ketchup).

Beans, salted yellow (p. 31. Canned yellow soybeans which have been salted and fermented).

Beef (p. 31-37 incl. Teriyaki steak, Sukiyaki, Beef with black bean sauce, incl. "2 tablespoons canned salted black beans [fermented black soybeans]").

Black bean (p. 43-44. Black soy beans which are fermented and salted. "Some are sold in cans in a salty liquid, others in plastic bags, covered with salt crystals." Also called "preserved black beans").

Flours & starches (p. 157-61). Incl. soy flour. "A high protein, low starch flour... used mostly in Japan [where it is called kinako] and China. In Korea roasted soy bean flour and fermented soy bean flour are used to make a variety of bean pastes."

Note. This is the earliest English-language document seen (Nov. 2012) that uses the term "roasted soy bean flour" to refer to kinako.

Legumes & pulses (p. 206-18). A long and interesting section. All entries have a scientific name. Many have an illustration. Those found in many Asian countries (e.g., green bean, green pea) have the name in each country. Includes: Introduction, adzuki bean, asparagus bean (see winged bean), asparagus pea, black-eyed pea (a variety of cowpea), black gram, blue pea, broad bean, butter bean (see lima bean), chick pea, cowpea (see yard-long bean), fenugreek, green bean, green pea, hyacinth bean (see lablab bean), lablab bean, lentil, lima bean, long bean (see yard-long bean), moong bean (see mung bean), moth bean, mung bean, parkia, peanut, pigeon pea, red bean (see adzuki bean), red kidney bean, rice bean, sataw bean (see parkia), snow pea, soy bean (short entry), sugar snap pea, tamarind, white gram (see black gram), winged bean (China: su-ling dou; India: Goa bean; Indonesia: kecipir; Japan: shikakumame; Malaysia: kacang botor; Philippines: sigarilyas; Sri Lanka: dara-dhambala. Thailand: thua pu). Yard-long bean (this is the fresh bean known by a host of names). Recipes: Adzuki bean soup.

Master sauce (p. 232). "Also known as 'flavour pot' or 'lu,' this sauce has a base of soy sauce, water, sugar and Chinese wine or sherry, with a few variable additions..." Cooking with it is similar to 'red-cooking.'

Miso (see soy bean products). Mushrooms & fungi (p. 237-40, incl. recipe for Braised bean curd, cloud ear and vegetables, and Braised soy mushrooms). Natto (see soy bean products).

Oils (p. 258-59, incl. coconut oil, gingelly oil [sesame oil], mustard oil, palm oil, palm kernel oil, peanut oil, perilla oil, sesame oil). Note: Soy oil is not mentioned here! Okara (see soy bean products). Salads, incl. recipe for Indonesian vegetable salad (gado-gado), that calls for 4 oz. fried bean curd. Shoyu (see soy sauce).

Soy bean, dried (349). China: da dau, wong dau, hak dau, tai dau. Indonesia: kacang kedelai. Japan: daizu. Korea: jaa jang. Malaysia: kedelai. Philippines: utaw. Thailand: thua lueang.

Soy bean, fresh. China: mao dau. Indonesia: kacang soja. Japan: edamame. Malaysia: kacang soja. Recipe: Fresh soy beans with bean curd.

Soy bean products (p. 350): Miso (incl. recipe for miso soup). Natto. Soy bean paste (go). Soy milk (including okara). Tahuri (Philippine fermented tofu). Tokwa (tokwan; very firm square tofu).

Soy bean sprouts, with recipe for soy bean sprout salad. China: dai dau nga choi. India: bhat. Indonesia: kacang kedele, taugeh. Japan: daizu no moyashi. Korea: Kong namul. Malaysia: kacang soja, taugeh. Philippines: utaw. Thailand: thua-lueang.

Soy sauce (p. 351-52). Chinese soy sauce: Dark soy sauce. Light soy sauce ("Usually labeled 'superior soy'"). Mushroom soy sauce (Dark soy sauce that has been flavored with straw mushrooms). Japanese soy sauces: Koikuchi (regular shoyu), tamari, usukuchi. Korean soy sauce ("About the same colour as Chinese light soy sauce, but not as fiercely salty and with a sweet malted aroma"). Thick and flavoured soy sauces: Kecap asin ("A dark, salty soy sauce, from Indonesia, a little thicker than the dark soy of China"). Kecap manis (A thick, sweet soy sauce from Java, Indonesia). Kicap cair: "The Malaysian equivalent of light soy sauce." Kicap pekat: "The Malaysian equivalent of dark soy sauce, though thicker than the Chinese version, but not as thick as kecap manis." Ponzu shoyu. Toyo mansi (p. 352): "A soy sauce used in the Philippines soured with kalamansi juice."

Note: This is the earliest document seen (April 2012)

© Copyright Soyinfo Center 2021

that uses the term "Kicap cair" or the term "Kicap pekat" to refer to light and dark Malaysian soy sauces, respectively.

Tempeh (p. 386). Incl. recipes for Savoury Tempeh and Thai style tempeh. Tofu (see bean curd).

Also discusses: Adzuki bean, agar-agar (incl. almond bean curd, awayuki), almond, amaranth, cowpea, crab in black bean sauce (recipe at crab), daikon, millet, monosodium glutamate ("I would strongly recommend omitting it"), Nonya (pronounced 'Nyonya.' The unique cookery found in Malaysia and Singapore resulting from the fusion of Malay and Chinese cuisine during the last century), peanut, peanut sauce, sago (this palm flowers only once in its life, at about age 15. Just before flowering, it builds up a large reserve of starch in the pith. The tree is felled, the pith scooped out, ground and washed to make sago starch), seaweed (incl. agar-agar, hijiki, kombu / konbu, mozuku, nori / laver, wakame), sesame paste, sesame seed, vegetarian meals ("By far the most important vegetarian food in the Far East... is bean curd"). Address: Australia.

1518. Yokotsuka, Tamotsu; Sasaki, Masaoki. 1998. Fermented protein foods in the Orient: shoyu and miso in Japan. In: Brian J.B. Wood, ed. 1998. Microbiology of Fermented Foods. 2nd ed. Vol. 1. London: Blackie Academic & Professional / Thompson Science. An imprint of Chapman & Hall. xx + 440 + 17 p. Illust. Index. 24 cm. [197 ref]

• ***Summary:*** Contents: Introduction. History: The history of fermented proteinaceous foods in China (chu / koji, chiang / jiang, shi [fermented black soybeans], chiang-yu / soy sauce / tou-yu, shi-tche [the juice or extract of shi]).

Note: "This section was based on material drawn from *Thirty-five Years History of Noda-Shoyu Company* (1955), *The History of Kikkoman* (1970), Sakaguchi (1979) and Wang & Fuang (1981)," the history of shoyu and miso in Japan (hishio or sho or soya or soy, miso or misho, tamari, miso-damari, tare-miso and usudare, shoyu, miso and shoyu of today). Fermented soybean foods in the Orient: shoyu, miso, tempeh and natto: Japanese shoyu (establishment of the Japanese Agricultural Standard {JAS} for shoyu in 1963, production methods, types and grades of shoyu by JAS, quality standard of shoyu exported from Japan, production [statistics], technological contributions by the Japanese government to the shoyu industry, soy sauce produced in Oriental countries other than Japan [i.e., Korea, Taiwan, Singapore, Malaysia, Indonesia], miso). Manufacture: Koikuchi shoyu (treatment of raw materials, koji making, mash-making and ageing, pressing of mash, refining), tamari shoyu, miso. Recent progress in shoyu and miso production in Japan: Soybeans and wheat as raw materials (soybeans, wheat), treatment of raw materials (soybeans, wheat), koji moulds, koji-making, mash fermentation (microbes in the mash, chemical changes in shoyu-mash fermentation, temperature of the mash, period of mash fermentation), refining (pressing of the mash, pasteurization), material balance in shoyu manufacture, product (color and clarity of koikuchi shoyu, flavour components of shoyu {HEMF, HDMF, HMMF, phenolic compounds, flavour constituents of the top note aroma of pasteurized shoyu}, formation of flavour components during heating for pasteurization, flavour components of shoyu worldwide, relationship between organoleptic evaluation of shoyu and its chemical constituents, nutritional concern about excessive salt intake, safety of fermented shoyu [aflatoxins], microbial stability of shoyu). Discussion.

In the *Ben-Chao-Gong Mu* [*Bencao gangmu*, The great pharmacopoeia, 1596] many types of shi are discussed. In more recent times these have apparently been classified into three types depending on the microorganism used in the fermentation: (1) *Aspergillus oryzae* type. (2) *Mucor* type, usually made in Szechwan. (3) *Bacillus* type. Soak and cook soybeans, then place them in a cloth bag. Cover with straw and ferment for 1-2 days at 25-30ºC. "When the beans are covered with viscous substances, Shui-tou-shi is prepared." Mix the sticky beans with ginger and salt, then pack tightly into jars; age for one week. The product [a sort of salted natto with ginger] is now ready to eat. "The organisms responsible for this fermentation have been identified as *Bacillus* species" (p. 356). Address: Research and Development Div., Kikkoman Co. Ltd., 339 Noda, Noda-shi, Chiba-ken, 278 Japan.

1519. Yonzan, H.; Tamang, J.P. 1998. Consumption pattern of traditional fermented foods in the Sikkim Himalaya. *J. of Hill Research* (*Sikkim*) 11(1):112-15. [6 ref]

• ***Summary:*** During 1996-97 a survey was conducted using a questionnaire in 270 randomly selected houses in three hill sub-divisions of the Darjeeling Hills of West Bengal and 315 houses in four districts of Sikkim representing the ethnic communities of the Nepalis, the Bhutia and the Lepcha. The amount of fermented foods consumed at every meal by each person was weighed directly using a portable balance and daily per capita consumption (in gm per day) was estimated. The frequency of eating fermented foods by each family (as a percentage) was also recorded. Annual home production of each fermented food was calculated on the basis of population based on Indian census records. A database was developed from the field data.

For kinema, the average consumption rate in the Darjeeling Hills was 80.6%, whereas it was 78.9% in Sikkim. Kinema was one of three foods that was not eaten daily; it was typically consumed 2-4 times a week as a source of plant protein. The survey showed that, in the Darjeeling Hills, 45.3% of the people prepared the fermented foods at home and only 28.3% purchased them from local markets, while in Sikkim 53.7% of the people prepared the fermented foods at home and only 18.8% purchased them from local markets.

Table 1 shows per capita consumption (gm per day)

© Copyright Soyinfo Center 2021

and annual home production (tons per year) of the various fermented foods. For kinema the figures show: In the Darjeeling Hills, the average per capita consumption was 3.3 gm/day (range 2.3 to 4.7) and the annual production for the entire area was 829 tonnes. In Sikkim, the average per capita consumption was 2.2 gm/day (range 0.7 to 3.7) and the annual production for the entire area was 327 tonnes. Address: Microbiology Research Lab., Dep. of Botany, Sikkim Government College, Tadong (near Gangtok), Sikkim 737 102, India.

1520. Yoo, Jin-Young; Kim, Hyeon-Gyu; Kwon, Dong-Jin. 1998. [Improved process for preparation of traditional Kanjang (Korean-style soy sauce]. *J. of the Korean Society of Food Science and Nutrition* 27(2):268-74. [17 ref. Kor; eng]

• ***Summary:*** "The traditional kanjang has been prepared by mixing meju and 18% saline solution, and fermenting for 60 days. The traditional kanjang is very salty and inferior in flavor and taste compared with commercial fermented soy sauce. To improve the quality of traditional kanjang, *Zygosaccharomyces rouxii* H-62, a flavor-related mutant, was inoculated during fermentation." Address: Div. of Food Biotechnology, Korea Food Research Inst., Seongnam 463-420, Korea.

1521. Young, Louise. 1998. Japan's total empire: Manchuria and the culture of wartime imperialism. Berkeley, California: University of California Press. xiii + 487 p. Map. Index. 23 cm. Series: Twentieth-Century Japan. [390 ref]

• ***Summary:*** A very important book. Contents: Part I: Making of a total empire–Manchukuo and Japan. 1 Jewel in the crown: the international context of Manchukuo.

Part II: Manchurian incident and the new military imperialism, 1931-1933. 2. War fever: imperial jingoism and the mass media. 3. Go-fast imperialism: elite politics and mass mobilization.

Part III: Manchurian experiment in colonial development, 1932-1941. 4. Uneasy partnership: soldiers and capitalists in the colonial economy. 5. Brave new empire: utopian vision and the new intelligentsia.

Part IV: New social imperialism and the farm colonization program, 1932-1945. 6. Reinventing agrarianism: rural crisis and the wedding of agriculture to empire. 7. Migration machine: Manchurian colonization and state growth. 8. Victims of empire.

Part V: Conclusion. 9. Paradox of total empire.

From the publisher's description: "In this first social and cultural history of Japan's construction of Manchuria, Louise Young offers an incisive examination of the nature of Japanese imperialism. Focusing on the domestic impact of Japan's activities in Northeast China between 1931 and 1945, Young considers 'metropolitan effects' of empire building: how people at home imagined and experienced the empire they called Manchukuo. Contrary to the conventional assumption that a few army officers and bureaucrats were responsible for Japan's overseas expansion, Young finds that a variety of organizations helped to mobilize popular support for Manchukuo–the mass media, the academy, chambers of commerce, women's organizations, youth groups, and agricultural cooperatives–leading to broad-based support among diverse groups of Japanese. As the empire was being built in China, Young shows, an imagined Manchukuo was emerging at home, constructed of visions of a defensive lifeline, a developing economy, and a settler's paradise."

From a review on the back cover: "One of the most important books in Japanese to appear in several years... Young provocatively concludes that Japanese authoritarianism and empire-building from 1921 to 1945 were products of the nation's modernization..."

The word "soybean" (or "soybeans") appears on pages 28, 32, 34, 38, 94, 183, 203, 208, 209, 211, 240, 344, 346, and 432, and "bean cakes" on p. 300.

The South Manchurian Railway is discussed throughout the book; see the Index entry for "Mantetsu." Address: Asst. Prof. of History, New York Univ.

1522. *Detroit Free Press* (*Detroit, Michigan*). 1999. Classified ad: Cook, Korean specialty (Sterling Heights, MI). Jan. 29. p. 35.

• ***Summary:*** "Prepare & cook foods according to traditional Korean recipes;"

"Dishes served include Kalbi, Doen Jang Chi Ge, Sun Dubu Chige,..."

"2 years experience required. Send resume to:..."

1523. Daniels, Nahum Stiskin. 1999. Recollections of publishing *The Book of Tofu* (Interview). *SoyaScan Notes.* March 2. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** "*The Book of Tofu* was one of those very special projects–almost timeless indeed. We did what we all set out to do, which was to communicate a very tangible idea to the West. It's very rare when people can get together and actually pull that off. It was a very exciting and very worthwhile project–something I'm always very proud of being involved in."

Nahum has always imagined [not true] that I [Shurtleff] went to speak to Weatherhill and Tuttle before coming to Autumn Press. "I thought you came to me as a last resort, after they rejected your idea... I remember the day that I took a phone call from you. We were living in Hayama. I remember picking up the phone and hearing your voice at the other end–much like to tonight. You said, "Hi Nahum, this is Bill Shurtleff." Yeah. "I'm thinking of doing a book on tofu" something like that. "I said to myself–it was just an instinctive 'Great!' I think I said 'I think that's a great idea.'" It triggered something–like a light bulb went on in my mind.

© Copyright Soyinfo Center 2021

"As soon as I heard it, I thought it was a fabulous idea." We were struggling to get our own little publishing company going.

Bill recalls: I remember that phone call too. And I remember thinking 'Amazing–There's somebody else in the world who thinks this is a good idea."

Nahum continues: "I had an image of you as this waiflike creature who had been in my peripheral vision in Kyoto. You were a free spirit, doing interesting and bizarre things. I didn't know you, but I had an instinct that when you set your mind to something, you were going to do it. Only much later did learn about your family; I still remember that your grandfather had his own railroad car."

*The Book of Tofu* was the sixth book that Autumn Press published, but we had never done anything of its magnitude before. Lima Ohsawa's book was very helpful in preparing me to do *The Book of Tofu.* Through one of the editors at Weatherhill I was introduced to a woman cookbook editor in America. She taught me the high style in cookbook editing.

"I remember just before *The Book of Tofu* was published, that your mom, may she rest in peace, loaned Autumn Press some money–about $5,000–to help pay for the first printing. This loan was very important and helpful to Autumn Press, to get us over the hump."

Kim Chi Ha and *The Book of Tofu:* In 1974 Autumn Press published *Cry of the People,* by Kim Chi Ha–Poems written from jail by a South Korean dissident poet. Some years later Robert L. "Bob" Bernstein, the President and CEO of Random House, was in Japan. He had a strong personal interest in free speech, and he spoke up for oppressed writers around the world. He knew of Kim Chi Ha, and knew he was in a dungeon in South Korea because he wrote and spoke publicly against the country's dictator and tyrant. In Japan, Bernstein's translator, who was a friend of the Stiskins, gave him a copy of *Cry of the People.* He said that he wanted to meet the people who had published this book. Bernstein called Nahum just as Nahum was preparing to leave Japan after seven years. Nahum didn't know who Bernstein was and said he was sorry but he was too busy to meet with him. Back in the states, after realizing the opportunity he had missed, Nahum called Bernstein and accepted an invitation to visit his office in New York City. He took copies of each of Autumn Press' books, including *The Book of Tofu,* which had just been published. They talked about publishing and Bernstein was very interested to see what kind of books Autumn Press was publishing. Before they parted Bernstein said that Random House would like to distribute Autumn Press' books. This was a huge break for Autumn Press. Random House soon noted that *The Book of Tofu* was selling very well. Several years later at a sales conference, Dick Krinsley, in charge of Ballantine Books, approached Nahum and said he would like to buy the paperback rights to *The Book of Tofu.* Thank you Kim Chi Ha.

In 1978 Autumn Press published *Nuclear Madness: What You Can Do,* by Helen Caldicott, a physician and anti-nuclear activist from Australia. The book sold very well and was eventually very influential. However it led to the downfall of Autumn Press, in a process filled with conflict, in which Helen eventually sued Autumn Press. Address: Stanford, Connecticut.

1524. *SoyaScan Notes.* 1999. Update on Pulmuone (Overview). March 25. Compiled by William Shurtleff of Soyfoods Center.

• ***Summary:*** Pulmuone U.S.A. Inc. is a tofu manufacturer in southern California located at 4585 Firestone Blvd., South Gate, California 90280. With the recent economic hard times in South Korea, where the mother company is located, there have been a few rumors that Pulmuone in both California and Korea may be having hard times. However a talk with a tofu industry expert from Southern California indicates that both companies are quite solid and strong. He says that both the U.S. company and the Korean mother company are still in business, but like everyone in Korea, times are somewhat difficult there. The California subsidiary is focused on the Korean-American market, but they have entered the Japanese-American markets and supermarkets in a small way, and they are doing some private labeling. They are also making noodles, and they may be going into fish cake products. So if they are expanding their line into different categories, they probably still have a pretty solid base.

A Japanese tofu expert who knows the founder in Korea says that he was a student activist during the years of Korean dictatorships, and thus was prevented from going to college. So instead he started Pulmuone, which became a very successful health food company.

1525. Ionmag Corporation. 1999. Health tofu: Health tofu maker from Ionmag Corporation (Leaflet). Koyang Industrial Complex, 628, Siksa-Dong, Ilsan-Ku, Koyang City, Kyunggi-Do, Korea. 1 p. Single sided. 30 cm.

• ***Summary:*** See next page. Leaflet (glossy color) sent by Patricia Smith from Natural Products Expo West. 1999. March. A large color photo shows this red and clear plastic home tofu maker against a circle of soybeans with an orange and red border. "Coming to fresh tofu, tasty tofu within short time." Specifications: Weight: 5.5 kg. Height: 370 mm [14.6 inches]. Diameter: 240 mm. Material: Polycarbonate ABS [Acrylonitrile Butadiene Styrene], Stainless steel. Voltage: 110/220 volts. World patent pending.

Note: This machine is also widely advertised elsewhere for homemade soymilk. Address: Koyang City, Kyunggi-Do, Korea. Phone: (82-344) 968-0051/4.

1526. Liu, KeShun. 1999. Oriental soyfoods. In: C.Y.W. Ang, K. Liu, and Y-W. Huang, eds. 1999. Asian Foods: Science & Technology. Lancaster, Pennsylvania: Technomic Publishing

Co., Inc. 546 p. See p. 139-99. Chap. 6. March. [60 ref]
• ***Summary:*** Contents: Introduction: Soybeans as a crop, composition and nutritional quality of soybeans, soyfoods–from the east to the west, soyfood classification.

Soymilk: Introduction, traditional soymilk, modern soymilk (techniques for reducing beany flavors, commercial methods, formulation and fortification, homogenization, thermal processing, and packaging), concentrated and powdered soymilk, fermented soymilk (with lactic acid bacteria), soymilk composition and standardization.

Tofu: Introduction, methods of tofu preparation, factors involved in tofu making (soybean varieties, concentration of soymilk, heat process of soymilk, types of coagulants, concentration of coagulants, coagulation temperature, coagulation time, process automation, packaging), varieties of tofu (silken tofu, regular and firm tofu, Chinese semidry tofu {*doufu gan*}, Chinese tofu sheets and tofu noodles, lactone tofu), varieties of tofu products (deep-fried tofu, Japanese grilled tofu, frozen tofu {"Made almost exclusively in rural farmhouses and temples by putting tofu outdoors in the cold weather, frozen tofu was never sold as a commodity in the past"}, Japanese dried-frozen tofu, Chinese savory tofu {"In China there are many specially made tofu varieties known as savory tofu"}, fermented tofu {Sufu or Chinese cheese, varieties of sufu, preparation methods, preparation principle}).

Soymilk film (yuba). Soybean sprouts. Green vegetable soybeans. Other non-fermented soyfoods: Okara, roasted soy powder. Concerning okara: In some parts of China, okara is salted and spiced and used as a pickle. Or it can be simply added to a dish with meat and vegetables. In other parts of China it is made into okara tempeh [called *mei-dou-zha* or meitauza].

Fermented soy paste (Jiang and miso): Koji, koji starter, and inoculum (koji, koji starter, inoculum), Chinese jiang (traditional household method, pure culture method, enzymatic method), Japanese miso (preparing rice koji, treating soybeans, mixing and mashing, fermenting, pasteurizing and packaging), principles of making jiang or miso.

Soy sauce (Jiangyou or shoyu): Chinese jiangyou (traditional household method, modern methods), Japanese shoyu (treatment of raw materials, koji making, brine fermentation, pressing, refining), principles of making soy sauce, chemical soy sauce (made by acid hydrolysis; heat with 18% hydrochloric acid for 8-12 hours, then neutralize with sodium carbonate and filter to remove insoluble materials), proximate composition of soy sauce, quality attributes and grades.

Japanese natto: Methods of preparation, principles of preparation.

Indonesian tempeh: Traditional method, pilot plant method, principles of tempeh preparation. Fermented black soybeans (Douchi or Hamanatto): Chinese douchi, Japanese Hamanatto.

Tables: (1) Names (English, Chinese, Japanese, Korean, Indonesian, Malay, Filipino) general description, and utilization of nonfermented Oriental soyfoods.

Soy sprouts: Chinese: Huang dou ya, Da dou ya. Japanese: Daizu no moyashi. Korean: Kong no mool.

Yuba: Chinese: Dou fu pi, Fu zhu. Japanese: Yuba. Korean: Kong kook. Filipino: Fu chok.

Yuba (Soy pulp): Chinese: Dou zha / doufu zha. Japanese: Okara. Korean: Bejee. General: "Insoluble residue after filtration of soy slurry into soymilk."

Roasted soybeans (Soynuts): Chinese: Chao da dou. Japanese: Iri-mame. Korean: no name. Indonesian: no name

Roasted soy powder: Chinese: Chao dou fen, dou fen. Japanese: Kinako. Korean: Kong ka au. Indonesian: Bubuk kedelai. (2) Names (English, Chinese, Japanese, Korean, Indonesian, Malay, Filipino) general description, and utilization of fermented Oriental soyfoods. (3) Proximate composition (gm per 100 gm fresh weight) of some fermented soyfoods.

Figures show: (1) Flowchart: Traditional Chinese method for making soymilk and tofu (from whole soybeans). (2) A commercial processing method (Alfa-Laval) for making soybase and a subsequent product–soymilk. (3) Photo of homemade firm tofu. (4) Photo of a dish of tofu and mushrooms. (5) Photo of cubes of sufu (Chinese cheese) on a white plate. (6) Flowchart for making sufu from firm tofu. (7) Photo of two packages of dried yuba sticks (Chinese). (8) Photo of a bowl of soy sprouts. (9) Photo of Chinese chiang, and Japanese red and white miso, each on one of three spoons in a shallow white bowl. (10) Flowchart of a common method for making Japanese rice miso [red miso]. (11) Photo of soy sauce in three different containers: dispenser, small bottle, and large Chinese can. (12) Flowchart of a common method for making Japanese koikuchi shoyu (soy sauce). (13) Photo of two chopsticks lifting some Japanese natto from a bowl full of natto; the thin strings connecting the natto above and below are clearly visible. (14) Flowchart of a common method for making Japanese natto from whole soybeans. (15) Photo of tempeh made in the USA in perforated plastic bags (Courtesy of Mr. Seth Tibbott, Turtle Island Foods, Inc., Hood River, Oregon). (16) Flowchart of traditional Indonesian method for making tempeh from whole soybeans. (17) Photo of Chinese *douchi* (fermented black soybeans) on a white plate.

• ***Summary:*** Contents: Introduction. Foods of Bangladesh. Cambodian foods. Chinese foods: Food selection, eating behaviors, intracultural differences, feasts, holidays and special foods. Indian foods. Indonesian foods. Japanese foods. Korean foods. Laotian foods. Malaysian foods. Nepalese foods. Foods of Pakistan. Philippine foods. Thai foods. Vietnamese foods.

In each country and culture, the role and practice of vegetarianism is discussed.

Soyfoods are mentioned as follows: China (p. 458): "For breakfast, Northerners prefer warm soymilk and fried wheat-dough crullers." Vegetarians from both north and south get an important part of their protein "from a sophisticated cuisine based upon considerable use of gluten and tofu," made to look and taste like animal products.

Indonesia (p. 463): "... foods are preferred sweet; even the local soy sauce, kecap manis, is fermented sweetened."

Japan (p. 465): Mentions shoyu and tofu.

Korea (p. 468-69): Mentions tofu.

Malaysia (p. 472): Discusses Chinese who married Malay women (called Nonyas); "their families are called Peranakan or Straits Chinese and their cooking is called Nonya Cuisine. Straits Chinese live mostly in Penang, Malacca, and Singapore; practice Buddhism; and cook their Chinese food with a Malay influence. Their Nonya cuisine is eaten communally; all dishes are served at once,..."

Nepal (p. 473): "During Janai Purnima, a soup called *quantee* is essential; it is made from sprouted soy, chick pea, black beans,..."

Pakistan (p. 476): Pad Thai, a popular lunch dish, is made with tofu. Note: Pad Thai, based on rice noodles, is one of Thailand's national dishes. Address: PhD, R.D., Prof., the Dep. of Family, Nutrition and Exercise Sciences, Queens College-CUNY, Flushing, New York.

1528. Fischer, Bruno. 1999. Sale of his company, Bruno Fischer GmbH (in Aetorf, Germany), to DE-VAU-GE in Germany (Interview). *SoyaScan Notes.* April 2. Conducted by William Shurtleff of Soyfoods Center.

• ***Summary:*** Bruno is a devout Seventh-day Adventist and DE-VAU-GE (DVG–Granovita) is a Seventh-day Adventist company. Many years ago DVG got out of the soymilk business; they sold their soymilk plant to Korea; it is now the third soymilk plant of Samyung Foods in Korea. Bruno is now interested in getting back into the soymilk manufacturing business in a different way. On 31 Dec. 1998 he sold all of his family-owned company, Bruno Fischer GmbH (in Aetorf, Germany) to DVG–for money. Bruno did not keep or exchange any stock. He now works as a consultant for DVG and no longer owns any part or shares of his former company. He sold the company largely because DVG contacted him at a very appropriate time and offered a very good price. The company had always been run as a triumvirate, his mother, his father, and Bruno. But during the summer of 1998, Bruno's mother had died very unexpectedly. Four weeks later, Bruno's father announced that he would like to get out of the business as soon as possible. This would mean major restructuring. Several months later, out of the blue, came the offer from DVG–like a gift from God. Bruno was not looking for a buyer. The timing was perfect. DVG was looking to buy a company that would allow them to penetrate the organic and natural foods food market better. They had a shopping list and Bruno's company was No. 1 on that list. DVG sells most of their products to the Reform Houses (the predecessor to the natural foods market and stores–*Naturkostlaeden*). DVG already owned a small company in the organic and natural foods market; they had tried for years, using this company, to penetrate the market, unsuccessfully. So they decided that they needed to buy one of the key players in that market.

DVG is owned by the Seventh-day Adventist Church. They contribute significant amounts of money to the church, but if they need money, they must go to non-church sources (mainly banks). Nevertheless DVG has grown at an astonishing rate. Fifteen years ago they had annual revenues (sales/turnover) of about 5 million Deutschmarks; today that figure has increased to about 200 million Deutschmarks. His experience in negotiating with DVG was that they were very ethical and fair. They offered attractive help in moving or severance pay (about one month's salary for each year they had worked for Fischer) to Bruno's former employees in Aetorf after his equipment was moved 400 km (250 miles) away northward to Lueneburg.

Bruno has a non-compete agreement with DVG, but they are interested in buying soymilk from him if should ever decide to make it. They now buy from Alpro.

Katrin [pronounced KAT-rin] Senger, who lives in Munich, is a colleague of Bruno's. She is doing her diploma thesis (something between a BA and an MA thesis) on his behalf on the soy market in Europe.

Bruno has started a new company named Natumi GmbH, located at the same address as his former company. Phone: +49 2243 850 162. Fax: +49 2243 850 172. The sale of his company to DVG is public knowledge. Address: Im Auel 88, 53783 Aetorf, Germany. Phone: 49-2243-4021.

1529. Yoo, S.K.; Cho, W.H.; Kang, S.M.; Lee, S.H. 1999. Isolation and identification of microorganisms in Korean traditional soybean paste and soybean sauce. *Korean J. of Applied Microbiology and Biotechnology* 27(2):113-17. April 28. [22 ref. Kor; eng]

• ***Summary:*** "As a basic study for quality improvement of Korean soybean paste and soybean sauce, we investigated on microflora of soybean paste and soybean sauce fermentation. Major microorganisms were isolated from the sample pastes and sauces, and identified systematically. Selected microorganisms were identified by MIS whole cell fatty acid analysis by gas chromatography. Identification

© Copyright Soyinfo Center 2021

results showed that *Bacillus licheniformis, Bacillus pumilis* and *Bacillus subtilis* were dominant in soybean paste and *Staphylococcus vitulus, Bacillus subtilis, Bacillus pumilus,* and *Lactobacillus fermentum* were dominant in soybean sauce. It seemed that these microorganisms played an important role in soybean paste and soybean sauce fermentation and could be used for the further studies such as protease and amylase activities."

Note: As of Jan. 2020 this journal is titled *Microbiology and Biotechnology Letters.* Address: Dep. of Biotechnology, College of Engineering and Bioproducts Research Center, Yonsei Univ., 134 Shinchon-Dong, Sudoemun-Ku, Seoul 120-749, Korea.

1530. Murphy, Patricia A. 1999. A new database on the isoflavone levels in foods, commercial ingredients, and soybeans (Interview). *SoyaScan Notes.* June 24. Conducted by William Shurtleff of Soyfoods Center. [1 ref]
• ***Summary:*** In April 1999 a new database became available on the Internet at www.NAL.USDA.gov/FNIC/FoodComp / Data/Isoflav/Isolfav.html. There are several files which are downloadable. Data are given for 160 foods, most of which are soy-related. Many individual branded products are included, such as Gimme Lean! or Lightlife Lean Links or Mead Johnson's Prosobee (infant formula). Soy oil is also included–just to show that it contains no isoflavones.

For each food, data may be given for daidzein, genistein, glycitein (pronounced gly-SEE-tun; if available), and total isoflavones. For each of these four information may be given on: Average, mean, and maximum, standard error, sample size, confidence code (A=best, C=least). of all published data. Finally a list of the numbers of all the references used to get this data. So there might be 7 references used to generate the mean value for tofu.

Soybeans themselves are also included, with data given for food-type soybeans, commodity-type soybeans, plus reports from Japan, Korea, Taiwan, etc. But there is no data on individual soybean varieties. Supplements are not included. For each food, some data is given on the isoflavone content The information in the database comes from published scientific studies and from work at Iowa State University's project on national sampling of foods. The food composition lab people will be updating the data as it is collected. There is also a separate file for items which are more typical of clover and alfalfa, which have different isoflavones.

The person in charge of the project is Gary Beecher, in the USDA Beltsville Lab. [Maryland], food composition group. David Haytowitz is the statistician. The funding came from the U.S. Army, Medical Branch, Breast Cancer Research Initiative. This year Congress, "in its wisdom," couldn't give any more money to HHS (the U.S. Department of Health and Human Services), so they gave a large amount of money to the Defense Department for work that would typically be done by NIH (National Institutes of Health). But the army has run this huge program very well–perhaps better than some NIH programs.

Note: NIH is under the Public Health Service, within HHS. Address: 2312 Food Sciences Building, Food Sciences and Human Nutrition Dep., Iowa State Univ., Ames, IA 50011.

1531. *ASA Today* (*St. Louis, Missouri*). 1999. Non-GMO niche markets may offer premium opportunities. 5(8):4. June.
• ***Summary:*** Since 1997, Brazilian suppliers have received a premium of up to 50% for non-GMO soybeans. Countries importing non-GMO soybeans include Norway, Korea, and Japan. Last year ADM and other processors paid fairly substantial premiums for non-GMO beans. Farmers who want these premiums and plant both GMO and non-GMO beans must clean their combines and bins.

1532. *Canadian Soybean Bulletin* (*OSGMB, Chatham, Ontario, Canada*). 1999. Canadian soybean exports. 13(1):4. June.
• ***Summary:*** A large table shows statistics on tonnes (metric tons) of soybeans exported to various countries, and regions, each year from 1994/95 to 1997/98. The countries are: In Asia–China, Hong Kong, Indonesia, Japan, Malaysia, Philippines, Singapore, South Korea, and Thailand. In Western Europe–Austria, Belgium, Denmark, France, Germany, Italy, Netherlands, Norway, Portugal, and Spain. By continent–Africa, Central America, Eastern Europe, Middle East, Oceania, South America, and United States.

In 1997/98 the countries to which the largest amount of Canadian soybean exports went were (in tonnes): Norway 159,000, United States 134,706, Japan 62,931, Portugal 58,465, Spain 34,759, Hong Kong 23,210, Belgium 20,687, and Malaysia 20,539.

1533. Bender, Karen. 1999. Work with soybeans, tofu, and biotechnology (Interview). *SoyaScan Notes.* July 12. Conducted by William Shurtleff of Soyfoods Center.
• ***Summary:*** Karen has done considerable research trying to find which compositional properties of soybeans contribute to tofu yield and organoleptic quality. Her research (like that conducted at Iowa State University) could find no variable or combination of variables that correlated positively with higher tofu yields.

She did considerable work with Korea, trying to find a way to get the Korean government to accept shiploads of special soybeans for tofu–but could not get them to make any changes in their strict rules. The cost of shipping identity preserved (IP) soybeans in containers is too high.

IFIC is a non-profit group based in Washington, DC, funded by large food and agribusiness companies, that tries be a source of accurate and fair information on biotech

© Copyright Soyinfo Center 2021

foods. Karen believes they do a good job.

This coming October, a potentially very interesting and important conference on biotechnology and food will be held in Chicago, Illinois. Sixty people have been invited to attend, representing agribusiness, academia, and consumers. It will closed to those not invited.

In one of its next 2-3 issues, Consumer Reports will publish an entire issue on genetically engineered foods. Address: Dep. of Agricultural and Consumer Economics, 1301 W. Gregory Drive, 304c Mumford Hall, Univ. of Illinois at Urbana-Champaign, IL 61801. Phone: 217-333-1694.

1534. Hesser, Amanda. 1999. Bet you can't eat just one soybean. *New York Times.* Sept. 8. p. F3. [1 ref]
• ***Summary:*** An excellent article on edamame (green vegetable soybeans), which are now becoming more popular in America. Trader Joes has been selling frozen green soybeans for 10 months. Sales at SunRich in Hope, Minnesota, have risen 25% in each of the last two years. Allan Routh, president, says he sells as many as he can grow. Recently SunRich began distributing the beans, grown mainly in Iowa and Minnesota, to mainstream grocery stores.

"Now that soy is being heralded for healthfulness," soybeans are seen as remarkable. But health is not the sole driving force behind the new interest in edamame. "Next to a bag of chips, soybeans in the pod happen to be the world's easiest hors d'ouevre." In Japan they are served in practically every bar. "In New York, edamame appears on the menus of most Japanese restaurants, usually among the appetizers. It also shows up on Korean and Chinese menus, as well as on ones that are not Asian"–such as Avenue [85th St. and Columbus Ave.] and Gourmet Garage [7th Ave. at 10th St.].

Most cooks and connoisseurs agree that fresh green soybeans are better than frozen. They have a sweeter and cleaner taste, and more snap when you bite into them. Frozen ones lack this sweetness and have a starchier, almost glutinous texture. The owner of two Chinese restaurants in New York City refuses to serve them frozen because freezing "ruins the texture."

Discusses which Asian-American restaurants in New York City serve green vegetable soybeans, and how they are served. Contains two recipes: Soybeans in the pod. Rice with edamame (*Mame gohan*). Color photos show: (1) A man picking green soybeans in a field; (2) A close-up of edamame pods.

1535. Bernard, Richard L. 1999. Re: Which soybean varieties are large-seeded and which are small-seeded. Letter to William Shurtleff at Soyfoods Center, Sept. 9–in reply to inquiry of Aug. 30. 5 p. Handwritten on letterhead.
• ***Summary:*** 1. Grande is large seeded. 2-3. Which Jackson? 4. Perry, Shore and Yelnando are grain type soybeans, not vegetable type. 5. "I compared your list of 'vegetable' types with my info and have a few comments." Protana, Provar and Proto and not large seeded; "they are specialty varieties released for their high protein content so probably should be put in a different category. This will be a growing category in the future–i.e., soybeans with special compositional traits."

"Three of those on your list [of large-seeded varieties], Hiro, Suru, and Chame, are not in the germplasm collection since there was no seed available under these names in 1949. Interestingly all 3 PI strains to which the record equates them are in the collection. I didn't change them to the cv. [cultivar] name when I was rearranging the collection in the 1950s since there was doubt about the trueness to type of these old accessions (2 of these 3 differed distinctly from an old inviable seed sample of the original PI strain). I guess none of this affects your handling of these 3 since you are dealing with the written record.

"Your listing of the old introduced varieties as 'New U.S. domestic soybean variety' requires some explanation I should think (or perhaps better terminology) since many of these are simply renamed foreign cultivars (often by simply shortening the foreign name or perhaps not changing it at all, e.g., Rokusun).

Also some of these are not very large seeded but I have no reason to doubt that they may be considered to be 'vegetable type.' There are two missing from your list that you may want to include: Hidatsa and Pando.

Page 3 is "Comments on your list of 16 possible candidates for the large seeded vegetable-type list." The following are grain types (not vegetable types): Delsta, Delnoshat, Mandell, Perry, Shore, Yelnanda, and [Yelnando]. Anwei, Chuku and Kirin were from the La Choy Co. in Ohio according to Morse [1948] and so one might think they were food types but I have no record of them and would not include them [as vegetable types] (they could be sprout types!). Fiskeby V is foreign and should not be included (its also a grain type in my estimation). Burwell, Kabott, and Portugal are in the collection but I have no info on their intended use. Kabott is quite large (100 seeds weigh 27 gm) and so on that basis should probably be considered a vegetable type. Burwell and Portugal are a little large for grain type (100 seeds weigh 22 gm) and Burwell is black, so I am on the fence on these and would depend on your written sources to decide. Hidatsa should be included (see above). I have never heard of 'Ra.' It's not in Morse's 1948 very inclusive list and I wonder if it is a misprint.

Note: Ra was first tested in 1975 as a "vegetable soybean" by Rodale's Organic Gardening and Farming (OGF) Research and Development Group in Pennsylvania.

There follow two handwritten reports: "Report #1: Bernard's date is earlier than Shurtleff." Delsoy, Emerald (1975), Funk Delicious (1937), Harovinton (1989), Kahala, Kaikoo, Kailua, and Mokapu Summer (All were released in 1969 by the University of Hawaii Agric. Exp. Station in Honolulu), Protana (1969), Provar (1969), Proto (1989),

© Copyright Soyinfo Center 2021

Sanga (1945), Verde (1967, 1968), Vinton (1978), Vinton 81 (1981).

"Report #2: Soyfoods Center date is earlier than Bernard." Aoda, Sioux (1938), Chame, Hiro, Suru (lost, discarded, or not in collection, therefore not in Technical Bulletin 1746), Cherokee, Disoy (did *Soybean Digest* jump the gun? Disoy was in regional tests before its 1967 release; three documents enclosed), Easycook, Giant Green, Imperial. Willomi, Jackson (Which "Jackson"? "This confusion illustrates clearly why variety names should not be used again... As for the old Jackson, I don't know of a description of it other than our germplasm evaluation report {Technical Bulletin No. 1844}, copy enclosed {as PI 82581}. For the germplasm collection we simply turned the original Jackson back into a PI strain and maintain it as PI 82581 [Chontekon, PI 82581, was Chontekon, from Rep. of Korea, introduced in 1929]. The Jackson released in 1953 is an entirely different variety"). Mendota, Rokusun, Seminole. Address: Prof. of Plant Genetics (Retired), Dep. of Crop Sciences, AW-101 Turner Hall, Univ. of Illinois, Urbana, IL 61801-4798.

1536. Han, Ouk-Kyu; Abe, Jun; Shimamoto, Yoshiya. 1999. Genetic diversity of soybean landraces in Korea. *Korean Society of Crop Science* 44(3):256-62. Sept. [25 ref. Eng]
• ***Summary:*** "In Korea, soybean cultivation can be traced back to about 2,500 years ago (Kwon, 1972). Consequently various landraces of different morphological and agronomic traits have been established, and are very useful as genetic resources for improvement of modern cultivars (Kwon, 1972). However, most such indigenous soybeans have been rapidly replaced by newly released improved varieties. This will doubtless cause a loss of genetic diversity in the Korean soybean population." Address: School of Plant Resources, College of Agriculture, Dankook Univ., Chonan 300-714, Korea.

1537. *Honolulu Star-Bulletin* (*Hawaii*). 1999. Wraps, skewers and sushi from Hanaki. Dec. 22. p. 24.
• ***Summary:*** The recipe for "Spicy Tuna" calls for (among other things):
"1 cup mayonnaise
"¼ cup chile pepper sauce
"¼ cup chile Kochujan Miso (hot chili miso sauce)"

1538. Choi, Shin-Yang; Cheigh, M.J.; Lee, J.J.; Kim, H.J.; Hong, S.S.; Chung, K.S.; Lee, B.K. 1999. [Growth suppression effect of traditional fermented soybean paste (doenjang) on the various tumor cells]. *J. of the Korean Society of Food Science and Nutrition* 28(2):458-63. [33 ref. Kor; eng]
• ***Summary:*** "Methanol extract and its fraction of traditional fermented soybean paste (doenjang) from Soonchang area were studied for growth suppression on the various tumor cells and suppression components, by using HPLC and GC were analysed. Hexane fraction of methanol extract was indicated 79%, 76%, 67%, 66%, 78% of growth suppression on L1210, P338D1, HepG2, WiDr and SNU-1 tumor cells, respectively. Ethylacetate fraction of methanol extract also showed 81%, 75%, 75%, 76% and 82% of growth suppression on the same tumor cells, respectively. Peak 8 obtained from HPLC of ethylacetate fraction indicated 81%, 77%, 77%, 75% and 79% of growth suppression on the same tumor cells and identified as a genistein, by comparing with standard one by HPLC analysis. Hexane fraction of methanol extract contained oleic acid, linoleic acid and palmitic acid." Address: Korea Food Research Inst., Songnam 463-420, Korea.

1541. Lee, Jae-Jung; Lee, D.S.; Kim, H.B. 1999. [Fermentation patterns of Chungkookjang and Kanjang by *Bacillus licheniformis* B1]. *Korean J. of Microbiology* 35(4):296-301 [19 ref. Kor; eng]
• ***Summary:*** "A Bacillus strain from Korean soil was isolated and identified to be *Bacillus licheniformis* B1 through various biochemical tests... This study demonstrated successive fermentation of Chungkookjang and Kanjang by B. licheniformis B1 isolated from nature, and suggested possible development of food rich in browning and nucleic acids." Address: Dep. of Life Sciences, Hoseo Univ., Asan-Si, 336-795, Changnam, Korea.

1542. Lim, Sun-Young; Park, K.Y.; Rhee, S.H. 1999. [Anticancer effect of doenjang in *in vitro* sulforhodamine B (SRB) assay]. *J. of the Korean Society of Food Science and Nutrition* 28(1):240-45. [24 ref. Kor; eng]
• ***Summary:*** "Growth inhibitory effect of doenjang (Korean soypaste) methanol extracts in SRB assay using AGS human gastric adenocarcinoma cell, Hep 3B human hepatocellular carcinoma cell and HT-29 human colon cancer cell was studied. The treatment of doenjang methanol extracts (2mg/assay) to the AGS, Hep 3B and HT-29 cancer cells inhibited the growth of the cancer cells by 55%, 60%, and 71%, respectively. Doenjang methanol extracts exhibited the highest inhibitory effect among other soybean fermented foods and original materials in the SRB assay. In addition, to separate active compounds of

© Copyright Soyinfo Center 2021

doenjang methanol extracts, we fractionated the doenjang with hexane, methanol, dichloromethane, ethylacetate and butanol. Growth inhibitory effect on the AGS, Hep 3B, HT-29 and MG-63 cancer cells was the highest in the fractions of dichloromethane and ethylacetate among other solvent fractions of the doenjang. These results showed that some compounds contained in the fractions of dichloromethane and ethylacetate might play a role on the anticanceric effect of doenjang." Address: Dep. of Food Science and Nutrition, Pusan National Univ., Pusan 609-735, Korea.

1543. Park, Kun-Young; Son, M.H.; Moon, S.H.; Kim, K.H. 1999. [Cancer preventive effects of doenjang in vitro and in vivo. 1. Antimutagenic and in vivo antitumor effect of doenjang]. *J. of the Korean Association of Cancer Prevention* 4(2):68-78. [36 ref. Kor; eng]
• ***Summary:*** "Antimutagenic and in vivo antitumor effects of doenjang (hexane, methanol and boiling extracts) were studied by using Ames test, SOS chromotest and Sarcoma-180 tumor cell-transplanted mice. The hexane, methanol and boiling extracts from doenjang showed strong antimutagenic activities (90-91% inhibition) toward aflatoxin B1 (AFB1) in Salmonella typhimurium TA98 and TA100." Address: Dep. of Food Science and Nutrition, and Pusan Cancer Research Center, Pusan National Univ., Pusan 609-735, Korea.

• ***Summary:*** "Eight soybean varieties including Danyeobkong, Danbaegkong, Kwanankong, Pureunkong, Manlikong, Sinpaldalkong 2, Jinpeumkong and Hwankeumkong were used for experiment. On the basis of quality characteristics of raw materials, such as seed coat weight rate, hydration swelling, and the content of fructose, glucose and sucrose, and chonggugjang, such as hardness, gamma-glutamyltranspeptidase, activity, free amino acid content, and amino type nitrogen content, Sinpaldakong 2 and Danyeobkong were desirable soybean cultivars for high quality chonggugjang processing." Address: National Rural Living Science Inst., Suwon 441-100, Korea.

1545. Ang, Catharina Yung-Kang Wang; Liu, KeShun; Huang, Yao-Wen. 1999. Asian foods: Science & technology. Lancaster, Pennsylvania: Technomic Publishing Co. 546 p. See p. 468. Illust. 24 cm.
• ***Summary:*** Contains 16 chapters by various authors. Chapters 6, 15 and 16 are cited separately.

Page 234: In Korea, meats are often flavored with *denjang,* a fermented soybean paste. *Gochu jang,* is a very hot fermented chili paste. Tofu is called *tobu.* Address: PhD, R.D., Research Chemist, National Center for Toxicological Research, U.S. Food and Drug Administration, Jefferson, Arkansas.

1546. Bladholm, Linda. 1999. The Asian grocery store demystified: A food lover's guide to all the best ingredients. Los Angeles, California: Renaissance Books. 234 p. Foreword by Jonathan Eismann. Illust. Index. 23 x 13 cm. Series: A Take it With You Guide.
• ***Summary:*** An original, well-researched and well-written book–though some of the terminology (such as "beancurd") is outdated. Soyfood products include: Beancurd noodles (p. 38). Kinako (p. 47. "A Japanese soybean flour, that is a light tan powder made by roasting and grinding soybeans. This flour is mixed with sugar and used to coat mochi (pounded rice cakes), ohagi (rice balls), and wagashi (a type of confection [Japanese confections]). Look for the Shirakiku brand and Assi roasted soybean flour, both in 1-pound bags"). Soy sauce, mushroom soy sauce, kecap manis (p. 53). Hoisin sauce (p. 54).

Chapter 10, titled "Soybean products" (p. 93-99) includes: Black bean sauce, dried soybeans, tempeh, beancurd (pressed beancurd, deep-fried beancurd, savory grilled beancurd {yaki-tofu}, freeze-dried beancurd [sic] {koyadofu}, bean curd sheets {fu pei, yuba, fu jook; the latter are "rolled-up, long, rumpled, cream-colored sticks of bean curd skin, bent in two"}), fermented beans (preserved black beans {fermented black beans, tau see}, bean sauce, toen-jang, chili/hot bean sauce, fermented beancurd), okara, edamame, soybean sprouts, soy milk.

Note: This is the earliest English-language document seen (March 2009) that uses the word "toen-jang" (or "toen jang") to refer to Korean-style soybean jang (miso).

Concerning preserved black beans: "Also called salted or fermented black beans or 'tau see,' this is made by steaming small black soybeans, then fermenting them with salt and spices. Used in a variety of dishes to add a pleasant rich aroma and salty taste... Crush or mash beans slightly to release more flavor or mix with garlic, fresh ginger, or chilies. Available in small glass jars, cans, and plastic bags. They should feel soft and not be dried out... Look for Pearl River Bridge brand labeled 'Yang Jiang Preserved Beans' in a 1-pound yellow canister, and Koon Chun Sauce Factory, Double Parrot, and Zu Miao Trademark brands all in 8-ounce bags." Note: This is the earliest English-language document seen (Nov. 2011) that uses the term "tau see" to refer to Chinese-style fermented black soybeans (preserved black beans).

Concerning bean sauce: "Varieties of this Asian staple include yellow bean sauce, brown bean sauce, bean paste (tau jeong), or sweet bean condiment. All are made from yellow or black soybeans, fermented with salt and in the sweet Northern Chinese type, with sugar-sweetened crushed yellow [soy] beans. Two forms are found: whole beans in

© Copyright Soyinfo Center 2021

a thick sauce and bean paste, which is mashed, ground or pureed beans. The whole bean type has a rounder flavor and adds texture, while the pastes are very salty and should be used sparingly... The yellow bean paste is tau cheo... Sold in glass jars and cans. Look for Koon Chun Sauce Factory, Kon Yick Wah Kee bean sauce, Amoy, or Yeo's.

Chapter 18, titled "Japanese food products" (p. 168-81) includes: Tsukemono (pickled in miso), miso paste, shiromiso, akamiso, mamemiso, natto, miso soup, noodle dipping sauce base (memmi), tamari sauce, teriyaki sauce, tonkatsu sauce.

Interesting non-soy products include: Sesame paste (p. 57). Satay sauce (with peanuts), gado-gado-dressing (p. 58). Peanut oil (p. 64). Sesame oil (p. 65). Amaranth (vegetable, p. 72). Winged beans (p. 76). Pickled wheat gluten (p. 108). Sesame seeds, peanuts, roasted peanuts (p. 118). Red/azuki beans, agar-agar (p. 121). Wheat gluten (p. 127). Sesame candy, peanut roll (p. 136). Sesame seed and peanut cookies (p. 137). Sweet red bean paste (azuki *an*, p. 139). Coix seed (Job's tears, p. 165). Japanese seaweed and kelp (p. 169-70). Umeboshi (p. 171). Fu (dried wheat gluten cakes), mochi (p. 177).

Note: Although angkak / ang-kak is not mentioned by name, under "red yeast rice" part of the description is "Did you ever admire those glowing red ducks and spare ribs in Chinese restaurants? The red color comes from powdered red yeast rice which is an ingredient in the marinade and barbecue sauce." Since this product is made with a mold (*Monascus purpureus*) and not a yeast, we prefer the term "red rice koji" in English. Address: Writer, designer, illustrator and photographer, Miami Beach, Florida.

1547. Joshi, V.K.; Pandey, A. eds. 1999. Biotechnology: food fermentation; microbiology, biochemistry and technology. 2 vols. New Delhi, India: Educational Publishers & Distributors. Exclusive distributors: Asiatech Publishers Inc. Illust. Index. 25 cm.

• ***Summary:*** In Vol. II ("Applied"), Chap. 13, "Oriental Fermented Foods" (p. 523-82; 212 references) starts with the following contents: 1. Introduction. 2. Legume dishes: Soy sauce, miso, tempeh, natto, sufu, ontjom, dawadawa. 3...

Table 1 contains these additional soybean fermented foods: Chee-fan (China); Hamanatto (Japan). Kecap / Ketjap (Indonesian soy sauce). Kinema (Nepal, Sikkim & Darjeeling). Meitauza (China, Taiwan; Fermented okara). Meju (Korean soybean koji). Soybean milk (China; sometimes fermented).

The index to Vol. I contains entries for natto, miso (chiang), and tempeh.

1548. Okura Boeki-cho (Ministry of Finance, Division of Trade). 1999. Miso yûshutsu tsûkan jisseki–Heisei 10 nen [Japan miso exports worldwide in 1998]. Tokyo, Japan. 1 p. [1 ref. Jap]

• ***Summary:*** This 1-page table, written in Japanese, gives the exports of miso to various countries, in calendar year 1998, by region. We will list them here in descending order of volume by region–in kilograms. Asia: Taiwan 349,591. Hong Kong 332,325. Korea 232,115. Singapore 120,681. Thailand 100,459. Philippines 44,605. Malaysia 40,129. Indonesia 26,585. China 23,024.

Middle East: United Arab Emirates (*Arabu*) 9,895. Israel 4,887. Kuwait 1,256.

Europe (Western and Eastern): Netherlands 115,703. Germany 102,724. England 74,231. France 45,971 Sweden 40,170. Italy 20,283. Belgium 17,932. Austria 13,370. Spain 6,118. Denmark 4,090. Canary Islands (Spain) 2,000. Russia 1,715. Finland 1,310. Switzerland 450.

North America: United States: 2,297,893. Canada 242,240.

Latin America: Argentina 12,589. Brazil 12,338. Costa Rica 400.

Africa: South Africa 2,678.

Oceania: Australia 164,601. Guam 31,553. New Zealand 27,621. Mariana Islands 6,578 (of which the largest is Guam). Palau Islands 650.

Note: This is the earliest document seen (March 2010) concerning soybean products (miso) in Palau; soybeans as such have not yet been reported.

Total exports. 4,531,300 kg. Total amount of miso made in Japan in 1998: 548,750,000 kg. Percent of miso made that is exported: 0.82%. Address: Japan.

1549. Wolff, David. 1999. To the Harbin Station: The liberal alternative in Russian Manchuria, 1898-1914. Stanford, California: Stanford University Press. xiv + 276 p. Plus 15 unnumbered pages of plates. Foreword by Nicholas V. Riasanovsky. Illust. Index. 24 cm. [300+ ref]

• ***Summary:*** This is the author's PhD thesis transformed into a book. He speaks Russian, Chinese, and Japanese, and has done extensive archival research in each.

From the publisher: "In 1898, near the projected intersection of the Chinese Eastern Railroad (the last leg of the Trans-Siberian) and China's Sungari River, Russian engineers founded the city of Harbin. Between the survey of the site and the profound dislocations of the 1917 revolution, Harbin grew into a bustling multiethnic urban center with over 100,000 inhabitants. In this area of great natural wealth, Russian, Chinese, Japanese, Korean, and American ambitions competed and converged, and sometimes precipitated vicious hostilities.

"Drawing on the archives, both central and local, of seven countries, this history of Harbin presents multiple perspectives on Imperial Russia's only colony. The Russian authorities at Harbin and their superiors in St. Petersburg intentionally created an urban environment that was tolerant not only toward their Chinese host, but also toward different kinds of 'Russians.' For example, in no other city of the

© Copyright Soyinfo Center 2021

Russian Empire were Jews and Poles, who were numerous in Harbin, encouraged to participate in municipal government. The book reveals how this liberal Russian policy changed the face and fate of Harbin."

"As the history of Harbin unfolds, the narrative covers a wide range of historiographic concerns from several national histories. These include: the role of the Russian finance minister Witte, the building of the Trans-Siberian Railroad, the origins of Stolypin's reforms, the development of Siberia and the Russian Far East, the 1905 Revolution, the use of ethnicity as a tool of empire, civil-military conflict, strategic area studies, Chinese nationalism, the Japanese decision for war against the Russians, Korean nationalism in exile, and the rise of the soybean as an international commodity. In all these concerns, Harbin was a vibrant source of creative, unorthodox policy and turbulent economic and political claims."

Soybeans are mentioned on pages 18, 91, 160, 169, 233. Address: PhD.

1550. Yi, Han-ch'ang. 1999. Chang: Yoksa wa munhwa wa kongup Soul T'ukpyolsi: Sin'gwang Ch'ulp'ansa. 267 p. Illust. (some color). 26 cm. [Kor]*

• ***Summary:*** Discusses: The history of fermented soyfoods and the fermented soyfoods industry in Korea. Soy sauce and hot pepper sauces in Korea. Address: South Korea.

1551. [Science of soybeans]. 1999. Seoul, Korea: Daekwang Publishing Co. See p. 1-14. *

• ***Summary:*** The cultivation of soybeans has been traced back to the ancient Kokuryo [Koguryo, Goguryeo] dynasty in Korea, in what is presently southern Manchuria in China. It is believed that soybeans and soyfoods have been consumed in Korea since the 3rd century B.C.

Note: According to Wikipedia (March 2009), the Goguryo state was founded in 37 BCE, long after the 3rd century B.C. The source of this information is two documents, the *Samguk Sagi* (*History of the Three Kingdoms,* completed in AD 1145; it is Korea's oldest extant history. Its chief compiler was Kim Pu-sik) and the *Samguk Yusa* (*Memorabilia of the Three Kingdoms,* in the late 13th century, a century after the *Samguk Sagi*). Unlike the more factually-oriented *Samguk Sagi*, the *Samguk Yusa* focuses on various folktales, legends, and biographies from early Korean history. Many of the founding legends of the various kingdoms in Korean history are recorded in the book.

1552. Hansen, Barbara. 2000. Beyond Korean cuisine: Kang Nam, with casseroles and barbecue, also has a sushi bar, Japanese menu. *Los Angeles Times* (*California*). Feb. 3. p. 182.

• ***Summary:*** We warmed up "with cups of barley tea. Then we ordered a series of Korean casseroles. The first, tofu *chigae* was little cubes of tofu, bits of beef and zucchini slices..."

"Next came *daen jang chi gae,* more tofu chunks in a heavy black stone pot so hot we didn't dare touch it."

"... a sort of Korean frittata accompanied by a soy dipping sauce with sesame seeds. The side dishes... included beef brisket boiled in seasoned soy sauce with fresh green shishito chiles." Address: Counter Intelligence, Times staff writer.

1553. Shurtleff, William; Aoyagi, Akiko. comps. 2000. Soy sprouts–Bibliography and sourcebook, 2nd century A.D. to 1999: Detailed information on 957 published documents (extensively annotated bibliography), 62 commercial soy sprout products, 59 original interviews (many full text) and overviews, 48 unpublished archival documents. Lafayette, California: Soyfoods Center. 408 p. Subject/geographical index. Author/company index. Language index. Printed 25 Oct. 1999. 28 cm. [1065 ref]

• ***Summary:*** This is the most comprehensive bibliography ever published on soy sprouts. It is also the single most current and useful source of information on this subject available today, since 88% of all references (and most of the current ones) contain a summary/abstract averaging 247 words in length.

This is one of more than 40 bibliographies on soybeans and soyfoods being compiled by William Shurtleff and Akiko Aoyagi, and published by the Soyfoods Center. It is based on historical principles, listing all known documents and commercial products in chronological order. It features: 37 different document types, both published and unpublished, every known foreign language publication on the subject, extensive translations of many Japanese and European works, and many original interviews. Thus it is a powerful tool for understanding the development of this subject and related products from its earliest beginnings to the present, worldwide.

Compiled one record at a time over a period of 24 years, each reference in this bibliography features (in addition to the typical author, date, title, volume and pages information) the author's address, number of references cited, original title of all non-English publications together with an English translation, month and issue of publication, and the first author's first name (if given).

It also includes details on 60 commercial soy sprout products, including the product name, date of introduction, manufacturer's name, address and phone number, and (in many cases) ingredients, weight, packaging and price, storage requirements, nutritional composition, and a description of the label. Sources of additional information on each product (such as references to and summaries of advertisements, articles, patents, etc.) are also given.

Details on how to use the bibliography, a complete subject and geographical index, an author/company index, a language index, and a bibliometric analysis of

© Copyright Soyinfo Center 2021

the composition of the book (by decade, document type, language, leading periodicals or patents, leading countries, states, and related subjects, plus a histogram by year) are also included. Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549. Phone: 925-283-2991.

1554. Tokyo Abura Tonya Ichiba [Tokyo Oils & Fats Wholesalers Cooperative Union]. 2000. Tokyo Abura Tonya Shi: Abura sho no rutsu on tazuneru [History of the Tokyo Oils and Fats Wholesalers: Searching for the roots of the merchants of oils and fats]. Tokyo: Tokyo Oils & Fats Wholesalers Cooperative Union. vi + 158 p. Illust. (some color). No index. 26 cm. [5 ref. Jap]

• ***Summary:*** Contents: Part I: The oil and fats business–an account of its history (p. 11). Note that the members of this union market both vegetable oils and animal fats (lard from pigs and tallow from cattle). 1. Roots (origin) of oil (p. 13): Origin of oil (p. 14), merchants of middle ages (p. 23), commerce of the middle ages (p. 29).

2. Edo period–Thriving wholesale oil dealers (p. 34): Economy of the Edo period (p. 35), sea transportation during the Edo period (p. 41), innovations in pressing out oil (p. 47), establishment of a fellow trader of stocks (p. 50), policy of the military government of the Edo period for wholesale dealers (p. 62).

Part II: 100 year history of the Tokyo wholesale oil dealers market (p. 95). 1. The beginning of the Tokyo wholesale oil dealers market (p. 97). 2. Tribulations of the Taishô period (p. 116). 3. Talking about wholesale oil dealers–memories / stories (p. 124). 4. Leaping wholesale oil dealers of the Shôwa period (p. 129). 5. History (steps) of wholesale oil dealers after World War II (p. 137).

Photos show: (1) First color photo–Cover of both volumes of a Japanese-language book titled *Seiyuroku* [Records of making oils and fats / Records of the crushing industry], issued in the 19th century. It describes the history of crushing in Japan. The illustrations on page 22 are from this book.

(2) The 2nd page of color photos titled *Edo-jidai no Seiyu Dogu* [Instruments used for crushing in the Edo period {mostly in the 1800s}] contains 4 separate photos Top left is a receptacle for grinding seeds. Top right is an air blower like a bellows below the pan to steam the ground seeds. Bottom left is a wooden bucket and a furnace for steaming ground seeds. Bottom right is a wedge press named a *shimegi* in Japanese.

The 3rd page of color photos shows the cover of two books issued after World War II. The left one, titled *Kogane no Hana*, describes the history of rapeseed in Japan. *Kogane* means "golden" and *hana* means "blossoms." The book on the right is titled *Rikyu Hachimangu*, referring to a shrine in Kyoto. It is said that a priest from this shrine developed the first crushing instrument named *Chogi* in 859.

The 4th page of color photos shows two illustrations of famous places in Edo (the old name for Tokyo) in 1800s. The top one shows the Nihonbashi area where a long and famous bridge crosses the river crosses the Nihonbashi River. The bottom one shows Isemachi-Kashi Dori; the buildings were the warehouses of goods and the market place.

On page 1-5 are the names of five Japanese who are important figures in this book: (1) Mr. Tatsuaki Kaneda, the President of Tokyo Oils & Fats Wholesalers Cooperative Union in 2000.

(2) Mr. Keishiro Fukushima, Director General, Foods Policy Planning Bureau, Ministry of Agriculture, Forestry and Fisheries. Describes his congratulatory remarks for 100 Year Jubilee of the Union.

(3) Mr. Masaji Shima, the President of Japan Oilseed Processors Association (JOPA) in 2000. His congratulatory remarks are also described.

(4) Mr. Yukio Sakaguchi. He is the Honored Chairman of Council for *Sukei-kai*, which is the Adoration Group for *Yamazaki Rikyu Hachimangu.* He passed away in 2002 when he was 101 years old.

(5) Kinzaburo Shiraishi, the President of Japan Oils & Fats Wholesalers Association in 2000.

Page 22 shows 4 line drawings from the book *Seiyuroku*, mentioned above. The two on the left show the wedge press. The top right shows several instruments used for crushing. The bottom right shows instruments used for refining, or (more precisely) filtration.

Two books on page 76 also describe the history of the crushing industry in Japan. The left one, issued in 1810, describes the origin and history of crushing industry. The right one, issued in 1716, describes the history of mainly wholesalers of vegetable oils.

Note from Y. Komura, who sent this book as a gift to Soyinfo Center: The editor of this book is Mr. Takayoshi Shimada, the CEO of the wholesale cooperative union, and the writer is Mr. Takahashi Shirashi, a professor emeritus of Keio University and scholar of Japanese history. In the old days, merchants of oils & fats used to work as seed crushers, refiners, wholesalers and retailers. However, the current meaning of *abura tonya* is mainly a wholesaler. Therefore I express it as "Wholesale Business" in the title. The book was published in celebration of the 100th anniversary of the Tokyo Oils & Fats Wholesalers Cooperative Union though, the Union has no formal title of the book in English. Therefore I myself translate the title of the book into English. As you know, the center of policy, business and culture of Japan used to be Kyoto and Nara in the old days. At that time Tokyo was the countryside with no industrial development. It is said that the crushing industry originated in Kyoto in 859. The priest of Yamazaki Rikyu Hachimangu, a shrine, developed a crushing instrument named a *Chogi*. This indicates that the other businesses concerning with seed crushing also developed in or around these areas. Merchants of oils and fats initially developed in Kyoto and expanded

© Copyright Soyinfo Center 2021

throughout Japan. It is said that rapeseed was introduced into Japan from China or Korea in the 16th century when the Tokugawa era [1600-1867] started–or perhaps somewhat earlier. Since then crushing rapeseed became popular even in the Tokyo area. Compared with a long history of the oilseed crushing industry in Japan, Tokyo has a very short history of this industry. Address: Tokyo, Japan.

1555. *ADM Nutrition & Health Update* (*Decatur, Illinois*). 2000. Successful soy conference. 2(1):4. Winter.
• ***Summary:*** "Evidence of the interest in the health benefits of soyfoods and soybean isoflavones was clearly apparent from the number of delegates attending the Third International Symposium on the Role of Soy in Preventing and Treating Chronic Disease, which was held October 31–November 3, 1999, in Washington, DC. During the four days of the conference nearly 600 researchers and health professionals heard presentations that focused on a range of topics. That attendance figure represents a twofold increase over the first symposium held in 1994. In addition to 48 oral presentations, there were over 100 poster presentations, which is three times more than were presented at the first meeting. Furthermore, in addition to cholesterol reduction, cancer, and osteoporosis, topics covered at the previous symposia, research at this third symposium addressed areas such as hot flashes, hypertension, and cognitive function.

"The number of exhibits was also impressive and clearly illustrated that soy products have become mainstream. During the Tuesday luncheon, six pioneers of the field were recognized for their contributions: Herman Adlercreutz, University of Helsinki (Finland); Chai-Won Chung, Dr. Chung's Food Company (Korea); Cesare Sirtori, University of Milan (Italy); David Kritchevsky, Wistar Institute (Philadelphia, Pennsylvania); Kenneth D.R. Setchell, Children's Hospital (Cincinnati, Ohio); and Doyle Waggle, Protein Technologies International (St. Louis, Missouri). The session on coronary heart disease was held in honor of the late Kenneth K. Carroll, for his work on the cholesterol-lowering effects of soy protein.

"As is always the case with scientific meetings, the research presented probably raised more questions than it answered but there is no doubt that those who attended left with greater enthusiasm for their field. The abstracts from the conference are expected to be published in the *Journal of Nutrition* sometime next year."

1556. **Product Name:** Jamae Soynut Crunch Bar.
**Manufacturer's Name:** Jamae Natural Foods Inc. (Marketer-Distributor).
**Manufacturer's Address:** 5958 West Pico Blvd., Los Angeles, CA 90035. Phone: 323-937-3670.
**Date of Introduction:** 2000 May.

**Ingredients:** Roasted soynuts, crisp rice, honey, sesame seeds, brown rice syrup, coconuts, natural flavor.
**Wt/Vol., Packaging, Price:** 1 oz (28 gm) individually wrapped in cellophane.
**How Stored:** Shelf stable.
**Nutrition:** Per bat (28 gm.): Calories 120, calories from fat 50, total fat 6 gm (9% daily value; saturated fat 2 gm), cholesterol 0 mg, sodium 0 mg, total carbohydrate 14 gm (dietary fiber 1 gm [4%], sugars 6 gm), protein 5 gm. Vitamin A 0%, vitamin C 0%, calcium 2%, iron 4%. Percent daily values are based on a 2,000 calorie diet.
**New Product–Documentation:** This product is listed in the Natural Flavors! (Brewster, New York) wholesale price list of 21 Sept. 2000. It is a snack bar sold in only one flavor. Talk with Meghan Merry of Health Flavors. For more

© Copyright Soyinfo Center 2021

information contact Jamae in California. Phone: 223-937-3670. Talk with Crystal Yu of Jamae. The company name is pronounced jah-MAY, the Korean word for "kinship." She took the product to the Natural Products Expo (Anaheim, California) in March 2000, and it was first sold in May. She is Korean American. Soyfoods Center taste test. The best tasting nutrition/energy bar we have ever tasted, and also the one with the most natural (cleanest) ingredients.

Talk with Tom Mosk of Heaven Scent Natural Foods. 2001. Oct. 1. His company owns a bakery where this bar used to be made.

1557. Kang, Min-Jung; Kim, S.H.; Joo, H K.; Lee, G.S.; Yim, M.H. 2000. Isolation and identification of microorganisms producing the soy protein-hydrolyzing enzyme from traditional mejus. *Journal of the Korean Society of Agricultural Chemistry and Biotechnology* 43(2):86-94. May. [29 ref. Kor; eng]
• ***Summary:*** "In order to develop the enzymatic hydrolysis system concerned with taste and flavor, strains having the high hydrolyzing activity on the soy protein were selected from some traditional Mejus. Two molds and one bacterium producing enzymes which were different in character of hydrolysis were isolated and identified. Leucine and azodye enzyme activities of both M4 and M5 were relatively high among in the isolated molds. And, leucine enzyme activity of B16 was the lowest in the isolated bacteria. These strains were isolated as microorganisms having a dissimilar hydrolysis pattern on the soy protein by enzymatic reactions." Address: Div. of Food, Biological and Chemical Engineering, Taegu Univ., Kyungsan 712-714, Korea.

1558. Lee, Cecilia Hae-Jin 2000. The rituals of barbecue cross all boundaries: Fourth of July. *Los Angeles Times* (*California*). June 28. p. 50-51 (D8-D9).
• ***Summary:*** "The traditional way to eat Korean barbecue in a restaurant is to take a piece of red-leaf lettuce (*sangchi*), place in it a piece of smoking meat, a slice of garlic (grilled or raw), a small dollop of chile paste (*kochujang*) or fermented soy paste (*dwenjang*), wrap the whole thing up and shove it into your mouth.

"In lieu of the *kochujang* and *denjang* you can dip the 'wrap' into a light sauce that the restaurant has provided for you."

Note the two ways of spelling *denjang*. Address: Daily News staff writer.

1559. Kim, Dong-Ho; Lee, K.H.; Yook, H.S.; Kim, J.H.; Shin, M.G.; Byun, M.W. 2000. [Quality characteristics of gamma irradiated grain shape improved meju]. *Korean Journal of Food Science and Technology* 32(3):640-45. June. [20 ref. Kor; eng]
• ***Summary:*** Meju [soybean koji] treated with gamma irradiation maintained better quality in storage than that of the control. Address: Team for Radiation Food Science and Biotechnology, Korea Atomic Energy Research Inst.

1560. Kono, Makoto. 2000. Life after the "Liefde": Dutch influence in Japan. *Look Japan* (*Tokyo*) 46(531):35-37. June.
• ***Summary:*** In 1600, the Dutch ship *Liefde* drifted ashore in Usuki Bay in Bungo Province (now Oita prefecture). Of the original 110 crew members, only 24 were still alive, and only six of these could walk ashore unassisted. The arrival of this ship marked the beginning of relations between Japan and the Netherlands, and the 400th anniversary of this key event is being celebrated in Japan this year. Two of the surviving crew were to earn important places in Japanese history: William Adams and Jan Joosten.

Adams, an Englishman, became Tokugawa Ieyasu's advisor on diplomacy and trade. He adopted the Japanese name Miura Anjin, married a Japanese woman, Oyuki, and was given the social rank of samurai. Two monuments and a festival commemorate the site of his residence in Tokyo and the grave of his wife. Jan Joosten became Ieyasu's advisor on military affairs. He, too was given a Japanese name, Yaôsu, and that name survives today in a slightly modified form as Yaesu, a district on the eastern side of Tokyo Station.

In 1633 the Tokugawa shogunate adopted a policy of national isolation which continued for 221 years until 1854 when the American Commodore Perry forced the country to open its doors to Western trade. During this time Japan maintained contact with only three nations: China, Korea, and the Netherlands. The Dutch were restricted to an artificial island named Dejima [Deshima], built by the shogunate in Nagasaki Harbor. This was the sole source of "Western Learning" which was more commonly called "Dutch Learning" (*rangaku*). The first area of interest to Japanese scholars was Western medicine, starting with anatomy. In 1774 a 5-volume anatomy was translated into Japanese by a team headed by Gempaku Sugita.

At the Dutch trading post in Dejima, three doctors were employed; each had a strong impact on the relationship between Japan and the West. Engelbert Kaempfer, a German, came to Japan early in the Edo period (1603-1867). Philipp Franz von Siebold, also a German, came in the middle years of the Edo period, and Carl Peter Thunberg, a Swede, came near the end. Besides medicine, all three taught natural history, focusing on the flora and fauna of Japan, and all three became well known in Europe for disseminating their knowledge of Japan.

1561. Sim, John. 2000. Update on Pulmuone (Interview). *SoyaScan Notes.* July 24. Conducted by William Shurtleff of Soyfoods Center. Followed by a letter dated 14 July 1997.
• ***Summary:*** John Sim recently returned to Pulmuone as marketing director. His company sells 95% of its tofu to the Korean-American market. Their factory in Southern California now makes 24,000 18-ounce blocks/cakes of tofu

© Copyright Soyinfo Center 2021

a day. They sell these through a distributor and they retail for $1.05 per cake, which is a very low price.

Pulmuone's tofu is now in the Ralph's supermarket chain in Southern California, and they have been advertising it regularly with Ralph's and doing promotions where the tofu retails for $0.79 for an 18 ounce cake. This has shaken up the competition (such as House Foods), causing competitors to lower prices and start advertising as well.

In late May of this year Pulmuone introduced their first nigari tofu. Their customers love the great, fresh flavor. The label reads simply "Premium Tofu" but soon they plan the add the word "nigari"–a work that many Koreans understand.

Pulmuone has also developed a marketing innovation–a disposable [resealable] lid. They place this next to the pack of tofu, and give it away free of charge. A message will be printed on it.

John would like to get his tofu into more supermarket chains over a wider geographical area. Go works with a broker, who has access to the buyers and who makes the presentation; John goes along to supply expertise on tofu.

John is looking for statistics on the tofu market in the USA. Peter Golbitz has lowered the price of his report to $4,000. SPINS wants $12,000 for their data. Address: Marketing Director, Pulmuone, 4585 Firestone Blvd., Southgate, California 90280. Phone: 213-564-2000.

1562. Choi, Yong-Soon; Lee, Bung-Hoon; Kim, Jong-Hwa; Kim, Nam-Soo. 2000. Concentration of phytoestrogens in soybeans and soybean products in Korea. *J. of the Science of Food and Agriculture* 80(12):1709-12. Sept. 15. *
• ***Summary:*** Five soyfoods contributed 96% of total genistein and daidzein intake in Korea; soy sprouts, chungkukjang (Korean natto), tofu, denjang (Korean soybean miso), and kochujang (red pepper and soybean paste), respectively. Average Korean daily intake of isoflavones from soyfoods is estimated as 21 mg per day.

1563. Bae, J.S.; Park, Y.H.; Jun, T.H.; Woo, J.S.; Lee, S.H. 2000. Genotype and environment interactions on isoflavone content in soybean seed. In: Kyoko Saio, ed. 2000. Proceedings–Third International Soybean Processing and Utilization Conference. Tokyo, Japan: Korin Publishing Co., Ltd. [xxiv] + 728 + 8 p. See p. 112-113. [5 ref]
• ***Summary:*** "Isoflavones in soybean [*Glycine max* (L).] seeds are considered to have some medical properties such as antitumor effects. The objective of this study was to estimate genotype x environment interactions for isoflavone concentration in soybean seed. Significant G x E interactions were observed in four major types of soybean seed isoflavones over three locations and over two years. The mean contents of daizein and genistein were lower in 1995 than 1996 over three locations. The response of the genotypes was not consistent over location and years, indicating that multiple testing should be required to make unbiased genotypic selection." Address: College of Agriculture and Life Sciences, Seoul National University, Suwon, Korea.

1564. Ha, B.K.; Lee, H.S.; Lee, S.H. 2000. Molecular mapping of resistance gene to bacterial pustule in soybean. In: Kyoko Saio, ed. 2000. Proceedings–Third International Soybean Processing and Utilization Conference. Tokyo, Japan: Korin Publishing Co., Ltd. [xxiv] + 728 + 8 p. See p. 110-111. [3 ref]
• ***Summary:*** "The objective of this study was to map the *Rxp* gene using simple sequence repeat (SSR) markers. The parents and 75 $F_8$ lines from the cross of `Suwon 157' (susceptible) x `Danbaekkong' (resistant) were scored for bacterial pustule reaction in the greenhouse after inoculation with an isolate of *X. campestris pv. glycines* (8ra). Major QTL mapped to LG D2 of the USDA soybean map. The gene was closely linked to SSR markers, Satt372 and Satt458, in LG D2." Address: Div. of Plant Science, Seoul National Univ., Suwon 441-744, Korea.

1565. Kim, Jung-In; Han, Jung-Hee; Kang, Min-Jung; Kwon, Tai-Wan. 2000. The hypoglycemic effect of *Chongkukjang* in normal rats. In: Kyoko Saio, ed. 2000. Proceedings–Third International Soybean Processing and Utilization Conference. Tokyo, Japan: Korin Publishing Co., Ltd. [xxiv] + 728 + 8 p. See p. 171-172. [3 ref]
• ***Summary:*** *Chongkukjang* is fermented Korean soybean paste very similar to natto.

Note: This is the earliest document seen (May 2021) that uses the spelling "Chongkukjang" to refer to Korean style natto. Address: Dep. of Food and Nutrition, Inje Univ., Kim-Hae, Kyung-Nam province, South Korea.

1566. Kim, Seok Dong; Kim, K.H.; Park, H.K. 2000. Soybean breeding for processing and utilization in Korea. In: Kyoko Saio, ed. 2000. Proceedings–Third International Soybean Processing and Utilization Conference. Tokyo, Japan: Korin Publishing Co., Ltd. [xxiv] + 728 + 8 p. See p. 23-28. [9 ref]
• ***Summary:*** Contents: Introduction. Procedures of soybean breeding in Korea: Soybean breeding before the Uruguay Round [of trade negotiations]. Soybean breeding after the Uruguay Round (from late 1993). Recent knowledge and technologies in soybean breeding for processing and utilization: Breeding of sprout soybeans, breeding of soy-sauce and soy-paste soybeans, breeding of bean-curd and soy-milk soybeans, breeding of specific soybeans, breeding of vegetable and early soybeans, breeding of high protein soybeans, breeding of lacking lipoxygenase soybean, utilization of biotechnology for breeding, studies on the application of radiation for genetic transformation. Prospect of soybean breeding in Korea: Sprout soybean, soy-sauce and soy-paste soybean, specific soybean, vegetable soybean,

© Copyright Soyinfo Center 2021

seed component.

Page 23: "Soybean cultivation in Korea is mainly based on self-sufficiency with a small area planted per farm house and it was enough for self-sufficiency up until the end of 1960s. But along with the rapid national economic development, the national demand of soybeans has greatly been increased from about 268,000 tons in 1970 to nearly 1.4 million tons in 1998 with the mean annual increase rate of over 10%. On the contrary, the area planted to soybeans showed a continuous decreasing trend from about 300,000 hectares in the early 1970s to 98,000 hectares in 1998 mainly due to farmers' low income from soybeans compared to other competing summer upland crops such as red pepper, sesame, potato, and vegetables, etc. Accordingly, the ratio of national self-sufficiency was lowered below 10% in 1998.

"Yield of soybeans in Korea has greatly increased from about 0.79 tons/ha in the early 1970s to 1.44 tons/ha in 1998; the yield nearly doubled during this periods. The yield increase was partially indebted, of course, to the improvement of cultural practices but mainly to the dissemination of the newly developed varieties to farmers.

"Soybean cultivation in Korea is suffering from many kinds of severe diseases and pests. But most soybean varieties developed by hybridization have fairly good resistance to most of the troublesome diseases and pests. Seventy more soybean varieties have newly been developed and released to the soybean growers since the first variety Kwangkyo, developed by hybridization, was released in 1969. Some of the soybean varieties are known to be widely used as useful genetic materials for disease resistance even in several foreign countries.

"Also, it is quite beneficial to soil fertility and cropping systems with other crops. It is worth while to review extensively soybean breeding for processing and utilization at present and in the near future in preparation for the possible food crisis in the 21st century." Address: National Honam Agric. Exp. Station, R.D.A. Iksan, 570-080, Republic of Korea; e-mail: kimsa@nhaes.go.kr.

1567. Ku, Ja-Hwan; Moon, Jung-Kyung; Yoon, Hong-Tae; Park, Keum-Yong; Lee, Yeong-Ho. 2000. Composition ratios of cyanidin-3-glucoside and delphinidin-3-glucoside in Korean soybean with black seed coat. In: Kyoko Saio, ed. 2000. Proceedings–Third International Soybean Processing and Utilization Conference. Tokyo, Japan: Korin Publishing Co., Ltd. [xxiv] + 728 + 8 p. See p. 155-156. [2 ref]
• ***Summary:*** "Major compounds of anthocyanin in soybean with black seed coat have been known as cyanidin-3-monoglucoside (C3G) and de1phinidin-3-monoglucoside (D36), The objective of this study was to provide basic information on the content and composition of C3G and D3G in Korean black soybean, In seed coat of 199 accessions, C3G content ranged from 0.05% to 2.62% with a mean value of 0.84%, and D3G content ranged from 0.00% to 0.75% with a mean value 0.15%, The proportion of D3G in the total anthocyanin ranged from 0.00 to 0,68 with a mean value of 0.14." Address: Upland Crop Div., National Crop Experiment Station, RDA, Suwon 441-857, Republic of Korea.

1568. Yan, Jeong-lye; Kwon, Tae-wan; Song, Young-sun. 2000. Enhancement of the fibrinolytic activity in plasma by oral administration of *Chongkukjang.* In: Kyoko Saio, ed. 2000. Proceedings–Third International Soybean Processing and Utilization Conference. Tokyo, Japan: Korin Publishing Co., Ltd. [xxiv] + 728 + 8 p. See p. 175-176. [2 ref]
• ***Summary:*** *Chongkukjang* is Korean-style natto fermented with *Bacillus circulans* K1 that produces strong fibrinolytic enzymes. The fibrinolytic activity of *chongkukjang* was tested in spontaneously hypertensive rats (SHR) by acute and chronic administration of *chongkukjang* extract and *chongkukjang* base. A graph shows that the fibrinolytic activity peaked 1 hour after administration. Address: 1. Dep. of Food Science and Technology, Kyugsung Univ., Pusan 608-736; 2. Dep. of Food Science and Nutrition, Inje Univ., Kimhae 621-749, Korea.

1569. Yang, Jeong-Lye; Kim, H-S.; Song, Y-S. 2000. Purification of fibrinolytic enzyme from *chongkukjang.* In: Kyoko Saio, ed. 2000. Proceedings–Third International Soybean Processing and Utilization Conference. Tokyo, Japan: Korin Publishing Co., Ltd. [xxiv] + 728 + 8 p. See p. 220-21. [2 ref]
• ***Summary:*** *Chongkukjang* is a traditional Korean fermented soybean paste. A new method of treating thrombosis has been widely sought, due to the limitations of present thrombolytic agents. "If a fibrinolytic enzyme is produced by food-grade microorganisms in a fermented food, the food can be consumed to prevent thrombosis and other related diseases." In this study the writers report a novel fibrinolytic enzyme from *chongkukjang* fermented with *Bacillus circulans* K-1.

This enzyme was smaller than that of nattokinase (27,700 Daltons) or *chongkukjang* kinase (28,200 Daltons).

Note: *Chongkukjang* appears to be a relative of Japanese natto, which is fermented by *Bacillus subtilis* (natto). Address: 1-2. Dep. of Food Science and Technology, Kyungsung Univ., Pusan 608-736; 3. Dep. of Food Science and Nutrition, Inje Univ., Kimhae 621-749, Korea.

1570. Yoshida, Shuji. 2000. The origins of fermented soybeans and their distribution. In: Kyoko Saio, ed. 2000. Proceedings–Third International Soybean Processing and Utilization Conference. Tokyo, Japan: Korin Publishing Co., Ltd. [xxiv] + 728 + 8 p. See p. 697-700. [8 ref]
• ***Summary:*** The origins of two types of fermented soybeans will be discussed: (1) *Jiang* is used in preserving meat. (2) *Dou-chi* is used in brewing.

© Copyright Soyinfo Center 2021

Jiang existed in the lower Huang-He [Yellow River] area before the Yin dynasty, ca. 1500 BC. Doujiang, jiang made of soybean, seems to have been invented much later, during the Han dynasty, around 300 B.C.

However *dou-chi* was already known in the middle and lower reaches of the Chang Jiang River [Yangtze River, which enters the ocean {East China Sea} near Shanghai, in southern China] before the Han dynasty. *Dou-chi* [fermented black soybeans] spread northward to the northeastern part of China, westward to Nepal, southward to Indonesia, and eastward to Japan.

1. Dou-chi and dou-jiang. Dou-chi is the oldest type of fermented soybean made by fermenting soybeans with species of *Aspergillus* mold. "'Dou-chi with ginger' was found in the ancient Ma Wang Dui Tomb no. 1 which was probably built in BC 186. Thus, dou-chi appeared in the Han Dynasty and was supposedly invented before the Qin dynasty (Bo 1984)."

The idea of culturing a "koji" mold on cooked soybeans was probably derived from the brewing process. Thus, instead of fermenting a cereal grain (such as rice for saké) they attempted to ferment soybeans. But as often happens, the final product was different from what had been expected. The result was a soybean covered with a mycelium of yellowish mold (*dou-huang*, where dou = soybean + huang = yellow). "Dou-chi is a sophisticated form of dou-huang; douchi is soaked in a little water and fermented for more than one month."

"Jiang, on the other hand, is probably derived from meat preservation. In the early days, meat was preserved simply by adding salt. Later, koji mold was employed for preservation and koji was produced. Jiang existed in the northern part of China during the Yin dynasty, about 1500 BC. Soybean jiang (*dou-jiang*), however was a relatively new product. It never existed before about the 3rd century B.C., during the early Han dynasty (Ishige & Raddle 1990)."

Dou-chi and dou-jiang each are connected with brewing. "I am not concerned here with the history of brewing in China but I will briefly introduce the hypothesis on koji mold development. There are two types of koji, the grain type and the cake type." The grain type was first introduced in the Chang Jiang [Yangtze] River area of southern China; from there it migrated to northern China. The cake type of koji, however, was invented in northern China (Yoshida 1993a).

Following this hypothesis, dou-chi was derived from the grain-type of koji, not from the cake type. "Therefore I assume that dou-chi originated in the Chang Jiang [Yangtze] River area of southern China, where the grain type was invented and is still popular. In practice, dou-chi is preferred in southern China." The dou-chi method of culturing mold on cooked soybeans was practiced before dou-jiang was invented. When the molded soybean method was introduced to northeastern China via northern China, it became common to produce dou-chi using the local soybeans produced in that area I assume that northeast China is the second center of dou-chi production; from there it spread to Korea and Japan. In Japan, dou-chi is known as "miso" [sic]. Address: National Museum of Ethnology, Osaka (Kokuritsu Minzokugaku Hakubutsukan), Japan.

1571. *Canadian Soybean Bulletin* (*OSG, Chatham, Ontario, Canada*). 2000. Canadian soybean exports. 14(2):3. Nov.
• ***Summary:*** A large table shows statistics in tonnes (metric tons) of soybeans exported to various countries, and regions, each year from 1996/97 to 1999/2000. The countries are: In Asia–China, Hong Kong, Indonesia, Japan, Malaysia, Philippines, Singapore, South Korea, and Thailand. In Western Europe–Austria, Belgium, Denmark, France, Germany, Italy, Netherlands, Norway, Portugal, and Spain. By continent–Africa, Central America, Eastern Europe, Middle East, Oceania, South America, and United States.

In 1999/2000 the countries to which the largest amount of Canadian soybean exports went were (in tonnes): Japan 179,708, United States 121,860, Malaysia 99,919, Indonesia 64,426, Denmark 47,444, Germany 43,410, and Netherlands 36,392.

• ***Summary:*** "Lipoxygenase (LOX) in soybeans is responsible for beany flavors which limit the wide utilization of soybeans to foods. This study was conducted to analyze beany flavor compounds of the normal Hwang-keumkong and LOX-deficient soybean cultivars, Jinpumkong which lacks L-2, L-3, and Jinpumkong 2 which lacks all L-1, L-2, L-3." Address: 1. Dep. of Food and Nutrition, Kyungmin College, Kyonggi-do, Korea.

1580. Park, Seok-Kyu; Seo, K.I.; Choi, S.H.; Moon, J.S.; Lee, Y.H. 2000. [Quality assessment of commercial doenjang prepared by traditional method]. *J. of the Korean Society of Food Science and Nutrition* 29(2):211-17. [32 ref. Kor; eng]
• ***Summary:*** "To standardize quality characteristics of commercial doenjang prepared by traditional method, general components, organic acids, amino acids and fatty acid composition were investigated. Moisture, crude protein, crude lipid, titratable acidity (expressed as milliliter of 0.1 N NaOH), acid value and salinity were 54.7%, 13.8%, 8.0%, 14.4 mL, 45.7 mg/g and 11.8%, respectively. The content of amino type nitrogen was 345.3 mg% (w/w) in the range of 207.6 to 443.5 mg% being 1.1 to 2.2-fold for all samples. Average value of Hunter color for L (lightness), a (redness) and b (yellowness) were 37.4, .1-9.7 and +21.3, respectively. Browning index value (expressed as optical density at 425 nm) of water-soluble compound (2.58) was above 7.1 times higher than that of the water-insoluble compound (0.38). Total contents of free and total amino acid were 3.81 and 9.72%, respectively, and then the former (about 1.1 to 3.7 times) was more different in all samples tested than that of the latter (about 1.1 to 2.0 times). Among amino acids, glutamic acid was abundant and its content of free and total amino acids was 0.57 and 1.24%, respectively. Of organic acids, lactic acid was the most abundant being 0.34% (average) and ranged from 0.15 to 0.86%. Linoleic acid (52.17%, as area%) was the highest content of the total fatty acids. Unsaturated and polyunsaturated fatty acids were 83.89 and 61.18%, respectively. Polyunsaturated fatty acid was markedly different among all samples and ranged from 51.52 to 64.91%." Address: Korea Fermented Food Research Inst., Sanchung 666-800, Korea.

1581. Yoo, Seung-Ku; Kang, S.M.; Noh, Y.S. 2000. [Quality properties on soy bean pastes made with microorganisms isolated from traditional soybean pastes]. *Korean J. of Food Science and Technology* 32(6):1266-70. [19 ref. Kor; eng]
• ***Summary:*** "Quality properties of soy bean pastes made with *Aspergillus oryzae* and 5 Bacillus strains isolated from traditional soy bean pastes were examined. The pH decreased gradually and contents of amino-type nitrogen increased during fermentation." Address: 1. Dep. of Biotechnology, College of Engineering and Bioproducts Research Center, Yonsei University, Korea.

1582. Cost, Bruce. 2000. Asian ingredients: A guide to foodstuffs of China, Japan, Korea, Thailand, and Vietnam. New York, NY: HarperCollins. xiv + 322 p. Illust. 24 cm. *
• ***Summary:*** The contents of this book is almost identical to that of the original 1988 edition. This is not a new edition.

1583. Delissen, Alain. 2000. Denied and besieged: the Japanese of Korea, 1876-1945. In: Robert Bickers and Christian Henriot, eds. 2000. New Frontiers: Imperialism's New Communities in East Asia, 1842-1953. Manchester (England) and New York: Manchester University Press. xiv + 290 p. See p. 125-45. [35 ref]
• ***Summary:*** Contents: Introduction ("Persistent denials of colonisation have characterized Japan's discourse regarding its sixty years' presence in Korea"). Birth and development of a community, 1876-1945. From migrants to colonists, 1876-1910 (The Nippon-Korean Treaty of Kanghwa {29 Feb. 1876} was a major breakthrough for the Japanese; it opened the port of Pusan to Japanese free trade and residence. "Still more important, however, were international treaties signed in the following two decades which opened up many more ports and cities–Wonsan {1881}, Inch'on

© Copyright Soyinfo Center 2021

{1883}, Mokp'o {1897}, Kunsan {1899}–and were all modelled on the Sino-Korean treaty of 1882. Patterns borrowed from Chinese `unequal treaties' were transferred to Korea to accommodate foreign communities and regulate their activities").

From colonists to gaichijin, 1910-1945 (Formal colonisation followed the annexation of Korea in 1910. It was accompanied by a shift in terms from colonist (*shokumin*) to "overseas Japanese" (*gaichijin*)). Territories within territories (The two main centers of Japanese population from 1915 to 1944 were Seoul and Pusan. See p. 138 for a map of the distribution of Japanese settlement in Korea, ca. 1940). Conclusion. Address: Assoc. Prof. of Korean History, Ecole des hautes études en sciences sociales.

1584. Kulp, Karel; Ponte, Joseph G., Jr. eds. 2000. Handbook of cereal science and technology. 2nd ed., revised and expanded. New York, NY: Marcel Dekker. ix + 790 p. Illust. Index. 29 cm. Series: Food Science and Technology, No. 99.
• ***Summary:*** Chapter 26, "Fermentation and microbiological processes in cereal foods," by Pierre Gélinas and Carole McKinnon (of Food Research and Development Centre, Agriculture and Agri-Food Canada, St. Hyacinthe, Quebec, Canada) (39 refs) (p. 741-54) contains a long table (p. 742-46) titled "List of foods prepared from fermented cereals." The four columns are: (1) Food name (synonym or related food). (2) Food type (characteristics). (3) Area (country or continent). (4) Main microorganisms.

Under "Soybeans" the following foods are listed: Chee-fan. Chinese yeast. Hama-natto. Kenima. Ketjap. Meitauza. Meju. Miso (chiang, doenjang, kochujang, tauco). Natto. Soy sauce (kanjang, kecap, kicap, shoyu, taosi [sic]). Sufu (tahuri, taokoan tao-hu-yi). Tairu (taire–fermented soybean milk, like yogurt, from Malaysia). Taotjo. Tempe (tempeh).

"Chee-fan" is described as "Curd-like" [fermented tofu] from China. Main microorganisms: *Mucor* spp., *Aspergillus glaucus.*

Note 1. Taokoan (listed under Sufu, above) is not a fermented food. It is the Filipino equivalent of Chinese *doufu-gan* or "pressed tofu." Filipino fermented tofu is *tahuri* (also spelled *tahuli*).

Table 2, "List of representative microorganisms associated with fermented cereal foods" (p. 74-48) contains two columns: (1) Type of microorganism (and within type, genus and species, listed alphabetically by genus). (2) Food produced.

Under "Bacteria" are: *Bacillus natto*–Hama-natto [sic], natto. *Lactobacillus delbrueckii*–Miso, soy sauce. *Pediococcus* spp.–Hamanatto. *Pediococcus halophilus*–Soy sauce. *Streptococcus* spp.–Hama-natto.

Under "Bacteria" are: *Actinomucor elegans*–Meitauza, sufu. *Aspergillus glaucus*–Chee-fan. *Aspergillus oryzae*–Hama-natto, ketjap, meju, miso, saké, soy sauce. *Monascus purpureus*–Anka (ang-kak, beni-koji, red rice), hong-ru (lao-hong). *Mucor* spp.–Chee-fan, ruhi, sufu. *Mucor hiemalis*–Sufu. *Rhizopus oligosporus*–Tempe.

Under "Yeasts" are: *Candida* spp.–Soy sauce. *Zygosaccharomyces rouxii*–Miso, soy sauce.

The section on "Major commercial fermentation processes" includes (p. 752-53) soy sauce (from wheat and soybeans) and miso (from rice and soybeans).

Note 2. Koji, the basis of soy sauce, miso, and saké fermentations, is not mentioned in either of the first two tables. However it is mentioned by name on p. 753. Address: 1. American Inst. of Baking; 2. Prof. Emeritus, Kansas State Univ. Both: Manhattan, Kansas.

1585. Kurlovich, B.S.; Rep'ev, S.I.; Petrova, M.V.; Buravtseva, T.V.; Kartuzova, L.T.; Voluzneva, T.A. 2000. The significance of Vavilov's scientific expeditions and ideas for development and use of legume genetic resources. *Plant Genetic Resources Newsletter* (*FAO/IBPGR*) No. 124. p. 23-32. [78 ref. Eng; fre; spa]
• ***Summary:*** This article is a summary of Vavilov's principal expeditions and their significance for scientific research and practice. "Nikolai I. Vavilov (1887-1943) is recognized as the foremost plant geographer, botanist, and geneticist of contemporary times." He "was the first to recognize the necessity for intensive plant collecting and preservation." He was very interested in the sites of ancient agricultural civilizations and of mountainous regions. In 1929 he organized an expedition to China, Japan, and Korea. After these expeditions, wild and cultivated soybean species were added to his collection. However the principal legumes he collected were mung beans, chickpeas, lentils, peas, and lupins.

His main contributions to the theory of plant introduction were: Centers of origin and diversity, law of homologous series, differential systematic- geographical methods, and geographical and ecological differentiation. The latter concept has enabled scientists from VIR (N.I. Vavilov Inst. of Plant Industry–St. Petersburg, Russia) to develop interspecific classifications for almost all leguminous crops, including soya bean (Korsakov 1971; Teplyakova 1997). Korsakov has also clarified the centers of origin of various soya bean species.

Presently the VIR germplasm collection has 43,000 accessions belonging to 15 genera and 160 species of the Fabaceae including soya beans.

A photo shows: (1) N.I. Vavilov and his wife, E.I. Barulina, in 1926, before the expedition to the Mediterranean. Address: N.I. Vavilov Inst. of Plant Industry (VIR), B. Morskaya str. 44, St. Petersburg 190000, Russia.

• ***Summary:*** Many comforting meals start with *naengmyun*–long, pale brown buckwheat noodles. They can be cooked "and chilled for salads or added to soups based on *denjang* (fermented soy bean paste) and *gochu jang* (not fermented chili paste), both sold in tubs and jars." Address: Ethnic explorer.

1587. Nielsen (A.C.) (IRI). 2001. Nielsen data on tofu in supermarkets, 52 weeks ending May 19, 2001. Chicago, Illinois. 8 p.
• ***Summary:*** Total selected tofu products: $46.214 million. Total units sold: 27.690 million.

Note: We find it very hard to interpret the data in this table. How is it sorted? How does one find or calculate the total tofu sales of a particular company? For some companies (Azumaya) this is clear but for others (Hinoichi) it is not. For those that are clear (in descending order by total tofu sales):

Nasoya $16,016,000. Mori-Nu $8,187,000. Azumaya $6,760,000. Hinoichi $4,164,949. White Wave $1,459,000. Wildwood Natural Foods $881,000. Marjon $877,000. The Soy Deli (Quong Hop) $830,487. Frieda's Finest $824,000 + $209,046. Denver Tofu $551,000. House Tofu $489,000. Kikkoman $393,000. Sun Luck $338,439. LEASA $330,000. Happy Tofu $271,000 + $111,468. Melissa's $245,000. Pacific Tofu $222,000. Soy Shop $213,900. Pulmuone $199,000. Mu-Tofu $181,000 Quong Hop & Co. $161,000. Island Spring $154,000. Surata Soyfoods $125,151. Farm Soy Dairy $108,000. Ctl Br. $107,000. Bountiful Bean $92,100. Vitasoy $89,871. Pacific Soy $81,100. Stow Mills $78,526. Banyan Tofu $77,600. Wo Chong $73,189. Harvest Light $70,000. Golden Gate $64,700. Cleveland Tofu $58,200. Panda Farms $54,000. Sacramento Tofu $52,900. China Rose $47,400. Fuji $47,000. Midwest Harvest, $44,000. Fresh Tofu Inc. $39,100. Furama $38,800. Spring Creek $24,400. Calco $7,700. Address: Chicago, Illinois.

1588. SPINS. 2001. SPINscan data on tofu in the natural / health food market, 12 months ending April 2001. San Francisco, California. 32 p.

1589. Bernard, Richard L. 2001. Breeding vegetable soybeans in the Midwest. In: T. Lumpkin, ed. 2001. Second International Vegetable Soybean Conference. Pullman, Washington: Washington State University. 202 p. See p. 21.
• ***Summary:*** "In recent years there has been a great deal of publicity on human nutritional and health value of soybeans, but this has resulted mostly in emphasis on consumption of soy products including traditional East Asian foods such as tofu and soy milk and modern products such as protein-enriched pastries and imitation meats with little recognition of whole soybeans as a potential food. The common attitude in the Midwest, the major soybean producing area in the world, is that soybeans are not suitable for eating–due to bad taste, anti-nutritional factors, or perhaps just tradition.

"Nevertheless there is a long history of trying to promote soybeans as a vegetable crop in this country. A number of large-seeded Japanese and Korean varieties along with a few from China were renamed and released in this country during the 1930's and 1940's and promoted for growing in the vegetable garden. Fifty of these are maintained in the USDA germplasm collection. Some of these were picked up by commercial vegetable seed companies, listed in their

© Copyright Soyinfo Center 2021

catalogs, and widely distributed, but vegetable soybeans remained largely unknown to the American public."

Fifty large-seeded vegetable type soybeans, mostly from Japan and Korea, are maintained in the USDA germplasm collection at the University of Illinois. When these vegetable cultivars are grown in the Midwest, they are more subject to our disease and insect pests, and to drought stress and shattering at maturity. Address: Dep. of Crop Sciences, Univ. of Illinois, Urbana, Illinois 61801.

1595. Shurtleff, William; Aoyagi, Akiko. 2001. The book of miso: Savory, high-protein seasoning. 2nd ed. Revised.

© Copyright Soyinfo Center 2021

Berkeley, California: Ten Speed Press. 278 p. Illust. by Akiko Aoyagi Shurtleff. Index. Aug. 28 cm. [223 ref]
• ***Summary:*** This revision has completely new front and back covers, designed and illustrated by Akiko. It contains a completely new "Appendix D–Miso Manufacturers in the West" (p. 255, updated to 10 May 2001). The page "About the Authors" (autobiographical) has been updated, and the original photographs have been replaced with more recent ones–reflecting the fact that Bill and Akiko separated in Nov. 1993 and their marriage ended in May 1995.

The last page, "Soyfoods Center," has been updated.

The inside back cover has been updated, and now includes current information about: (1) *Miso Production*, a book published by Soyfoods Center about how to start and run a company making miso on any of various scales and budgets. (2) *Miso and Soybean Chiang: Bibliography and Sourcebook*, published by Soyfoods Center. (3) SoyaScan, the unique computerized database produced by Soyfoods Center. This database now contains more than 62,000 records from 1100 B.C. to the present, and more than 76% of all records have a summary / abstract averaging 146 words in length. A description of the four different types of records (published documents, commercial soy products, original interviews and overviews, and unpublished archival documents), and the number of each type, is given.

The title page, copyright page, and table of contents have been redesigned and updated to give the book a much more contemporary look. Other small changes have been made throughout the book. Still contains 130 vegetarian recipes–both western and Indonesian.

Ten Speed Press gave this book a new ISBN: 1-58008-336-6. Yet despite the many changes described above, the authors preferred not to have this called a "new edition" or "revised edition." Address: Soyfoods Center, P.O. Box 234, Lafayette, California 94549. Phone: 925-283-2991.

• ***Summary:*** A restaurant review of Yooki Yama ("snow-capped mountain"), 1018 Main St., Branford, Connecticut. The "silk tofu casserole, a Korean dish whose contents were steamy hot and included "custard-soft bean curd cakes" which "floated in a batch of red-hot pepper sauce that made our eyes smart. The tofu was like a sponge, absorbing all the fire of the peppery broth. Wow!" Yooki Yama's owner is Japanese Korean, which explains the spicy hot dishes on the menu.

One of the "recommended dishes" is "Age-dashi tofu" [age-dashi-dofu]–"deep-fried soy bean cakes [tofu] served with a perky ginger scallion dip."

Note: Branford is a seaside town with many lively restaurants just east of New Haven, Connecticut, midway between New York City and Providence, Rhode Island.

• ***Summary:*** Dr. Cherl-Ho Lee (2016, p. 9) states: Botanical and historical research indicates that it was the region covering South Manchuria and the Korean Peninsula where soybeans originated with the most abundant wild varieties.

The Korean soybean museum opened in April 2015. It was paid for by The city of Youngju, Kyungsang bukdo, which paid ca. 6 billion won (US $5 million). The basic message of the museum is that soybean cultivation originated on the Korean Peninsula–not in Manchuria or in China.

In the book *Soybean Storytelling* (2017, Foreword) we read: "The cultivation and usage of soybeans began in Korea, but because most ancient histories of Korea are intermingled with Chinese culture, this fact has not been properly disseminated to the world. Dr. Kwon Tai-wan, the founding director of the Korea Food Research Institute, formed the Committee for the Establishment of a Korean Soybean Museum in 2001 in order to begin the work on a museum that would inform visitors of the true history and use of soybeans. Below is the letter of intent penned at the Promotion Committee's inception:

"Purpose of Promoting the Establishment of a Korean Soybean Museum: "We wish to illuminate the research we have done, which indicates that in the history of humanity, Koreans were the first to plant soybeans and use them for food. Soybeans were used as food in Northeast Asia more than 3000 years ago; from the 3rd century BC soybeans were disseminated to the southern region of China, Southeast Asia, and Japan; they were introduced to Europe in the 18th century; and during World War II they were cultivated as a cash crop in the United States. Today soybean cultivation has spread all around the world:

"It is known that soybeans supplemented with rice comprise a nutritionally complete meal but recently it has come to light that soybeans also help prevent and cure cancer, heart disease, and other adult-onset diseases. Some cultures have already been supporting their health by consuming soybeans as a staple in their diets, and now in the West, where soybeans have long been used for oil or fodder, the cytological value of soybeans is being revealed; thus quickly ushering in an era of dietary soybean consumption. Due to the spread of cultivation and the variety of its uses, the soybean, though it originated in Northeast Asia, has now become a global-crop as well as a food item for people all around the world.

"Soybeans, which helped sustain the health of our ancestors where they lived on the Korean Peninsula and in Manchuria, as well as that of their descendants through a long passage of time, have now been introduced on the world stage. The 21st century can be called the culture century, or an era in which culture is judged to be the conscience and capacity of nations. Many museums have been established here and there on this earth, each a symbol of its given culture, and yet nowhere is there a museum about soybeans. Is it not appropriate that a museum specializing in soybeans should be established in the origin nation of soybeans? By establishing a museum on an international scale that focuses on soybean culture and utilization techniques, we hope to broadly inform the global village of soybean culture and development, and by so doing contribute to humanity's health.

"Going beyond simply amassing and exhibiting artifacts relating to soybean culture from days long past, research and analysis will be done on global data and literature relating to soybeans, thus creating a forward-looking, creative museum that provides informational exchange on an international scale and focuses on research education. There will be an all-weather greenhouse, a soybean products manufacturing lab, and even a soybean specialty café, such that everything about soybeans can be seen, learned, pondered, eaten, and experienced all in one place. In this way the museum will be self-supporting in its operations and development.

"From this viewpoint we wish to establish a soybean museum that will revive our culture of the past thousand years and thereby bequeath the wise and creative spirit of our ancestors to future generations in the 2000s. We will marshal all of our abilities for the work at hand

"September 2001

"Committee for the Establishment of a Korean Soybean Museum Promoters: Kwon Tai-wan, Kim Seok-dong, Kim Seok-min, Kim Jun-young, Ryu Yong-hwan, Lee Cherl-ho, Lee Young-tack, Chang Hak-gil; Jeong Jang-seop, Jung Chai-won, Cho Se-young, Hong Eun-hi

"With the support of research funds from the Daesan Agricultural Foundation in 1998, this work began with a study written by Kwon Tai-wan, Kwon Sin-han, Lee Cherl-ho, and Hong Eun-hi, "The feasibility study on the establishment of a World Soybean Center," which began an all-inclusive research project into the history and scientific development of soybeans.

"In 2005 the committee, which included most of the major soybean specialists in the country, published the book Soybeans (15 chapters, 794 pages, published by Korea University Press)..."

pressure]. *J. of the Korean Society of Food Science and Nutrition* 30(4):611-16. [24 ref. Kor; eng]
• ***Summary:*** "Effects of high pressure and thermal pasteurization on the survival of microorganisms and quality changes of kochujang during 120 days of storage at 37ºC were investigated. Viable cell counts were 1.43 x 106 CFU/g in heat-treated, and 1.56 x 103 CFU/g in pressure-treated, and decreased up to 3 log cycle, compared with 3.78 x 106 CFU/g in the untreated kochujang."

Note: CFU = Colony Forming Units. Address: Dep. of Food Science and Engineering, Cheju National Univ., Jeju 690-756, Korea.

1604. Shon, M.Y.; Kwon, S.H.; Sung, C.K.; Lee, S.W.; Park, S.K. 2001. Isolation and microbiological characteristics of *Bacillus megaterium* SMY-212 for preparation of black bean Chungkugjang. *J. of Life Sciences* 11:304-10. [Kor; eng]*

1605. Tamang, Jyoti Prakash. 2001. Kinema. *Food Culture* (*Kikkoman Inst. for International Food Culture, Noda, Japan*) No. 3. p. 11-14. http://kiifc.kikkoman.co.jp. [7 ref. Eng]
• ***Summary:*** Contents: Introduction. Hypothesis of the origin of kinema. Methods of preparation. Kinema dishes. Socio-economic factors. Microbiology and nutritive value of kinema. Transition in food culture.

"The common word kinema is derived from 'kinambaa' of the Limboo dialect (Limboo, being one of the major ethnic communities of Nepalis), 'ki' means fermented and 'nambaa' means flavor. The kingdom of 'Limbuwan' (presently the eastern Nepal districts of Therathum, Taplejung, Panchthar, Dhankuta, and Ilam) was established by the Limboo earlier than the seventh century and remained independent till the unification of Nepal in the seventeenth century. Though there is no historical document on the origin of kinema, it is certain that among the Nepalis, the Limboo started production and consumption of this unique fermented flavorful soybean food."

A flow chart shows the traditional method of kinema production practiced in Sikkim–starting with 100 gm dry soybeans. Clean and wash. Soak in water overnight. Drain excess water. Add clean water. Boil. Drain excess water. Crack lightly in a wooden mortar with a wooden pestle. Sprinkle with wood ash (up to 1% by weight). Wrap in fern leaves and keep in a bamboo basket, covered. Allow to ferment at 25-45ºC for 2-3 days. Result: About 230 gm kinema.

Photos show: (1) A plate of kinema. (2) A woman pounding cooked soybeans with a heavy, 4 foot long pestle in a large wooden mortar (14 inches wide by 18 inches high). (3) The woman adding firewood ash to the pounded soybeans in the mortar. (4) The cooked soybean grits are placed in the leaves of a local fern (*Glaphylopteriopsis erubescens*) prior to wrapping and fermentation. (5) Wrapped in fern leaves, the grits are kept in a bamboo basket, covered with a jute bag. (6) Kinema curry served in a side dish next to a plate of the ingredients.

(7) Jyoti Prakash Tamang, Ph.D., born in Darjeeling, India, in 1961. A pioneer in the study of varieties of kinema / natto in the states of Northeast India and the southern Himalayan foothills.

The most common recipe for kinema curry is given. Heat vegetable oil in a frying pan and add 1 chopped onion and fry until it becomes tender. Add 1 sliced tomato and ¼ tablespoon turmeric powder; fry for two minutes. Add 250 gm fresh kinema, 1 teaspoon salt, and 3 sliced green chilies; fry for three to five minutes. Pour in a little water to make a thick curry, and cook for 5-7 minutes more. Kinema curry is now ready for serving with boiled rice.

A map shows kinema diversity in the Eastern Himalayan regions. It is called "kinema in eastern Nepal, the Darjeeling hills, Sikkim and Bhutan, aakhuni in Nagaland, hawaijar in Manipur, turangbai in Meghalaya, and bekanthu in Mizoram... These fermented soybean foods are similar to the natto of Japan, chungkok-jang of Korea, thua-nao of northern Thailand and pe-poke of Myanmar."

Note 1. This is the earliest document seen (Jan. 2012) that mentions "aakkhuni," a close relative of Nepalese kinema and Japanese natto.

Note 2. This is the earliest document seen (Jan. 2012) that mentions "bekanthu," a close relative of Nepalese kinema and Japanese natto.

Note 3. This is the earliest document seen (Jan. 2012) that mentions "turangbai," a close relative of Nepalese kinema and Japanese natto from Meghalaya.

Note 4. This is the earliest document seen (Jan. 2012) that uses the alternative spelling "pe-poke" to refer to pepok, a close relative of Nepalese kinema and Japanese natto from Myanmar.

Note 5. This is the earliest English-language document seen (Jan. 2012) that uses the alternative spelling "chungkok-jang" to refer to Korean natto. Address: Ph.D., Professor, Sikkim Government College / Director, Darjeeling Centre for Traditional Food Research.

1606. Tamang, Jyoti Prakash. 2001. Food culture in the Eastern Himalayas. *Himalayan and Central Asian Studies: J. of Himalayan Research and Cultural Foundation* (*New Delhi*) 5(3-4):107-18. [6 ref]
• ***Summary:*** Various fermented soybean foods are made and consumed in the eastern Himalayas and its adjoining foothills. They include kinema, which is prepared in eastern Nepal, the Darjeeling hills, Sikkim, and Bhutan. Close relatives of kinema are *aakhuni* in Nagaland, *hawaijar* in Manipur, *turangbai* in Meghalaya, *bekanthu* in Mizoram, and *pe-poke* in Myanmar.

Table 1, "Ethnic fermented foods of the Eastern Himalayas and its adjoining foot-hills," gives details about

© Copyright Soyinfo Center 2021

each of these foods: Food name, substrate, nature and use, region of use.

Table 2 shows that a non-fermented food consumed by Nepalis is *Vatamas ko achar,* a seasoning whose main ingredient is ground roasted soybeans.

Consumption of fermented soyfoods is uncommon in the Western and Hindu-Kush Himalayas, and even in other parts of India. These fermented soyfoods are similar to *natto* of Japan, *thua-nao* of northern Thailand, and *chungkok-jang* of Korea. Address: Food Microbiology Lab., Dep. of Botany, Sikkim Government College, Gangtok, Sikkim 737 102, India.

1607. Hart, Dennis. 2001. From tradition to consumption: Construction of a capitalist culture in South Korea. Seoul, South Korea: Jimoondang Publishing Company. xx + 200 p. Index. 23 cm. Series: Korean Studies Dissertation Series, No. 2. [380* ref]

• ***Summary:*** A profound and very insightful book. Chapter 5 (p. 83-114) is "Creating the Korean housewife." For centuries, the making and storage of foods [such as fermented soyfoods (*jang*)] have been a key responsibility of women, who were completely in charge of the preparation and cooking of food. Through this complex and demanding work she gained appreciation and status in the home. And her foods were unique, with a unique taste, which was the taste of her household and family.

Now all that has changed; she has become a consumer in a convenient, shiny modern kitchen where industrialized foods can be prepared by the flick of a switch. What will replace the old ways? How will she find real satisfaction and meaning? As the divorce rate rises and urbanization increases, what bonds will hold families together? (p. 98-103). Address: Korea.

1608. Hepinstall, Hi So Shin. 2001. Growing up in a Korean kitchen: A cookbook. Berkeley, California: Ten Speed Press. 254 p. Illust. Index. 26 cm.

• ***Summary:*** The best book seen to date for information and recipes on soyfoods in Korea. The author grew up in Cheongju, South Korea, in her ancestral home. Families made sauces in earthenware crocks (p. 7). A list of ingredients with descriptions includes: Bean curd (Tubu [tofu]). Beans, dried (K'ong, incl. yellow and black soybeans, mung beans and red [azuki] beans). Koch'ujang (Korean hot red pepper paste [with soybeans]). Kudzu (Ch'ik). Meju (Korean fermented soybean paste block [soybean koji]). Piji (Bean curd dregs [okara]). Red bean paste (P'at komul). Soy sauce (Kanjang). Soybean powder (K'ong karu; a yellow powder sold in 1-lb plastic bags). Soybean sprouts (K'ong namul). Toenjang (Korean fermented soybean paste).

Essential sauces and pastes: Recipe for: "Homemade soy sauce and fermented soybean paste: Kanjang and toenjang." It makes 10 gallons and takes about 2 months to prepare. Unusual ingredients include: 3 pieces oak wood charcoal, 1 gallon white grain syrup (choch'ung), 10 toasted jujubes, and 5 dried hot red peppers. For about 60 days, let the crock stand in the open without a lid; cover when it rains. At the end of 60 days the mash is filtered through a bamboo basket lined with a fine-mesh cloth into a crock to yield two products: The fermented soybean paste (toenjang) remains in the strainer, whereas the soy sauce filters through into the crock. Store the paste in a sterilized crock; sprinkle a thin layer of coarse salt on top. "Pour the soy sauce liquid into a caldron, bring to a boil, and allow to simmer over low heat until it is reduced to one-third of its original volume." Adjust saltiness. The paste and the sauce or now ready to be aged, but we are not told for how long.

Soy sauce at this stage (unaged) is called *ch'ongjang* (clear soy sauce) or *Choson* kanjang (Korean soy sauce). A plain and somewhat salty brown sauce, it is used mostly in base seasonings and clear soups. To make *chin kanjang,* a superior thin, syrupy, jet-black soy sauce, similar to the dark soy sauce sold in today's markets, submerge a large-mesh cloth pouch containing black soybeans, p'yogo mushrooms, and strips of kelp (*Miyok*) in the clear, unaged soy sauce and simmer over low heat for about an hour. The longer it is aged, the mellower it becomes, and the more intense the flavor.

Homemade hot red pepper paste (*Koch'ujang,* with 1 cup fine meju powder and ½ cup soy sauce). Instant fermented soybean paste (*Makjang;* uses 5 cups powdered meju and takes 10 days to mature). Vinegar soy sauce (*Ch'o kanjang*). T'ang soybean paste (*T'anggukjang;* "the best tasting soybean paste among all toenjang). Fermented soybean paste with garlic and bean curd (*Ssamjang;* "Probably the tastiest soybean paste made in the Korean kitchen," p. 32).

Main dishes: Five grain rice (*Ogkpap or Chapgokbap,* with ½ cup dried black soybeans, p. 41. Koreans traditionally eat this dish on the 15th day of the 1st month of the lunar year). Soybean sprouts with steamed rice (*K'ongnamulbap,* p. 44). Ceremonial soup (*T'ang,* with medium firm tofu, p. 62). Seaweed soup (*Miyokguk,* with tofu, p. 65). Kimchi soup (*Kimchiguk,* with tofu and soybean sprouts, p. 67). Soybean porridge (*K'ongjuk,* with 1 cup soybean powder, p. 78). Noodles in chilled soybean milk (*K'ong kuksu,* with 1 quart soy milk, p. 86). Stuffed dumplings (*Mandu,* with medium-firm tofu, p. 90-91). Soy sauce kimchi (*Chang kimchi,* p. 103).

Side dishes: Seasoned soybean sprouts (*K'ong namul,* p. 122, incl. Chilled soybean sprouts, and Soybean sprout soup). Sauteed cabbage kimchi with beancurd and pork (p. 130). Bean curd and vegetable stew with fermented soybean paste (*Tubu toenjang tchigae,* p. 138). Bean curd and vegetable hot pot (p. 152). Soybean pancakes (p. 163). Stuffed pan-fried bean curd (p. 167). Stuffed pan-fried

© Copyright Soyinfo Center 2021

p'yogo mushrooms (with bean curd, p. 168). Stuffed pan-fried peppers (with bean curd, p. 169).

More tofu recipes are on pages 170, 171, 172, 196-97, 199, 200, 204-05, 217. Many recipes call for kelp, kim (laver, nori) or seaweed (see index). Address: Washington, DC.

1609. Huang, Guiyou. ed. 2001. Asian American autobiographers: A bio-bibliographical critical sourcebook. Westport, Connecticut: Greenwood Press. xiii + 446 p. See p. 281-85. Index. 24 cm. [200+* ref]

• ***Summary:*** Pages 281-85: Contains an excellent biography of Ilhan New (1895-1971), by Seiwoong Oh. New was one of the two founders of La Choy Food Products, Inc. Born in Korea on 15 Jan. 1895, New was the eldest son of a moderately successful entrepreneur who eventually settled in Pyongyang, the present capital of North Korea, where New grew up, as he describes in his autobiography *When I Was a Boy in Korea.* Most of his childhood memories are from Pyongyang. The intended audience for the book was American children.

In Pyongyang, New's father started selling imported products and became interested in Western culture and religions; he was eventually baptized as a Christian. Inspired by what missionaries in Pyongyang told him about the West, New's father decided to send his son, now age 9, to live in a Presbyterian household in Kearney, Nebraska, and to receive an American education. During this time his name was accidentally changed to "Ilhan" from "Ilhyung." First in Kearney, then in Hastings, Nebraska, New attended high school, playing center on the football teams and debating on the debate team. In 1919 he graduated from the University of Michigan, with a B.A. degree, then worked for the Michigan Central Railway and General Electric in New York. In 1922, with a friend from the University of Michigan, Wally Smith, he co-founded La Choy Food Products, Inc. in Detroit. The business grew steadily. In 1925 New married Mary Woo, an American-born Chinese, whom he met at the University of Michigan and who later became a physician. In 1926 he and his new wife returned to Korea (which had been ruled and occupied by Japan since 1910), where (like his father) he opened an import company, first in dyeing materials then later in pharmaceutical products. While in Korea, he was asked by Lothrop, Lee and Shepard Publishing Co. to write a book about his childhood. He consented and in 1928 his book, *When I was a Boy in Korea,* was published in English. This book later came to be widely recognized as the earliest literary work in English by a Korean American. Yet it was not an autobiography, and contains "little information about the author's life except bits and pieces to be gleaned from his passing remarks."

Note: In 1930 New left La Choy Food Products, probably selling his share to his partner and friend, Wally Smith.

In Korea, New's import business grew rapidly. But in 1936, during one of his trips abroad, he decided to stay in California to join the Korean movement for independence from Japan and to study for an M.B.A. [Master of Business Administration] degree from the University of Southern California.

After World War II, in 1946, New returned briefly to Korea, but came back to the USA to study law at Stanford University (in California) and reconsider his future plans. In 1953 he returned to Korea, where his pharmaceutical company had grown steadily in his absence. New resumed his position as chairman and worked to expand the business. By the 1970s his firm's net profit ranked among the top ten in Korea–a remarkable achievement. He had earned a reputation in Korea as a model entrepreneur, who supplied the people with products they strongly wanted and who returned his profits to the public, "as a pioneer in applying modern management science to his business, and as a philanthropist who, among others, founded and fully financed New Han Engineering High School, offering full scholarship for all students.

He died in 1971 at about age 76. In his will, de donated all his money to the Korea Social and Educational Trust Fund, except for $10,000 to be given to his granddaughter for her college tuition. His museum, located in Seoul, houses his personal correspondence, personal possessions, and other historical records of his life.

The bibliography for this chapter (p. 285) cites 5 studies of Ilhan New and his book, from 1929 to 1999. Address: Oh: PhD, English Dep., Rider Univ., Lawrenceville, New Jersey.

1611. Lee, Cherl-Ho. 2001. Fermentation technology in Korea. Seoul, Korea: Korea University Press. iii + 330 p. Illust. Index. 26 cm. [Eng]

• ***Summary:*** Korea has a long history of eating fermented soyfoods. Early documents indicate that the cultivation of soybeans originated in Manchuria, which was part of Korea in ancient times.

Contents: 1. Evolution of Korean Dietary Culture. 2. Primitive Pottery Age (B.C. 8000 to about 3000)–the era of fermentation experiments. 3. History of Cereal Fermentation Technology. 4. Korea, the land of soybean fermentation: the origin of soybean as food, history of soybean fermentation, *meju* preparation–the fermentation starter, Korean soysauce [kanjang, made at home] vs. Japanese soysauce [shoyu, made industrially], *chongkukjang:* a fermented soybean paste as an instant military paste of the old days, *kochujang:* a wonderful harmony of hot, sweet, meaty and salty tastes.

5. Effect of soybean fermentation on the protein quality. 6. Kimchi, Korean fermented vegetable food. 7. Fish

© Copyright Soyinfo Center 2021

fermentation technology. 8. Lactic acid fermented foods and their benefit in Asia. 9. Present status and prospect of Korean fermentation industry. Appendix: Collection of research paper abstracts in Korea–I. Alcoholic fermentation. II. Soybean fermentation. III. Kimchi fermentation. IV. Fish Fermentation. V. Other fermentations. Authors index.

Page 79. The earliest known document that mentions *kochujang* (fermented red pepper paste) is the *Chungbosanlimkyungje* written by Chung-Im in 1765. It describes several varieties of fermented soybean products including *jeupjang* and *chongkukjang* besides *kochujang* and their processing methods practiced in Korea at that time. date from the 2nd half of the 17th century.

Shell mounds along the coastline of the Korean Peninsula and the Japanese archipelago show that the dietary habits of the people changed from less hunting and more gathering at the beginning of the Holocene period (ca. 10,000 BCE) as the dwellings moved to the coastline.

Interestingly the increased consumption of marine products coincided with the invention of primitive pottery. Around the late Paleolithic, by 6000 BCE, the use of *Jeulmun* (Korean) or *Jomon* (Japanese) pottery has spread over the Korean Peninsula and the Japanese Archipelago. Archaeologists call this period the *Jeulmun* period in the Korean Peninsula and the *Jomon* period in the Japanese archipelago (from ca. 8000 BCE). Agriculture had not yet begun.

Page 6: Table 1-1 "Chronology of early Korean culture" includes the following:

ca. 2,333-108 B.C. Traditional date of the founding of the Kingdom of Chosum by Tangun.

ca. 1,200 B.C. Beginning of the Bronze Age, black pottery, Megalithic culture, dolmens, menhirs, agricultural tools.

ca. 1,122 B.C. The establishment of Kija Chosun.

ca. 800-700 B.C. The rise of the Chin state and the Han tribes in the south [of Korea].

ca. 500 B.C. The beginning of the Iron Age.

ca. 194 B.C. The rise of Wiman Chosun in the north and the three federations of the Han tribes in the south.

109-108 B.C. Invasion of Korea by the Han dynasty of China, the fall of Wiman Chosun.

57 B.C. to 699 A.D. The Three Kingdoms period.

57 B.C. The founding of the state of Saro (later Silla).

ca. 37 B.C. The emergence of Koguryo.

ca. 18 B.C. The emergence of Paekche.

372 A.D. Official adoption of Buddhism and the establishment of a school of Confucian studies in Koguryo

384 A.D. Official adoption of Buddhism in Paekche.

527 Official adoption of Buddhism in Silla.

663 The destruction of Paekche by Silla.

668 The destruction of Koguryo by Silla.

668-918 Unified Korea of Silla.

About the author (inside front dust jacket): Cherl-Ho Lee earned his PhD in Food Science at the Royal Veterinary and Agricultural University, Denmark. He was a postdoctorate research associate at the Massachusetts Institute of Technology in the USA. His previous works include:

1. Extrusion Technology I and I (1987, 1988, in Korean).
2. Fish Fermentation Technology (UNU Press, 1993).
3. Lactic Acid Fermentation of Non-dairy Food and Beverages (1994, in Korean).
4. Food Evaluation and Quality Control (1999, in Korean).
5. Introduction to Korean Food Science (Korea University Press, 2003). Address: Prof. of Food Engineering, Graduate School of Biotechnology, CAFST, Korea Univ., Seoul, 136-701, Korea.

1612. Namkoong, Joan. 2001. Go home, cook rice: A guide to buying and cooking the fresh foods of Hawai'i. Honolulu, Hawaii: Namkoong Publishing. 104 p. Illust. (color photos by Rae Huo). Index. 28 cm. [28 ref]

• ***Summary:*** "A collection of food stories that appeared in the *Honolulu Advertiser* from 1994 to 2001 and information about food products." "Guide to buying and cooking the fresh foods of Hawai'i" (from the publisher).

The Foreword begins: "'Go home, cook rice' is what we say at the end of the day when we're heading home;..."

The section titled "Soy" (p. 67-71) begins with brief definitions of tofu, fresh soybeans [edamame], soy sprouts, miso, natto, and "fermented black beans." Then come recipes: Basic miso sauce (with "white or red miso"). Spicy soy beans (with "1 pound soybeans"). Soy bean sprouts (*kong na mul* in Korean, with "1 {8-ounce} package soy bean sprouts"). Page 69 titled "Soybean curd," with a sidebar of "Tofu tips" describes more soyfoods: Tofu (incl. okara and silken tofu). Aburage (thicker, denser slabs of fried tofu are called *Dau hu chien* in Vietnamese). Then we read this unusual statement: "Before a coagulant is added to form tofu, a thin skin forms on the surface of soybean milk as it stands. This skin is lifted off and allowed to dry, forming a product that has a firm, chewy texture when reconstituted in water. Known in Chinese as *fu jook* [dried yuba sticks], bean curd skin is used as an edible wrapper, and in braised and vegetarian dishes. They come in large flat sheets or in 'bamboo' sticks that are pleated."

Tempeh. Fermented bean curd (which can be red or white in color. Fermentation in rice wine and salt produces a pungent flavor). A color photo shows 3 forms of tofu: fresh tofu, aburage, and *dau hu chien* [which resembles Japanese deep-fried tofu cutlets–*atsuage / namaage*]. Then a recipe for Lemon grass tofu (Vietnamese). Page 71 discusses "Soy bean sauces" such as hoisin, bean sauce, and shoyu (made with koji). Page 72: "The flavors of soy sauces." Chinese soy sauces (tend to be saltier than Japanese shoyu). Tamari. Kecap manis. Light or sodium reduced soy sauces. Dashi

© Copyright Soyinfo Center 2021

soys. How to use soy sauces. This section ends with recipes for: Basic Korean sauce (with "1 cup soy sauce"). Basic teriyaki sauce (with "1 cup soy sauce, mirin, sake, raw white sugar, smashed garlic, and a piece of smashed ginger). Basic hoisin sauce (with "6 tablespoons hoisin, 2 tablespoons soy sauce, brown sugar, sesame oil, minced garlic, minced ginger, and Sriracha sauce {a Thai, Vietnamese, or Chinese hot sauce}). Address: Former *Honolulu Advertiser* food editor, Hawaii.

• ***Summary:*** "The characteristics of brown color of Korean traditional soy sauces under different processing conditions were investigated in this research. As for meju type, traditional and modified mejus were used. The samples were produced from four levels of aging time, 0 day, 60 days, 120 days and 180 days in both clay jar and glass jar." Address: 1. Dep. of Food and Nutrition, Yonsei Univ., Seoul 120-749, Korea.

1614. Cho, Seung Yong; Rhee, C. 2002. Sorption characteristics of soy protein films and their relation to mechanical properties. *Lebensmittel-Wissenschaft + Technologie* (*Zurich*) 35(2):151-57. March. [25 ref]
• ***Summary:*** "Appropriate selection of plasticizer type and concentration will be helpful in controlling moisture content and the moisture adsorption rate of a film, thereby improving the film stability under varying RH conditions." Address: Korea Univ., Inst. of Life Science and Natural Resources, College of Life and Environmental Sciences, 5-1, Anam-Dong, Sungbuk-Ku, Seoul, 136-701 (Korea).

1615. Pulmuone USA Inc. 2002. Pulmuone, a plate full of nature. South Gate, California. 16 p. Each page: 18.3 x 26 cm.
• ***Summary:*** Brochure (glossy color) sent by Patricia Smith from Natural Products Expo West. 2002. March. On the cover are five small rectangular photos of foods (including whole dry soybeans) against a white background.

Contents: 1. An Asian approach to natural food. 2. Pulmuone foods bring out the nature to your meals. 4-5. Tofu: Better protein source than meats. A photo shows the company's tofu products: Four types of basic tofu (each 18 oz. / 510 gm, regular, firm, silken, and soft). Two types of extra soft (10 oz / 300 gm) in round tubes. Tofu broth seasoning (1.6 oz / 45 gm). Two private label types of tofu for Japanese markets (firm and soft). Egg tofu (4.3 oz / 122 gm).

6-7. Fresh noodles (uncooked). Ten different types, incl. 2 Ramen and 1 udon.

8-9. Dry noodles / Instant rice noodles. Twelve different types (5 cup type, 3 bowl type, and 4 traditional straight types).

10-11. Traditionals. 4 sizes of hot pepper paste, 3 sizes of soybean paste, 2 sizes of hot bean sauce, 1 cho jang (sashimi sauce), 1 chungkukjang [Korean natto], 9 types of grains and beans, including soybean, red bean, black soy bean, mung bean, sweet brown rice, brown rice, etc.

12-13. Other. Three types of tea, 4 flavors of farm pudding, 2 types of sauce (black bean sauce, and curry sauce mix). Three types of vinegar. 3 types of pickled radish. Imitation crab meat [vegetarian]. Sesame oil.

14. Frozen foods. Beef dumpling and Kimchi dumpling. Frozen udon in tubs (3 types). Buns & pancakes (5 types).

Page 16. Important dates in the history of Pulmuone: (actually chronology).

1981 May–Pulmuone Organic Foods opened to sell organic vegetables from its own farm.

1984 May–Pulmuone Foods Co., Ltd. incorporated.

1984 June–Tofu and Bean Sprout Plant: Yangju, east of Seoul.

1986 Nov.–Mineral spring water plant opened in Chungju, South of Seoul.

1987 May–Pulmuone Kimchi Museum opened in Seoul.

1988 Dec.–Natural House opened (Natural foods chain stores) in Korea.

1989 Jan.–Pulmuone Food Standards Committee started to work (To set up standards for food formulas, ingredients and manufacturing processes): Korea.

1990 Jan.–Soybean paste [jang] plant opened in Doan, south of Seoul.

1991 Jan.–Pulmuone USA Inc. founded.

1991 June–Fresh noodle plant opened in Chuncheon, northeast of Seoul.

1993 Aug.–Ilsongjung Foods Ltd., Korean-Chinese joint venture, opened in China.

1995 June–Tofu Plant opened in Los Angeles.

1995 Sept.–ISO 9002 certificate obtained.

1997 Sept.–Fresh Noodle Plant opened in Los Angeles, USA.

1999 Sept.–Tofu plant opened in Shanghai, China.

Below the chronology small photos show: (1) Inside of the Pulmuone Tofu Plant in Los Angeles. (2) Inside the Pulmuone Fresh Noodle Plant in Los Angeles.

"Pulmuone was founded in 1981 with 40 employees. It has grown to become a multinational company of 2,000 employees with annual sales volume of $250 million." "The secret to success lies in uncompromising commitment to better foods and better life." Address: 4567 Firestone Blvd., South Gate, California.

1616. Pulmuone USA Inc. 2002. Pulmuone. Soga (so good!!) (Portfolio). South Gate, California. 12 inserts. 31 cm. Inserts 28 cm.

© Copyright Soyinfo Center 2021

• ***Summary:*** Portfolio (glossy color) sent by Patricia Smith from Natural Products Expo West. 2002. March. On the cover are the Pulmuone and Soga logos plus various scattered stylized green leaves against a white background.

Inserts: (1) Soga Organic Tofu (firm, soft, or silken). (2) Quick and handy tofu cookbook (15 x 9 cm, 16 p., mostly recipes). (3) Soga Non-dairy Soy Smoothie Base (in a round plastic tube). (4) Non-GMO Nigari Tofu, firm or silken.

(5) Katsuo [dried, shaved fish] udon noodle soup and Katsuo tempura udon. (6) Star-K Kosher certification, for 9 tofu products. (7) OCIO organic transaction certificate, for soybeans. (8) Pulmuone to open 2nd tofu plant in New York (in Tappan, New York, on March 16, 2002. News release, dated 26 Feb. 2002). (9) Overview of company. "We will have a production capacity of 20 million units per year from our new plant facility in New York, opening in March 2002."

(10) Industry facts on soyfoods and health. 69% of Americans recognize soyfoods as healthy, 22% have no opinion and only 9% feel soy is unhealthy. 42% of Americans report that they consume soyfoods once a month or more. 27% consume soyfoods weekly. During the year 2000 the soyfoods category as a whole grew by 21.1% to reach $2.77 billion; during the year 2001 sales are expected to grow by 15-15%, Since 1995 dollar volume has grown by 250% for the category, hitting double digit increases in each year. (11) A natural tofu (firm, soft, or silken). (12) "Pulmuone, a plate full of nature" (color booklet, 16 p.). Address: 4567 Firestone Blvd., South Gate, California.

1617. **Product Name:** Soga Organic Twin-Pack Tofu.
**Manufacturer's Name:** Soga Soyfoods [Pulmuone U.S.A.].
**Manufacturer's Address:** 4585 Firestone Blvd., South Gate, CA 90280. Phone: 866-356-2800.
**Date of Introduction:** 2002 March.
**Ingredients:** Feb. 2007: Water, organic soybeans, calcium sulfate, glucono delta lactone, magnesium chloride. Certified by Quality Assurance International.
**Wt/Vol., Packaging, Price:** 15.5 oz (439 gm) packed in molded plastic tray with heat-sealed, peel-off plastic film lid. Retails for $0.99 (2007/02 Lafayette, California).
**How Stored:** Refrigerated.
**Nutrition:** Per 3 oz (85 gm): Calories 80, calories from fat 45, total fat 5 gm (8% daily value; saturated fat 1 gm), cholesterol 0 mg, sodium 5 mg (<1%), total carbohydrate 2 gm (dietary fiber <1 gm [3%], sugars 0 gm), protein 9 gm. Vitamin A 0%, vitamin C 0%, calcium 15%, iron 6%.. Percent daily values are based on a 2,000 calorie diet.
**New Product–Documentation:** Talk with John Sim, head

of sales at Pulmuone. 2003. Nov. 10. This product was introduced in March 2002 at the Natural Products Expo West, at Anaheim, California.

Product with Label purchased at Trader Joe's in Lafayette, California. 2007. Feb. 4. "Organic Extra Firm Twin Pack Tofu." This packaging innovation is one of the most original and important since water-packed tofu started to be packaged in plastic tubs with a heat-sealed film lid. The front panel is red, white, pink, blue, black and green. The product name is in both English and Korean. The ingredients (black on pink) are in English, French, and German. In the upper right corner is a color photo of diced tofu served with veggies on a blue dish. An illustration shows the twin packs, with large arrows on each pointing in opposite directions: (1) "Enjoy now." (2) "Enjoy later." Logo: USDA organic. Each No. 5 PP plastic tub is 5.5 by 11 by 5 cm deep.

1618. **Product Name:** Soga Healthy Toppers [Diced Deli Ham, Chicken Style Strips], and Healthy Tenders [Breaded Chicken Style with BBQ Dipping Sauce] (Meat Alternatives).
**Manufacturer's Name:** Soga Soyfoods [Pulmuone U.S.A.].
**Manufacturer's Address:** 4585 Firestone Blvd., South Gate, CA 90280. Phone: 866-356-2800.
**Date of Introduction:** 2002 March.
**Ingredients:** Chicken Style Strips: Textured soybean protein, whey protein, soybean oil, evaporated cane juice, salt, white pepper, vitamin E, mustard, lemon juice, sage, thyme.
**Wt/Vol., Packaging, Price:** 6 oz. package.
**How Stored:** Refrigerated.
**New Product–Documentation:** Talk with John Sim, head of sales at Pulmuone. 2003. Nov. 10. This product was introduced in March 2002 at the Natural Products Expo West, at Anaheim, California.

Leaflet (front and back, 8½ by 11 inch, color) sent by Patricia Smith from Natural Products Expo West (Anaheim, California). 2003. Oct. The front shows the front panel of three packages. The rear gives nutrition facts and ingredients.

1619. Steinkraus, Keith H. 2002. Fermentations in world food processing. *Comprehensive Reviews in World Food Science and Food Safety* 1(1):23-32. April. [96 ref]
• ***Summary:*** The section titled "Alkaline fermentations" (p. 28) states that highly alkaline fermentations are generally safe. These include *dawadawa* in Nigeria, *soumbara* in the Ivory Coast, and *iru* in West Africa–each made by fermentation of the soaked and cooked seeds of the African locust bean tree (*Parkia biglobosa*). This is a bacterial fermentation; the bacteria belong to the genus *Bacillus*, typically *Bacillus subtilis.* No inoculum is used.

Soybeans can be substituted for the locust beans.

Protein-rich alkaline fermentations also include several based traditionally on soybeans; natto from Japan, thua-nao from northern Thailand, and kinema from Nepal and environs. In each food, the essential microorganism is *Bacillus subtilis* and related bacilli. The enzymes produced are highly proteolytic; the proteins in the substrate are hydrolyzed to peptides and amino acids. Ammonia is released and the pH rapidly rises to 8.0 or higher. The combination of high pH and free ammonia plus the rapid growth of the essential microorganisms at relatively high temperatures (above 40ºC) make it difficult for spoilage microorganisms to grow. Therefore the products are quite stable and well-preserved. They are safe to eat even when made in an unhygienic environment.

The section titled "High salt savory flavored amino / peptide sauces and pastes" (p. 28) discusses sauces and pastes including Chinese soy sauce, Japanese shoyu and miso, Indonesian kecap, Korean kanjang, Taiwanese inyu, and Filipino taosi.

"The ancient discovery of how to transform bland vegetable protein into meat-flavored amino acid / peptide sauces and pastes was an outstanding human accomplishment." Address: Prof. Emeritus, Microbiology and Food Science, Cornell Univ., Ithaca, New York 14853.

1620. Park, Eunnie. 2002. A Korean fare-thee-well. *Record* (*The*) (*Hackensack, New Jersey*). May 17. p. 91.
• ***Summary:*** This about the Korean Food Festival to be held from now until May 31 at the Delegate's Dining Room, The United Nations, First Avenue and 45th Street, Manhattan, New York.

Women wearing colorful *hanbok*, traditional Korean dress, will be on hand to interpret the food.

"The most common condiments used in Korean cuisine are soy sauce [*kanjan*], sesame oil, red pepper paste or powder [*gochujang*], *doenjang* (soybean paste), garlic and ginger. Combinations of these condiments can be found in almost any dish." Address: Staff writer.

1621. *NSRL Bulletin* (*National Soybean Research Laboratory, Urbana, Illinois*). 2002. World food aid representatives visit NSRL for soy workshop. 9(2):4-5. June.
• ***Summary:*** "Representatives from international organizations, such as Save the Children and Africare, recently participated in an intensive workshop at the National Soybean Research Laboratory (NSRL) on increasing the use of soy in their aid efforts. The session was organized by the World Initiative for Soy in Human Health (WISHH).

"'One of the major goals for the WISHH program is to introduce soy protein products in food aid programs,' says Pradeep Khanna, program coordinator at the NSRL. 'Activities range from developing ways soy can increase the protein in breads suitable for Afghanistan and central Asian countries to identifying new uses for soy protein isolates and concentrates.'

"Primary funding for the program is provided by

© Copyright Soyinfo Center 2021

the United Soybean Board and the American Soybean Association. Additional funding has come from the Illinois Soybean Checkoff Board and state soybean organizations from across the country. The NSRL provides technical support and program leadership for a wide range of projects sponsored by WISHH.

"Khanna notes that one important project resulted when the relief efforts in Afghanistan uncovered an important need to increase the protein content of the local diet.

"'The increase in protein ideally should come in the form of flat bread, which is the major staple in the country,' Khanna says. 'WISHH has directly responded to this need by collaborating with the North American Millers Association to field test soy-fortified wheat flour, which has 12 percent soy flour in the blend. The two groups are working to ensure the product will suit local tastes.'

"The intensive training program at the NSRL was specially designed to meet the needs of private voluntary organizations in their food aid efforts. Topics included demonstrations and evaluations of soy foods made from defatted soy flour, textured soy protein, soy milk, and other soy protein products. During their trip, the participants also visited a soybean farm, the Central Soya facilities in Gibson City, Illinois and Fort Wayne, Indiana, and the Bunge plant in Danville, Illinois.

"'This workshop allows international hunger fighters to gain first-hand knowledge of how soy and soy protein products can play an important role in feeding the world,' Khanna says. 'Many of those in attendance represent aid organizations that already use thousands of tons of U.S. soybeans and soybean oil. It further provided them with the opportunity to interact with industry representatives and evaluate how soy protein products can fit both their immediate food aid efforts and their long-term economic development programs.'

"As part of the workshop, representatives from private voluntary organizations also discussed ways that soy can fit with new government initiatives to fight world hunger and how it can provide much-needed protein for those suffering from HIV and AIDS. An estimated 36 million people worldwide have HIV or AIDS. Some African countries have infection rates as high as 25 to 35 percent of their populations.

"'WISHH has been working to make the nutritional benefits of soy available to people with HIV and other devastating diseases around the world,' Khanna says. 'In many cases, nutrition intervention may be the primary effort to assist those people. The importance of nutrition intervention is amplified where medications are unavailable. The vast majority of recommended calorie-containing nutritional supplement products contain soy ingredients for optimum nutrition.'

"The activities to assist people living with AIDS include collaborating with leading nutritionists to better understand and develop the benefits of soy for targeted programs and communicating these results domestically and internationally. Other efforts are aimed at supporting private voluntary organizations, such as Humana People to People, to create soy restaurants as part of its Total Control of the Epidemic program.

"'Additional activities have led to the development of demonstration feeding programs to provide new scientific research and best practices for using soy in target countries,' Khanna says. 'Another major focus is on working with nongovernmental agencies to develop testing and feeding programs with value-added soy products that can provide badly needed protein in the diet, especially for children and young mothers.'

"As part of this effort, WISHH is also building long-term relationships in countries that could grow to become customers for U.S. soy products. More than a million metric tons of U.S. soybeans have annually gone into food aid in recent years, representing 3 percent of total U.S. soybean exports. Many former food aid recipients, such as the Philippines and Korea, are now important long-term commercial customers for U.S. soybeans products.

"'Most future growth in food demand will be in developing and middle-income countries,' Khanna says. 'Almost all of the world's projected increase of 1.2 billion people by 2020 will be in these countries. The middle-income classes of developing countries are also expected to grow by 68 percent from mid-1990s levels during the next four years. That represents an increase equal to the current combined populations of Japan and the European Union.'

"Khanna further points out that the WISHH program routinely leverages the soybean checkoff funds by cooperating with humanitarian groups and government agencies, as well as the international marketing staff at the American Soybean Association.

"'The project offers a win-win situation for soybean growers,' he says. 'It can provide a better diet for millions of people around the world, while reducing the current surplus of soybeans in the U.S. By working with private voluntary organizations, we can ensure that soy products go to the places where they will do the most good.'

"Additional information about a wide range of WISHH activities and programs is available on the internet at www.wishh.org."

Note: As of March 2019 this website is still working and the organization appears to be very active worldwide. The executive director is Jim Hershey, and the WISHH Committee has 18 members, including 3 women. Many new programs concern establishing aquaculture projects in developing countries, and working with businesses to add defatted soy flour to baked goods.

1622. *Record* (*The*) (*Hackensack, New Jersey*). 2002. Classified ad: Cook / Korean-Japanese. Oct. 6. p. 99.

1623. Tamang, Jyoti Prakash. 2002. Lesser-known ethnic fermented soybean foods of the eastern Himalayas. In: K. Liu, et al., eds. 2002. Proceedings China & International Conference & Exhibition on Soybean Technology & Development Cooperation (CISCE) 2002 [Extended abstracts]. Beijing, China: Chinese Cereals and Oil Association (CCOA). [7] + 474 p. See p. 232-33. Held 6-9 Nov. 2002, Beijing, China. [Eng]
• ***Summary:*** The food culture of the people of the Eastern Himalayas is somewhere between the food culture of East Asia and the food culture of Southeast Asia. Soybean is a leguminous summer crop, which has been used for centuries to prepare both fermented and non-fermented foods in the Eastern Himalayan regions of Nepal, India, and Bhutan. The fermented foods prepared in this region are *kinema, aakhuni, hawaijar, turangbai,* and *bekanthu.* These fermented soyfoods are similar to natto of Japan, *thua-nao* of northern Thailand, *douchi* of China [sic], *chungkok-jang* of Korea, and *pe-poke* of Myanmar. All of the above foods have a bacterium, *Bacillus subtilis* as their dominant organism.

A detailed discussion of kinema, its history and its microorganisms, is given. Address: Food Microbiology Lab., Sikkim Government College, Gangtok, Sikkim 737 102, India.

1624. *Canadian Soybean Bulletin* (*OSG, Chatham, Ontario, Canada*). 2002. Canadian soybean exports. Winter. p. 2.
• ***Summary:*** A large table shows statistics in tonnes (metric tons) of soybeans exported to various countries, and regions, each year from 1998/99 to 2001/2002. The countries are: In Asia–China, Hong Kong, Indonesia, Japan, Malaysia, Philippines, Singapore, South Korea, Taiwan, and Thailand. In Western Europe–Austria, Belgium, Denmark, France, Germany, Italy, Netherlands, Norway, Portugal, and Spain. By continent–Africa, Central America, Eastern Europe, Middle East, Oceania, South America, and United States.

In 2001/2002 the countries to which the largest amount of Canadian soybean exports went were (in tonnes): Japan 126,619, Malaysia 101,698, United States 60,244, Germany 29,377, Indonesia 26,836, Hong Kong 22,800.

Total Canadian soybean exports have declined dramatically during the past two years, from a peak of 946,360 in 1999/2000, to 746,241 in 2000/2001, down to 471,492 in 2001/2002.

1627. Kim, Yong-Ho. 2002. Current achievement and perspectives of seed quality evaluation in soybean. *Korean J. of Crop Science* 47(Suppl.):95-106. [27 ref. Eng]
• ***Summary:*** "Soybean is one of the most important sources of protein and oil in the world. Recently, emphasis has been laid on the chemical composition of soybean seeds for the processing soybean foods. Improvement of soybean components has been expected to improve food-processing quality for the processed soybean products such as soymilk and various edible ingredients as well as fur the traditional soyfoods." Address: Dep. of Life Science, Soonchunhyang Univ., Asan, Chungnamm 336-745, Korea.

1628. Kwon, Byung Sun; Shin, Jeong Sik. 2002. [Seed protein content and fatty acid composition of black seeded soybeans collected from southwestern islands]. *Korean J. of Crop Science* 47(3):240-43. [15 ref. Kor; eng]
• ***Summary:*** "A total of 135 black seeded soybeans genotypes were collected in 45 island locations from January to May 2001. Seeds of 135 genotypes collected were analyzed for crude protein and fatty acid compositions. The crude protein content was averaged to be 40.75%, and was ranged from 34.70% to 44.20%. The average palmitic acid, stearic acid, oleic acid, linoleic acid and linolenic add content were 11.41%, 3.93%, 22.75%, 53.55%, and 8.35%, and the ranges of those were 9.00% to 14.40%, 2.90% to 5.00%, 22.75% to 26.50%, 50.30% to 57.20% and 6.7% to 11.20%, respectively. Heritabilities of palmitic acid, oleic acid, linoleic acid, and crude protein were higher, but that of stearic acid and linolenic acid were relatively lower. Crude protein content was correlated positively with oleic acid content, whereas it was correlated negatively with linoleic acid, palmitic acid, stearic acid, and linolenic acid contents." • ***Summary:*** "Soybean sprout traits were evaluated for soybeans for sprout (*Glycine max*) and wild soybeans (*Glycine soja*). Soybeans for sprout are characterized with small seed size of 10-14 grams per 100 seeds and are traditionally used only for producing sprouts. No difference was observed in hypocotyl length and sprout yield between two types of soybean. (However total length, hypocotyl length, body weight, and the rate of good quality were greater in soybeans than in sprouts.) Number of lateral roots and root length were greater in wild soybeans. Contents of crude oil, oleic acid, and sucrose were higher in soybean for sprout, while that of protein and linoleic acid were higher in wild soybeans. There was no difference in sprout isoflavone content." Address: 1. Div. of Plant Biosciences Major in Agronomy, Kyungpook National Univ., Daegu 702-701, Korea.

• ***Summary:*** Contents: Summary. Introduction. Fermentation starters: History of solid state fermentation starters in northeast Asia, cereal alcoholic fermentation starters, soybean fermentation starters. Fungal fermented foods: Cereal alcoholic products (rice wine, rice beer, alcoholic rice paste, alcoholic rice seasoning), fermented soybean products (Korean kanjang and doenjang, Japanese shoyu and miso, tempe, Chinese sufu), other fermented products (Chinese red rice {Anka}, enzyme foods). Hygienic aspects of fungal fermented foods: Mycotoxins in fermentation raw materials, mycotoxin formed during fermentation. Conclusion.

Page 162: "... soybean sauce, *kanjang*, and soybean paste, *doenjang*, have been used in Korea for more than 2000 years and formed the characteristic flavor of Korean cuisine. The term "Shi" [fermented black soybeans], the Chinese letter [character] indicating *meju*, first appears in *Jijiupian* written in the Han period (206 B.C. to 208 A.D.) of China. *Bowuzhi* of Jin (265-420 A.D.) of China describes that *Shi* [fermented black soybeans] originated in a foreign country, and the letter is a dialect. *Xintangshu* of the Tang period (618-807 A.D.) in China names Shi as a special product of Balhai or Bohai (688-826 A.D.), a nation founded by the refugees from defeated Kokuryo (37 B.C. to 668 A.D.)

Note: The source for the very important information given above on page 162 is endnote 33: Lee, S.W. (1990). "A study on the origin and interchange of Dujang (also known as soybean sauce) in ancient Asia." *Korean J. of Dietary Culture* 5:313.

"It is generally recognized that Koreans were the first to experiment with soybean fermentation, sparking the beginning of the soy sauce culture of the Orient (Lee, C.H. 2001. *Fermentation Technology in Korea.* Seoul: Korea University Press). Their traditional fermentation technology was so advanced that they taught their techniques to neighboring countries."

Page 162-63: "*Meju* [soybean koji], the fermentation starter for Korean soysauce, *kanjang*, is made from soybean... The ripening of *kanjang* mash in the brine is ended in 1-2 months."

1634. Ling, Kong Foong. 2002. Food of Asia: authentic recipes from China, India, Indonesia, Japan, Singapore, Malaysia, Thailand and Vietnam. Singapore: Periplus. 192 p. Illust. (color photos). Index. 31 cm.

• ***Summary:*** This oversized paperback book, loaded with glossy color photos, is an expanded version of the original 1998 edition. The introduction and essays are by Kong Foong Ling. The index, which is poor, makes the book hard to use if you are looking for particular foods found throughout Asia such as soybeans, soy sauce, miso, salted / fermented black beans, yuba [bean curd skin], etc.

Contents: The flavors of Asia. Ingredients. The Asian kitchen. Burma. China. India. Indonesia. Japan. Korea. Malaysia & Singapore. The Philippines. Sri Lanka. Thailand. Vietnam. Appendix.

The "Ingredients" section (p. 10-17) includes: Bean curd (incl. cotton or momen tofu, silken bean curd, deep-fried bean curd or aburage, grilled bean curd or yakidofu, fermented bean curd or nam yee). Bean curd skin [yuba]. Black beans, salted (and fermented). Hoisin sauce ("A

© Copyright Soyinfo Center 2021

sweet sauce made of soy beans, with spicy and garlicky overtones"). Miso (incl. red miso and white miso). Salted soy beans (incl. "yellow bean sauce"). Soy sauce (incl. light soy sauce, black soy sauce, red soy sauce, Kikkoman, tamari, thick sweet soy sauce (kecap manis–Indonesian)). Tempeh. Also: Red beans (dried azuki). Seaweed (incl. dried kelp, golden kelp, mozuku, salted dried kelp, laver or nori, wakame). Sesame (black and white seeds, tahina {tahini}). Sesame oil. Sesame rice crackers.

Korea (p. 109+). Page 110: There are also many fermented pastes and sauces for dipping, called *chang.* Every restaurant and home has its own formula for making chang. Based on a fermented mash of soy beans, the three most common varieties are *kan chang* (dark and liquid), *daen chang* (thick and pungent), and *gochu chang* (fiery and hot).

Soybean is mentioned on pages 8, 11, 68, 89.

Beancurd or bean curd is mentioned on pages 8, 10, 11, 26, 32, 33, 35, 36, 40-42, 68, 70-71, 74, 89, 90, 92, 93, 94, 96, 100, 102, 104, 107, 111, 112, 113, 119, 120, 127, 133, 158, 172, 175, 185, 189, 190, 191, 192.

Bean curd skin [yuba] is mentioned on pages 11, 35, 36.

Bean paste and bean paste sauces, p. 8, 32.

Fragrant soy sauce is mentioned on page 128.

Also: Red bean paste, p. 46 (canned, azuki).

1635. National Academy of Korean Language (Kungnip Kugôwôn). 2002. An illustrated guide to Korean culture: 233 traditional key words. Seoul, South Korea: Hakgojae. 479 p. Illust. (Color). Index. 24 cm. [79 ref]

• ***Summary:*** This is one of the most interesting books about Korean culture and foodways we have ever seen. It is divided into sections (such as "Korean food" or "Korean housing life") and each section contains a number of key Korean words. These words include each of the three different types of fermented soyfoods (*jang*).

*Jangajji* (p. 47-48 + p. 13) "is a fermented food made with various kinds of vegetables and stored in soybean sauce, soybean paste, or red pepper paste." Each of these is a fermented food which contains soybeans as a major ingredient. The good taste of vegetables will last more than a year if they are well prepared and pickled one of these three types of *jang.* On the Korean menu rice, which is the main dish, is clearly distinguished from the side dishes–one of which is *jangajji.* Vegetables used to make *janggajji* include garlic, sesame leaves, cucumber, turnip, green pepper and various roots. Each is prepared in its own special way, then placed in a gauze bag in the *jang.*

*Bulgogi* (p. 49-50) is marinated, grilled meat, usually beef, thinly sliced, mixed with soy sauce, chopped green onions, garlic, sesame, salt, pepper, sugar, etc., then marinated in a bowl before grilling.

*Dubu* (p. 55-56 + 82, 204) is the Korean word for tofu. "Koreans have traditionally made and eaten it a great deal at home. *Dubu* is said to have been first made in China around the second century B.C. It seems to have come into Korea at the end of the Goryeo Dynasty [918-1392–First unification of the Korean Peninsula]. Yet in the Joseon Dynasty [Choson Dynasty 1392-1897] the Koreans are recorded as passing the art of making *dubu* to neighboring countries, such as China and Japan. Even in China they are said to have highly praised Korean women for their cooking skills, especially for their making of *dubu."* Soymilk curds are called *sundubu.*

"Korean people sometimes eat *dubu* as it is or sometimes eat newly made hot *dubu* with soy sauce. They also cook it on a griddle, slightly seasoned with salt. Additionally, *sundubu* stew with very soft uncurdled bean curd is a popular dish." Koreans prepare *dubu* in more than fifty different ways.

Sayings: "'Losing a tooth while eating dubu.' It means that everybody should always be careful even about small matters, however easy they may seem, because absent-mindedness may cause a fatal error. It also means that anyone can make an unexpected error. Although *dubu* is so soft and tender that one can swallow it without chewing, this proverb says that while eating *dubu* a tooth may fall out,

"'If one hears a kind word, one may buy *dubu* instead of *biji* [okara], bean curd dregs.' Biji is cheaper than dubu. But if a seller speaks well of a buyer, the latter, pleased at the compliment, will certainly buy the more expensive *dubu* instead of the biji. It means that one will be willing to give more than expected, if one hears a warmhearted word from another person. This proverb emphasizes the importance of words.

"'Seek for *dubu* in the bean field.' This proverb indicates a person who is in such a hurry that he or she looks for *dubu* in the soy bean field, even though *dubu* is made through a long process after the beans are picked. It refers to an extremely hasty action.

A *dok* (p. 200-03) "is a glazed earthenware jar used to store soy sauce, soy bean paste, hot pepper paste, grain, wine or *gimchi."* A *dok* made in the traditional way is said to be able to breathe–which plastic containers cannot do. Doks from different parts of Korea have different shapes and sizes (3 color photos are shown). A large *dok* that holds soy sauce is called a *ganjangdok.* "The middle sized *dok* is used to store *doenjang,* soy bean paste, while the small *dok* is for storing hot pepper paste, sliced vegetables preserved in soy sauce.

The content of a *dok* also determines its cover and position. Thus, a *dok* containing soy sauce is usually given a cover of glazed earthenware or unglazed pottery and placed on a terrace for soy sauce jars.

Of the various different dok, the one used for making soy sauce, is the one given the greatest importance by Korean women. "As soy sauce determines the quality of meals in the family, incorrect storage of the *jangdok* will affect the taste of food and result in injuring the health of the family members." Everyone knows to put the lid on the

© Copyright Soyinfo Center 2021

*jangdok* when it rains or snows.

A *jangdokdae* is a terrace where *dok,* especially those containing soy sauce [*jang*], are stored. It is generally located in a well-ventilated and sunny place, usually in a back garden next to the kitchen. "From early times in Korea, the *jangdokdae* has been a criterion of good housekeeping. Thus, housewives pay great attention to the *jangdokdae* when an important guest is to visit their home. They tidy its surroundings and clean the *dok* again. In addition, housewives make a great effort to decorate the jangdokdae by planting flowers around it and giving it a separate gate. In some cases they enshrine a spirit of the soil to guard the house in the *jangdokdae.*

"In the past, most important religious rites for the peace of a family and to protect against misfortune were held at home. During these rites, the housewife prayed without fail to the guardian spirit of the house and to the three gods governing childbirth for the tranquility of her family and the success of her children and for the constant delicious taste of soy sauce.

Sayings: "'The taste of the soy sauce is good compared to the *jangdok.'* This saying points out that delicious soy sauce, the basic seasoning for Korean food, is contained in the outwardly coarse *jangdok.* It means that the content of something may be excellent, however humble its appearance."

A *maetdol* (p. 204-05) is a hand-turned stone mill, used to grind grains or beans. It is most often used for grinding soy beans for *dubu.* Continued. Address: Seoul, Korea.

1636. National Academy of Korean Language (Kungnip Kugôwôn). 2002. An illustrated guide to Korean culture: 233 traditional key words (Continued–Document part II). Seoul, South Korea: Hakgojae. 479 p. Illust. (Color). 24 cm. [79 ref]

• ***Summary:*** (Continued): This is one of the most interesting books about Korean culture and foodways we have ever seen. It is divided into sections (such as "Korean food" or "Korean housing life") and each section contains a number of key Korean words.

*Meju* (p. 63-64; soybean koji) "is a lump made by fermenting boiled soy beans, and is the basic material for *ganjang* or *doenjang. Meju* is one of the characteristic Korean foods which have existed since the era of the ancient states and have fascinated the appetites of Koreans for a long time.

"*Meju* is traditionally made on the first day of winter, about when *gimchi* making is finished and the very cold weather starts. To make *meju* of good quality, above all clear and well-ripened soy beans should be selected and kept fully soaked in water overnight. Next, the well-steeped beans are put in a pot and boiled until they no longer smell fishy and break down easily, After this, they are pounded in a mortar. They are considered fully mashed only after ridding them of the moisture generated in boiling. They have to be pounded only to the extent that pieces of beans can still be seen. The mashed beans are poured on a flat place and shaped into *meju* of moderate size. The shape may vary from family to family, but it is usually made into a flat block shape. Lumps of *meju* made in this way should be dried for two or three days, as they drain and become solid. When they are placed in a warm *ondol* room for about two weeks, their surfaces became evenly covered with mold. The temperature and humidity of the room must be kept at the proper level during this period. If the temperature or humidity is too high, the *meju* will rot. Lumps of *meju* over which a film of mold has formed are tied up with ropes of straw and suspended from the ceiling in a warm room during the winter. When spring comes, the lumps of *meju* are taken outdoors on a sunny day and dried. Only lumps of *meju* which have gone through all these processes can be used as the basic material for soy sauce [*jang*].

"*Ganjang, doenjang* and *gochujang* are the basic condiments of Korean food. Without these three, Korean food cannot be prepared properly. Meju is essential for the preparation of all three kinds of sauce. This is why meju, though never directly eaten itself, is indispensable for Korean food.

"In the past, as soon as winter set in, lumps of *meju* could be seen hanging at every door. Yet, as the process of making *meju* into *ganjang, doenjang* and *gochujang* is complicated and takes a lot of time, these various sauces and pastes gradually came to be produced in massive quantities by factories. Moreover as lumps of *meju* made by improved methods came on the scene, it has become harder and harder to see the traditional scene, However, *meju* is still an indispensable ingredient in Korean food. It is now being produced year round though its outward appearance is somewhat different from that of the past Sayings: "'To not believe a person, even if he makes *meju* of soy beans.' It means that one deliberately turns a deaf ear to the truth. This is how one makes such a truth claim: 'What I say is as true and natural as the fact that *meju* is made of soy beans.' On the other hand, it may have an opposite meaning; a person is so given to lying all the time as to never be believed, no matter what is said."

*Ganjang* (p. 65-66 + p. 16, 32, 63, 64, 67, 68, 69), or soy sauce, is a Korean traditional condiment made from fermented soybeans. With its unique aroma as well as its sweet and salty taste, the blackish liquid of *ganjang* is invariably added to most Korean dishes, The history of *ganjang* is so old that it dates back to ancient kingdoms. Some old documents say that *ganjang* was already contained in the list of a queen-elect`s gifts to her parents-in-law in a wedding ceremony in the Silla Dynasty (57 BCE to 935). Judging from this, it can be inferred that *ganjang* been a basic food for Koreans since the era of the Three Kingdoms.

"In early spring, Korean housewives make *ganjang*

© Copyright Soyinfo Center 2021

from soybean lumps [koji] which were prepared in the early winter of the previous year and fermented well during the winter. First they lightly wash the fermented soybean lumps in flowing water and dry them under the sun for two or three days. Next, they prepare salt water a day in advance to let its impurities precipitate, leaving pure salt water only. When everything is ready, they put the fermented soybean lumps one by one into clean vats and pour salt water of the proper concentration on them. After that, charcoal and red peppers are floated. The former helps to remove humidity and impurities, and the latter to sterilize the ingredients. Soy sauce made in this way can reveal its own taste only after maturing in the sun for forty to sixty days. When soy sauce is sufficiently mature, they pour only the stock [liquid] out of the vat and boil it down.

"Making *ganjang* was very important for Koreans. Hence, they observed various taboos and cautiously selected the day for making ganjang. Housewives were especially concerned with their own movements. They did not go out for three days before the selected day, and they tried to avoid all chance of meeting evil spirits. After making ganjang, of course, they made every effort to ripen it and store it properly, They festooned the entrance of the vat with a straw rope to keep off evil spirits, and they cleansed the vats every day. It was natural for them to exert themselves to the utmost, for ganjang, once made, would remain unspoiled for a year at least or even for several years.

"As times have changed, the number of households personally making ganjamg has decreased and most households use mass-produced ganjang. However, traditional home-made *ganjang* is much better than factory-made *ganjang* in its unique aroma and flavor.

Sayings: "'Like a small bowl of *ganjang* on a lord's dining table.' Ganjang is always located at the center of the dining table in Korean table settings. This proverb uses the fact that a small cup of *ganjang* meant only as a condiment, is located at the very center of a lord's dining table. On the other hand, it sometimes has the opposite meaning: an unimportant-looking person who holds an important post. This meaning derives from the idea that *ganjang* is an important condiment used to make the taste of Korean food better although it appears unimportant.

"'Ganjang in a mudhole.' The mudhole is a place dug out and covered with a straw mat where vegetables, *ganjang*, etc. are put. In this proverb, though the mudhole may seem humble, it contains *ganjang*, a most important condiment for Korean dishes. It means that the content of something is good although the appearance is not good" (Continued). Address: Seoul, Korea.

1637. National Academy of Korean Language (Kungnip Kugôwôn). 2002. An illustrated guide to Korean culture: 233 traditional key words (Continued–Document part III). Seoul, South Korea: Hakgojae. 479 p. Illust. (Color). 24 cm. [79 ref]

• ***Summary:*** (Continued): This is one of the most interesting books about Korean culture and foodways we have ever seen. It is divided into sections (such as "Korean food" or "Korean housing life") and each section contains a number of key Korean words.

*Doenjang* (p. 67-68 + 22, 26, 39, 41, 53, 64, 69, 70, 201; Korean soybean jang), "soy bean paste, is one of the Korean traditional seasonings; it is made as a thick sauce from ripened and fermented soybeans. Containing a unique flavor and aroma, it is generally used as the basic seasoning in Korean soups or stews. Additionally, when mixed with vegetable sprouts, it can create a special taste.

"People make *doenjang* along with *ganjang*, soy sauce. At the outset they make a mixture based on fermented soybeans, which does not differentiate between *ganjang* and *doenjang; doenjang* is separated from ganjang later. As it has a richer taste than ganjang and the fermented beans are also eaten, *doenjang* is excellent in nutrition.

"There are basically two ways to make *doenjang.* One is to use the remaining boiled soybean lumps [mash] after making *ganjang*, and the other is to make it without scooping out the *ganjang* at all. The process is the same as that of making ganjang, in that boiled soybean lumps are fermented. But after the *ganjang* is fermented, the *doenjang* will go through further processing in two ways.

"If the remaining boiled soybean lumps are used, then after scooping out the ganjang, the boiled soybean lumps are mixed with salt and packed tightly in a jar. They are exposed to the sun and fermented for a month or so.

"If *doenjang* is to be made directly without scooping the ganjang out, the soybean lumps are put in a small quantity of salt water from the outset and fermented, then mashed with the ganjang. The taste of *doenjang* made in this way is better, because the nutritious ingredients of the fermented soybeans are not scooped out with the ganjang.

"Koreans, having lived an agricultural life for a long time, could not easily obtain meat or fish, In this environment, soy beans were a good source of protein. Furthermore, people were able to maintain a well-balanced diet by eating condiments made from soy beans almost every day. In addition, while soy beans have the disadvantage of being hard to digest, doenjang, as a fermented food, is easily digested and absorbed. Recently, as its preventive effect against cancer has been suggested, it has turned out to be a scientifically valuable food.

"As the dwelling environment has changed and the *jangdokdae*, the soy-jar terrace, has disappeared today the number of Koreans who buy and eat factory produced *doenjang* rather than home-made is increasing. However, it seems apparent that *doenjang* will continue to provide the unique taste of Korean food."

*Gochujang* (p. 69-70 + 39, 53, 64, 71) "is a unique Korean indigenous food which is made by fermenting

© Copyright Soyinfo Center 2021

a mixture of grain, powdered soybeans and red pepper, malt, and salt. It is a thickly boiled red sauce, and has a characteristically hot spicy taste. Yet its sweet and savory flavor blends well with its hot taste. As it contains carbohydrate from the grain, protein from the soybeans, and vitamins from the red pepper, it is nutritious as well,

"People use *gochujang* for several purposes, from putting it into boiling soup or mixing it with sprouts as a condiment to eating it as a side dish. It is one of the three traditional jangs of Korea, along with ganjang and doenjang, in which fermented soybeans are used. As red pepper was introduced to Korea at the end of the sixteenth century it was the last of the three; it has been made since the middle of the eighteenth century.

"Gochujang is prepared after making ganjang, in the third or fourth months of the lunar calendar, before the weather gets hot. For grain it may use glutinous rice, barley, or flour, each of which make the gochujang somewhat different. It is *gochujang* made of glutinous rice that is considered the best and eaten most often even today. In order to make it, first, glutinous rice flour is kneaded into a doughnut-shaped cake, called *gumeongtteok* and then boiled. It is then mashed and spread out as the water it was boiled in is added little by little. Powdered soybeans and red pepper are added and mixed well, Finally salt is added and it is allowed to ferment for a month or so in the sun.

"Gochujang has a greater variety of uses than the other Korean jangs, just adding gochujang to cooked rice makes a good meal. Putting ground meat or vegetables into the mixture makes an excellent *bibimbap,* rice mixed with vegetables. In addition, it serves as a sauce for dipping various sprouts, dried fish, and slices of raw fish and as a condiment for cooked rice wrapped in lettuce or laver [nori]. Finally, it also makes soup or stew delicious along with *doenjang,* and it works as a seasoning for a salad, boiled food, and broiled meat or fish.

"With the modernization of Korean society *gochujang* is now being mass produced and the manufacturing process has changed somewhat. But its basic raw materials and taste are not at all different. Additionally Koreans' love of gochujang remains unchanged, and lots of Koreans carry *gochujang* with them if they will be away from the Korea for a long time. In foreign countries, Koreans find it easy to eat foods they don't like by adding a little gochujang. To that extent, *gochujang* is a very familiar food which suits the taste of Koreans.

Sayings: "'Even twelve pots of *gochujang* can't please a husband.' As mentioned, *gochujang* is an important condiment. A woman can prepare many delicious dishes if a family has as many as twelve pots of gochujang. This proverb says that delicious food alone cannot please a husband. It has another meaning: the husband is such a moody man that he cannot be pleased. It means that material goods alone cannot affect a persons mind.

"'Gochujang brought from a daughters house.' It means something extremely valuable. Gochujang itself is valuable; *gochujang* made by a married daughter herself and sent to her parents is all the more precious so they eat it sparingly and make it last a long time.

"'Can *gochujang* be omitted in cooked rice wrapped in lettuce?' It means that two things or two people are closely related to each other and are always seen together. This proverb has meaning because Koreans cannot eat cooked rice wrapped in lettuce without adding *gochujang.*

*Ondol* (p. 173-74 + 14, 63, 170), found only in Korea, is a heating system to warm the floor itself. Because of this warm floor, Koreans have developed a seated lifestyle.

*Kongnamul* (p. 43-44; soybean sprouts) is one of the vegetables Koreans eat most frequently. It is a good source of vitamin C and protein.

*Jjigae* (p. 39+) is a dish in which is put *gochujang,* hot pepper paste, or *doenjang,* soy bean paste, with meat or vegetables and boiled with spices into a thick stew. It is thicker and saltier than *guk.*

*Doenjangjjigae* (p. 41) "is a kind of *jjigae* in which vegetables, bean curd, and meat/shellfish are added in addition to its main ingredient *doenjang,* bean paste. Its ingredients vary from season to season. For example, in summer unripe hot peppers are added, in autumn a variety of mushrooms, and in winter dried radish leaves. The savory odor peculiar to doenjang blends well with the hot and salty taste of this *jjigae.* Especially in summer people enjoy *gangdoenjangjjigae* with its stronger taste of *doenjang. Gangdoenjangjjigae,* which uses somewhat unsalty but light *doenjang* as the main ingredient, is boiled with slices of unripe hot peppers and zucchini and bean curd in a small *ttukbaegi. Gangdoenjangjjigae* makes up for the lack of protein in the traditional Korean diet at a cheap price. It is easily found in the restaurants which ordinary people often frequent and is one of the favorite foods of all Koreans." Address: Seoul, Korea.

1638. Price, David Clive; Kawana, Masano. 2002. Food of Korea: authentic recipes from the land of morning calm. Singapore: Periplus; North Clarendon, Vermont: Distributed by Tuttle Pub. 120 p. Illust. (Color). 21 cm.
• ***Summary:*** In this attractive book, almost every recipe is accompanied by a glossy, full-page photo (usually of a prepared dish in an attractive table setting) on the facing page. The 60+ recipes were created by the chefs of the Sarabol Restaurant in The Shilla Hotel, Seoul.

Page 16: There are also many fermented pastes and sauces for dipping, called *chang.* Every restaurant and home has its own formula for making chang. Based on a fermented mash of soy beans, the three most common varieties are *kan chang* (dark and liquid), *daen chang* (thick and pungent), and *gochu chang* (fiery and hot).

Note: Soy sauce is also spelled *ganjang* (p. 23, 72).

© Copyright Soyinfo Center 2021

Korean-style miso (thick and pungent) is also spelled *doenjang* (p. 30, 60). Korean chili paste (fiery and hot) is also spelled *gochujang* (p. 23, 26, 31, 82, 106).

Bean curd [tofu] is mentioned on pages 9, 19, 24, 30, 44, 50, 56, 58, 60, 66, 68, 70, and 74.

Soybean sprouts (or bean sprouts) are mentioned on pages 6, 10, 11, 24, 40, 46, 64, 106.

Soy beans are mentioned on pages 6, 9-12, 19, 23-26, 30, 31, 44, 46, 50, 62, 106, and 120.

Fermented soybean paste (doenjang) is mentioned on pages 23, 25.

Soy sauce is mentioned on 27 pages (definition on p. 27). The two main types are light and dark.

1639. Tamang, J.P.; Thapa, S.; Dewan, S.; Jojima, Y.; Fudou, R.; Yamanaka, S. 2002. Phylogenetic analysis of *Bacillus* strains isolated from fermented soybean foods of Asia: kinema, chungkokjang, and natto. *J. of Hill Research* (*Sikkim*) 15(2):56-62. [22 ref]

• ***Summary:*** A total of 38 strains of dominant endospore forming and rod shaped bacteria were isolated from kinema, chungkokjang, and natto (three closely related fermented soyfoods), and studied phenotypically. All endospore forming rods were identified as *Bacillus subtilis.* The average load of endospore forming bacteria of the samples was about 100 million colony forming units (CFU) per gm.

Fig. 1 (p. 60) is a "Phylogenetic tree [also called a horizontal cladogram] showing the relationships of *Bacillus subtilis* strains to other strains of the genus *Bacillus* and related genera based on partial sequence of 16S rRNA gene."

This suggests that *B. subtilis* strains responsible for the fermentation of sticky Asian soyfoods might have originated from the same stock. Address: 1-3. Food Microbiology Lab., Dep. of Botany, Sikkim Government College, Gangtok, Sikkim 737 102, India.

1640. American Soybean Assoc. 2003. Bean beat: ASA reports U.S. soybean quality survey results. *Soybean Digest.* Feb. p. 56.

• ***Summary:*** The results of ASA's 17th U.S. Soybean Crop Quality Survey were presented in Dec. 2002 during a 2-week international mission to Korea, Japan, China, and Taiwan. The survey contained information about the protein (35.4%), oil (19.4%), and amino acids content of this year's U.S. soybean crop.

This was the first year that the survey gathered information about amino acids, according to author Tom Brumm of the Agricultural and Biosystems Engineering Dep. at Iowa State University. Livestock producers use amino acid content to determine the value of soybean meal. The report is based on a survey of 1,400 randomly selected ASA farmer-members across the USA; each submitted samples of their crop. For details see www.asasoya.org under "Current News & Events."

1641. *Bluebook Update* (*Bar Harbor, Maine*). 2003. Soybeans used as food will grow by 72% this decade: Soyatech releases new study. 10(1):2. Jan/March.

• ***Summary:*** "Whole Soybeans as Food Ingredient," a new study published [in January] by Soyatech, Inc., focuses on the market for soybeans for food.

Over the past 30 years, soybean production globally has grown over 400%. The production in 2002 was about 184 million metric tons, with the combined products of Argentina and Brazil looking like they might overtake the United States, the largest producer. The lower cost of production factors like land and labor in South America and the high value of the dollar are contributing factors.

Annually, 85% of soybeans are crushed into oil and meal and 9% are processed into human food, 95% of which is consumed in Asia. China, Japan, Korea, Indonesia, and Taiwan are the main consumers.

A small percentage of the beans crushed into meal are processed into soy protein ingredients for food. Examples include soy protein concentrates, soy flour, and isolated soy proteins. 3.2% of the crushed beans are used in this manner; however, use of crushed soybeans is food is expanding at 6 times the rate of the use of whole soybeans.

The use of soybeans for food will expand by 72% between the years of 2000 and 2010, requiring that additional soy protein plants be constructed. Distribution channels will also require expansion.

Although only 0.2% of the U.S. soybean crop is processed into human food domestically, 8.8% are when global exports are included. 6.3 million acres of soy beans therefore ultimately are used for food.

A pie chart titled "Soybean usage: 1996-2001" shows: Soybean crush 84.4%. Direct food use 8.6%. Feed/seed/residual 5.7%. Change in stocks. 1.4%.

1642. Park, Kun-Young; Jung, K.-O.; Rhee, S.-H.; Choi, Y.-H. 2003. Antimutagenic effects of *doenjang* (Korean fermented soypaste) and its active compounds. *Mutation Research* 523-524:43-53. Feb/March. [52 ref]

• ***Summary:*** *"Doenjang* (Korean fermented soypaste) is one of the important fermented foods of Korea. *Doenjang* has been traditionally manufactured from *meju,* which is fermented rectangular shape molded from crushed cooked soybeans. The main microorganisms involved for *meju* fermentation are *Bacillus subtilis* and molds such as *Rhizopus* sp., *Mucor* sp., and *Aspergillus* sp. We have already reported that *doenjang* is safe from mycotoxin, especially, aflatoxin contamination due to the manufacturing process of the *doenjang."* Address: Dep. of Food Science and Nutrition, Pusan National Univ., Busan 609-735, South Korea.

1643. *Non-GMO Source* (*The*) (*Fairfield, Iowa*). 2003. China increasing soy imports and domestic production. 3(5):8.

© Copyright Soyinfo Center 2021

May.

• ***Summary:*** "China's soybean imports are expected to reach 16.5 million metric tons (MMT) this year, a slight increase over 16.2 5 MMT last year. In 2001-2002, the US accounted for 43 percent of China's soybean imports followed by Argentina (30 percent), and Brazil (27 percent). In 2002-2003 Brazil is the dominant supplier with 45 percent market share followed by the United States with 37 percent and Argentina with 18 percent.

"China's soybean exports totaled 304,093 MMT in 2001-2002 with the majority of these going to Japan, North Korea, and South Korea.

"Domestic soybean production is expected to reach 17 MMT this year. Nearly all of soyfood products, such as tofu and soy beverages, which the Chinese consume in large quantities, are derived from domestically grown soybeans. Very few imported soybeans go for domestic food use.

"The Chinese government recently published a Five-Year Plan, which states the country's goal to increase the yield and oil content of domestic soybeans to that of imported soybeans. The Plan also mentions developing China's northeast area as a zone for producing non-GMO soybeans only.

"(Source: US Department of Agriculture–Foreign Agricultural Service)."

1644. *Ontario Soybean Growers Newsletter.* 2003. Canadian Soybean Export Association holds annual meeting. May. p. 6.

• ***Summary:*** "The Canadian Soybean Export Association (CSEA) held their 8th annual business meeting recently in Guelph. The following members were elected to lead the association in 2003-2004:

Chair: Brad Richmond, Maple Leaf Foods International

Vice-Chair: Marty Huzevka, Hensall District Co-operative

Past-Chair: Martin Vanderloo, Huron Commodities Inc.

Executive Member: Jim Gowland, OSG

Secretary / Treasurer: Kim Cooper, OSG

"CSEA is a voluntary association of members of the Canadian soybean industry, working to promote exports of Canadian soybeans and soya products into world markets. This year's activities included hosting a group of soybean industry members from Japan, Taiwan and Western Europe, participating in a technical mission to Japan, Taiwan, South Korea and Singapore, and the development of two resources to promote the Canadian soybean industry." Address: Chatham, ONT, Canada N7M 5L8.

1645. Wood, Marcia. 2003. USDA plant collectors' exotic expedition captured in historical photo albums. *Agricultural Research* (*USDA*). June. p. 18-19.

• ***Summary:*** Seven albums, containing more than 1,000 photographs from the Dorsett-Morse Expedition to East Asia, are now owned by Special Collections, National Agricultural Library at Beltsville, Maryland. The collection is officially named the "Palemon Howard Dorsett Collection." Researchers visiting the library can, by appointment, view the albums. Each print is pasted on heavy green paper, typical of that used for photograph albums of the early 1900s; below each is a handwritten caption in black ink which generally includes the date, location where the photo was taken, and the name of the plant or object shown–notes Susan H. Fugate, head of the library's special collections. For example: "Soja ussuriensis, Wild soy bean. View [of] the wild soy bean plants growing along road side on [the] outskirts of Heijo [today's Pyongyang / P'yongyang, the capital of North Korea]... These plants appear different from wild soy bean found in Manchuria and Japan. The leaves are larger and somewhat different [in] shape."

A selection of nearly 50 prints can be viewed on the Web at www.nal.usda.gov/speccoll/findaids/dorsett.

The major focus of this expedition was soybeans. "Today soybeans are the second largest U.S. farm crop, worth more than $14 billion in 2002." Food uses that Dorsett and Morse envisioned are part of that market. "What's more, studies are revealing the new benefits of soy compounds such as isoflavones."

"Some of the credit for this current success can be attributed to the Dorsett-Morse expedition. The team brought back about 4,500 soybean specimens as well as another 4,500 specimens of interest. Some of the soybean plants had prized traits, such as resistance to harmful microbes that could otherwise devastate the crop.

"Dorsett, born in Illinois in 1862 and educated at the University of Missouri, joined USDA in 1891. After more than a decade, he left the department to start his own business, then rejoined as a plant explorer in Washington, D.C., in 1909.

"The Dorsett-Morse Oriental Exploration Expedition was an unqualified success and further enhanced Dorsett's reputation as a premier plant explorer. In 1936, he won the Frank N. Meyer Medal from the Council of the American Genetic Association for his outstanding work. The award was named in honor of another USDA plant explorer, who died under what some claim were mysterious circumstances while on a collecting expedition in China.

"But that's another story."

A photo shows P.H. Dorsett (second from right) and his Chinese interpreter Peter Liu on the trail. No date is given. Address: USDA ARS.

1646. **Product Name:** Soga Puree Soy Smoothie / Soy Smoothie Base.
**Manufacturer's Name:** Soga Soyfoods [Pulmuone U.S.A.].
**Manufacturer's Address:** 4585 Firestone Blvd., South Gate, CA 90280. Phone: 866-356-2800.
**Date of Introduction:** 2003 August.

© Copyright Soyinfo Center 2021

**Ingredients:** Filtered water, non GMO whole soybean, natural flavors, carrageenan, pectin, alginate.
**Wt/Vol., Packaging, Price:** 32 fl. oz (1 qt).
**How Stored:** Refrigerated.
**New Product–Documentation:** See next page. Talk with John Sim, head of sales at Pulmuone. 2003. Nov. 10. This product was introduced in Aug. 2003. It is still being test marketed.

Spot in *Vegetarian Times.* Aug. p. 17. "So good." "Add a nutritional boost to your home-made smoothies with Soga's non-dairy soy Smoothie Base. One package ($1.89 for 10 oz.) contains more than 16 grams of soy protein. Enjoy these healthful smoothies as an easy-to-make breakfast or as a cool midday treat. Just add fruit and juice and blend! 323.564.3000; www.pulmuone-usa.com. A photo shows a pouch of the Smoothie Base surrounded by bananas and strawberries.

Leaflet (8½ by 11 inch, single sided, color photocopy) sent by Patricia Smith from Natural Products Expo West. 2004. March. A photos shows a 1 quart Tetra Brik Aseptic carton of Soga Soy Smoothie Base. Eight bulleted benefits are listed. The ingredients and nutrition facts are given.

1647. Yang, Jeong-Lye; Lee, S.H.; Song, Y.S. 2003. [Improving effect of powders of cooked soybean and chongkukjang on blood pressure and lipid metabolism in spontaneously hypertensive rats]. *J. of the Korean Society of Food Science and Nutrition* 32(6):899-906. Aug. [31 ref. Kor; eng]
• ***Summary:*** "The effects of cooked soybean and a traditional fermented soy product, chongkukjang, on blood pressure and lipid metabolism were studied in spontaneously hypertensive rat (SHR). SHRs were divided into 3 groups (n=10, male), and fed casein, powders of cooked soybean, and chongkukjang as dietary protein sources for 6 weeks. Body weight gain was not different among experimental groups, but food efficiency was increased in groups fed cooked soybean and chongkukjang diets compared to control group." Address: 1. School of Food Science and Nutrition & Food Science Inst., Inje Univ., Kimhae 621-749, Korea.

1648. Cotter, Alice; Cashman, K.D. 2003. Genistein appears to prevent early postmenopausal bone loss as effectively as hormone replacement therapy (Open Access). *Nutrition Reviews* 61(10):346-51. Oct. [22 ref]
• ***Summary:*** "Recent data from a randomized, double-blind, placebo-controlled, year-long clinical trial suggest that supplementation with the dietary phytoestrogen genistein (54 mg/day) may be as effective as hormone replacement therapy in attenuating menopause-related bone loss without causing the associated side effects. These findings may have implications for the development of diet-based strategies aimed at osteoporosis prevention."

"The richest sources of dietary isoflavones are soy, soy products (in particular, tofu, miso, natto, and fried tofu), and other legumes. Owing to the regular consumption of soy-based products in Asian populations, daily intake of isoflavones in those countries can be between 20 and 50 mg (20) but may be as high as 150 mg/day, such as in Japan, Taiwan, and Korea (21)."

Thus, soy isoflavones (e.g., daidzein and genistein) are implicated in some health-enhancing properties such as improvement of bone health. Address: 1. B.Sc., Dep. of Food and Nutritional Sciences, University College, Cork, Ireland.

1649. *Iowa Soybean Review* (*Iowa Soybean Association, Urbandale, Iowa*). 2003. Top U.S. customers received assistance. 15(1):15. Oct.
• ***Summary:*** Every one of the top ten U.S. soybean customers was once a recipient of some type of U.S. foreign assistance. "Today these nations are powerful U.S. trade partners. A table shows export value in millions of U.S. dollars."

Whole soybeans: European Union $1,167 million. China $1,012. Mexico $755. Japan $724. Taiwan $385. Indonesia $245. Korea $226. Canada $130. Thailand $115. Israel $95 million.

Soybean meal: Canada $200 million. Indonesia $167. Philippines $138. Dominican Republic $71. Turkey $62. Saudi Arabia $59. Japan $59. Mexico $50. Egypt $49. Thailand $44 million. Source: U.S. Department of Commerce.

1650. Kim, M.-R.; Kawamura, Y.; Lee, C.-H. 2003. Isolation and identification of bitter peptides of tryptic hydrolysate of soybean 11S glycinin by reverse-phase high-performance liquid chromatography. *J. of Food Science* 68(8):2416-22. Oct. [33 ref]
• ***Summary:*** "The 21 peptides purified from the bitter fraction of tryptic hydrolysates of soybean 11S glycinin by using gel-permeation high-performance liquid chromatography (HPLC) and a series of 3 C18 reverse phase (RP)-HPLC were in the molecular weight range of 200-1400 Da and showed mostly the hydrophobicity of less than 1400 cal/mol. Although the primary structures of the bitter peptides from 11S glycinin were not exactly the same as those of the proglycinin, many bitter peptides were basic mimics of the common structure, indicating the significance of the primary structure of a peptide playing a role in the bitter taste perception." Address: 1, 3. Center for Advanced Food Science and Technology, Graduate School of Biotechnology, Korea Univ., Seoul, 136- 701, Korea.

• ***Summary:*** "Soy-based infant formula has been used for centuries in Korea. Soybeans contain phytochemicals with a biochemically active component, isoflavone. Isoflavone is a kind of phytoestrogens, structurally and functionally similar to estrogen. This study was conducted to investigate the effects of soy-based infant formula on growth, development, and isoflavone concentration in the plasma and urine. Thirty-nine healthy infants who were delivered at Korean university medical center were recruited." Address: 1. Dep. of Medical Nutrition, Graduate School of East-West Medical Science, Research Inst. of Clinical Nutrition, Kyunghee Univ., Seoul 130-701, Korea.

1652. Sim, John. 2003. Update on Pulmuone & Soga (Interview). *SoyaScan Notes.* Nov. 10. Conducted by William Shurtleff of Soyfoods Center. Followed by a letter dated 14 July 1997.

• ***Summary:*** About 3½ years ago T.J. Song, a native Korean who graduated with an MBA from Stanford Business School, joined the company and is now vice president and CEO. It had been an uphill battle to try to get Caucasian American consumers to recognize, pronounce, and buy Pulmuone. Late 2001 he proposed that Pulmuone start to develop tofu products that would be marketed to mainstream American consumers. All the sales and marketing people agreed with his idea. "It was a no-brainer." So Mr. Song spearheaded the idea to expand Pulmuone's focus beyond the Korean ethnic market and to keep the corporate office's basic philosophy of caring for the environment, caring for neighbors. The company motto is: "We do not sell products that we would not serve to our own family." They decided to use the name "Soga"–which has various association: Soy + garden, yoga, etc. The first products (Organic Twin-Pack Tofu) were introduced in March 2002 at the Natural Products Expo at Anaheim. They outsource their graphic design to RAP Communications. Pulmuone's full-time marketing director is Michael Bylinken. Several weeks ago there was a major article about Pulmuone in the Los Angeles Times business section. Address: Marketing Director, Pulmuone, 4585 Firestone Blvd., Southgate, California 90280. Phone: 866-356-2800.

1653. **Product Name:** Furée (Non-Dairy Natural Soy Smoothie) [Strawberry Banana, Raspberry, Tropical Blend].
**Manufacturer's Name:** Pulmuone U.S.A.
**Manufacturer's Address:** 4585 Firestone Blvd., South Gate, CA 90280. Phone: 866-356-2800.
**Date of Introduction:** 2003 November.
**Wt/Vol., Packaging, Price:** 10.5 oz plastic chug (single serve bottle).
**How Stored:** Refrigerated.
**New Product–Documentation:** Small ad in Natural Foods Merchandiser. 2003. Nov. p. 43. "Pulmuone USA introduces Furée, a soy-based smoothie that offers a nutritious meal

alternative for people on the go. It is completely soy-based; contains 12 gm of soy protein and more than 22 vitamins and minerals; and is low-fat, nondairy, lactose-free, cholesterol-free and kosher. Consumers will find Furée thick, satisfying, refreshing and convenient. Furée comes in three all-natural fruit flavors: Strawberry Banana, Raspberry and Tropical Blend. Call 323.564.3000 or visit www.sogasoyfood.com."

Ad (8½ by 11 inches) by Soga in Natural Foods Merchandiser. 2003. Sept. p. 135. "The smoothie category is now complete–New. The only completely soy-based

© Copyright Soyinfo Center 2021

smoothie. Complete meal-in-a-bottle. More soy protein. More vitamins and minerals. 100% natural. Non-dairy." "New Furée is the most complete smoothie in the category.

Note: (1) Is this being introduced by Soga or by Pulmuone? Probably Soga since the Soga logo appears near the top of each plastic bottle. (2) Is it being introduced in place of or in addition to Soga Soy Smoothie Base? Probably in place of.

• ***Summary:*** "Three kinds of apple kochujangs were prepared using different commercial meju (normal commercial product, two commercial products from *Aspergillus* sp. and *Bacillus* sp.) and investigated about characteristics. The contents of total free sugar were the highest, 22.43%

© Copyright Soyinfo Center 2021

in apple kochujang (II) after 10 week fermentation... There was no significant difference for taste and color in apple kochujangs." Address: Div. of Food, Beverage & Culinary Arts, Yeungnam College of Science & Technology, Daego 705-703, Korea.

1661. Choe, Ji Sook; Moriyama, Yukiko. 2003. Korean cooking for everyone. Tokyo, Japan: Joie, Inc. 112 p. Illust. (many color). Index. 26 cm.
• ***Summary:*** A cookbook of "quick & easy recipes," each step of which is illustrated by numerous color photos. The Korean name of each recipe is given, written in both Korean characters and Roman letters. Many recipes are seasoned with soy sauce.

Soy related recipes: Assorted vegetables (Namool, with soybean sprouts and toasted sesame seeds, p. 44-45). Stuffed cabbage rolls (Cabbage sam, with firm tofu, p. 54-55). Seafood and vegetable omelet (Cheon, with firm tofu, p. 56-57). Tofu steak (Tuboo steak, with firm tofu, p. 60). Braised tofu (Tuboo chorim, with firm tofu, p. 61). Tofu hot pot (Tuboo cheongol, with firm tofu, p. 62). Tofu casserole with miso (Tuboo toenjang chige, with tofu, red miso and white miso, p. 63). Vegetables and beef on rice (Bibimpap, with soybean sprouts, p. 64). Rice with soybean sprouts (Kongnamul bap, and with light soy sauce, p. 68). Stir-fried rice (Bokkumbap, with soybean sprouts and kochu jang, p. 69).

In the section titled "Preparation" is a subsection on "How to make kochu jang (hot sauce)" (p. 95). The major soy ingredient is "meju [soybean koji] powder." "No one-pot dish, rice dishes, salads or stews are Korean without this sauce. Each Korean family has its own recipe, but the common method is the 'slow and steady' maturation to form a good harmony of hot, sweet and sour flavors. "Born from the severe weather and environment, *kochu jang* became the Korean's masterpiece of seasonings. Make a large amount and store as it keeps well."

The word "jang" is found in seasonings such as *kan jang* (soy sauce), *toen jang* (miso, soy bean paste), and kochu jang (hot fermented soy bean paste).

Koreans believe that "Food is a medicine." When there is any disorder, the first thing to do is to take revitalizing food, rather than medicine (p. 102).

The glossary of "Ingredients" (p. 107-09) describes miso, nori seaweed, sesame oil, sesame seeds, soybean sprouts, soy sauce, tofu, and wakame seaweed.

1662. Farnworth, Edward R. ed. 2003. Handbook of fermented functional foods. Boca Raton, Florida: CRC Press. 390 p. Illust. Index. 24 cm.
• ***Summary:*** An overview, with two chapters on fermented soyfoods (natto and miso) cited separately. Chapter 1, titled "History of fermented foods" (p. 1-25) includes brief and vague histories of "Soy foods" including (p. 18-19) soy sauce, miso, tempeh, natto, and sufu [fermented tofu].

Chapter 4, titled "Kefir: A fermented milk product" (p. 77+) states (p. 85-86) that kefir can be made by growing kefir grains in soybean milk (Abraham and de Antini 1999, p. 327-33).

Chapter 9 is "Natto–A food made by fermented cooked soybeans with *Bacillus subtilis* (*natto*)," (p. 227-245).

Chapter 11 is "Miso: Production, properties, and benefits to health" (p. 277-87).

Chapter 12 is "Korean fermented foods: Kimchi and doenjang" (p. 287-305). Soyfoods are mentioned on page 289 include ganjang (soy sauce), doenjang (fermented soybean paste), chongkukjang (quick fermented soybean paste), and gochujang (hot chili pepper soybean paste); each of these is a major condiment in Korean cuisine. Address: PhD, Senior Research Scientist, Food Research and Development Centre, Agriculture and Agri-Food Canada, St. Hyacinthe, Quebec, Canada.

1663. Food and Agricultural Organization of the United Nations. 2003. Soybeans: Area harvested, yield, and production. *FAO Yearbook–Production* (*Rome, Italy*) 57:115-16.
• ***Summary:*** The 2003 Production Yearbook, under "Soybeans" (p. 115-16, in English, French, and Spanish) gives area harvested (1,000 ha), yield (kg/ha), and production (1,000 metric tons), each for the years 1989-91, 1995, 1996, 1997, for the following places: World. Africa: Benin, Burkina Faso, Burundi, Congo–Democratic Republic, Cote d'Ivoire, Egypt, Ethiopia PDR, Ethiopia, Gabon, Liberia, Madagascar, Morocco, Nigeria, Rwanda, South Africa, Tanzania, Uganda, Zambia, Zimbabwe.

North and Central America: Belize, Canada, El Salvador, Guatemala, Honduras, Nicaragua, Panama, USA.

South America: Argentina, Bolivia, Brazil, Colombia, Ecuador, Paraguay, Peru, Suriname, Uruguay, Venezuela.

Asia (fmr = former). Asia: Azerbaijan, Bhutan, Cambodia, China, East Timor (1,000 MT), Georgia, India, Indonesia, Iran, Iraq, Japan, Kazakhstan, Korea–Democratic People's Republic of (north), Korea–Republic of (south), Laos, Myanmar, Nepal, Pakistan, Philippines, Sri Lanka, Syria, Tajikistan, Thailand, Turkey, Viet Nam (Vietnam).

Europe (former). Europe. Albania, Austria, Bosnia Herzegovina, Bulgaria, Croatia, Czechoslovakia, Czech Republic, France, Germany, Greece, Hungary, Italy, Moldova Republic, Romania, Russian Federation, Serbia-Montenegro, Slovakia, Slovenia, Spain, Switzerland, Ukraine. Note: Serbia-Montenegro appears for the first time. Harvested 112,000 ha (yield = 2,099F kg/ha) in 1999-2001, 87,000 (yield = 2,369F) in 2001, 100,000 (yield = 2442F) in 2002, and 131,000 (yield = 1,720F) in 2003. Produced 224,000 metric tons in 1999-2001, 207,000 MT in 201, 244,000 MT in 2002, and 226,000 MT in 2003.

Note: In this 2003 Yearbook the USSR was not listed for the first time in the history of the publication.

1664. Hosoi, Tomohiro; Kiuchi, Kan. 2003. Natto–A food made by fermenting cooked soybeans with *Bacillus subtilis* (*natto*). In: Edward R. Farnworth. 2003. Handbook of Fermented Functional Foods. Boca Raton, Florida: CRC Press. 390 p. See p. 227-50. [111 ref]

• ***Summary:*** Contents: Fermented soybean foods in Asia. Ingredients of natto: *Bacillus subtilis* (*natto*) spores, soybeans (color, size, protein content, sugar content, washing and storage methods). Natto processing: Washing and soaking of soybeans, steaming of soybeans, inoculation with *Bacillus subtilis* (*natto*) spores, packaging, fermentation, packing for shipment, changes in packages. Assessment of quality: Chemical composition, sensory tests (8 criteria), changes in consumers' preferences (growing preference for larger soybeans and natto with markedly weaker odors and strings). Health benefits: *Bacillus subtilis* (*natto*) cells (effects on intestinal microflora and feed efficiency, effects on the immune system, anti-allergy effect of subtilisin, fibrinolytic activity of subtilisin, role of vitamin K-2 (menaquinoe-7) in the prevention of osteoporosis), phytoestrogens–effects on cancer and osteoporosis. Conclusions.

Natto and related foods are all made by fermentation with the bacterium *Bacillus subtilis* (*natto*). These include sweet dou chi (*xian doushi*) in China (where it is used as a seasoning for Beijing duck [Peking duck]), kinema in Nepal and Myanmar, *tua nao* in Thailand, and *chungkuk-jang* in Korea.

In the year 2000 a total of 10.1 million metric tons of soybeans in Japan were converted directly into foods; more than 80% of these soybeans were imported. Between 1991 and 2000 there was a 13% increase in soybean consumption for natto products.

Natto makers prefer to use certain soybean varieties such as Suzuhime and Suzumaru which are grown in Hokkaido, Kosuzu in Iwate, Miyagi, and Akita Prefectures, and Natto-Shoryo in Ibaraki Prefecture.

Natto makers generally desire the following qualities in soybeans: 1. Extra small or small size (for consumers from Tokyo northward). 2. Easily washable. 3. Yellow surfaces and hila. 4. A suitable degree of stickiness when made into natto. 5. Relatively sweet taste. 5. Minimal changes in constituents and appearance during storage.

In Japan, soybeans are classified by diameter into four groups: (1) Extra small is less than 5.5 mm diameter. (2) Small is 5.5 mm to 7.3 mm. (3) Medium is 7.3 mm to 7.9 mm. (4) Large is greater than 7.9 mm in diameter.

Japan's leading natto trade association is called the "Federation of Japan Natto Manufacturers Cooperative Society."

A soybean allergen has been identified as *Gly m* d 28K. This allergen is found in high concentrations in various nonfermented soybean products such as soy protein isolate, tofu, dried frozen tofu, and yuba. However fermented soybean products such as natto, soy sauce and miso do not contain this allergen. "*Bacillus subtilis* (*natto*) produces a serine protease [proteolytic enzyme] of subtilisin NAT during its growth. Subtilisin NAT appears to degrade *Gly m* d 28K."

"Circulating platelets and blood-derived proteins (fibrin) are essential for the formation of blood clots, which prevent bleeding long enough for healing to occur. However, excess coagulation prevents normal physiologic blood flow, which causes thrombotic disorders Thrombolytic therapy is the most direct means of restoring blood flow. *Bacillus* spp. produce serine proteases called subtilisins, which are known to have fibrinolytic activity" [8 references cited]. Address: 1. PhD, Tokyo Metropolitan Food Research Centre; 2. PhD, Dep. of Food Science and Nutrition, Kyoritsu Women's Univ. Both: Tokyo, Japan.

1665. Kwon, Hoonjeong; Kim, Young-Kyung Lee. 2003. Korean fermented foods: Kimchi and doenjang. In: Edward R. Farnworth. 2003. Handbook of Fermented Functional Foods. Boca Raton, Florida: CRC Press. 390 p. See p. 287-304. Chap. 12. [86 ref]

• ***Summary:*** Contents: Introduction. Kimchi: Changes during fermentation, cancer, cardiovascular disease, nitrosamines and ethyl carbonate.

Doenjang: Cancer (epidemiology, anticarcinogenic and antimutagenic activities in vitro and animal models), cardiovascular disease (inhibition of angiotensin converting enzyme, antithrombotic peptides), isoflavones. Conclusions. Conclusions. Acknowledgments.

Note: Angiotensin is an oligopeptide in the blood that causes vasoconstriction (constriction of blood vessels), increased blood pressure, and release of aldosterone from the adrenal cortex. It is a hormone. The inhibition of angiotensin converting enzyme is thought to help relieve medical conditions such as high blood pressure, heart failure, diabetic nephropathy and type 2 diabetes mellitus.

Table 12.1 titled "Fermented food consumption by the Korean population" (gm per person per day) gives statistics for the following soy based foods:

Ganjang (soy sauce): Overall 6.6, highest 8.0 in persons aged 30-49.

Gochujang (hot pepper-soybean paste): Overall 3.7, highest 5.2 in persons aged 30-49 years.

Doenjang (soybean paste): Overall 5.6, highest 8.0 in persons aged 50-64.

Jajang (black [soy] bean paste): Overall 1.1, highest 1.8 in persons aged 7-12.

Chongkukjang (soybean paste, quick fermented [Korean-style natto]): Overall 1.0, highest 2.4 in persons aged 65 or older.

Mixed bean paste: Overall 1.0, highest 1.5 in persons
