# DEDICATION AND ACKNOWLEDGMENTS

**This book is dedicated Cherl-Ho Lee and Shin-Han Kwon.**
**And to the many generations of soybean growers and soyfoods makers in Korea.**

Part of the enjoyment of writing a book lies in meeting people from around the world who share a common interest, and in learning from them what is often the knowledge or skills acquired during a lifetime of devoted research or practice. We wish to give deepest thanks...

Of the many libraries and librarians who have been of great help to our research over the years, several stand out:

University of California at Berkeley: John Creaser, Lois Farrell, Norma Kobzina, Ingrid Radkey.

Northern Regional Library Facility (NRLF), Richmond, California: Martha Lucero, Jutta Wiemhoff, Scott Miller, Virginia Moon, Kay Loughman.

Stanford University: Molly Molloy, who has been of special help on Slavic-language documents.

National Agricultural Library: Susan Chapman, Kay Derr, Carol Ditzler, John Forbes, Winnifred Gelenter, Henry Gilbert, Kim Hicks, Ellen Knollman, Patricia Krug, Sarah Lee, Veronica Lefebvre, Julie Mangin, Ellen Mann, Josephine McDowell, Wayne Olson, Mike Thompson, Tanner Wray.

Library of Congress: Ronald Jackson, Ronald Roache.

Lane Medical Library at Stanford University.

Contra Costa County Central Library and Lafayette Library: Carole Barksdale, Kristen Wick, Barbara Furgason, Sherry Cartmill, Linda Barbero.

Harvard University's Five Botanical Libraries (especially Arnold Arboretum Library): Jill Gelmers Thomas.

French translation: Martine Liguori of Lafayette, California, for ongoing, generous, and outstanding help since the early 1980s.

Japanese translation and maps: Akiko Aoyagi Shurtleff.

Loma Linda University, Del E. Webb Memorial Library (Seventh-day Adventist): Janice Little, Trish Chapman.

We would also like to thank our co-workers and friends at Soyinfo Center who, since 1984, have played a major role in collecting the documents, building the library, and producing the SoyaScan database from which this book is printed:

Irene Yen, Tony Jenkins, Sarah Chang, Laurie Wilmore, Alice Whealey, Simon Beaven, Elinor McCoy, Patricia McKelvey, Claire Wickens, Ron Perry, Walter Lin, Dana Scott, Jeremy Longinotti, John Edelen, Alex Lerman, Lydia Lam, Gretchen Muller, Joyce Mao, Luna Oxenberg, Joelle Bouchard, Justine Lam, Joey Shurtleff, Justin Hildebrandt, Michelle Chun, Olga Kochan, Loren Clive, Marina Li, Rowyn McDonald, Casey Brodsky, Hannah Woodman, Elizabeth Hawkins, Molly Howland, Jacqueline Tao, Lynn Hsu, Brooke Vittimberga, Tanya Kochan, Aanchal Singh.

Special thanks to Tom and Linda Wolfe of Berwyn Park, Maryland. And to Lorenz K. Schaller of Ojai, California.

■ For outstanding help on this Korea book we thank: Cherl-Ho Lee, Billy Bramblett, Dr. Chung's Fooods Co., Katarzyna J. Cwiertka, Milan Drake, Eric C. Fehlberg, H.T. Huang, Gai W. Kim, Kyung Lee, Leonard L. Lee, Suni Kim Lukoskie, Kyoung-Hee Park, Kiyoyo Pipher, Pulmuone, John Sim, Margaret Morse Thalman.

■ Finally our deepest thanks to Tony Cooper of San Ramon, California, who has kept our computers up and running since Sept. 1983. Without Tony, this series of books on the Web would not have been possible.

This book, no doubt and alas, has its share of errors. These, of course, are solely the responsibility of William Shurtleff.

■ This bibliography and sourcebook was written with the hope that someone will write a detailed and well-documented history of this subject.

**Copyright © 2021 by Soyinfo Center**

# INTRODUCTION

**Brief chronology of soy in Korea**.

The most widely used soyfoods in Korea today are:

Soy sauce (*ganjang*)
Soybean paste (*doenjang*)
Soybean curd (*dubu*)
Red pepper paste (*gochujang*)
Soybean sprouts (*kongnamul*)
Korean soybean koji (*meju*)
Korean-style natto (*chongkukjang. cheonggukjang*)

**544 CE** – The *Qimin Yaoshu* [Important Arts for the People's Welfare], by Jia Sixie (Chinese) states, when listing the different types of soybeans: There are also the yellow Korean bean (*huang gaolidou*), the black Korean bean (*hei gaolidou*),…" This is the earliest document seen that mentions Korea in connection with soybeans.

**668 CE or before** – "Ancient Chinese records indicate that soy sauce is not indigenous to China, but rather was introduced from Korea during the era of the Koguryo Dynasty" (2nd century BCE to 668 CE) (Kwon & Song 1996, p. 20-32).

**683 CE** – A record states that Korean-style jang (*toenjang*) and soy sauce (*kanjang*) are among the presents exchanged at a royal wedding (Pettid 2008).

**9th century** – Soy sauce and soybean paste start to be made in Korean homes (Cwiertka 2006, p. 389-410).

**1613** – The *Dongui Bogam*, by Heo Jun (Jo, Dyun) is published in Korea. This is an early, important and widely known book in traditional Korean medicine. In it, the medicinal functions of doenjang are first described.

**1650-1700** – Red pepper paste is first mentioned in Korean documents.

**1876** – Japan, starting to act like a European imperial power, "opens" Korea, demanding that Pusan be designated as a treaty port and opened for Japanese free trade and residence – just at Japan herself had been "opened" in 1854 by Commodore Matthew C. Perry, U.S. Navy. Soon Japan "opened" more ports and cities in Korea: Wonsan (1881), Inch'on (1883), Mokp'o (1897), and Kunsan (1899) – all modeled on the unequal Sino-Korean treaty of 1882 (Delissen 2000).

These fateful, unfriendly moves would place Japan on a course that would inexorably lead to World War II.

The number of Japanese residing on the Korean peninsula increased from less than 1,000 in the 1880s to over 170,000 in 1910 (Duus 1995).

**1883 Sept.** – "Account of a secret trip to the interior of Korea" [in 1875], by W.J. Kenny is published in the *Transactions of the Asiatic Society of Japan* (11(Part II):141-47. He mentions various soyfoods, but he did not like them.

**1886** – The earliest known commercial soy sauce brewery in Korea, the Yamamoto Soy Sauce Brewery, is established in the port city of Pusan (Cwiertka 2006, p. 389-410).

**1895 April 17** – The Treaty of Shimonoseki ends the Sino-Japanese War (1894-95); Japanese victory establishes Japan as a regional power. China is obliged to cede Taiwan (Formosa), the nearby Pescadores Islands, and the Kwantung Peninsula in South Manchuria to Japan; recognize Korea's

Copyright © 2021 by Soyinfo Center

independence; etc. The origin of the Sino-Japanese War was a dispute over Korean affairs. Previously China had adamantly insisted on its suzerainty over Korea – which Japan refused to recognize.

**1898** – *Korea and Her Neighbors: A Narrative of Travel, with an Account of the Recent Vicissitudes and Present Position of the Country*. 2 vols., by Mrs. Isabella L. Bird Bishop is published in London. The author made four visits to Korea between Jan. 1894 and March 1897. She mentions various soyfoods.

**1885-1904** – A 30-page study of the grain trade between Korea and Japan is written by Dennis McNamara, Center for Korean Studies, University of California, Berkeley (dated 2 Nov. 1983). Korea increasingly exports rice and soybeans to Japan as Japan industrializes.

**1900** – An article titled "Some Common Korean Foods," by J.D. VanBuskirk is published in the *Transactions of the Korea Branch of the Royal Asiatic Society* (Vol. 14, pages 1-8). Table 1, "Korean food products," based on statistics published in the 1917 report by the Bureau of Agriculture of the government General, shows Korean production in millions of bushels: Rice 61. Barley 25. Millet 19. Wheat 8. Beans and peas 18. The section titled "Bean and pea foods" (p. 4-5) gives the name of each food with Korean characters and discusses:
Bean curd (*tu-bu*)
Bean residue [okara] (*pi-chi*)
Bean sauce (*kan-chang*; a liquid) made with *me-ju* [*soybean koji*]
The solid part of the sauce (*toin-chang*)
Another bean sauce [Korean-style natto] (*ko-cho-chang*)
Sprouted beans (*kong-na-mul*)

**1905 Sept. 5** – The Treaty of Portsmouth ends the Russo-Japanese War (Feb. 1904-1905). In a mere 50 years Japan has transformed herself from an isolated underdeveloped country with no industrial base into a modern nation, a major military and industrial power. The victorious Japanese move into Korea. The treaty gives Japan the Russian lease on the Kwantung Peninsula and the Russian-built South Manchurian Railway as far north as Changchun. This victory wins for Japan full status as a world power and equality with the nations of the West.

**1907** – Korea becomes a Japanese protectorate.

**1909** – The earliest known statistics for soybean area and production in Korea are as follows: The area cultivated rose dramatically from 280,090 *cho* in 1909 to a peak of 375,340 *cho* in 1912 (1 cho = 2.451 acres). Production also rose sharply from 1,533,027 *koku* in 1909 to 2,452,203 *koku* in 1912 (1 *koku* = 180 liters or 47.6 gallons) (*Bulletin Economique de l'Indochine* (Hanoi), March/April 1915, p. 260).

**1910 Aug.** – Using the Japan-Korea Annexation Treaty, Japan forcibly annexes Korea as a province called Chōsen. Japan will continue to exercise rather harsh control over Korea until 1945, including importing a large percentage of the soybeans grown in Korea

**1920** – Soybean production in Japan peaks at about 548,000 metric tons per year, as Japan begins to import more and more low-cost soybeans from Manchuria and Korea. As a result, soybeans become unprofitable for Japanese farmers and they tend to grow soybeans mainly for their own home use. Soybean production in Japan continues to fall until 1945 – near the end of World War II.

**1922** – La Choy Food Products begins to sell soy sauce in the United States. Based in Detroit, Michigan, the company was founded to produce mung bean sprouts in Detroit, by Mr. Ilhan New (a Korean) and Wally Smith. Soon they are doing a booming business and by 1922 they are importing fermented soy sauce from China in wooden barrels to use as a seasoning in their Asian food products.

**Copyright © 2021 by Soyinfo Center**

Mr. New is the earliest known Korean to make soyfoods in the Western world. By 1923 Chinese & Korean Soy Co. was selling soy sauce in Honolulu, Hawaii.

**1929 Oct. 23** – P.H. Dorsett and William Morse arrive in Keijo (Seoul), Korea, as plant explorers during their 2½ year agricultural expedition to East Asia. They study soybeans (at harvest time) and soyfoods and take many black-and-white photos that still exist in the 8,818-page log of their expedition at the USDA National Agricultural Library (Beltsville, Maryland). The Japanese authorities are very helpful and cooperative. They return to Japan on Dec. 8.

**1930**: From June 24 to July 1 Morse takes a quick trip to northern Korea to look for Zoysia grass.

**1930**: From Aug 21 to Sept. 28 Morse is back in Korea studying soybeans (at planting time) and collecting soybean germplasm in both northern and southern Korea. The log provides a rare, valuable record of soybeans and agriculture in Korea during this time.

**1938** – 17.8% of the soybean imports of Japan proper came from Korea (Lautensach 1988); most of the rest of Japan's soybean imports came from Manchuria.

**1945 Sept. 2** – Surrender of Japan after World War II. The documents of unconditional surrender are signed on board the battleship USS Missouri in Tokyo Harbor. Japan's empire is broken up. Manchoukuo (Manchuria) and Formosa (Taiwan) are returned to China. Korea is divided into north and south.

**1945** – The earliest known Korean tofu company is started in the United States in Los Angeles (Lager 1945).

**1945** – *Korean Recipes*, by Harriet Morris, is the earliest know Korean cookbook that mentions soyfoods published in the United States. It contains a recipe for making soy or bean sprouts at home, and a recipe for using Bean Sprouts (*Khong na-mool*).

**1945** – *Korea: Eine Landeskunde auf Grund eiener Reisen und der Literatur* [Korea: A geography based on the author's travels and literature], by Hermann Lautensach is published. It contains extensive information about soybeans in Korea in 1938. In 1988 it was published in English, with updated Korean names.

**1948 May** – South Korea declares independence as the Republic of Korea with Seoul as its capital.

**1948 Sept. to Dec.** – Heartsill Banks, a soybean expert, goes to Korea to study soybeans and soyfoods. He reports back in several articles published in *Soybean Digest*.

**1949 June** – Raymond Culbertson and Allan K. Smith report on soybeans and soyfoods in Korea in Soybean Digest.

**1950 June 25** – Outbreak of the Korean War between North and South Korea. The war began when North Korea invaded South Korea following clashes along the border and insurrections in the south. Though estimates vary widely, approximately 900,000 North Koreans, or 10 percent of North Korea's population, migrated to the South between 1945 and 1953. The fighting ends on 27 July 1953, when the armistice agreement is signed. The agreement restores the border between the Koreas near the 38th Parallel and creates the Korean Demilitarized Zone (DMZ), a 2.5-mile (4.0 km)-wide fortified buffer zone between the two Korean nations. Minor incidents continue there to this day.

**1966-1975** – "Korea's thriving economy presents the fastest growing new market for American soybeans. Between 1966 and 1970 annual Korean imports of soybeans and soybean products totalled 40,000 metric tons (MT). In the next 5 years

Copyright © 2021 by Soyinfo Center

imports increased to 58,000 MT. Then, in 1976, purchases leaped to 300,000 MT (*Soybean Digest*, 1979. July/Aug. p. SID-1-2).

**1968** – The *Korean Journal of Food Science and Technology* is launched, and is still being published. It contains a large number of articles about Korean soyfoods.

**1968 July** – The American Soybean Association (ASA) decides to expand its market development activities to Korea. Scott Sawyers, ASA country director in Japan, reports back on the soybean market in Korea in *Soybean Digest* (Sept. 1968, p. 68+). In May 1972 Sawyers wrote "Korea – a growing market for U.S. soybeans" in *Soybean Digest*, p. 26-29).

**1972 Aug. 24** – A favorable review of the restaurant Korea House is published in the *Chicago Tribune*. An estimated 10,000 people of Korean ancestry now reside in Chicago. Four years ago there was only one Korean restaurant in the city; now there four.

**1979 July** – The American Soybean Association opens an office in Seoul, Korea with the goal of selling more soybeans and soybean products (oil and meal) in Korea. It is headed by Dr. Kyung Lee, a native Korean and graduate of University of Illinois. Now a U.S. citizen, Dr. Lee has been an ASA employee for nearly six years.

"The bustling Korean economy is one of the fastest growing new markets for American soybeans. In the last three years Koreans have nearly doubled their purchases of U.S. soybeans from 155,000 metric tons in 1976 to over 300,000 metric tons in 1978. Growth is expected to continue…"

**1982** – Dr. Chung's Foods Co. is the largest producer of soymilk in Korea. Annual sales in 1981 were about $14 million.

**1984 April** – *Korea Soybean Digest* begins publication, in Korean only.

**1989** – The best article seen to date about soyfoods in Korea is "Vegetable Protein Foods in Korea," by S.H. Kim and T.W. Kwon of the Korea Foods Research Inst. in Seoul, Korea (In Applewhite 1989, p. 439-442).

**1997 Dec. 18** – Kim Dae Jung, a longtime dissident, wins the presidential election, ushering in a period of freedom and democracy for South Korea.

**2000 Oct. 13** – Kim Dae Jung is named winner of the Nobel Peace Prize for his work toward reconciliation with North Korea.

**2000 July 17** – A new system for Romanization of Korean into English, named the Revised Romanization (RR) is introduced – a revision of the McCune-Reischauer system. It makes Korean (*hangul*) compatible with the computer age. It was developed by the National Academy of the Korean Language from 1995 and was released to the public on 7 July 2000 by South Korea's Ministry of Culture and Tourism in Proclamation No. 2000-8.

**2001 Jan**. – Formation of Soyworld Museum Promotion Committee (SMPC), initiated by Prof. Tai-Wan Kwon, Founding Chairman, searching for the museum site and fund raising.

**2005 Oct**. – Publication of the book *Soybean* by SMPC at Korea University Press (15 chapters, 794 p.).

**2008 April** – Cyber Soyworld Museum and Home-page open (www.soyworld.org). Note: This URL has changed. For the latest URL search for the name Soyworld Science Museum.

**2008 Dec**. – Memorandum of understanding with Yeongju City for the construction of Soyworld Science Museum.

**Copyright © 2021 by Soyinfo Center**

**2008** – *Korean Cuisine: An Illustrated History*, by Michael J. Pettid is published in London. Outstanding.

**2009 May** – Project for the Basic Plan for the construction of Soyworld Science Museum (Dr. Jong-Hwan Hwang).

**2011 March** – Project for the Soy-world story telling (Ms. Mi-Kyung Yu).

**2013 Feb**. – Completion of basic design of the Soyworld Science Museum in Yeongju.

**2013 March** – Ground-breaking for the start of Museum construction.

**2014 March** – Donation of Soybean Growth Chamber by Dr. Chung's Food.

**2014 Sept**. – Completion of Exhibition Hall, Activity Hall and Soybean Growth Chamber.

**2014 Dec**. – The Korea Food Research Institute begins to publish the *Journal of Ethnic Foods* (Open Access).

**2015 April 30** – Opening of Soyworld Science Museum in Yeongju, South Korea. "The basic message of the museum is that soybean cultivation originated on the Korean Peninsula – not in Manchuria or in China."

According to Dr. Cherl-Ho Lee (Jan. 2018): "The construction cost, building and exhibition except for land and personnel, was 5 billion won (ca. 5 million USD.). The museum was built by Yeongju City. The Yeongju Agricultural Extension Center is managing the museum. The entrance fee has been planned, but for the time being no fee is collected. The number of visitors is 200-300 during weekend, and 50 during weekdays; children 50%, middle and high school students 20%, adults 30%, and a very few foreigners 1-2%."

**Present Status**: South Korea takes great pride in its soyfoods, especially its fermented soyfoods, which many current studies show have therapeutic or medicinal value.

South Korea is also a shining example of a democratic country that has rid itself of three authoritarian regimes.

"Total domestic soybean consumption in MY (Marketing Year) 2021/22 is forecast to stay around 1.39 million MT (MMT). MY 2020/21 soybean consumption is expected to stay around 1.39 MMT, down 0.9 percent from the previous year.

"MY 2021/22 soybean imports are forecast to remain unchanged at 1.3 MMT. MY 2020/21 soybean imports are expected to increase slightly (0.7 percent) to 1.3 MMT.

"The 2021 autonomous food grade TRQ is expected for release in early March 2021.

"MY 2021/22 demand for crushing soybeans will remain flat at one MMT if crushing margins remain steady.

"MY 2021/22 soybean oil imports are forecast at 450,000 MT, up five percent from the current marketing year's estimate. In MY 2020/21, soybean oil imports are expected to increase seven percent to 430,000 MT." (Source: USDA Foreign Agricultural Service, Seoul, Korea).

## ABOUT THIS BOOK

This is the most comprehensive book ever published about the history of soybeans and soyfoods in Korea. It has been compiled, one record at a time over a period of 42 years, in an attempt to document the history of this ancient and interesting food. It is also the single most current and useful source of information on this subject.

This is one of more than 100 books compiled by William Shurtleff and Akiko Aoyagi, and published by the Soyinfo Center. It is based on historical principles, listing all known documents and commercial products in chronological order. It features detailed information on:

- 63 different document types, both published and unpublished.
- 1798 published documents - extensively annotated bibliography. Every known publication on the subject in every language.
- 198 unpublished archival documents.
- 147 original Soyinfo Center interviews and overviews never before published, except perhaps in our books.
- 93 commercial soy products.

Thus, it is a powerful tool for understanding the development of this subject from its earliest beginnings to the present.

Each bibliographic record in this book contains (in addition to the typical author, date, title, volume and pages information) the author's address, number of references cited, original title of all non-English language publications together with an English translation of the title, month and issue of publication, and the first author's first name (if given). For most books, we state if it is illustrated, whether or not it has an index, and the height in centimeters.

All of the graphics (labels, ads, leaflets, etc) displayed in this book are on file, organized by subject, chronologically, in the Soyinfo Center's Graphics Collection.

For commercial soy products (CSP), each record includes (if possible) the product name, date of introduction, manufacturer's name, address and phone number, and (in many cases) ingredients, weight, packaging and price, storage requirements, nutritional composition, and a description of the label. Sources of additional information on each product (such as advertisements, articles, patents, etc.) are also given.

A complete subject/geographical index is also included.

# ABBREVIATIONS USED IN THIS BOOK

A&M = Agricultural and Mechanical
Agric. = Agricultural or Agriculture
Agric. Exp. Station = Agricultural Experiment Station
ARS = Agricultural Research Service
ASA = American Soybean Association
Assoc. = Association, Associate
Asst. = Assistant
Aug. = August
Ave. = Avenue
Blvd. = Boulevard
bu = bushel(s)
ca. = about (circa)
cc = cubic centimeter(s)
Chap. = Chapter
cm = centimeter(s)
Co. = company
Corp. = Corporation
Dec. = December
Dep. or Dept. = Department
Depts. = Departments
Div. = Division
Dr. = Drive
E. = East
ed. = edition or editor
e.g. = for example
Exp. = Experiment
Feb. = February
fl oz = fluid ounce(s)
ft = foot or feet
gm = gram(s)
ha = hectare(s)
i.e. = in other words
Inc. = Incorporated
incl. = including
Illust. = Illustrated or Illustration(s)
Inst. = Institute
J. = Journal
J. of the American Oil Chemists' Soc. = Journal of the American Oil Chemists' Society
Jan. = January
kg = kilogram(s)
km = kilometer(s)
Lab. = Laboratory
Labs. = Laboratories
lb = pound(s)
Ltd. = Limited
mcg = microgram(s)
mg = milligram(s)
ml = milliliter(s)
mm = millimeter(s)
N. = North
No. = number or North
Nov. = November
Oct. = October
oz = ounce(s)
p. = page(s)
photo(s) = photograph(s)
P.O. Box = Post Office Box
Prof. = Professor
psi = pounds per square inch
R&D = Research and Development
Rd. = Road
Rev. = Revised
RPM = revolutions per minute
S. = South
SANA = Soyfoods Association of North America
Sept. = September
St. = Street
tonnes = metric tons
trans. = translator(s)
Univ. = University
USB = United Soybean Board
USDA = United States Department of Agriculture
Vol. = volume
V.P. = Vice President
vs. = versus
W. = West
°C = degrees Celsius (Centigrade)
°F = degrees Fahrenheit
> = greater than, more than
< = less than

# HOW TO MAKE THE BEST USE OF THIS DIGITAL BOOK - SEARCH IT

**Most Important Thing**: The **KEY** to using this digital book, which is in PDF format, is to **SEARCH IT** using Adobe Acrobat Reader: For those few who do not have it, Google: **Acrobat Reader** - then select the **free** download for your type of computer.

**Click on the link to this book and wait for the book to load completely and hourglass by cursor to disappear (4-6 minutes).**

**Type [Ctrl+F] to "Find." A white search box will appear near the top right of your screen.**
**Type in your search term, such as Seoul or North Korea.**
**You will be told how many times this term appears, then the first one will be highlighted.**
**To go to the next occurrence, click the down arrow, etc.**

**For those using a Mac without Acrobat Reader: Safari is often the default browser. Click "Edit" in the toolbar at top. In the dropdown click "Find," then click "Find..." again. A search bar will open across top of screen with a search box at right. In this box type a word or phrase you would like to search, such as Seoul or North Korea. Click "Done" then scroll through the various matches in the book**.

**Chronological Order**: The publications and products in this book are listed with the earliest first and the most recent last. Within each year, references are sorted alphabetically by author. If you are interested in only current information, start reading at the back, just before the indexes.

**A Reference Book**: Like an encyclopedia or any other reference book, this work is meant to be searched first - to find exactly the information you are looking for - and then to be read.

**How to Use the Index**: A subject and country index is located at the back of this book. It will help you to go directly to the specific information that interests you. Browse through it briefly to familiarize yourself with its contents and format.

Each record in the book has been assigned a sequential number, starting with 1 for the first/earliest reference. It is this number, not the page number, to which the indexes refer. A publication will typically be listed in each index in more than one place, and major documents may have 30-40 subject index entries. Thus a publication about the nutritional value of tofu and soymilk in India would be indexed under at least four headings in the subject and country index: Nutrition, Tofu, Soymilk, and Asia, South: India.

Note the extensive use of cross references to help you: e.g. "Bean curd. See Tofu."

**Countries and States/Provinces**: Every record contains a country keyword. Most USA and Canadian records also contain a state or province keyword, indexed at "U.S. States" or "Canadian Provinces and Territories" respectively. All countries are indexed under their region or continent. Thus for Egypt, look under Africa: Egypt, and not under Egypt. For Brazil, see the entry at Latin America, South America: Brazil. For India, see Asia, South: India. For Australia see Oceania: Australia.

**Most Important Documents**: Look in the Index under "Important Documents -."

**Organizations**: Many of the larger, more innovative, or pioneering soy-related companies appear in the subject index – companies like ADM / Archer Daniels Midland Co., AGP, Cargill, DuPont, Kikkoman, Monsanto, Tofutti, etc. Worldwide, we index many major soybean crushers, tofu makers, soymilk and soymilk equipment manufacturers, soyfoods companies with various products, Seventh-day Adventist food companies, soy protein makers (including pioneers), soy sauce manufacturers, soy ice cream, tempeh, soynut, soy flour companies, etc.

Other key organizations include Society for Acclimatization (from 1855 in France), American Soybean Association, National Oilseed/Soybean Processors Association, Research & Development Centers (Peoria, Cornell), Meals for Millions Foundation, and International Soybean Programs (INTSOY, AVRDC, IITA, International Inst. of Agriculture, and United Nations). Pioneer soy protein companies include Borden, Drackett, Glidden, Griffith Labs., Gunther, Laucks, Protein Technologies International, and Rich Products.

**Soyfoods**: Look under the most common name: Tofu, Miso, Soymilk, Soy Ice Cream, Soy Cheese, Soy Yogurt, Soy Flour, Green Vegetable Soybeans, or Whole Dry Soybeans. But note: Soy Proteins: Isolates, Soy Proteins: Textured Products, etc.

**Industrial (Non-Food) Uses of Soybeans**: Look under "Industrial Uses ..." for more than 17 subject headings.

**Pioneers - Individuals**: Laszlo Berczeller, Henry Ford,

Copyright © 2021 by Soyinfo Center

Friedrich Haberlandt, Artemy A. Horvath, Englebert Kaempfer, Mildred Lager, William J. Morse, etc. Soy-Related Movements: Soyfoods Movement, Vegetarianism, Health and Dietary Reform Movements (esp. 1830-1930s), Health Foods Movement (1920s-1960s), Animal Welfare/Rights. These are indexed under the person's last name or movement name.

**Nutrition**: All subjects related to soybean nutrition (protein quality, minerals, antinutritional factors, etc.) are indexed under Nutrition, in one of more than 70 subcategories.

**Soybean Production**: All subjects related to growing, marketing, and trading soybeans are indexed under Soybean Production, e.g., Soybean Production: Nitrogen Fixation, or Soybean Production: Plant Protection, or Soybean Production: Variety Development.

**Other Special Index Headings**: Browsing through the subject index will show you many more interesting subject headings, such as Industry and Market Statistics, Information (incl. computers, databases, libraries), Standards, Bibliographies (works containing more than 50 references), and History (soy-related).

**Commercial Soy Products (CSP)**: See "About This Book."

**SoyaScan Notes**: This is a term we have created exclusively for use with this database. A SoyaScan Notes Interview contains all the important material in short interviews conducted and transcribed by William Shurtleff. This material has not been published in any other source. Longer interviews are designated as such, and listed as unpublished manuscripts. A transcript of each can be ordered from Soyinfo Center Library. A SoyaScan Notes Summary is a summary by William Shurtleff of existing information on one subject.

"**Note**:" When this term is used in a record's summary, it indicates that the information which follows it has been added by the producer of this database.

**Asterisks at End of Individual References**:

1. An asterisk (*) at the end of a record means that Soyinfo Center does not own that document. Lack of an asterisk means that Soyinfo Center owns all or part of the document.

2. An asterisk after eng (eng*) means that Soyinfo Center has done a partial or complete translation into English of that document.

3. An asterisk in a listing of the number of references [23* ref] means that most of these references are **not** about soybeans or soyfoods.

**Documents Owned by Soyinfo Center**: Lack of an * (asterisk) at the end of a reference indicates that the Soyinfo Center Library owns all or part of that document. We own roughly three fourths of the documents listed. Photocopies of hard-to-find documents or those without copyright protection can be ordered for a fee. Please contact us for details.

**Document Types**: The SoyaScan database contains 135+ different types of documents, both published (books, journal articles, patents, annual reports, theses, catalogs, news releases, videos, etc.) and unpublished (interviews, unpublished manuscripts, letters, summaries, etc.).

**Customized Database Searches**: This book was printed from SoyaScan, a large computerized database produced by the Soyinfo Center. Customized/personalized reports are "The Perfect Book," containing exactly the information you need on any subject you can define, and they are now just a phone call away. For example: Current statistics on tofu and soymilk production and sales in England, France, and Germany. Or soybean varietal development and genetic research in Third World countries before 1970. Or details on all tofu cheesecakes and dressings ever made. You name it, we've got it. For fast results, call us now!

**BIBLIO**: The software program used to produce this book and the SoyaScan database, and to computerize the Soyinfo Center Library is named BIBLIO. Based on Advanced Revelation, it was developed by Soyinfo Center, Tony Cooper and John Ladd.

**History of Soybeans and Soyfoods**: Many of our digital books have a corresponding chapter in our forthcoming scholarly work titled History of Soybeans and Soyfoods (4 volumes). Manuscript chapters from that book are now available, free of charge, on our website, www.soyinfocenter.com and many finished chapters are available free of charge in PDF format on our website and on Google Books.

**About the Soyinfo Center**: An overview of our publications, computerized databases, services, and history is given on our website.

SOYINFO CENTER

World's Most Complete Collection of Soy Information

Founded 1976 SoyaScan Databases Publishing Consulting Research Library

# INTRODUCING SOYINFO CENTER

**Mission**: To be the world's leading source of information about soyfoods and utilization of soybeans in both printed and electronic formats. Much of our information is **free**!

**Founding**: In October 1972 William Shurtleff and Akiko Aoyagi began full-time research on soyfoods in Japan while writing *The Book of Tofu*. In August 1976 they founded Soyinfo Center (named Soyfoods Center until 2006) in California.

**Books in Print**: 100+ books on soyfoods and soybeans by Shurtleff and Aoyagi are presently in print. These include three popular books, market studies, and 70 comprehensive histories & bibliographies.

**Book Sales**: These books have presently sold more than 830,000 copies. Our best-selling book is *The Book of Tofu*.

**SoyaScan Database**: SoyaScan is the world's most comprehensive computerized database on soybeans and soyfoods. It presently contains 110,500+ records from 1100 B.C. to the present. These include four basic types of records providing detailed information on: 94,600+ published documents, 16,700+ commercial soy products, 6,300+ original interviews and overviews, and 8,400+ unpublished archival documents. These records are unique, and have been added one at a time over many years; none have been downloaded from other databases. A *Thesaurus* of our database is available.

**Free Books on Google Books**: At least 80+ of our history books and biographies are available free in digital PDF format on Google Books. The same books are also available on our website (see dropdown upper right).

**Focus of SoyaScan Database**: In descending order of importance: Soybean utilization (for both food and industrial uses), history, market statistics, processing, nutrition, technology, marketing, and soybean production (agriculture).

**How to Use the SoyaScan Database**: This database is very easy to use. You do not need a computer or any special skills. Simply call the Soyinfo Center and discuss the information you need with our specialists.

**Website**: At www.soyinfocenter.com you will find basic information about us, entire free online reference books, a photo gallery, 1,500 pages of our manuscript history of soybeans and soyfoods (free), a thesaurus to subject headings in our database, information on ordering of all our popular printed books, etc.

**Research Library**: The Soyinfo Center Library owns about 99,500 documents, almost all of which have a record in the SoyaScan database. Available for use by researchers with an appointment.

**Consulting Services**: William Shurtleff has been serving as a consultant to the soyfoods industry for more than 27 years. He probably has more personal contacts in this field, worldwide, than anyone else in the world. He has helped to start more than 450 new companies.

# HISTORY OF SOYBEANS AND SOYFOODS IN KOREA (544 CE TO 2021)

1. Jia Sixie. 544 CE. Qimin yaoshu [Important arts for the people's welfare]. China. Passage on soy reprinted in C.N. Li 1958 #66, p. 66-67, and #295, p. 216-20. Translated by Shih Sheng-han 1958, 1962. [Chi]

• ***Summary:*** Wade-Giles reference: *Ch'i Min Yao Shu* (QMYS) by Chia Ssu-hsieh. Northern dynasties–Northern Wei (386-534 CE; established by nomadic people from the northern steppes). This is the world's earliest encyclopedia of agriculture. H.T. Huang (2002) adds: "This is the most important book on agriculture or food technology ever published in China. At a remarkably early date it gives both general information and great detail about agriculture and food processing." The QMYS is divided into 10 books / fascicles (*juan*), and subdivided into more than 91 consecutive parts.

In his Preface, Jia Sixie states that the material in his book comes from four sources: (1) The Chinese classics; (2) Contemporary books, proverbs, and folk songs; (3) Information gathered from experts; and (4) His personal experience ("original material").

A partial English-language translation of the "original material" and commentary by Shih Shêng-han was published in 1958 (2nd ed. 1962). The numbered text below is based on the 1962 translation titled "A preliminary survey of the book *Ch'i Min Yao Shu:* An agricultural encyclopaedia of the 6th century." 2nd ed. Peking, China: Science (Kexue) Press. x + 107 p.

Book 2. General comments. The best time to plant soybeans (*dadou*) and oilseed hemp (*youma*) depends on the climate and soil condition. "Realization of the importance of proper choice of season and soil." These two factors are the key to agricultural success. A table (p. 33) shows: Best, medium, and latest time for various operations: Planting spring soybeans: Best time–First ten days of the 2nd month. Medium–First ten days of the 3rd month. Latest time–First ten days of the 4th month. Also gives such times for azuki beans, male and female hemp, and sesame seeds. For making jiang: Best time–12th and 1st month. Medium–2nd month. Latest–3rd month. Making *shi* (fermented black soybeans): Best–4th and 5th month. Medium–20th day of 7th month until 8th month. Latest–None. In addition: Large dark-red beans (*da chidou*) should be planted in the 3rd lunar month, and harvested in the 6th month (See Li 1958 #385).

Note 1. This is the earliest document seen hat uses the verb "harvest" as a verb in connection with soybeans.

Note 2. The scientific- and common name of dark-red beans is unclear; it may well be another name for azuki beans.

Chapter 4. Millets. It is best to plant millets on new fields (without a previous crop), or on a field where the previous crop was soybeans. Best, medium, and least suitable soil / ground for planting various crops. Spiked millet: Least suitable–Following turnips or soybeans. Panicled millets–Medium soil–Following soybeans. 1.3 Amount of seeds to be sown at different seasons: Soybeans: Best time–8 *sheng/ mou* (= 220 ml/508 square meters). Medium time–10. Latest time–12.

Chapter 6, "Soybeans" (*dadou*)*:*

Note 3. The first third (approximately) of this section is quotations from four early Chinese works and commentaries on them: (1) The *Erya* (Literary expositor) (ca. 150 BCE) says: *"rongshu* is the same as *renshu."* Sun Yan's commentary on the *Erya* explains that *rongshu* is the soybean (*dadou*).

(2) According to the *Guangya* by Zhang Yi (Ancient dictionary: Enlargement of the *Erya*) (230 CE), soybeans (*dadou*) are called *shu;* azuki beans (*xiaodou*) are also called *da. Hudou* is *jiangdou.* Dr. Huang adds: The true identity of *hudou* is unknown.

(3) The *Guangzhi* by Guo Yigong (Extensive records of remarkable things) (390 CE) says: When you plant the azuki bean (*xiaodou*), you can get three crops a year. The flavor is good. *Baidou* ("white bean") is coarse, large, and edible. *Cidou* ("prickly bean") is also edible. *Judou* ("millet bean") has a seedling which is like that of the azuki bean (*xiaodou*). The flowers are purple. It can be used for flour (*mian*). It is grown in a place called Zhuti within Jianin (in today's Sichuan). Of soybeans (*dadou*), we have the yellow *luodou* ("drop bean"), the *yudou* ("imperial bean," in which the bean is elongated), the *yangdou* ("poplar bean"), whose leaves are edible, and the *hudou* ("foreign bean"), which comes in green (*qingdou*) and yellow (*huangdou*) varieties.

(4) According to the *Bencao* (probably *Shennong Bencao Jing; Benjing*) (Classical pharmacopoeia of Shennong, the Heavenly Husbandman) (100 CE), when Zhang Qian (W.-G. Chang Ch'ien) traveled to foreign lands, he brought *hudou* ("foreign bean") seeds back to China.

Note 4. Zhang went west along what is now called the Silk Road during the Former / Western Han dynasty, was gone for 11 years, and returned to China in 126 BCE. The *hudou* is now generally thought not to be a soybean.

The *Qimin Yaoshu* then begins: So now (i.e., Later Wei), we have two kinds of soybeans (*dadou*), black and white, as well as *changshao* ("long tip") and *niujian* ("cow

© Copyright Soyinfo Center 2021

path") varieties. There are three kinds of azuki beans (*xiaodou*)*:* The green (*ludou*), the red (*chixiaodou*), and the white (*baixiaodou*) varieties. There are also the yellow Korean bean (*huang gaolidou*), the black Korean bean (*hei gaolidou*), the *yandou* ("swallow bean") and the *bidou;* all are varieties of soybeans (*dadou*). Then there are *wandou, jiangdou*, and *laodou;* all are varieties of azuki beans (*xiaodou*).

Note 5. This is the earliest document seen (May 2021) that mentions Korea in connection with soybeans.

Note 6. This is the earliest Chinese-language document seen (May 2021) that uses the word *baixiaodou* to refer to white azuki beans.

Spring soybeans (*dadou*)*:* Plant them at the same time as the early grains; the middle of the 2nd lunar month is best. Use 8 *sheng* of seeds per *mou.* The second best planting time is the first third of the 3rd lunar month; use 10 *sheng* per *mou.* The latest you can plant them is the first third of the 4th lunar month; use 12 *sheng* per *mou.* If you meet with late germinating weather, you can plant in the 5th or 6th lunar month, but you must increase the amount of seed used.

The soil should not be overly fertile. After land has been harvested in the previous autumn, it can be planted sparsely. If the soil is too rich, you may get luxuriant growth but fewer pods. Harvest the crop late. The pods do not drop. If you harvest too early, the seeds will not be full. Use a drill to plant, so the seeds will be placed deep in the soil. The seedlings will be sturdy and have deep roots to reach the moisture in the soil. Pierce (?) once, plow once, and hoe several times.

Mow / cut when all the leaves have fallen. When some leaves are left, it is harder to cut the stems. After mowing, quickly plow stubs under the soil. The soybean stubs dry out easily. If you do not plow them under, the soil will not retain moisture.

To produce [soybeans] for animal feed (*jiao*), use a wheat field as a base, and plant 3 *sheng* of seeds per *mou.* Broadcast the seeds and use a plow to form a narrow and shallow channel; level it plane. If the weather is dry, the stems will be coarse and sturdy, and the leaves sparse. If there are too few seeds, the seedlings will not grow tall; if the seeds are placed too deep, the seedlings will not be able to emerge from the soil.

If the soil is too damp, first plow deeply, then broadcast the seeds away from the plowed furrows and level the soil. Do not do this if the soil is not too damp.

In the 9th month, if you see leaves close to the ground turning yellow and about to fall, immediately harvest the crop. Even if the leaves do not turn yellow, they can easily start to rot. If you do not harvest, the wind will quickly strip the leaves, and the rain will rot the stem. The crop will be ruined.

Book 2, "Cultivating cereal grains." The best way to improve the soil is to plow under green beans (*lüdou*, probably *Dolichos* species rather than mung beans or green gram). Azuki beans or sesame seeds (*huma*) are next (Note 7. Sesame seeds are not a legume and do not enrich the soil). It's best to broadcast these densely in the 5th or 6th month, then plow them under [as green manure] in the 7th or 8th or eighth month. In the yield of spiked millet planted the next spring should be 10 *sheng* per *mou.* The effect is as good as adding the excreta of silk worms or well-rotted compost. Varieties of crops. The Chinese and English names of 7 cereal crops and the number of varieties of each recorded in the QMYS are given; soybeans are not in this list. Fertilizing the ground: Succession of crops. This table is similar to a previous one but: For soybeans: Most favorable forerunner– Spiked millet. For azuki beans the best forerunner is spiked millet or wheat. The QMYS was the first book to state that using green manure is "the best thing to do." The best preceding crops for plowing under as green manure are Dolichos beans (*lüdou*) or azuki beans. The next best crops are hemp, foxtail millet (*su; Setaria italica*), or sesame seeds. The least desirable are rapeseed / colza (*wujing*) or soybeans (*dadou*).

Note 8. This is the earliest document seen (May 2014) worldwide that mentions rapeseed.

Harvesting and storing crops. Soybeans: In the 9th month, when the lower leaves become yellow and fall, reap quickly. Different harvest dates are given for azuki beans and sesame seeds.

Chapter 8 (Li 1958, p. 217)–Hemp: Be careful not to plant soybeans (*dadou*) mixed with hemp.

Chapter 10–Barley or wheat: Upland (high) fields are good for cultivating cereal grains or beans.

Note 9. This is the earliest document seen (May 201) that gives basic formulas for fermented soyfoods or soy condiments such as jiang, soy sauce, etc.

2. Wei Shou. 554 CE. Weishu [History of the Northern Wei dynasty]. China. Passage on soy reprinted in C.N. Li 1958 #68, p. 68. [Chi]

• ***Summary:*** Wade-Giles reference: *Wei Shu*, by Wei Shou (lived 506-572). Published 554 CE; revised 572 CE. This Wei dynasty (386-550 CE), which was part of the Northern Dynasties (386-581 CE), consisted of the Northern Wei dynasty (386-534 CE) and the Eastern Wei (534-550 CE); this book covers the period 385-550 CE (Wilkinson 2000, p. 504, 811).

The soybean is mentioned in four parts of this book: The biography of Cui Kai. Mentions the growth of soybean leaves (*huo*) and four types of grains–soybeans (*shu*), wheat (*mai*), *he* (an indeterminate type of cereal), and setaria millet (*shu*). The term "northeast" is also used elsewhere in this biography.

The chronicle of western regions (*xiyu*). Mentions the four grains, rice (*dou*), setaria millet (*shu*), soybeans (*shu*), and wheat (*mai*).

© Copyright Soyinfo Center 2021

Chronicle of the Di tribe: A pastoral people, remnants of an ancient tribe, they lived mostly in *Qinghai* (W.-G. Tsinghai), in far western China, north of the Tibetan Autonomous Region. They lived mainly on meat and fermented milk. They also cultivated barley (*damai*), setaria millet, and soybeans (*dou*). The climate is cold. Note 1. This is the earliest Chinese-language document seen (May 2014) that uses the term *damai* to refer to barley.

Note 2. If soybeans were cultivated in today's Chinese province of Qinghai, most of which lies north and east of Tibet, and which has an average elevation of 3,000 meters above sea level, does this suggest that soybeans might also be grown or used in Tibet?

Record of Ling Zheng: This is probably about a geographical location, since Dunhuang (W.-G. Tun-huang) is mentioned; it is a town in today's western Gansu (W.-G. Kansu) province, north central China, and an important trading center on the Silk Road from the first millennium BCE. The Record states that during a certain year in a certain region there was a very heavy frost; cereals (*he*) and soybeans (*dou*) were all killed. (Translated by H.T. Huang, PhD, June 2002).

Note 3. According to Kwon, Shin-Han (1972, *SABRAO Newsletter* 4(2):107-11. July. "History and the land races of Korean soybean"), the earliest record of soybean culture in Korea is found in this Chinese document (which he calls *Wei-zu*, written in 551 CE). Kwon says this document states that the five sacred grains, namely millet, rice, barley, wheat and soybean, were grown in "Ok-Jo," an ancient tribal nation covering north-eastern China and the north-eastern part of the Korean peninsula. However Kwon considers soybean culture in Korea to have started in the 5th to 4th century BCE or earlier. Kwon cites this entire book, without citing any particular section or pages to prove his important claim, namely that this is the earliest document seen concerning soybeans in Korea, or the cultivation of soybeans in Korea; this is poor scholarship by Kwon. In the passages on soybeans that appear in Li (1958), Dr. Huang can find none that correspond to or confirm Kwon's claim. Dr. Huang adds: In northeastern China the climate is very cold; he wonders if rice (typically a southern crop) could have been cultivated there.

Note 4. During this Northern Wei dynasty, Buddhism became an integral part of Chinese culture. The emperor built the famous Buddhist cave temples at Yungang City, about 16 km from Datong (W.-G. Ta-tung), a city in northern Shanxi province. Datong was the capital of the Northern Wei dynasty. Also, in 526, Bodhidharma arrived in China from India to spread the doctrine that enlightenment / perfection could be realized through inward meditation. Gradually Buddhism spread from the north to the south of China.

Shih Shêng-han (1962), in his translation and interpretation of the *Qimin Yaoshu*, includes a lengthy analysis of the sources from which it is drawn. On pages 14-15 is a discussion (with two excerpts) of this book (*Weishu*). Soybeans are mentioned twice: (1) "In summer, when Scorpio culminates at dusk, sow glutinous panicled millet and soya" (*shu*). (2) Red soil is good for soybeans (*shu*).

Fairbank, Reischauer, and Craig (1973, p. 91) note that Buddhism in China, unlike Christianity in the Roman Empire, was apparently adopted by the rich before it spread downward to the poor. It first seems to have made more rapid progress in the "barbarian" North than in the South, probably because the non-Chinese rulers of this area felt no prejudice against it as a foreign religion. "The greatest imperial patrons of the new religion were the emperors of the 'barbarian' Northern Wei Dynasty (386-534). Two groups of Buddhist cave temples, at Yün-kang near their first capital [Datong] in northern Shansi and at Lung-men near their second capital of Loyang [Luoyang], contain some of the finest artistic remains of early Chinese Buddhism. By the sixth century, however, the South was as thoroughly permeated by Buddhism as the North."

3. Minamoto no Shitagau. 923 CE. Wamyô ruijûshô (Wamyôshô) [General encyclopaedic dictionary. 10 vols.]. Japan. [Jap]*

• ***Summary:*** Heian period. This is a collection of Japanese names, by subject.

Needham (1986, p. 590) cites this as: Minamoto no Shitagau. +934. *General Encyclopaedic Dictionary.*

Shurtleff & Aoyagi (1983. *The Book of Miso*, 2nd ed., p. 221): "Some scholars believe that the pronunciation 'miso' originated in the *Wamyosho* (also called *Wamyo Ruijusho*), the earliest dictionary of the Japanese language, encyclopedic in scale and written between 903 and 938 by Minamoto no Shitagau. It was modeled after Chinese dictionaries and listed many types of hishio including ones pronounced *miso, misho*, and *kara hishio.* It also mentioned fermented black soybeans."

J.R. Wang and Y.H. Lee (1976) in "Traditional soybean foods in Korea" state that: "Since an old Japanese literature [document], *Hwameyruitsuroku* [*Wamyô Ruijusho;* Collections of Japanese Names, by Subject], of Heyan [Heian] records that 'Maljang (Meju) is a Korean soy sauce and paste' and a record on Maljang was also observed in the ruins of Nara, it is evident that soy sauce and paste were introduced from Korea to Japan during the Nara period (645-793 A.D.)."

Sato (1963, p. 33), in his book titled "Documents on Fermented Black Soybeans, Chiang, Miso, and Shoyu," cites this as the tenth earliest Japanese document seen on the subject. See section 16 (Shoume/Anbai). The selections were made during the Encho period then published more than 700 years later in about 1615, during the Genwa era. It is written entirely in Chinese characters (*Kanbun*).

Note: This is the earliest document seen concerning soybeans or soybean products in Korea. It seems very likely

© Copyright Soyinfo Center 2021

that soybeans were also being grown in Korea by this time, but this is not stated.

4. Kim, Busik. comp. 1145. Samguk Sagi / Samkuk Saki [Records of the historian / History of the Three Nations]. Goryo (Korea). [Chi]*
• ***Summary:*** This book is well known in Korea as the oldest surviving chronicle of Korean history. It is written in Classical Chinese, the written language of the literati of ancient Korea, and its compilation was ordered by King Injong of Goryeo (ruled 1122-1146) and undertaken by the government official and historian Kim Busik (3 Chinese characters) and a team of junior scholars. For details, see Wikipedia.

But it is also the earliest known document that mentions soybeans or soyfoods in Korea. Cherl-Ho Lee (2016, p. 6) states: "According to the earliest Korean history *Samguk Sagi* (1145 AD) rice, rice wine, oil, honey, soy sauce, soybean paste, dried meat, and fish sauce were the most important food items prepared for a wedding in the royal family in Silla in the year 683 AD."

In reply to a question from W. Shurtleff (Aug. 2017) asking: "What is the earliest document in Korean that mentions the soybeans or soyfoods?" Cherl-Ho Lee replies: "The first Korean record on soybean appears in *Samkuksaki* (History of Three Nations) written by Kimbusik in 1145. It describes a list of royal wedding gifts including Jang (fermented soybean product [soybean paste]) and Shi (soybean fermentation starter) in the King Shinmun 3rd year (683 CE) record."

Note: This is the earliest document seen that mentions Korean Jang (fermented soybean paste). Address: Korea.

5. Yi Saek. 1396? Mogun-jip [Collected Writings of Mogun]. Korea. Undated. [Kor]*
• ***Summary:*** The earliest Korean document seen that mentions tofu is the literary collection of Yi Saek, who lived 1328-1396.

Endnote 16 (p. 202): This collection is titled *Mogun-jip* [*Collected Writings of Mogun*] after his pen name, Mogun. "Yi was one of the leading Confucian literati of the late Koryo period and is appraised as one of the exemplary literary talents of the Koryo dynasty" (Pettid 2008, p. 40-41, 202).

6. Kwon, C.; Yu, H.T.; Roh, J.R.; Park, Y.D. 1433. Hyangyak-jipsongbang See Vol. III. [Kor]*
• ***Summary:*** The earliest known reference to *gochujang* (Red Chili Paste with Soybeans) appeared in this book. Hyangyak means "Korean traditional medicine." It was written by Korean doctors. It appeared during the 15th year of the reign of King Sejong in the Chosun Dynasty [Fig. 2; This book refers to gochujang or gochojang as chojang (2 Cc?) and gochu as gocho or gochu (1 Cc)] [13]. However, the early references to gochujang are primarily focused on its medicinal properties rather than its role as a food additive. For example, gochujang was often used to promote digestive issues caused by weaknesses in the spleen and stomach. Address: Korea.

7. Sejong sillok [Veritable Records of King Sejong]. 1434. Korea: See p. 66, 27b-28a. Record of 24 Dec. 1434. [Kor]*
• ***Summary:*** In Korea's dynastic records, an entry from 1434 states that an emperor from China's Ming dynasty (1368-1644) sent some serving women to the Choson court to prepare various foods; one of these was tofu. "The account states that all the dishes were harmonious and served beautifully and the means of preparing the tofu was even more exquisite"

Endnote 17 (p. 202): *Sejong Sillok* (*Veritable Records of King Sejong*), p. 66, 27b-28a (1434-12-24).

Of the many foods that the women brought to the Choson court from the Ming court, only tofu was singled out for praise in this particular entry (Pettid 2008, p. 41, 202).

8. Han, K.H.; Yim, W.J.; Kwon, C. 1445. Euibangyuchi [Kor]*
• ***Summary:*** The 2nd earliest known reference to *gochujang* (Red Chili Paste with Soybeans) appeared in this book. The early references to gochujang are primarily focused on its medicinal properties rather than its role as a food additive. For example, gochujang was often used to promote digestive issues caused by weaknesses in the spleen and stomach. Address: Korea.

9. Chun, S.E. 1460. Siknyo-chanyo [Kor]*
• ***Summary:*** The 3rd earliest known reference to *gochujang* (Red Chili Paste with Soybeans) appeared in this book. The early references to gochujang are primarily focused on its medicinal properties rather than its role as a food additive. For example, gochujang was often used to promote digestive issues caused by weaknesses in the spleen and stomach. Address: Korea.

10. Ch'oe Pu. 1488. P'yohae-rok [A record of drifting across the sea]. Korea. Unpublished manuscript. [ soy ref. Kor]*
• ***Summary:*** This is the diary of a Korean official–Ch'oe Pu. In Feb. 1488, during the Ming dynasty, he and his crew were caught in a storm off the coast of Cheju, at the southernmost tip of Korea; they drifted for 16 days in an open boat, a terrible ordeal, to the southeast coast of China, landing near Ning-po. After being taken captive, he and his crew suffered many more ordeals, but were gradually sent to Peking, following the route of the Grand Canal. On the way, in Shao-hsing prefecture, the Regional Commander and the other two high officials served him tea and fruit, and wrote a list of twelve foods and drinks to be presented to him. The last item on the list was "One plate of bean-curd."

© Copyright Soyinfo Center 2021

In Peking, his adventure attracted the attention of the highest authorities, who provided the means to return him to the border of his homeland at the Yalu River. In 1488 Ch'oe presented his travel diary to the Korean King, "who was pleased and ordered that it be put into the archives."

Note 1. This is the earliest document seen (Nov. 2020) concerning an early foreign traveler in China in connection with soybeans.

Note 2. In 1965 this work, translated into English by John Meskill, was published by Univ. of Arizona Press. Bean-curd is mentioned on p. 73. Address: Korea.

11. Saito, Akio. 1599. [Chronology of soybeans in Japan, 1336 to 1599, the Ashikaga/Muromachi period] (Document part). In: Akio Saito. 1985. Daizu Geppo (Soybean Monthly News). Jan. p. 14. [Jap; eng+]

• ***Summary:*** 1350–Dengaku (Oden) is mentioned in the records of the Gion shrine in Kyoto.

1444 June–The present characters for "tofu" appear in the *Kagakushu* encyclopedia.

1450–The suribachi (a serrated earthenware grinding bowl or mortar) becomes popular among the common people, therefore miso soup becomes popular.

1469–In the feudal domain of Sanuki (*Sanuki no kuni*) the Sakade Salt Farm (*Sakade Enden*) starts operation.

1500–In the published collection of Japanese poems and songs titled *Shichijû-ichiban shokunin-zukushi uta awase*, there is a drawing of a lady in a black kimono and white headband sitting cross legged on a low platform on a street and selling large and small pieces of cut tofu.

1521–The present characters for the word "shoyu appear for the first time in the book *Ekirinbon Setsuyoshu.*

1526–In a memorandum by Munenaga is written: "Late in the night, sitting by the sunken open-hearth fireplace together, and eating many Dengaku tofu" (*Yo mo fuke, irori-be ni hiza o narabe, Dengaku tofu o do kasanari.*) It seems that at the end of the Muromachi period, people spread miso on tofu, grilled it over a fire, then ate it.

1535–In Kishu (today's Wakayama prefecture), Akagiri Umataro? (Zenuemon/Yoshiuemon?) starts selling Yuasa Shoyu, which is derived from Kinzanji miso.

1558–Iida Ichirobei of the feudal domain of Shimôsa (*Shimôsa no kuni;* today's Noda city in Chiba prefecture) makes tamari shoyu, called Kawanaka-jima Goyo Tamari, and sends it to the Takeda family in Koshu. This is the beginning of Noda Shoyu. It is said that the taste of shoyu gave a great boost to the energy of Takeda's army. At about this same time Takeda Shingen (lived 1521-1573) starts to use dried-frozen tofu (*kori-dofu*) for his army in Kawanaka-jima after tasting the delicious kori-dofu from Sahtobei?

1559–The book *Tokitsugu Kyoki* by Yamashina Tokitsugu (lived 1507-1579) states that Tokitsugu sent a small keg of shoyu to Nagahaki kyoku. It seems that at the end of the Muromachi period, shoyu is becoming popular.

1560 May–Oda Nobunaga (who lived 1434-1582) wins the war over Imagawa Yoshimoto (1519-1560) in Okehazama. At about this time people start use the technique of frying to prepare the side dishes to their meals (*fukushoku-hin*) for the first time.

1573-91–Shoyu making starts on the island of Shodo-shima.

1574–Tanaka Chobei of the feudal domain of Shimousa (today's Chiba prefecture) Ichikawa starts making shoyu.

1587–Maruo Magouemon of Hanshu Tatsuno makes shoyu using Mikazuki soybeans.

1591–Akagiri Saburobei of Yuasa in Kishu-han (today's Wakayama prefecture) starts to use Shoyu Kaisen, a ship of at least 200 koku [9,520 gallons] capacity to transport his shoyu to other feudal domains (*kuni*) for sale.

1594–The term *koma-dofu* appears in the Rokuon Diary of Ginkakuji. "Rokuon" means "deer garden." *Koma-dofu* is a very firm tofu which originated in Korea.

Note. This is the earliest document seen (April 2013) that mentions firm tofu. Address: Norin Suisansho, Tokei Johobu, Norin Tokeika Kacho Hosa.

12. Jun, Heo. 1613. Dongui bogam [Principles and practices of Eastern Medicine]. Korea: [Kor]*

• ***Summary:*** Some give the date as 1611. It was translated into English in 2013, after 6 years of translation work. A good description of the book can be found on Wikipedia:

Contents: Overview: Introduction and Contents. Part I: Internal Bodily Elements. Part II: External Bodily Elements. Part III: Miscellaneous Disorders 1. Part IV: Miscellaneous Disorders 2. Part V: Miscellaneous Disorders 3. Part VI: Miscellaneous Disorders 4. Part VII: Herbs, Acupuncture and Moxibustion. Appendices: Index.

The book emphasizes the importance of preventive medicine, a good health regimen, and pragmatic herbal medicine. It discusses traditional diagnostic methods. This book "was written with the hope that people would be able to heal their own bodies." Dr. C.H. Lee wrote in 2008: "It is not surprising to find that fermented soybean products have been used as medicine" in this famous old book. Address: Royal Physician, Korea.

13. Heo Jun [Jo, Dyun]. comp. 1613. Donguibogam (Dongui Bogam {RR}, Tongui Pogam {MR}). 25 vols. Korea: Nae-uiwon. 787 p. 26 cm. Facsimile edition reprinted in 1975 by Namsandang (Seoul, Korea). [Kor]*

• ***Summary:*** This is an early, important and widely known book on traditional Korean medicine. In it, the medicinal functions of doenjang are first described. It describes herbs that can be found on the Korean Peninsula. Embodying a systematic approach, its basic theory is based on the Naegyeong.

The compiler, Heo Jun, started working on the Dongui bogam in the 29th year of King Seonjo's reign (1596) as

© Copyright Soyinfo Center 2021

requested by the king. The book was completed in the 2nd year of King Gwanghaegun's reign (1610) and was published by Nae-uiwon ("royal hospital"). The *Dongui Bogam* consists of 25 volumes. It was started by Heo Jun by the king's request but was stopped because of the second Japanese invasion of Korea in 1597. After the war, the king once more ordered Heo Jun to complete the book and this time, the King allowed about 500 books kept in the national library to serve as sources of information. Heo Jun kept writing the book, but before it was completed, the king died. It was completed in the second year of his successor's reign as the fruit of 15 years of hard work.

14. In't Comptoir Nagasaekij [In the office of Nagasaki]. 1647. Letter to Taiwan / Formosa, Oct. 16. Unpaginated. Handwritten, with signature. [Dut]

• ***Summary:*** Shipped and loaded in the sailing ship (*fluijtschip*) the *Zwarte Beer* [literally "black bear"] sailing from this place with a Bill of Lading of the chiefs [of this office] to Taiwan (*Taijoan*) in consignment send to the honorable Pieter Antonisz, Maritime (*Overwater*), President of the Island of Formosa (*Eijlants Formosa*).

The list of provisions sent includes: "12 pots of hard bread costs together with the pots–f 30:--:--. 10 kegs (*balien / taru*) of sake (*sackij*) of 15 *maas* a piece–f 15:--:--. 10 kegs (*balien*) of Soy [sauce] at 27 *condrijn* a piece–f 2:-7:--.

Bibliographic reference in Dutch: NA, NFJ 847, Journal (16-10-1647).

Location: Nationaal Archief, Den Haag, De Archieven van de Nederlandse Factorij Japan (NFJ); toegangsnummer 1.04.21; inventaris nummer 847. Boekhoudkundig journaal [National Archives, Prins Wilhem Alexanderhof 20, The Hague. www.nationaalarchief.nl. The Archives of the Dutch Factory in Japan (NFJ); access number 1.04.21; record number 847. Journal of bookkeeping].

Note 1. This is the earliest document seen (March 2021) concerning soy and Taiwan.

Note 2. This is the earliest Dutch-language document seen (March 2021) that clearly mentions shoyu or soy sauce, which it calls *Soije*.

Note 3. A *maas* and a *condrijn* are old units of Asiatic currency of account used in China and Japan. The VOC glossary says: 1 *maas* = 7 or 8 stuivers, but in Siam 1 *maas* = 9 stuiver. A *condrijn* is smaller than a *maas*. The symbol "f" stands for guilder, the basic Dutch monetary unit. "f 2:07:8" is read "two guilders, 7 stuivers and 6 pennigen." One gulden (singular of guilder) = 20 stuivers. One stuiver = 12 pennigen.

Note 4. In 1624 the Dutch established their first trading post on Formosa. They had their colonial capital at Tayoan City (source of the modern name "Taiwan," and site of present day Anping). This is the earliest document seen (March 2021) that mentions Formosa or Taiwan in connection with soy.

Note 5. This is the earliest document seen (March 2021) concerning involvement by the Dutch or the Dutch East India Co. (VOC) with soyfoods (soy sauce) or soybeans.

Note 6. This is the earliest document seen (March 2021) concerning soy sauce in international trade (imports or exports). In this case exported from Japan to today's Taiwan.

Note 7. This factory (trading post) on Deshima Island in Japan was owned by the Honorable Dutch East India Company (VOC). Deshima was a small island in Nagasaki harbor, on Japan's southernmost main island of Kyushu. In 1600 the Dutch first made contact with Japan when the Dutch ship *De Liefde* drifted ashore in Usuki Bay in northeastern Kyushu. Many of the original 110 crewmembers had died and only 6 of those remaining could walk ashore unassisted. Two of the survivors went on to earn important places in Japanese history: William Adams and Jan Joosten.

In 1616 European ships were limited to the two ports of Nagasaki and Hirado (an island off the northwest coast of Kyushu, just northwest of Nagasaki).

In 1633 the Tokugawa shogunate (upset at Portuguese Christian missionaries intent on making converts and instigating revolts) adopted a policy of national isolation which continued for 221 years until 1854.

In 1639 the Portuguese were expelled. This left only the Dutch among the Europeans still trading with Japan and their representatives were moved in 1641 from Hirado to the tiny artificial island of Deshima / Dejima built by the shogunate in Nagasaki harbor, where they were kept as virtual prisoners. During this time Japan maintained contact with only two other nations: China and Korea. Chinese merchants were also allowed to trade at Nagasaki, but under strict controls.

By 1639 the Japanese had so successfully closed their doors to the outside world that subsequently Japan all but dropped out of the consciousness of Europeans. The only important exception was the annual Dutch vessel from the East Indies to the Dutch trading post on the island of Deshima in Nagasaki harbor.

During the 1600s and 1700s, the Dutch expanded their network of trading posts throughout Asia, they continued to order provisions from Japan via their tiny but very important trading post at Deshima. Address: Deshima, Nagasaki, Japan.

15. Lee, Ik. 1761. Seongho Saseol Compendium of Seongho Lee Ik (1681-1763). Korea: [Chi]

• ***Summary:*** An early description of the soybean appears in this book. The following was translated by Dr. Cherl-Ho Lee of Korea: Soybean is one of the five grains, which people do not value. But if you claim that grain saves people, the power of soybeans is the greatest. The people of later generations have few living well, and many poor, so that all the good food made of good grain is given to the rich, and only soybean is passed to the poor to sustain their life.

The price is equal to unhulled rice when soybeans are

© Copyright Soyinfo Center 2021

in cheap rice. When you mill 10 pounds of unhulled rice, you'll have four pounds of polished rice. So you can change 10 pounds of soybean with four pounds of polished rice. In terms of losses, 3/5 is added, which is a big gain.

Grinding soaked soybean with a stone mill will result in soymilk to make dubu [tofu], and there are also abundant amount of residues [biji = okara] left. If you boil it (biji) and make soup, it tastes delicious. Sprouting soybeans to make soybean sprouts adds a few doubles. Poor people can fill their stomachs by grinding beans, cutting bean sprouts, and combining them to make porridge. I know these things as I live in the country, so I will write them down so that I can see and understand them for those who teach and rule the people.

Dr. Cherl-Ho Lee of Korea writes: Seongho Saseol [4 Chinese characters] is a manuscript consisting of 30 volumes in 30 books, written by Lee Ik (1681-1763), a scholar of the Korean Practical Science or Realist School of Confucianism, *Silhak.* This book is an encyclopedia, compiled by his nephews in 1761, in which he wrote about his country's politics, economy, society, culture, geography, customs, thoughts, history, books, and answers to his disciples' questions. It was written in Chinese and translated into Korean in 1977. The Korean alphabet, Hangul, was invented in King Sejong's period in the 15th century, but used mainly by women. Scholars in the Joesun Kingdom preferred to use Chinese characters, much as European scholars preferred to use Latin in medieval times. The Korean alphabet has been used as the official way of writing since the Republic of Korea was founded in 1948. Seongho is Lee Ik's nick name or pen name, and Saseol means compendium or editorial. So, Seongho Saseol can be translated into English as 'A compendium of Seongho Lee Ik (1681-1763).' Address: Korea.

16. Seungjungwon-ilki [Diary of King Chosun Royal Secretariat]. 1768. *
• ***Summary:*** This book mentions that food was not eaten without gochujang.

17. Shimazu, S. 1804. Seikei-zusetsu [Illustrations. 30 vols.]. Japan. 26 cm. [Jap]*
• ***Summary:*** Nagata (1960, p. 75) states that Shimazu has pointed out in *Seikei Zusetsu* (1804-1806) that summer soybeans were sown in April preceding the autumn in the western provinces.

Goto (1984, p. 136) states: "Seikei-zusetsu (1804) outlined the methods of soybean production as recent practices." The book was apparently compiled, authored and/or illustrated by Senshun Sô (1751-1834) and Kunihashira Shirao (1762-1821).

Wikipedia: In the entry for *kongnamul muchim* (the Korean word for soy sprouts) is large color photo soybean sprouts. Address: Japan.

18. Bretschneider, Emil V. 1882. Botanicon sinicum. Notes on Chinese botany from native and Western sources. I. *J. of the North-China Branch of the Royal Asiatic Society* 16:18-230. For the year 1881. [1882* ref. Eng]
• ***Summary:*** The single most important early work on Chinese botany written by a Westerner. Bretschneider, an M.D., lived 1833-1901.

Contents: Preliminary notices (p. 18-22). 1. Contribution towards a history of the development of botanical knowledge among eastern Asiatic nations: Chinese literature on materia medica and botany (p. 22-75, incl. the Materia Medica of Shen Nung, p. 26-32), Chinese works on agriculture (p. 75-86). Chinese geographical works containing botanical information (p. 86-92). Early acquaintance of the Chinese with Indian and Western Asiatic plants (p. 92-95). History of materia medica and botany in Japan (p. 96-101). On the botanical knowledge of Coreans [Koreans], Manchoos [Manchus], Mongols, and Tibetans (p. 101-05).

2. On the scientific determination of the plants mentioned in Chinese books (p. 105+, incl. Cleyer, Siebold, and Kaempfer, p. 124-27). 3. Alphabetical list of Chinese works (p. 131-216). Index of Chinese authors (p. 217-22). Appendix: Celebrated mountains of China (p. 223-28).

"Preliminary notices: "More than ten years have elapsed since I published a little essay (1) intended to show the mode adopted by the Chinese in treating of Natural science, especially Botany, and what degree of advantage European Botanists may derive from the study of Chinese botanical works. The present paper now brought before the public, although treating of the same subject and reproducing occasionally the matter of my former essay, will prove to be virtually a work new in substance, entirely recast, into which also a considerable amount of new information has been introduced.

"In resuming my past labours after a long interval I cannot but repeat what I confessed in the preface of my former paper, that I am neither a Sinologue nor Botanist, my knowledge of Chinese as well as of Botany being quite limited..." Footnote (1) "On the Study and Value of Chinese Botanical Works, with Notes on the History of Plants and Geographical Botany from Chinese sources, by E. Bretschneider. Illustrated with 8 Chinese wood-cuts. This article appeared originally in the *Chinese Recorder* of 1870 and 1871, published in Foochow. The editor of this periodical, at that time, seems to have had little experience in proof-reading; at any rate my paper (although presented in a very clear manuscript) came to light with such a profusion of misprints and other inaccuracies, that it would have been ridiculous to append to it a complete list of errata. I therefore would feel quite disposed to disavow this my first scientific essay; all the more since at the time I wrote it I had not yet sufficiently mastered the subject, and many of my former statements require modification."

© Copyright Soyinfo Center 2021

Concerning Shen nung, "Chinese works on agriculture" (p. 75) states: "The primeval Emperor *Shen nung*, whom the Chinese believe to have composed the first treatise on Materia medica, is also credited with having laid the foundation of Chinese Husbandry. His name implies this tradition, for Shen nung means: the Divine Husbandman. It is related in the early records that the people of his age were rude and wholly unacquainted with the advantages of agriculture. They subsisted on fruit, vegetables, and the flesh of birds and beasts. Shen nung examined first the quality of the soil, fashioned timber into ploughs and taught the people how to till the ground and raise grain. On a previous page I referred to the mountain in Shan si, where tradition makes him first teach his people the fundamental processes of agriculture. Sz' ma Ts'ien [Ssu-ma Ch'ien] (B.C. 163-85) records in the *Shi ki* [*Shih chi; Historical records*] (book 1) that Shen nung sowed the five kinds [of cereals]."

In the section on the work of early Europeans who studied the flora of East Asia, the following researchers are discussed in detail: Cleyer (p. 124), Kaempfer (p. 125-26), Thunberg (p. 126), Siebold (p. 126-27), Miquel and Zuccarini (p. 127), Hoffman and Schultes (p. 127-28), Dan. Hanbury (p. 128), O. Debeaux (p. 128), Dr. Fr. Porter Smith (p. 128-29), and P. Perny (p. 130; very critical). Address: China.

19. Bretschneider, Emil V. 1882. Botanicon sinicum. Notes on Chinese botany from native and Western sources [Part I]. London: Trübner & Co. 228 p. No index. 28 cm. [1882* ref. Eng]

• ***Summary:*** The contents of this book was first published in 1882 as an article in the *Journal of the Royal Asiatic Society, North China Branch.* (Vol. XVI, 1881; Article III). Series 2. The contents and pagination of this book is the same as the original article (which see). This book has been digitized in full view on HathiTrust. Address: M.D., Physician of the Russian Legation at Peking, China.

20. Griffis, William Elliot. 1882. Corea: The hermit nation. New York, NY: Charles Scribner's Sons. xxiii + 462 p. See p. 270. Illust. Map. Index. 23 cm. 8th ed. 1907. [99* ref]

• ***Summary:*** An excellent, early history of Korea by a fine historian. Contents–3 parts: I. Ancient and medieval history. II. Political and social Korea. III. Modern and recent history.

Chapter 30, "Housekeeping, diet, and costume" states (p. 270): "Among the poorer classes, a cooked fish is rarely seen on the table; for no sooner is it caught than it is immediately opened and devoured. The raw viands are usually eaten with a strong seasoning of pepper or mustard, but they are often swallowed without condiment of any sort. Often in passing along the banks of a river, one may see men fishing with rod and line. Of these some are nobles who are not able, or who never wish to work for a living, yet they will fish for food and sport. Instead of a bag or basket to contain the game, or a needle to string it upon, each fisher has at his side a jar of diluted pepper, or a kind of soy [sauce]. No sooner is a fish hooked, than he is drawn out, seized between the two fingers, dipped into the sauce, and eaten without ceremony. Bones do not scare them. These they eat, as they do the small bones of fowls."

Note: This is the earliest document seen (Nov. 2020) that mentions Korean soy sauce, which it calls simply "soy." Address: Ithaca, New York. Formerly of the Imperial Univ. of Tokio, Japan.

21. Kenny, W.J. 1883. Account of a secret trip to the interior of Korea [in 1875]. *Transactions of the Asiatic Society of Japan* 11(Part II):141-47. Sept. [Eng]

• ***Summary:*** Translated from the Japanese. Page 142: 19 March 1875 near Pusan. "The food was rough and coarse, and assailed my nose with such a stench that indicated that it was putrid. One glance at it was quite sufficient to create a bitter taste in the mouth. To give a specimen or two of the dishes–one was herrings and shrimps pickled in salt (the latter cut in small pieces), exceedingly offensive to the smell. The soup or broth, made of bean sauce (Daidzu [soybeans] {a large French bean [sic]} and wheat are boiled, then mixed together, pounded and made into lumps; these are piled up, with straw between, for several weeks, after which they are again taken out, and, when dried, are ready for use), is thick like mud. With the exception, perhaps, of the pickled shrimps, I could not bring myself to eat any of these dishes." Note: This bean sauce may have been Korean-style miso, *doenjang*, however it does not typically contain wheat as an ingredient.

Page 144-45: March 27... "In this house I stopped about a fortnight. Their food was rice or pulse, sometimes mixed, half and half, with wheat; and as to vegetables (they rarely used cultivated vegetables, but generally picked young shoots of wild herbs), they steam them, dip them into vinegar and soy [sauce], and then use them. During the fortnight or so I remained at this house I never saw them eating meat once. It is 'said that even the middle and higher classes find it difficult to eat meat, and can only eat salt fish. The articles of food are for the most part rancid in smell. They make no particular change in their garments for inside and outside wear. Their bodies and limbs are impregnated with filth; their clothing is a nest of vermin."

22. Forbes, Francis Blackwell; Hemsley, William Botting. 1886-1888. Enumeration of all the plants known from China proper, Formosa, Hainan, the Corea, the Luchu Archipelago, and the island of Hongkong; Together with their distribution and synonymy. *J. of the Linnean Society of London, Botany* 23:1-521. See p. 188-189. [14 ref]

• ***Summary:*** Discusses the following Glycine species: 1. Glycine hispida Maxim. Cultivated throughout China and Japan and other parts of Asia. 2. Glycine Soja, Sieb. et Zucc.

© Copyright Soyinfo Center 2021

Grows in Amur, Mandshuria [Manchuria], and Japan. "This may be the wild form of the foregoing cultivated plant, and it is treated as such by most botanists; but as it is so easily distinguished, we follow Maximowicz in keeping them apart."

3. Glycine tabacina, Benth. Described near Amoy in Fokien [Fukien / Fujian province] by Sampson, and at Whampoa [Huangpu] in Kwangtung [province in southeastern China, which contains Canton] by Hance. Grows in New Caledonia, and very widely diffused in Australia.

4. Glycine tomentosa, Benth. Described at Talienwhan in Shingking by Swinhoe, hb. Hance, and at Amoy in Fokien by Sampson, hb. Hance, and at Tamsui in Formosa [today's Taiwan] by Oldham. Grows in the Philippine Islands and Eastern Australia. "[Walpers, in Nov. Act. Nat. Cur. xix., Suppl. i. p. 324, records *Johnia Wightii*, Wight et Arn. = *Glycine javanica*, Linn., a common Asiatic and African plant from Cape Lyngmoon.]"

The frontispiece, facing the title page, is a detailed, fold-out map showing all of China and Corea [Korea], showing Chinese provincial boundaries, and major cities and rivers.

Note: This is the earliest document seen (March 2021) concerning soybeans (but only wild perennial relatives of soybeans) in Taiwan; cultivated soybeans had not yet been reported in this country. No mention is made of soybeans or their wild perennial relatives in Korea or Hong Kong.

See also: The peanut (p. 171) *"Arachis hypogaea*... a South-American plant, is cultivated in China, as in most warm countries.

*Pueraria Thunbergiana* (p. 191-92; long and detailed discussion, with many references). Address: 2. Asst. for India in Herbarium of the Royal Gardens, Kew.

23. Kellner, O. [Oskar Johann]; Nagaoka, M.; Kurashima, Y. 1889. Researches on the manufacture and composition of "miso." *Bulletin of the College of Agriculture, Tokyo Imperial University* 1(6):1-24. Dec. [12 ref. Eng]

• ***Summary:*** Contents: Introduction. Raw material and preparation of miso: Soy beans, koji from rice or barley, common salt. The chemical processes during the ripening of miso (incl. chemical composition of fresh substance and dry matter, which include nitrogenous substances or albuminoids, ether extract [crude fat], carbohydrates, crude fibre, ash, solubility, water). Varieties, composition, and nutritive properties of miso: (1) "Shiro miso, white miso, is characterized not only by its white colour but also by its low content of salt and by the short time it will keep good"–no longer than 10 days; 4 days fermentation time. (2) "Yedo miso, so called from the former name of the metropolis" [Yedo/Edo, now Tokyo]; 20 days. (3) "Inaka miso, country miso, is the richest in salt and is prepared with the help of barley koji"; 11-12 months. (4) "Sendai miso derives its name from the city of Sendai in Miyagi prefecture where it is widely prepared, but is frequently also termed *Aka miso* (red miso)"; 8-15 months. (5) Other sorts of miso which are only of local importance. Four are consumed mostly in miso soup: Sano miso, Nagaseyama miso, Mikawa or Sanshiu miso [Sanshu miso]. Four others can be consumed uncooked and used as condiments: Kinzanji miso ("named after a Buddhist temple and prepared by fermenting a mixture of soy beans, barley koji, salt, starch-sugar {*amé*}, slices of egg plant {*Solanum melongena*}, and ginger roots"), Sakura miso ("quite similar to the preceding, but sweeter on account of an admixture of large quantities of starch-sugar or raw cane sugar"), Tetsuka miso [Tekka miso] ("is common miso with the addition of sesamum oil, roasted soy beans, and slices of the roots of burdock {*Arctium Lappa"*}), Kogo miso ("is prepared like common miso but with an addition of rice bran").

Note 1. This is the earliest English-language document seen (Dec. 2012) that contains the term "roasted soy beans."

The introduction begins: "Miso, e.g. a food prepared from a mixture of soy beans, rice or barley, common salt, and water, by slow fermentation, seems to have been known in Japan since remote times. Its manufacture, like so many other useful processes, appears to have been taught to the Japanese by Chinese or Koreans. At least the *Sandai jitsu roku*, tells us, that a Chinese priest named *Jingo* transmitted more than 1000 years ago a small quantity of miso to the then Emperor of Japan, and the name *'Korei shiwo'* sometimes, though not frequently used instead of the word 'miso,' points to its introduction from Korea, where indeed, as well as in China, miso is still a favorite food.

"In Japan miso is very widely consumed, especially by the lower classes, who enjoy it as a sort of food adjunct to the vegetables of which their daily diet consists. Although it is eaten throughout the whole country, it seems to be especially favoured in the north-eastern provinces. Statistics on its consumption do not exist at present and may also be difficult to compile, as in the countryside it is made by families themselves [at home], and only in large communities are special miso works [factories] established. Assuming, however, 10 monme (37.5 grms.) to be the lowest quantity daily consumed per head, and 20 millions out of the 39 [million] of the whole population to eat miso every day, a yearly amount of nearly 30 million kilograms of miso is arrived at, for the preparation of which more than half the yearly produce of soy beans (2.3 million koku [335,000 tonnes] in 1883) is needed. Although these figures are certainly too low, they surely indicate the importance of this food in the nutrition of the Japanese people."

Tables show: (1) The composition of three different types of soy beans that make good shoyu and good miso, and the weight of 1000 grains/seeds of each (p. 3). (2) The composition of four different types of sea salt: Ajino from Bizen, Ako from Harima, Mitajiri from Suwo, and Giotoku from Shimosa [Shimôsa] (p. 4). (3) The composition of soy

© Copyright Soyinfo Center 2021

beans and of barley, and amount of each used in making miso (p. 6). (4) The composition of the fermenting miso after 50, 85, 120, and 150 days, on a fresh (as-is) basis (p. 7) and a dry-matter basis (p. 8). (5) Changes in nutrients in the soy beans and in the barley during fermentation (p. 11). (6) Changes in the miso during fermentation (p. 13). (7) Temperature of the original mixture and length of fermentation for four types of miso: Shiro miso, Yedo miso, Inaka miso, and Sendai miso (p. 15). (8) Composition of five types of miso (p. 19). (9) Proportion of raw materials, age, temperature of the beans when mixing them with the other ingredients, and price per *kin* (=0.601 kg) of the same four types of miso.

Note 2. Dr. Kellner published three subsequent articles in this journal but none concerned soybeans: (1) "Manuring experiments with paddy rice" (Bulletin No. 8, June 1890); (2) "Manuring experiments with paddy rice. (Third year)" (Bulletin No. 11, July 1892); (3) "Comparative experiments on the effects of various phosphatic fertilizers on upland soil, and analysis of rice grain" (Bulletin No. 12, March 1893).

Note 3. This is the 2nd earliest English-language document seen (April 2021) that contains statistics on the production or consumption of soyfoods (in this case miso), in Japan.

Note 4. This is the 2nd earliest document seen (April 2021) that contains statistics on miso by geographical area.

Note 5. This is the earliest English-language document seen (Aug. 2001) that mentions the word "nutrition" in connection with soy.

Note 6. This is the earliest document seen (April 2021) that mentions "Inaka miso" [made at home in the countryside], or "Tetsuka miso" [Tekka miso], or "Yedo miso" [Edo miso], or "Sendai miso" [a dark rice miso made in and around the city of Sendai], or "Kinzanji miso," or "Sanshiu miso" [Sanshu miso, a soybean miso made in central Japan].

Note 7. The parallel Japanese title of this English-language periodical is *Tôkyô Nôrin Gakkô. Gakujutsu hôkoku.* Address: Dr., Prof. of Agricultural Chemistry, Imperial College of Agriculture and Dendrology, Komaba, Tokyo, Japan.

Index flora sinensis: Enumeration of all the plants known from China proper, Formosa, Hainan, the Corea, the Luchu Archipelago, and the island of Hongkong; Together with their distribution and synonymy. 3 vols. London: Taylor and Francis. Illust. 22 cm.
• ***Summary:*** The content of this book is identical to the three articles that appeared in the *Journal of the Linnean Society,* vols. 23, 26, and 36. Glycine species were discussed in Vol. 23. See p. 188-189.

25. Whitney, William Dwight. ed. 1889. The century dictionary: An encyclopedic lexicon of the English language. 6 vols. New York, NY: The Century Co. See vol. I, p. 488.
• ***Summary:*** This dictionary contains three entries related to the soy-bean in Volume 1. At the entry for "bean" we read: "Sahuca or soy beans, the seeds of *Glycine Soja,* largely cultivated in India and China, from which the sauce known as *soy* is made.

"bean-cake, n. A large cheese-shaped compressed cake of beans after the oil has been expressed, used largely in northern China as food for cattle, and in the sugar-plantations of southern China as manure."

"bean-curd, n. A thick white jelly resembling blanc-mange [blancmange], made of beans, much eaten by the natives of northern China, Corea [Korea], and Japan."

Note 1. This is the earliest document seen (Aug. 2014) concerning soybean products (bean-curd) in Korea; soybeans as such have not yet been reported.

Note 2. This edition of *The Century Dictionary,* published from 1889-1891, is the earliest edition listed in the *National Union Catalog.* Address: Prof. of Comparative Philology & Sanskrit in Yale Univ.

26. Giles, Herbert Allen. 1892. A Chinese-English dictionary. London: Bernard Quaritch; Shanghai, Hongkong, Yokohama & Singapore: Kelly and Walsh, Ltd. xlvi + 1416 p. 31 cm. [4 ref. Eng; chi]
• ***Summary:*** This massive volume, weighing almost 12 lb, contains more than 1,450 pages and 13,848 Chinese characters. Contents: Dedication (to the Honourable C.P. Chater). By the same author (17 books). Preface: Number of characters, the characters numbering, duplicate characters, phonetic arrangement, orthography, the tones, the dialects (Beneath the number attached to each character will be found its rhyme (R) as given in the *P'ei-wên-yün-fu.* The romanization of each character is given in Cantonese, Hakka, Foochow, Wênchow, Ningpo, Peking, Mid-China, Yangchow, and Ssuch'uan {Szechwan} dialects, as well as in Korean, Japanese, and Annamese, each being distinguished by its initial letter), the definitions, the entries, etymology, grammar, difficulty of Chinese, personal. Philological essay (incl. tones, ranging from 4 to 9, in ten dialects). Table of sounds.

Examples of soy-related characters:

*Chiang* (p. 122, No. 1220). "A soy made by mixing salt with bean-flour. Sauce. Pickled food." Fourteen compounds using this character are given, including: Bean sauce, soy. Pickled bean curd [fermented tofu]. Bean sauce. Soy [sauce] is of two kinds, the clear and the thick. Dry relishes. Soy colour–a dark reddish drab. He won't use money for vinegar to buy soy.

*Ch'ih* (p. 205, No. 1996). "Salted fruits, etc., dried and used as relishes." Four compounds incl.: Salted beans. Soy, sauce.

*Ch'ou* (p. 259, No. 2521). "Sweet-smelling; strong-

© Copyright Soyinfo Center 2021

smelling. Stinking. *Ch'ou fu.* "stinking bean-curd; noxious."

Note 1. This is the earliest English-language document seen (Oct. 2011) that mentions *Ch'ou fu* which it translates as "stinking bean-curd." This is also the earliest document seen (Oct. 2011) that uses the term "stinking bean-curd."

*Fu* (p. 458, No. 3686). "Rotten; putrid; worthless." Eleven (p. 458, No. 3686). "Rotten; putrid; worthless." Eleven compounds and sayings include: Bean curd, see No. 11,417. Bean curd officials–a term of contempt applied to certain of the poorer classes of official servants who are compelled to feed largely on this cheap food. Also explained as flabby or unenergetic officials. A Mongol name for cheese. A kind of milk made from beans (*rufu* = milk + fu) [Note: Probably fermented tofu, *not* soymilk].

*Huang* (p. 522, No. 5124). Yellow. Compounds: Yellow beans [soja].

*Mao* (p. 778, No. 7,679). "Hair, down, feathers." But the word "Hairy beans" = edamame does not appear here.

Shih (p. 988, No. 9999). See No. 1996.

*Ta* (p. 1,036-37, No. 10,470). "Great." But the word "Great bean" = soybean does not appear here.

*Tou* (p. 1,127, No. 11,417). "Beans; pulse." See also No. 11,412. Thirty compounds, incl.: Bean-sprouts. Bean-curd. A cheap restaurant (a bean-curd restaurant). Bean-cake. Bean oil. Big bean, black bean, or yellow bean = the soja bean (*Glycine hispida*, Max.), used for making bean-curd, soy, oil, etc. Ground-nuts.

*Yu* (p. 1,316-17, No. 13,409). "Oil, fat, grease." 45 compounds incl. Sesamum-seed oil. Linseed. Wood oil. An oil factory. Oil dregs. But "bean-oil" = soybean oil does not appear here.

Note 2. This is the earliest English-language document seen (Aug. 2007) that contains the term "sesamum-seed oil." Note 3. Herbert Giles lived 1845-1935.

Note 4. Unfortunately, the pronunciation of the compounds is not given (as in Mandarin).

Note 5. This is the earliest English-language document seen (Oct. 2011) that uses the term "pickled bean curd" to refer to fermented tofu.

Note 6. This is the earliest English-language document seen (Oct. 2002) that uses the term "Wood oil" to refer to what would later be called "China wood oil" or "tung oil," a pale yellow drying oil obtained from the seeds of tung trees (any of several trees of the genus *Aleurites*), and used mainly in quick-drying varnishes and paints, and for waterproofing. Address: H.B.M. [Her Britannic Majesty's] Consul at Ningpo [Zhejiang province, China].

27. Gilmore, George William. 1892. Korea from its capital: With a chapter on missions. Philadelphia, Pennsylvania: Presbyterian Board of Education and Sabbath-School Work. 328 p. See p. 210. Illust. 19 cm.

• ***Summary:*** Page 210: "Of beans and lentils many varieties, all small, are grown; they are used for food by man and beast. In the winter a common dish–and by some foreigners said to be a very toothsome one–is made of sprouted [soy] beans." Address: Rev., A.M.

28. Japan, Dep. of Agriculture and Commerce, Agricultural Bureau. 1893. A descriptive catalogue of the agricultural products exhibited in the World's Columbian Exposition. Tokyo: Printed by Seishibun-sha. 115 p.

• ***Summary:*** The World's Columbian Exposition was a World's Fair held in Chicago, Illinois, to celebrate the 400th anniversary of Christopher Columbus's arrival in the New World in 1492.

Discusses 38 commercial products, with most divided into basic information and products made from the crop. Includes: Rice ("The manures applied to rice fields" include "green manures, farm yard manures, composts, ordures, fish manures, Sake kasu, Shoyu kasu, rape seed cake, and soy bean [cake] {p. 11}), barley ("It is much used as the material for making miso. Miso is prepared by pounding together boiled soy bean, salt, and the Koji {yeast}* prepared from common barley or naked barley; and is one of the most common articles of food in Japan." (Footnote: *"Eurotium oryzae). It [barley] is also used for making *ame* {p. 23}).

Wheat ("Wheat is used principally for preparing soy [sauce], vermicelli, onmen [sic, somen?], undon [sic, udon], and several kinds of confectionary" {p. 27}. It is also used for making *fu* or wheat gluten; "Roast 'fu' is used as food by boiling it with soup, soy, mirin, etc." {p. 29}), naked barley (*Hordeum nudum; hadakamugi*), Job's tears (*Coix lacryma; hatomugi*), soy bean (*Soja hispida; daidzu*), adzuki (*Phaseolus Radiatus*, [*azuki*]), sasage (*Dolichos Umbellatus*), haricot bean (*Phaseolus vulgaris*), peas, buckwheat ("Sobakiri" and "Kôri-soba" are both seasoned with soy sauce {p. 46}), rape seed (*Brassica chinensis, natane*) and rape seed oil (*natane abura*), sesame seeds (yellow {*kigoma*}, white {*shirogoma*}, and black {*kurogoma*} are displayed) and sesame oil (made from only yellow and white sesame), yegoma (*Perilla occimoides*), hemp, shiitake, chilli (*Capsicum Longum; tôgarashi;* "The fresh unripe fruit and leaves of certain varieties are eaten by cooking them with soy, sugar, "Katsuwobushi" [katsuobushi],* etc." {p. 103}). Also discusses: Dried daikon (p. 109-11), konjak flour (*Conophallus konjak; konniak-ko, konnyaku;* "For cooking, it is cut into small pieces and boiled with soy, soup, mirin, sugar etc." {p. 112}), kampio (*Lagenaria vulgaris; kampio* [*kampyo, kanpyo*]*;* "It is used as an article of food by boiling with water, soy, sugar, mirin etc." {p. 113}), wine.

Concerning the soy bean: In 1887, the total area of arable land devoted to soy bean cultivation is 4,633,152 *tan* (1 *tan* = 0.245 acre; thus 1,142,472.2 acres or 462.352.16 hectares). The total production of soy bean in the Empire was estimated to be 3,253,790 *koku* [419,459 metric tons] (1 *koku* = 180 liters, and 1 bushel = 35.2390 liters; thus 585,682,200 liters = 16,620,284 bushels).

© Copyright Soyinfo Center 2021

Note 1. From the above figures, a yield of 14.53 bushels per acre can be calculated.

From 1887 to 1891 the price of soybeans per *koku* ranged from 4.180 yen in 1888 to 5.319 yen in 1890. Four specimens of soybeans were exhibited:

No. 24. Green soy bean (*awo-daidzu*) The produce of Akumi-gun, in Yamagata prefecture.

No. 25. Black soy bean (*kuro-daidzu*). The produce of Sapporo-gun, in Hokkaido. No. 26. Common soy bean. The produce of Chikuba-gun, in Ibaraki prefecture. No. 27. Soy bean (Itachi-daidzu). The produce of Iruma-gun, in Saitama prefecture.

"Daidzu or soy bean is extensively used in Japan to prepare various kinds of foods indispensable for the daily meal, such as 'soy' or 'shôyu,' 'tamari' (a kind of soy), tofu, and miso. It is also largely used as a food for horses and manure [bean cake].

Note 2. This is the 2nd earliest English-language document seen (April 2012) that mentions tamari, which it calls "tamari" (not "tamari shoyu").

A analysis of the percentage composition of 3 kinds of soy beans analyzed by the Sanitary Experiment Station at Tokio is given; Green soy beans have the highest crude protein content (42.85% with 12,28% water). White soy beans (*shiro-daidzu*) have the highest ash content (5.00% with 13.46% water). Black soy beans have the highest fat content (18.26%, and the 2nd highest crude protein content 40.25%, with 11.09% water). Soy bean (*Itachi-daidzu*) from Saitama prefecture.

Although daizu is abundantly produced in Japan, since its daily consumption by all classes of people is great, it is now imported from China and Korea in large quantity. However imported soy bean is never used to make first class shoyu or soy, since the imported beans are inferior to those produced in Japan.

A table shows the quantity (in *kin*) and value (in *yen*) of soy bean exported from Japan from 1887 to 1891; 2.1 million *kin* were exported in 1889.

Four specimens of soy sauce are on display. Two brands (the trade marks are shown) are made by Mr. Mogi Shichirouemon, and two are made by Mr. Mogi Saheiji. All are made at Noda-machi, Chiba prefecture, Japan. Brands (a) and (c) are of the first quality; brands (b) and (d) are of the second quality.

A table shows the amount of shoyu made in Japan each year from 1887 to 1891; the amount ranges from 1,304,551 *koku* in 1888 to 1,157,982 *koku* in 1890. Since 1 *koku* = 180 liters, the amount made in 1888 is 234,819,180 liters. The total number of shoyu manufacturers in 1889 was 10,682. A table shows the price (in yen) of various brands and quantities of shoyu from 1887 to 1892. A brief description of the process for making shoyu is given. The word "barm" is used instead of koji. Either barley or wheat can be used with daizu to make the barm. The "mixture is kept for about 25 months, stirring it occasionally with a paddle, say twice a day during winter and three times in summer, and when it is fermented to the required degree, soy is extracted by means of a soy press. The clear liquid thus obtained is pasteurized by heating to about 130º F. and when entirely cooled, it is transferred into casks."

As shoyu is manufactured from daizu, wheat, etc., "it naturally contains a large quantity of albuminous matter. Shoyu is used in Japan as table salt is in Europe and America; consequently it is indispensable for daily use for cooking fish, meat, vegetables. etc. It has a remarkable merit when applying it in the place of sauces (like 'worcestershire') for beefsteak, fry, stew, etc. It answers better than salt when used with cold meat.

"Japanese soy or 'Shoyu' has long been exported to various parts of Europe where those who once taste it never fail in extolling its flavour. It is said that in Holland, Japanese soy has been used by many people from long years ago and highly esteemed by them." A table shows the chemical composition of shoyu.

"Since the fine flavour of Japanese soy has recently become known to people abroad, several trial consignments were made both to Europe and America, and the result, though it has obtained a high reputation among them, still it has not yet become a leading article of export." A table shows the annual amount and value of shoyu exported from Japan from 1887 to 1891. It ranges from 1,302.71 *koku* worth 11,091 in 1887 to 3,749.01 *koku* worth 41,028 yen in 1891. Thus the exports are growing rapidly.

Three specimens of tamari are one display, one dilute and one concentrated. The first two are made and sold by Mr. Ishima Mosaku. The 3rd (regular tamari) is made and sold by Mr. Morimoto Chôhachi. All are made at Yokkaichi in Miye [Mie] prefecture. Tamari is made chiefly in the prefectures of Miye, Aichi and Gifu [in central Japan]. Tamari is very similar to shoyu except that no wheat is used in manufacturing tamari.

Tofu (bean curd): "Tofu is one of the most favourite foods of Japanese and sold in all places both in towns and villages. The specimen here exhibited is called Yakidofu and is prepared by roasting partially dried 'Tofu' over a charcoal fire." "As 'Tofu,' sometimes called bean curd, being a coagulated vegetable albumen of soy beans, it contains a large proportion of nutritious matter, most important to human life, especially, to those who subsist mainly upon vegetables." The price of this Yakidofu is 18 yen per 10 dozen.

Note 3. This is the earliest English-language document seen (April 2013) that mentions grilled tofu, which it calls *Yakidofu.*

A specimen of Kôri-tôfu or frozen bean curd is displayed; it is made in Minami Adzumi-gun, Nagano prefecture. "As it can be preserved for many years it is a suitable for provision for vessels undertaking long voyages."

© Copyright Soyinfo Center 2021

Concerning adzuki: There are both red adzuki and white adzuki. Early varieties are sown in the spring; late varieties {called aki-adzuki in the autumn}. "It is mostly used for preparing "An"–a pulpy mixture of boiled Adzuki flour and sugar, and in that state is largely used for making various kinds of confectionary." It is also used to make "Sarashi-an or refined flour of 'adzuki," and "shiruko–a juice prepared by boiling the flour with a suitable quantity of water and adding sugar..." Note 4. Shiruko could be described as adzuki bean soup with mochi (rice cake).

Concerning rape seed: "Rape was formerly cultivated to a great extent but since the introduction of Kerosene Oil, the acreage of its cultivation has been much diminished, yet it is grown in nearly all parts of Japan and forms one of the important farm crops."

29. Japan. Dep. of Agriculture and Commerce, Bureau of Commerce (Nôshômushô Shôkôkyoku). 1893. General view of commerce & industry in the empire of Japan. Tokyo: Printed by M. Onuki. ii + 491 p. See p. 22, 37, 67, 247, 324, 345, 349-51, 429-30, 440-41, 469-70, 474. Index.

• ***Summary:*** Name of organization with diacritics is: Nôshômushô Shôkôkyoku. Pages 21-22: A list of all the 71 commodities exported from the port of Kobe in 1891 whose value exceeded ¥10,000. The largest by far was rice (5.5 million yen), followed by tea, matches, and camphor. Also: Kanten or colle vegetable [agar] 408,615. Rape seed oil 114,572. Sea weeds 22,372. Cut sea-weeds 17,765. Soy [sauce] 11,483 yen.

Page 37: After the "Restoration of Meiji," a new port was opened at Kobe, near Osaka. Its principal articles of merchandise were "rice, salt, sugar, tea, soy,..."

On pages 61-67 are tables of Japanese weights and measures and comparative tables with those of the empire of Great Britain, including both troy and avoirdupois. These show Japanese units for length (9 units; the standard is the shaku), area of land (6), capacity (5), and weight (6; the standard is the kwan). In 1885 the Government of Japan joined the Universal Metric Convention, and in 1891 established the present system of weights and measures.

Page 67: Industrial pursuits can be classified into original ones (that existed from ancient times, having first been introduced from China and Corea [Korea]) and those introduced from the West. Original industries include "salt making, sugar making, Sake brewing, soy brewing, oil producing,..."

Page 247: Exports (Class 22) include "Soy. The total value of the latest export is 41,029 yen, and chiefly exported to Hawaii."

Page 324: A table shows imports (both weight and value) of "Oil-cake" from 1887 to 1891, from China, Korea, and Other.

Page 345: Class II–Duty free goods includes "Oil cake."

Page 349: Class II–Duty free goods, includes "All kinds of Mush-rooms, excepting Shiitake, Confectionaries, all kinds of Liquors, Vinegars, Soy [sauce], Oils, and Prepared Tobacco... Sea-weeds excepting Kobu [Kombu, seaweed],..."

Pages 429-30: "Table of the total quantity [weight in picul or catty] and value [in yen] of the commodities exported from Japan to the United States." Soy [sauce] rose from 7,862 catties [1 catty weighs 1.33 lb] worth 261 yen in 1887 to 9,744 catties worth 1,146 yen in 1891.

Page 440-41: Chapter 7, "Commercial and industrial unions in Japan," lists the 2,013 "trade unions" of businesses in the same general field. One of these, "Liquor and soy," has 106 members.

Pages 469-70, 474: Table III lists "Industrial corporations." One class, "Soy and miso," has 4 members and capital of 75,500 yen. Address: Tokyo, Japan.

30. *Mataura Ensign* (*Otago, New Zealand*). 1894. Corea [Korea] and Coreans: Roasted dog and other delicacies. In search of a female. Sept. 29. p. 7.

• ***Summary:*** From NZ Press, by Fare Fac: "The Kingdom of Corea has for centuries been a bone of contention between China and Japan... But, with one exception, the Chinese have always come out victorious. This was in 1592," when Japanese forces invaded the country and defeated the Chinese. Five years later, however, the Chinese again became possessed of the country, and have held it as a suzerain ever since. It was the Japanese who gave the name to the outside world. The Chinese name is Tsiotsien, the native name Kaoli, and the Japanese name Korai, *Anglice* Korea or Corea."

The eastern slope is not very fertile, so most of the population lives on the western slope. Here they raise a little barley, rice and [soya] beans in the alluvial pockets of the foothills.

"The [soya] bean cake is the pressed marc of the pulse grown on the western shores. The oil is used internally and externally–it smells worst when it in used outside–also for lighting and lubrication. The marc is used for fuel and stock food. The bean cakes look exactly like 24 inch grindstones and are quite as soft."

31. Cavendish, Alfred Edward John; Goold-Adams, Henry Edward. 1894. Korea and the sacred white mountain: Being a brief account of a journey in Korea in 1891. London: George Philip & Son. 224 p. Illust. (40 original, many color). Maps. Index.

• ***Summary:*** This book is an amplification of the author's diary kept during a stay of a few weeks in Korea. Soy is mentioned as follows: Page 12: "Chefoo is the watering-place for Korea, Pekin, Tientsin, and Shanghai, but the foreign portion of it is very small, with three indifferent boarding-houses, but good pears and good bathing, if you do not mind a naked fisherman or two about. The chief exports appear to be straw plait for hats and bean-cake for manure."

© Copyright Soyinfo Center 2021

Page 33-34: Korean ponies, which carry foreign travelers and their belongings, are very small. The forage ration consists of about 2 lbs. of beans and millet boiled in water, and the whole poured hot into a trough; the average feed is two gallons of this mixture, given three times a day, and supplemented by 2 lbs. of chopped straw (rice or millet).” “Other means of transport are found in donkeys, cattle, and coolies.”

Page 48: Beans are becoming largely grown in Korea, for the demand for them in Japan is increasing, as they are used in the manufacture of Bean-curd, Miso, and Soy [sauce], while the Japanese are growing instead mulberries for sericulture. Wheat, barley, and rice, the latter of two kinds, one of which grows in dry soil, are also increasing, the export of these in 1890 being–barley, 5,260,533 lbs., value $50,341; [soya] beans, 87,950,800 lbs., value $1,004,762; wheat, 5,869,466 lbs., value $60,381; rice, 116,622,000 lbs., value $2,057,868.”

Note: This is the earliest document seen (May 2021) that gives statistics for trade (imports or exports) of beans [probably mostly soybeans], from Korea.

Page 54. “Besides flax, maize, and cotton, there were fields of the small millet (*Setaria italica*), substitute for porridge, and of the tall millet, Susu or Kaoliang (*Holcus Sorghum*), with stems 8 to 12 feet high and as thick as a man’s thumb, turning to golden yellow or bright mahogany colour; from the latter kind the Koreans make the coarse cloth of which their rough garments are composed, when they do not use Manchester shirtings; also fields of beans, food for cattle and men, and the foundation of Japanese soy [sauce] and our Worcestershire sauce.”

Pages 146-47: “He produced some samshu, a muddy fluid which smelt and tasted like Kaffir beer, with strong spirit in it; this peculiar taste is due to the bean-water [water in which soy beans have been boiled] which they mix with the spirit distilled from rice or millet. We were given a bottle of this liquor by the head-man, and the cook bought another of Chinese make, which was quite clear and less diluted with bean-water.”

Pages 195-96: “Whilst waiting in the inn to-day, I had plenty of opportunities of observing the nauseous smell of the food greedily devoured by the Koreans. Five or six little dishes, containing various preparations of meat or fish, chillies, [soy] beans, cabbage, rice, &c., were ranged on a little table a foot high, and gave forth a most evil odour. A Korean likes his viands very highly seasoned, and in eating takes a little of every dish into his mouth, that he may enjoy the pleasant mingling of the different flavours.” Note: At least one of these dishes probably contained Korean-style soy sauce or miso–but we cannot be sure.

Bean or beans (usually noted in passing as a crop with other crops) are mentioned on pages 66, 67, 68, 134, 138, 150, 191, 194, 199. Address: 1. Captain, F.R.G.S., 1st Argyll and Southern Highlanders, now in Edinburgh; 2. Captain, R.A.

32. The First Sino-Japanese War (1894-1895), and the Treaty of Shimonoseki (17 April 1895) (Important event). 1895.
• ***Summary:*** The origin of the Sino-Japanese War was a dispute over Korean affairs. “Japan’s opening of Korea in 1876 led to increasing embroilment with China over the peninsula. Peking adamantly insisted on its suzerainty over Korea, which Japan refused to recognize...

“During the next decade the Chinese intensified their efforts at modernizing their military forces, particularly the navy, while the Japanese became increasingly involved in Korea, thus setting the stage for an even more serious confrontation. Then the Tonghak (‘Eastern Learning’), a popular religious organization with a strongly antiforeign bias, broke out in revolt in southern Korea in 1894, China sent a small body of troops at the Korean king’s request, and Japan then sent in a larger force, demanded reforms of the Korean government, and finally seized control of it and had it declare war on China. War followed between Japan and China on August 1.

“The ensuing hostilities were the first real test of the efforts at military modernization both China and Japan had been making for a whole generation. Most Westerners assumed that the Chinese giant would win through sheer size, but Japan quickly proved that its modernization had been more successful. Its armies seized the whole of Korea and then invaded Manchuria. But victory was largely determined by sea power, which in the absence of railways controlled even China’s access to Korea. While the Chinese fleet was larger, the Japanese was qualitatively much better. On September 17 off the mouth of the Yalu River, the Japanese, using modern British naval tactics, severely crippled the Chinese fleet, which came out like cavalry, lined abreast. The Japanese then captured the naval base of Port Arthur in South Manchuria and besieged Weihaiwei on the northern coast of Shantung, where the remainder of the Chinese fleet was bottled up. Weihaiwei fell, the fleet surrendered, and China had to sue for peace.

“The terms of the Treaty of Shimonoseki, signed between Itô and Li on April 17, 1895, were relatively severe, though perhaps less so than they might have been had not a Japanese fanatic shot and wounded Li. China was obliged to cede Taiwan, the nearby Pescadores Islands, and the Kwantung Peninsula in South Manchuria; recognize Korea’s independence; pay 200 million taels indemnity; open more ports; and negotiate a commercial treaty. The latter, signed in 1896, gave Japan all the privileges that the Western powers had in China and added the further privilege of carrying on ‘industries and manufactures,’ using the cheap labor in the treaty ports.” Note: The Treaty of Shimonoseki gave all foreigners a clear right to establish factories in treaty ports. After 1895, foreign-run factories using Western technology rapidly increased in number as, revealingly, did privately

© Copyright Soyinfo Center 2021

owned Chinese factories using Western technology.

"Japan's triumph, however, was soon tarnished by a blatant power play by the Western nations. Russia, which itself had ambitions in both Manchuria and Korea, was alarmed by Japan's success. It persuaded Germany and France to join in a diplomatic intervention on April 23, 1895, 'advising' Japan to give up the Kwantung Peninsula. Bowing to *force majeur,* Japan complied, receiving in compensation 30 million taels of additional indemnity. There was naturally a strong reaction of indignation among the Japanese public, which became further embittered when the same three powers appropriated pieces of China for themselves in 1898, the Russians taking, under a twenty-five year lease, the Kwantung Peninsula that Japan had been forced to disgorge only three years earlier.

"The achievement of equality: Still, Japan's victory over China greatly impressed the West, and the British in particular, disillusioned with the incompetence of the Chinese government, began to show a decidedly more pro-Japanese attitude."

"On July 30, 1902. the Anglo-Japanese Alliance was signed–the first military pact on equal terms between a Western and a non-Western nation... The British, seeing their long dominance of the eastern seas threatened by the rise of new naval powers, bolstered their position in East Asia by allying themselves with the only strong naval power in the area. They also forestalled by this pact any Russo-Japanese pact to partition Northeast Asia and instead secured Japanese support for the maintenance of the treaty system in China. The Japanese, faced with growing rivalry with Russia over Korea and Manchuria, needed the alliance to ensure that, if war broke out, Russia would not be joined by other European powers, as it had been in its intervention over the Kwantung Peninsula in 1895. The wording of the alliance made it clear that in such a case Britain would come to Japan's aid."

But an even more important victory came a few years later in 1904, when Japan defeated the powerful Russian Empire.

33. Japan. Dep. of Agriculture and Commerce, Bureau of Commerce (Noshomusho Shokokyoku). 1897. General view of commerce & industry in the empire of Japan. Tokyo: Printed by Y. Yamaguchi. 315 p. See p. 22-23, 234. Also published in 1900 in Paris by M. de Brunoff)

• ***Summary:*** Name of organization with diacritics is: Nôshômushô Shôkôkyoku. Page 5: "The treaty ports or towns open to foreign trade are: Yokohama and Tokyo, on the Bay of Tokyo. Kobe and Osaka on the Bay of Osaka. Niigata, on the western coast of Honshiu [Honshu]. Hakodate, on the Tsugaru Strait. Nagasaki, on the south-western coast of Kiushu [Kyushu], Kelung, Tamsui, Takow, and Taiwan on the western coast of Taiwan. Ten partially opened ports in Japan and three in Corea [Korea] are also listed.

On pages 18-22 are tables of Japanese weights and measures and comparative tables with those of the empire of Great Britain, including both troy and avoirdupois.

Agriculture and mining (p. 22-23): Agriculture has been the leading pursuit of the people since earliest times and in the greater part of the cultivated area rice is grown; other principal food crops are wheat, barley, and soya beans. Industries not imported from the west include "salt making, sugar making, sake brewing, soy brewing, oil producing,... (p. 23).

Imports–Class II.–Duty free goods (p. 228) includes: "Grain, including rice, paddy, wheat, barley, oats, rye, peas, beans [incl. soya beans], millet, Indian corn. Flour and meal prepared from the above. Oil cake [when imported from Manchuria, this was typically soya bean cake].

Exports–Class II.–Duty free goods (p. 232-34) includes: "All kinds of mushrooms, excepting Shiitake, Confectionaries, all kinds of liquors, Vinegars, Soy [sauce], Oils, and Prepared Tobacco... Sea-weeds excepting Kobu [Kombu, seaweed],..." Address: Tokyo, Japan.

34. Bird, Isabella L. (Mrs. Bishop). 1898. Korea and her neighbors: A narrative of travel, with an account of the recent vicissitudes and present position of the country. 2 vols. London: John Murray. Vol. 1: x + 261 p. Illust.

• ***Summary:*** In Vol. 1: Preface, p. vi: "It must be evident to all who know anything of Korea, that a condition of tutelage, in some form or another, is now absolutely necessary to her existence as a nation. The nominal independence won for her by the force of Japanese arms is a privilege she is not fitted to enjoy, while she continues to labour under the burden of an administration that is hopelessly and superlatively corrupt."

Page xi: The author made four visits to Korea between Jan. 1894 and March 1897 as part of her larger plan to study the characteristics of the Mongolian races. Her first journey produced the impression that Korea was the most uninteresting country she ever travelled in.

Soy [sauce] is mentioned–Pages 141-42: If, while traveling, no "clean room" existed in an inn, "I had a room in the women's quarters at the back, remarkable only for its heat and vermin, and the amount of ang-paks, bundles of dirty clothes, beans rotting [fermenting] for soy [sauce and paste], and other plenishings which it contained,..."

Page 177: "A quart of rice, which when cooked is of great bulk, is a labourer's meal, but besides there are other dishes, which render its insipidity palatable. Among them are pounded capsicum, soy [sauce], various native sauces of abominable odours, kimchi, a species of sour kraut [*kimchi*], seaweed, salt fish, and salted seaweed fried in batter. The very poor only take two meals a day, but those who can afford it take three and four."

Pages 178-79: "The Korean is omnivorous. Dog meat is

© Copyright Soyinfo Center 2021

in great request at certain seasons, and dogs are extensively bred for the table." And Koreans waste nothing. "Cooking is not always essential. On the Han [river] I saw men taking fish off the hook, and after plunging them into a pot of red pepper sauce, eating them at once with their bones. Wheat, barley, maize, millet, the Irish and sweet potato, oats, peas, beans, rice, radishes, turnips, herbs, and wild leaves and roots innumerable, seaweed, shrimps, pastry made of flour, sugar, and oil, *kimchi*, on the making of which the whole female population of the middle and lower classes is engaged in November, a home-made vermicelli of buckwheat flour and white of egg, largely made up into a broth, soups, dried persimmons, spongecakes, cakes of the edible pine nut and honey, of flour, sugar, and sesamum seeds, onions, garlic, lily bulbs, chestnuts, and very much else are eaten. Oil of sesamum is largely used in cooking, as well as vinegar, soy [sauce], and other sauces of pungent and objectionable odours, the basis of most of them being capsicums and fermented rotten [soy] beans!"

Note: The Han is a major river in today's South Korea and the fourth longest river on the Korean peninsula after the Amrok (Yalu), Tuman (Tumen), and Nakdong rivers.

Page 182: The inn, if inn it was, gave me a room 8 feet by 6, and 5 feet 2 inches high. *Ang-paks*, for it was the family granary, iron shoes of ploughs and spades, bundles of foul rags, seaweed, ears of millet hanging in bunches from the roof, pack-saddles, and worse than all else, rotten beans fermenting for soy [sauce and paste], and malodorous half-salted fish, just left room for my camp-bed."

Note: The author does not mention Korea's very popular soybean pastes–such as doenjang or kochujang. She may well have used the word "soy" to refer to both soy sauce and soy pastes.

Bean or beans are mentioned: Page 18: "Hides, [soy] beans, dried fish, *bêche de mer*, rice, and whale's flesh are among the principal exports. It was not till 1883 that Fusan was officially opened to general foreign trade, and its rise has been most remarkable."

Page 39: In the market booths are to be seen "rice, millet, maize, peas, beans,..."

Page 85: In 1894 they paid taxes on barley, beans, rice, and cotton.

Page 100: "... they conveniently export their surplus produce, chiefly beans, tobacco, and rice, and receive in return their supplies of salt and foreign goods."

Page 112: In the Han River valley: "Every valley has its streamlet, and is barred across by dykes of mud from its head down to the Han–rice, with tobacco, beans, hemp, and cotton, being the great articles of export."

Page 119: "Ma-Kyo is the river port of Che-chön... "It exports rice, beans, and grain from the very rich agricultural country on both sides of the river,..."

Page 123: "When full grown a bull can carry from 350 to 500 lbs. They are fed on boiled beans, cut millet stalks, and cut pea haulm, and the water in which the beans are boiled."

Page 138: Korean ponies "are fed three times a day on brown slush as hot as they can drink it, composed of [soy] beans, chopped millet stalks, rice husks, and bran, with the water in which they have been boiled."

Page 147: "There is much wet rice along the route, as well as dry rice, with a double line of beans between every two rows,..."

Page 149: "It is a most fertile tract, and could support a large population, but not being suited for rice, is very little cultivated, and grows chiefly oats, millet, and beans, which are not affected by the strong winds."

Page 150: "There the villagers could not or would not take us in. They said they had neither rice nor beans, which may have been true so late in the spring."

Page 185: "A smaller valley contains about 3,000 acres of rice land only, and on the slopes surrounding all these are rich lands, bearing heavy crops of wheat, millet, barley, cotton, tobacco, castor oil, sesamum, oats, turnips, peas, beans, and potatoes."

Page 186: "In wheat, barley, or rye fields the sowing is in October, and the harvest in May or June, after which beans, peas, and other vegetables are sown."

Page 187: "Grain, peas, and beans are threshed out with flails as often as not in the roadway of a village,..."

Page 189: The village "has several schools, and exchanges rice and beans for foreign cottons at Won-san,..."

Page 217: Newchwang "is a city of 60,000 souls, the growth of its population having kept pace with its rapid advance in commercial importance since it was opened to foreign trade in 1860. Several British steamers with big Chinese characters on their sides were at anchor in the tideway, and the river-sides were closely fringed with up-river boats and sea-going junks, of various picturesque builds and colours, from Southern China, steamers and junks alike waiting not only for cargoes of the small beans for which Manchuria is famous, but for the pressed bean-cake which is exported in enormous quantities to fertilise the sugar plantations and hungry fields of South China."

Page 218–Concerning Newchwang: "'Peas,' really beans (Footnote: *Glycene hispides* [sic, *Glycine hispida*] {Dr. Morrison}), are its chief *raison d'être*, and their ups and downs in price its mild sensations. 'Pea-boats,' long and narrow, with matting roofs and one huge sail, bring down the beans from the interior, and mills working night and day express their oil, which is as good for cooking as for burning."

Page 235–Muk-den [Mukden] is a busy place, and does a large and lucrative trade, specially in grain, beans, and furs."

Seaweed is mentioned on pages 38, 140, 142, 177, 179, 182, 198-99. Kimchi: p. 98, 147, 177. Address: F.R.G.S., Geographer, Great Britain.

35. Bretschneider, Emil V. 1898. History of European botanical discoveries in China. 2 vols. London: Sampson Low, Marston and Co., Ltd. xv + 1167 p. Indexes (names of persons, names of plants). 28 cm. 2nd ed. 1935. [200+* ref]
• ***Summary:*** This magnificent work has been digitized in full view on HathiTrust.

Vol. I ends on page 624. Vol. II is on pages 625-1167. National Union Catalog says Bretschneider's formal Russian name is Emilii Vasil'evich Bretshneider (1833-1901).

The soy bean (search for Soja OR hispida OR soy) is mentioned on 22 pages of this book.

In Vol. 1: On pages 401-03 the author discusses the life and work of George Bentham, the author of *Flora Hongkongensis.*

On pages 403-51 the author discusses the life and work of Robert Fortune. "The travels and explorations of R. Fortune in China, beginning with the year 1843, inaugurate a new era in the history of botanical discoveries in that country. Previous to that time the Chinese plants known to our botanists in Europe and introduced into our gardens, came from Canton or Macao...

"R. Fortune was born in Berwickshire, Scotland, on the 16th of Sept., 1812, and was educated in the parish school of Edrom... Fortune visited China four times, 1843-45, 1848-51, 1853-56, 1861, and accordingly published four interesting accounts of his travels in that country." Fortune traveled in Japan during 1860, visiting the ports of Nagasaki, Kanagawa, and Yukuhama [Yokohama] near Yedo. He visited Yedo for 15 days. In the spring of 1861 he returned to Japan. His four books are "Three years wandering in the northern provinces of China" (1847), "A journey to the tea countries of China" (1852; in which he discusses the soy bean), "A residence among the Chinese" (1857), and "Yedo and Peking: A narrative of a journey to the capitals of Japan and China" (1863).

Pages 536-37 discuss Louis C.N.M. Montigny, who was born on 2 Aug. 1805 at Hamburg [Germany] of French parents. He first went to China in 1843, as *chancellier* accompanying the French Embassy. In 1847 he was appointed Consular Agent at Shanghai, where he stayed until about 1858. He died on 14 Sept. 1868 and his obituary appeared in the *Revue Horticole* (1869, p. 52). During his residence in Shanghai he rendered great services to natural science and horticulture by introducing into France interesting beasts and birds, and useful Chinese economic plants–including *Soja hispida* and its oil. These plants were cultivated a distributed by the *Société d'Acclimatation* of Paris.

Page 545 notes that Voisin, a French missionary who went to China in 1824, obtained from China several economic plants among which was the textile plant, *Ko.* Seeds were presented to the Museum of Natural History in Paris through Stanislas Julien and the plants raised from these seeds were examined by Prof. Jussieu, who found that it was a legume resembling *Dolichos bulbosus.* It was later identified as Pueraria.

Pages 554-55 discuss Stanislas Julien the great French sinologist, who was born in 1797. In 1832 he succeeded A. Rémusat as Professor of the Chinese language at the Collège de France. He translated several interesting Chinese treatises on economic plants, their cultivation and use, generally with a view to incite his countrymen to introduce these plants into France. In 1855 he wrote about *Soja hispida* in the *Bulletin of the Society for Acclimatization* (France) (p. 225). He died in 1873.

Contents: Preface (book includes, in addition to China proper, Manchuria, Mongolia, Eastern Turkestan, Tibet, Corea [Korea], and the Liu kiu [Loochoo] and Bonin [Ogasawara] Islands. Note: The latter are about 30 subtropical islands located about 1,000 miles directly south of Tokyo, Japan).

Also discusses: azuki beans (*Phaseolus radiatus,* p. 76, 129), cowpeas (*Vigna sinensis,* p. 77), hemp (*Cannabis sativa,* p. 166, 169. 228, 493, 520. 522-23), kuzu (*Pueraria Thunbergiana,* p. 175, 738, 755, 1051), *Arachis hypogaea* (groundnuts; peanuts) (p. 231, 233, 451, 663, 844), sesame (*Sesamum orientale,* p. 11, 158, 165, 226, 487).

Concerning *Prunus mume* we read: "Near the entrance to the pass on the Canton side, Abel [Dr. C. Abel, 1816-1817] saw a species of *Prunus* in full flower, in Chinese *mei hwa shoo;* hence the name of the mountain. (The *mei hwa* is *Prunus Mume,* S. & Z. [Siebold & Zuccarini]) (184)" (p. 233). See also p. 893.

Note: This is the earliest English-language document seen (Dec. 2006) that uses the term *Prunus mume* to refer to the name of the tree whose fruit is used to make umeboshi salt plums. Address: Late physician to the Russian Legation at Peking; now at St. Petersburg.

36. Gifford, Daniel L. 1898. Every-day life in Korea: A collection of studies and stories. Chicago, New York, Toronto: Fleming H. Revell Co. 231 p. See p. 20, 53. Illust. Map. No index. 20 cm.
• ***Summary:*** Page 20: "Beans are used for food–put sparingly into the rice kettles, or decomposed for a peppery sauce which furnishes one of their side dishes. Again they are mixed with chopped straw and boiled in water, forming a hot mixture that is the sole food of cattle and horses in Korea. Beans are also an article of export." Note 1. These beans are soybeans and the peppery sauce may be *kochujang.*

Page 53: "The heaping bowl of rice is then discussed, either with the brass spoon or chop-sticks. And the chop-sticks descend every now and then upon the contents of the little side dishes, the brine-soaked 'mu,' or turnip, the bits of dried fish or meats, a species of sauerkraut [*kimchi*] composed of cabbage, shrimp, ginger, onion, red pepper, salt, etc., with an occasional dip into the bean sauce [soy sauce]

© Copyright Soyinfo Center 2021

(à la Worcestershire). For liquid food he drinks cold water, or the water in which the rice has been cooked."

Note 2. In 1898 Pyeng-yang [Pyongyang] was "by far the most important city in the north of Korea,..." As of 2009, it is the capital of North Korea. Address: Rev., Mendota, Illinois. Formerly eight years a missionary in Pyeng-yang [Pyongyang], Korea.

37. *Lake Wakatip Mail* (*New Zealand*). 1899. The industries of Japan. July 7. p. 4.
• ***Summary:*** "Agriculture is the chief pursuit of the people of Japan, and in the greater part of the cultivated area rice and the principal food crops, wheat, barley, and soya beans, are grown. Mulberry trees are planted everywhere. Tea is mainly planted in the south of Honshiu and in Taiwan, Formosa. The mineral wealth of the empire is great, but much improvement is needed in mining. The coal production is rapidly increasing, especially in Kiushiu and Hokkaido. The development of the iron industry is somewhat slow, but much is hoped for in the future. The production of silver has been steadily rising; copper and antimony are also among the principal exports of the country.

"The industries of the Japanese empire may be distinguished as 'original' and 'imported.' The original industries which existed from early times are those of ceramics, weaving embroideries, lacquer work, paper, metals, leather, wood, and bamboo carvings, camphor, vegetable wax, salt, sugar, sake, soy [sauce], oil, tobacco, indigo, and raw silk. These industries seem to have been first introduced from Corea or China, but the lapse of several hundred years has obliterated the original traces. Their scope of working is generally small, and the tools and instruments used are rude and simple. The industries which have been introduced into the country are those lately brought over from Europe and America. These comprise cotton spinning, brick making, preparation of drugs and chemicals, cement works, wire making, woollen manufacture, shipbuilding and machinery; match, paper, and soap making. These industries are generally carried on in a large scale, employing a vast number of workmen and using water and steam power. According to the latest returns, the total number of factories belonging to companies and individuals is five thousand nine hundred and eighty-five, one thousand and ninety-eight of these being provided with steam engines and two hundred and twenty-one with both steam and hydraulic engines."

38. YUrkevich, Lyutsian. 1899. Soya rannyaya, kak nasyshchnaya pishcha dlya gubernii, postradavshikh ot neurozhaya [Early soya as daily food for provinces suffering from crop failure]. Kiev, Ukraine, Russia: Printing House of Peter Barsk. 19 p. 20 cm. [Rus]
• ***Summary:*** Sigizmund Yaroshevskii brought soybeans to Russia from abroad; however, due to lack of effort to acclimatize these soybeans, they started to disappear. In 1893, I. Ovsinskii [Ovsinsky, Owinski, Owinsky] reintroduced black and brown varieties of soybeans from the East to the Podol'skaya region [part of Ukraine in 2002]. In 1895, Yurkevich brought soybeans from North Korea into Chernigovskaya, Mogilevskaya and Vilenskaya regions [also part of Ukraine in 2002]. It was found that soybeans, which were inexpensive and nutritious, could be used to feed the starving and malnourished population. Also, soybeans were used in Russia as a feed for army horses (when Yurkevich traveled to Korea, he also noticed that their horses were fed soybeans). Also discusses: Acclimatization and cultivation of soybeans. Unique features of soybeans. Six recipes for dishes made with soybeans: 1. Soy flour to make bread. 2. Soy flour to make *mamalyga* (boiled dough). 3. Soy flour to make pancakes. 4. Cooked soybeans to make porridge. 5. Soybeans to make soy oil. 6. Miso used in a porridge.

Both August Chechet (who lived under the name of Gal'vachi) in an article in the agricultural journal, *Roln. i Hodow* No. 40 of 1898, and J. Farcy in his article in *Journal de l'agriculture pratique* No. 14 of 1898 approvingly recommend soybeans. There follows a long quotation from Chechet's article. Address: Kiev, Ukraine, Russia.

39. *Times* (*London*). 1900. Japanese commercial interests in Manchuria. Oct. 5. p. 12, col. 2. [1 ref]
• ***Summary:*** "The Commissioner of Chinese Customs at Niu-chwang [pinyin: Yingkou, formerly Newchwang; Niuchwang, Niuzhang] refers, in his report for the past year, to the important part played by Japan in the recent rapid growth in the foreign trade of Manchuria."

"This growth in trade with Japan may be said to have commenced with the war between Japan and China [1894-1895], which probably opened the eyes of the Japanese to the wealth of Manchuria and the peculiar value of its products to themselves. The Soya bean is consumed in enormous quantities in Japan, the better qualities for food and the inferior ones as manure. In former years the supply was obtained from Korea, but the Manchurian bean is cheaper. Beancake is used as a food for cattle and for manure, and its value in both respects is well known. Japanese shipping at Niu-chwang naturally shows a great increase likewise."

40. *Journal of the Oriental Institute* (*Vladivostok*). 1900-1901. Sovremennaia letopsis' Dal'nego Vostoka [Contemporary chronology of the Far East]. p. 157-58. [Rus]*
• ***Summary:*** This chronology was published in installments under a specific grant from the Governor-General of the Amur Region. The entry for 1900-1901 titled "Japanese interests in Manchuria" describes increasing Japanese soybean imports from Niuzhuang, Manchuria, since soybeans from Manchuria are found to be less expensive than those imported from Korea.

© Copyright Soyinfo Center 2021

41. VanBuskirk, J.D. 1900. Some common Korean foods. *Transactions of the Korea Branch of the Royal Asiatic Society* 14:1-8.

• ***Summary:*** Table 1, "Korean food products," based on statistics published in the 1917 report by the Bureau of Agriculture of the Government General, shows Korean production in millions of bushels: Rice 61. Barley 25. Millet 19. Wheat 8. Beans and peas 18. Since exports and imports of foodstuffs are relatively small compared to the amount produced, and the number of animals fed is not large, "these figures should give us a good idea of the amount of food eaten."

Rice is sometimes cooked with peas or beans (incl. soy beans) mixed in (called *pat-pap* or *kong-pap*). But the cooking takes longer and the beans are often not well cooked, and thus less digestible (p. 3).

The section titled "Bean and pea foods" (p. 4-5) gives the name of each food in Korean characters and discusses: (1) Bean curd (*tu-bu*), equivalent to Japanese tofu, is curded with the "concentrated mother liquid from sea water" [Jap. nigari]. The bean residue [okara] (*pi-ch'i*) left over from making tofu is also sometimes eaten. Bean curd "is not generally eaten without further preparation; it is commonly added to soups and stews and often made into omelets with eggs; another palatable food is made by cooking the bean curd for a short time in bean sauce (*chang*) and serving this with sesame oil, pepper and onions; it is called *to-bu cho-rim.* Bean curd may be eaten without further cooking served in sauce."

Note 1. This is the earliest English-language document seen (April 2013) that uses the term *tu-bu* to refer to Korean tofu.

Pea curd (*mook*) is similar to beancurd in composition but made from peas using a very different process.

"Bean Sauce (*kan-chang*) is somewhat like the Japanese 'sho-yu' but is more salt and not sweetened. Soy beans are thoroughly boiled, mashed, made into cakes and partially dried. These cakes (*me-ju*) are stored for months and allowed to mold and slowly ferment: when ripe they are broken up and soaked in salt water for a long time, then strained, the solid part being dried and used as a condiment (*toin-chang* [*doenjang*]). The liquid is boiled and the coagulated protein scum frequently removed; when sufficiently concentrated the liquid sauce is cooled and stored. This is the indispensable condiment for Koreans.

Note 2. This is the earliest English-language document seen (Nov. 2020) that uses the term *kan-chang* to refer to Korean soy sauce.

"Another bean sauce (*ko-cho-chang*) is made by taking about equal parts of the fermented bean cakes, rice, and salt, with a large amount of red pepper, the mixture being soaked in a small amount of water till ripe. This too is very important as a condiment."

Note 3. This is the earliest English language document seen (April 2021) that uses the term *toin-chang* to refer to Korean fermented soybean paste (*doenjang*). clearly mentions Korean-style red pepper paste, which it calls "ko-cho-chang,"–today commonly called "red pepper sauce."

Note 4. This is the earliest document seen (Nov. 2020) that clearly mentions Korean-style red pepper paste, which it calls "ko-cho-chang,"–today commonly called "red pepper sauce."

"'Kong-cha-ban' is made by boiling beans in the bean sauce; they do not swell but are hard, brittle, and very salty. Sugar and sesame oil may be added when serving them.

"Sprouted beans (*kong-na-mul*) are very common. The beans are soaked in water and allowed to sprout. When the sprouts are quite long both beans and sprouts are boiled and served–sauce is generally added."

Kim-chi, a fermented food made from cabbage or sliced turnips, is sometimes served with added bean sauce.

Among animal foods: "'Mut-chim' is dried fish soaked in water, then shredded; it is then soaked in bean sauce. Sesame oil and pepper are added; it is then allowed to stand for a short time." Address: M.D.

42. Speer, Robert E. 1901. The "morning calm" country–Korea: The country which Russia covets and which Japan must have. *American Magazine* (*The*) (*Frank Leslie's Popular Monthly*) 52(2):174-86. June. See p. 182.

• ***Summary:*** Page 182: "At the inns along the road you order your meal as 'a table of rice,...' It is brought on a low, pretty, four-legged table and set down on a floor before you. On it are rice, in a copper bowl, cucumber soup, an omelette, salt fish, shredded cabbage in salt water, salted shrimps, hard bean sauce made out of the pressed bean extract, of which great quantities are said to be shipped from China and Korea as the basis of Worcestershire sauce. But perhaps this is a fable. There are many such told in Asia."

Note: The term "hard bean sauce" probably refers to Korean-style soy sauce. But the meaning of the word "hard" is unclear.

43. *Oesterreichische Monatsschrift fuer den Orient* (*Vienna*). 1901. Industrielles aus Japan [Japanese Industries]. No. 10. Page 114, col. 2. Oct. [Ger]

• ***Summary:*** The production of the Japanese bean sauce shoyu, also known as soy (*Soja*), serves primarily for [local] consumption, since it appears to be indispensable to the Japanese for their foods. In spite of the fact that a large portion of shoyu is imported from the northern provinces to Nagasaki prefecture (Nagasaki-ken), the production here is nevertheless not insignificant (even though shoyu is also exported by the Chinese and the Japanese to Korea and China), amounting to 13,547 yen for 1899. This bean sauce is produced from wheat, beans, cooking salt, and water, and its aroma and flavor are particularly popular with the English and the Americans.

© Copyright Soyinfo Center 2021

In Nagasaki prefecture, around 9,100 *koku*, or 1,638,000 liters are produced [each year]. The price for one koku (180 liters) in Nagasaki amounts to approximately 3 to 5 yen.

Some of the industrial branch offices that are listed below serve exclusively for the filling of the needs of the Nagasaki prefecture. Their products are of low quality, but they satisfy the modest needs of the middle classes.

44. Dep. of Finance (Okurashô). 1901. Financial Annual of Japan (No. 1). Tokyo, Japan: Government Printing Office. 74 p.

• ***Summary:*** A table titled "Amount of taxation under various heads" (p. 12-13) gives the government revenue (in yen) from various types of taxes from 1867-68 to 1901-02. The soy [sauce] tax began in 1885-86 and was 640,179 yen that year. The rates of taxes on soy and income were raised in 1899. The soy tax jumped from 1,535,648 in 1898-99 to 2,453,392 in 1899-1900. In 1901-02 it was 3,808-730.

Note 1. In 1867-88, Japan's main sources of income were land tax (2.00 million yen), customs duties (0.721 million yen) and other miscellaneous taxes (0.534 million yen) for a total of 3.265 million yen.

In 1901-02, Japan's main sources of income were land tax (46.56 million yen), income tax (5.618 million yen), saké tax (55.280 million yen), various business taxes (6.263 million yen), customs duties (15.77 million yen) and other miscellaneous taxes (2.233 million yen) for a total of 138.741 million yen.

Note 2. In 1894-95 was the First Sino-Japanese War, over domination of Korea; Japan won. In 1904-05 was Russo-Japanese war; Japan won, gaining complete control of Korea. Address: Japan.

45. Hosie, Alexander. 1901. Manchuria: Its people, resources, and recent history. London: Methuen & Co. xii + 293 p. See p. 180-84, 218-24, 240-45, 252-53. Illust. Index. 23 cm.

• ***Summary:*** The Preface states that Hosie was in charge of the British consulate at Newchwang in Manchuria from Nov. 1894 to July 1897 and from April 1899 to April 1900. In 1900 he made the first careful estimate of soybean production in Manchuria, calculating the amount at 600,000 tons. He noted that during that period most of Manchuria's soybean exports went to southern China, through the ports of Swatow, Amoy, and Canton, where mills were erected for extracting the oil; the cake was used for fertilizing sugar plantations there and in Java. Nearly all of the soybean oil exported from Manchuria was consumed in China.

Note 1. This is the earliest document seen that gives soybean production or area statistics for Manchuria.

Chapter 2, titled "Recent events in Manchuria" (p. 39-72) begins with the Sino-Japanese war of 1894-95 (it began on 3 Aug. 1894 and concerned a dispute over the kingdom of Corea [Korea]), the Japanese invasion of Corea and Manchuria, Japanese victory and the treaty of Shimonoseki (17 April 1895), the complexities of railway construction and financing in Manchuria (from the start of construction of the Manchurian Railway on 28 Aug. 1897), and the expected effects of the new railroads on Manchurian trade. Manchurian trade currently labors under serious disadvantages due largely to climatic conditions, absence of good roads, and the slow and clumsy methods of transport. "I have said that it is practically impossible to sow, reap, and export [soy] beans, the most valuable trade product of the country, in the same year, and that they have to be carried by cart and stored at depots on the waterways to await shipment when the ice breaks up in the following spring. In this way capital is locked up for months and heavy storage charges are incurred" (p. 67). The Russian Central Manchurian Railway should greatly alleviate these problems. Bubonic plague struck Manchuria in 1899 (p. 69).

Note 2. This is the earliest document seen (Jan. 2008) concerning the transportation of soybeans by railway.

Chapter 7, titled "Agriculture and agricultural products" (p. 172-98) contains extensive information on "Beans" (which are actually soybeans). Beans are often used on large farms in the second year of a 4-year crop rotation consisting of millet, beans, rice (or barley or wheat), and millet. Other important cereal crops are Job's tears (*Coix lachryma*, used medicinally and in making sweetmeats) and tall millet (*Kao-liang*).

"A large variety of beans is grown in Manchuria, and, together with their resultants, bean-cake and bean-oil, they constitute by far the most valuable item in the export trade of the three provinces." In April they are sown by hand in drills, and the crop ripens in September. "The Chinese distinguish the beans of commerce by their colours, and they are known as Yellow (Huang Tou), Green (Ch'ing Tou), Black (Hei, or Wu Tou), White (Pai Tou), Red (Hung Tou) and Small Green (Lü Tou). The yellow, green and black are varieties of the soy bean (*Glycine hispida, Moench.*, or *Dolichos soja*, L.)..." The white and red beans are "the ray-fruited dwarf bean (*Phaseolus radiatus*, L.)" [azuki bean]. The Lü Tou (small green bean, *Phaseolus mungo*, L.) [mung bean], "the smallest but one of the most important of the beans of commerce cultivated in Manchuria," is used to make vermicelli and bean sprouts (p. 184).

Concerning soy beans: The "yield per acre, which requires from 16 to 18 lb. of seed, is estimated at from 27 to 39 bushels, with a weight of about 40 lb. per bushel." [Note: A U.S. bushel of soy beans weighs 60 lb.]. "Each variety of soy bean has a number of sub-species. The yellow has three, known respectively as (a) Pai-mei (white eyebrow), from the white scar on the saddle or point of attachment to the pod; (b) Chin-huang, or Chin-yüan (golden yellow or golden round), from the golden colour and more rounded shape of

© Copyright Soyinfo Center 2021

the bean; and (c) Hei-chi (black belly), from the dark brown scar on the saddle. All the three sub-species are highly prized for the quantity of oil or fat which they contain, but sub-species (a) and (b) are noted for the quality of the bean-curd (Tou-fu) or legumine obtained from them, as well as for the sprouts which are procured by soaking the beans in water, and which are greatly relished as a vegetable.

"There are two sub-species of the green bean (Ching-Tou)." One has a green epidermis (skin) but is yellow inside, while the other is green on the both the surface and inside.

The black bean (Wu Tou) has three sub-species:–(a) To-wu-tou (large black bean), where the epidermis is black and the inside green. It yields oil or fat, and it is likewise boiled with millet or rice and used for food.

"(b) Hsiao-wu-tou (small black bean), where the bean is somewhat smaller than the sub-species (a), with a black epidermis and yellow inside. It is largely used for horse feed and also yields oil, the refuse being employed for feeding pigs. It is likewise pickled for food.

"(c) Pien-wu-tou (flat black bean), where the epidermis is black and the inside yellow. It is flattened and elliptical in shape, and is mostly used for pickling and for horse feed." (p. 181-82).

A detailed description is then given of Tou-fu, or bean curd, and how it is made (p. 183-84).

"Besides these beans of commerce there are several varieties of garden beans cultivated for food, such as...; the Mao Tou, or hairy bean [probably green vegetable soybeans], with short hairy pods, each containing one to three beans (epidermis white and inside green);... With the exception of the Mao Tou these are usually cooked and eaten with the pods" (p. 186).

"The plants grown in Manchuria whose seeds yield oil are six in number. They are (1) *Dolichos soja,* L., or soy bean," (2) Castor oil plant. (3) *Sesamum orientale,* or sesame. (4) *Perilla ocymoides,* L., or perilla. (5) The cotton plant. (6) *Cannabis sativa,* L., or the true hemp plant. "The names and uses of these [six] oils are the following: (1) *Tou yu* [soy bean oil]–cooking, mixing paints and lighting" [illumination]. All these six "oil-yielding seeds" (with the exception of *sesamum seeds,* which are roasted) are crushed, steamed and subjected to great pressure. A table (p. 188) shows the percentage and value of the oil and cake extracted from these six seeds.

A black-and-white photo shows a Chinese bean mill at Newchwang with a huge granite stone wheel (facing p. 220).

Also discusses: Job's tears or pearl barley (p. 180-81). *Phaseolus radiatus* (the ray-fruited dwarf bean [azuki] which is red or white, p. 182-83). Hemp, a valuable textile plant (p. 186-88, 251). Sesamum seed (p. 188). Ground-nuts [peanuts] (p. 188, 251). The ground nut (*Arachis hypogæa,* L.) is cultivated in Manchuria for food, however not to any great extent. The oil is not extracted from the nuts, as it is in the south of China. Seaweed (p. 258).

A second edition of this work was published in 1904 (London: Methuen & Co., 293 p.; New York: C. Scribner's Sons; see p. 181-87). In the 1910 ed. (published in Boston by J.B. Millet Co.; 320 p.), see p. 75-79. Address: M.A., F.R.G.S., Once Acting British Consul, Tamsui; Now at Aberdeen (Scotland or Hong Kong).

46. Irish, H.C. 1901. Garden beans cultivated as esculents. *Missouri Botanical Garden, Annual Report* 12:81-165. See p. 147-48. [3 soy ref]

• ***Summary:*** The article begins: "In entering upon a study of garden beans in 1898, all procurable varieties catalogued by leading seed firms of America and Europe were grown at the Missouri Botanical Garden during that and the two succeeding years. Habit of growth and other varietal characters were carefully noted in the field each year. These, together with the seed characters, have been brought together and classified. The varieties studied are here grouped under five genera which are distinguished from each other mostly by technical characters as follows:" Phaseolus, Dolichos, Vigna, Glycine, and Vicia. There follow detailed descriptions, keys, synonymy and figures of all the seeds various esculent [edible] varieties, with notes on diseases, culture, and cooking.

Under *Glycine hispida* Maxim. (p. 147-48) is a list of five previous scientific names for the soybean and the sources in which those names were first cited. A photo (plate 44) shows the front and side views of six soybean varieties.

A full-page original illustration (line drawing, plate 46) shows the leaves, pods, and flowers of a soybean plant.

Describes five varieties whose seeds can be obtained from seedsmen Haage & Schmidt: Yellow Soy, Black Soy, Green Soy, Brown Soy, and Etampes Soy. The accession numbers for each of these, and their original foreign names and places or countries of origin are given.

A long footnote states that a number of the domestic U.S. seeds came from the Field Columbian Museum or the Philadelphia Commercial Museum [Pennsylvania]. Most of the imported seeds came from Japan, including at least seven soybean ("Daidzu") varieties: (1) Yellow–10757, "Daidzu," Mujage Agric. School, Japan. (2) Yellow–10758, "Daidzu," Iwate Agric. Institute, Japan. (3) Yellow–10760, "Daidzu," Japan. (4) Black–10752, "Kuro mame," Japan. (5) Black–10753, "Daidzu," Osaka Agric. School, Japan. (6) Green–7743, "Awo-daidzu," Yamacata [sic, Yamagata], Japan. (7) Green–10756, "Daidzu," Iwate Agric. Institute, Japan.

But at least one each came from Russia (10470 Kazan), Siam (10574 "Waa Tai"; 10768 "Lau Lao Peas"), Korea (10771 "Pea Bean"), Floyd County, Georgia (USA; 10932), and Polk County, Georgia (USA; 10937 "Weevil Proof Peas" (Beans)).

48. Hulbert, Homer B. 1902. The products of Korea. Ed. 2. Seoul, Korea:

• ***Summary:*** Homer Bezaleel Hulbert lived 1863-1949.

Note: In 1905 Homer B. Hulbert (A.M., F.R.G.S.) was editor of *The Korea Review,* published by the Methodist Publishing House, Seoul, Korea. Hulbert's book, *The Products of Korea* is reviewed and quoted in 1902 (in Vol. 2, No. 3), and the section on beans is quoted on pages 109-11, as follows:

"Next in importance to rice come the different kinds of pulse, under which heading we include all the leguminous plants, the bean and pea family. That Korea is well provided with this valuable and nutritious form of food will be seen from the following list of the commonest kinds. Of round beans, or peas, called *kong*, we find the 'horse bean,' often called 'bean-cake bean,' the 'black bean,' the 'green bean,' the 'oil bean,' the 'spotted bean,' or 'checkered bean,' the 'chestnut bean,' the yellow bean,' the 'white- cap bean,' the 'grandfather bean,' the 'brown bean,' the 'red bean.' There are several of the long beans that come under the name *kong*, such as the 'South-river bean,' the 'Japanese bean' and the 'Kwaug-ju bean,' but most of the beans proper belong to the family called *p'al* which includes the 'mixed bean,' a variety which produces various colors of beans in a single pod, the colors being black, red, yellow, white and blue; the 'speckled bean,' the 'court-dress bean,' the 'white bean,' the 'black bean,' and the 'blue bean.'

"Of all these different varieties of pulse the first or 'horse- bean' is by far the most common. It is the bean which forms such a large part of the exports of Korea. It is supposed by Koreans to have originated in north-western China and derives its name from the fact that it is used very largely for fodder [for horses].

"Of all these different varieties the only one that is surely indigenous is the black bean, as it is found no-where else in eastern Asia. Of the rest the origin is doubtful. The horse bean grows in greatest abundance in Kyüng-sang Province and on the island of Quelpart, though of course it is common all over the country. The black bean flourishes best in Chül-la Province; the green bean, oil bean and white cap-bean flourish in Kyüng-geui Province; the yellow bean, in Whaug-ha Province; the South River bean, in Ch'ung Ch'üng Province; the grandfather bean (so called because of its wrinkles) grows anywhere, but not in large quantities; the brown bean and chestnut bean, in Kang-wün Province; the different kinds of *p'at* all grow best in southern Korea.

"Of these different kinds of beans the horse bean alone is largely exported, although a few black beans are also taken to Japan.

"It would be difficult to over-estimate the importance of these different species of pulse to the Korean; for they furnish oily and nitrogenous elements that are wanting in the rice. It is impossible to enumerate the different kinds of food which are prepared from beans for they are almost as numerous as the dishes we make from wheat flour. It will suffice to say that, on an average, the Koran eats about one sixth as much beans as rice. They say that the man who eats beans will be strong, and they attribute it to the oil, which is found in such large proportion especially in the round bans or *kong.*

"The most celebrated story about beans, current among the Koreans, tells about how they saved the life of a noted Chinaman. His brother had usurped the throne of the Wei Kingdom and, as in most oriental countries, the younger brother was an object of suspicion. He was seized and brought before the King, his elder brother. The King said, 'From the place where you are standing step forward seven paces and if during that interval you do not compose a quatrain you will be condemned.' It is easy to believe that this threat was a spur to Pegasus. The young man stepped forward the seven paces and spoke the following lines:

"The bean-husks crackle beneath the kettle

"The beans themselves boil in the kettle;

"Both beans and husks come from the same root.

"It is sad to see products of the same stem antagonize each other.

"The brother on the throne was so struck by the truth of this that he acquitted his younger brother, whose loyalty had always been perfectly sound.

"The price of beans as compared with rice may be said to be one half, as a general rule; though local conditions will vary the rule at times. There are certain kinds of beans which cost nearly as much as rice while the cheapest kinds cost only one fourth as much. The commonest bean, the horse-bean, costs about one third as much as rice.

Note: From the above, it seems clear that what Koreans call "horse-bean" is the same as we call soybean. "Black beans" may be our "black soybeans," and the "oil bean" may also be a type of soy bean, as may several others.

49. Dmitriev, Konstantin. 1903. Ekskursiya dlya izucheniya porta In-kou [A trip for the study of the port of Yingkou]. *Izvestiya Vostochnogo Instituta* (*J. of the Oriental Institute, Vladivostok*) 7:21-146; 8:115-270. [Rus]

• ***Summary:*** As the major export port for Manchurian soybeans and soy products prior to the completion of the Chinese Eastern Railway and the consequent rise of Dairen and Vladivostok to preeminence, Yingkou is the appropriate

© Copyright Soyinfo Center 2021

focus for a study of the increasing export trade to Southern China and Japan (especially) in the 1880s. Pages 85-88 list foreign companies and establishments operating in Yingkou in 1902-03.

Of particular interest might be Bandinel and Co. known in Chinese as Jichang (?) which represented such worldwide and regional ocean freighters as Hamburg- American, Lloyds and Mitsui Bussan as well as the oil mill carrying its own name (*Jichangyan*).

Tables (p. 256) give 1901 export statistics for soybeans, cake and oil both by quarters and destinations (Hong Kong, Japan, Chinese ports, Samarang [Semarang, Central Java], and Korea). Address: Manchuria.

50. Roberts, H.F. 1904. The signs of spring. *Industrialist* (*The*) (*Manhattan, Kansas*) 30(22):339-45. March 19.
• ***Summary:*** A charming essay on farming, fraudulent seedsmen, soybeans, etc.

Pages 341-42: "It is amusing to find a number of dealers advertising the soy-bean under the name of the 'Japanese Coffee Berry.' One catalogue says, 'This Japanese bean we find by actual test, when roasted and coarsely ground, tastes so nearly like Brazilian coffee that the difference is hardly perceptible.' Another dealer calls it 'The German Coffee Berry,' and says: 'While in Germany we took the greatest pains to look up our great German Coffee Berry, and to our surprise and pleasure we found it used in almost all hotels and restaurants in Switzerland, Germany, Holland, and France. They use large quantities, mixing it with Rio and other genuine coffee, and we predict that no novelty offered in years will meet with such a hearty reception as the German Coffee Berry. It is the poor man's friend and the rich man's delight; ripening in Wisconsin and the Dakotas in 4½ months."

"But he has still another, that he designates by the grotesque name of 'Japanese Jaavaa Coffee,' that appears to be nothing more than another variety of soja bean. Concerning this wonderful plant he announces: 'Travelers in Corea and Japan and missionaries on duty in these countries have long referred to a berry that was used there as a coffee substitute. Customers have written us regarding this coffee. Some call it Idaho Coffee, the Colorado Coffee, the California Java, and Domestic Coffee Berry. We obtained a supply of seed, have grown it here in the North, and find that in some respects it is superior to our Great German Coffee Berry, and we offer it as a fit companion to this most remarkable novelty in the coffee substitute line. The berry is larger, is different shaped, and the growth of the plant is somewhat different from the German Coffee Berry. It is certainly a healthier drink than genuine coffee, and we are sure that those using same will not regret it.'

"The 'Jaavaa' comes fifty cents higher by the pound than the 'German.' Why not, with such a title? The odd part of the matter is that the self-same dealers in other places in their catalogues offer for considerably less the same article under its legitimate name, the soja or soy-bean."

Note: This is the earliest (and only) document seen (Feb. 2021) that uses the term "Japanese Coffee Berry" to refer to the soy-bean.

51. China, Imperial Maritime Customs. 1904. Decennial reports on the trade, navigation, industries, etc., of the ports open to foreign commerce in China, and on the condition and development of the treaty port provinces, 1892-1901, with maps, diagrams, and plans. 2 vols. Shanghai, China.
• ***Summary:*** Vol. I is "Northern and Yangtze Ports." This is Statistical Series No. 6.

Page 3: Newchwang–"Regarded from the standpoint of volume of commerce, Newchwang became one of the most important of the Treaty ports. The very aspect of the place underwent a rapid change during these last years. The mud village of the 'sixties' [1860s] grew into a rich and populous town, with many fine shops, houses, and temples, and with something of a modern look, due to the tall chimneys of the steam beancake factories. The river was crowded with great steamers, and the chant of the boatmen on the numberless Native craft intermingled with the scream of the steam-launch; the Foreign quarter, once consisting of a few semi-Chinese cottages, exhibited quite a pretentious array of European buildings–the mansion of the merchant, the church, the hospital, the hotel,–with lower evidences of civilisation in the shape of the grog shop; whilst a few miles off, on either side, were the two Railway Settlements, already little towns themselves. Add to these changes the outward and visible signs of the Russian military occupation in the year 1901, the European carriages and horses and the jinrikshas on the roads, as well as the number of Foreigners of all nationalities to be seen in the streets, and it will be realised that the sleepy bean mart of the old days has passed away for ever.

"Economical and political causes both contributed towards this sudden start forward.

"For many years it had been the policy of the Chinese Government to keep Northern Manchuria undeveloped. But in the 'eighties' there were signs of a change of view. The northern frontier was fortified and some encouragement was given to immigrants to take up unoccupied land in the three provinces. They had poured in in large numbers for many years before; for example, in 1876 it was estimated that about 1,000,000 Shantung and Chihli peasants came into Manchuria. But official encouragement no doubt acted as a stimulus; people continued to arrive, more land was brought into cultivation, and more grain produced. The immigrants who survived the hardships of travel and the first few struggling years inevitable to the pioneer, soon found that they were in a far richer land than that of their own provinces. The virgin soil gave forth abundantly; there was a great wealth of agricultural products to be disposed of;

© Copyright Soyinfo Center 2021

transport, though difficult and expensive, was not hampered by fiscal oppression; and, by a happy stroke of fortune, at the moment when there was superabundance of supply there arose in Japan a great demand for the staple productions. The discovery of the Japanese market for beans and beancake was the most potent economical factor in the development of trade in Southern Manchuria."

Page 15: Newchwang (plus Manchuria in general)–"Turning to Exports, Appendix No. 6 [p. 42] is a comparative table showing the exportations of Bean products during the past three decades. Comparing the annual average of each decade, we find evidence of a large increase in production, showing how the demand in Japan stimulated supply, though it must be remembered that the table is imperfect as a record of output, as it does not include the junk [a Chinese inland sailing vessel] statistics, which were available for the first time only in 1901. As regards steamer figures, however, it appears, taking average figures, that nearly three times as much Beancake went away in the last decade as in the first; about seven times as much Bean Oil; and more than twice the quantity of Beans. Bean products constitute about 80 per cent. of our total Exports; so the above figures explain much of Newchwang's recent prosperity."

Pages 22-23: Newchwang–"Industries–Bean mills–Since the closing, in 1868, of the first steam bean mill, which proved a complete failure, owing chiefly to Native opposition, the idea of making beancake by machinery was evidently never lost sight of. The southern Chinese merchants, who have nearly the whole beancake trade in their hands, at last realised the advantage to be gained by making beancake and extracting the oil by machinery. In 1896 a steam bean mill, under Foreign* auspices, probably to avoid Chinese official supervision, commenced work.

Note: *Shannon Brown (1981, p. 463) states: In 1896 in Newchwang, Butterfield and Swire (B&S; second only to Jardine, Matheson and Co. among British firms in China) finally opened the steam-powered bean mill that they had been considering since 1893.

"Since then three more have been started–one in the summer of 1899, one in the autumn of 1900, and one in the autumn of 1901. All these mills are fitted with electric light, and though mostly under Foreign protection, they are entirely under Chinese control, the machinery being worked by Chinese without any Foreign aid. The four factories between them are able to turn out 15,600 beancakes per day. It requires about 8 *tou* (240 catties) of beans to make five bean-cakes, which are passed by the Customs at an average of 48 catties each. The process of making the beancake by machinery is similar to the Native method. The beans are crushed between two iron rollers driven by steam; they are then placed on the steaming grate, where steam is supplied from the steam boiler, instead of from a pan with boiling water underneath the grate; the oil is pressed out with jackscrew presses. The beancakes made by machinery when compared with those made by Native method are stronger and drier, also paler in colour and better in appearance generally. The cost of outturn is about 20 per cent. cheaper and the yield of oil about 7 per cent. more. The cost of outturn by machinery being Taels 0.25 and the yield of oil 22 catties per five cakes; whilst the cost by Native method is Taels 0.30 and the yield of oil 20 catties per five cakes."

Page 28: "All goods imported and exported from or to sea pay Duty and Likin. All imports from Chinese ports only pay half, or Coast Trade, Duty, with the exception of [soya] beans, beancake, bean oil, grain, Native cloth, black tea, fine and coarse chinaware, earthenware, and Lo-hai paper, which pay full Duty but on a reduced tariff scale."

Page 42: Appendix No. 6, a table, gives "Export of beancake, bean oil, and beans, with decennial averages, 1872-1901. For each item and each year is given the weight in piculs and the value in Haikwan taels.

Note 1. Between 1872 and 1901 the weight of beancake that passed through Newchwang customs increased 6.5 fold, the weight of bean oil increased 5.4 fold, and the weight of [soy] beans increased 3.8 fold.

Note 2. In Peking Chinese, *hai-kuan* = maritime customs. A tael is a former Chinese monetary unit based on the value of a tael of standard silver.

Page 43: Appendix No. 7, a table, gives "Average prices of [soya] beans, beancake, and bean oil, 1892-1901 (in Haikwan taels per 300 catties for beans, per 10 pieces for beancake, and per 100 catties for bean oil).

Note: A digital search for the terms bean, beans, beancake, or bean oil will show that that are mentioned on at least 45 pages in this remarkable report. Address: Shanghai, China.

52. Hoshi, Hajime. 1904. Handbook of Japan and Japanese exhibits at World's Fair, St. Louis [Missouri]. n.p. 206 p.
• ***Summary:*** The Preface begins: "Since Commodore Perry, of the United States Navy, opened Japan to the world's commerce [in 1854], the foreign trade of the country has developed with wonderful rapidity. This startling rapid development of Japanese trade is due to the readiness and celerity [swiftness] with which the frank and courageous people of the Empire abandoned their old customs and turned their faces toward a new civilization. There was no hesitation, no halting, no looking backward. The entire nation awoke with a start to the realization that it was moving in the wrong direction, and turned about and dropped easily in the march of modern progress. Foreign ideas were adopted, foreign methods were imitated and frequently improved upon, and the closest commercial relations were sought with the United States and the countries of Europe. With this adoption of foreign ideas came a desire for foreign goods. New methods made necessary the use of Western machinery in factories and on farms. Even Western foodstuffs became popular.

"Japan's total foreign commerce was increased from 26.6 million yen in 1868 to 582.6 million yen in 1902 or 2,219 per cent. The total exports were increased from 15.5 million yen in 1865 to 281.7 million yen in 1903 or 1,811 per cent. During the same period the imports increased from 10.7 million yen in 1865 to 300.9 million yen, or 2,790 per cent."

Baron Masanoho Matsudaira is Vice-President of the Imperial Japanese Commission to the Louisiana Purchase Exposition.

Concerning "Shoyu, or soy.–The shoyu manufactories in 1901 numbered 15,993, producing 68,940,680 gallons annually" (p. 28).

In 1902 Japan's principal exports in million yen were (p. 40-41): Copper, crude and refined–10.3. Rice–6.7. Tea, green (pan fire)–6.2. Tea, green (basket fire)–3.6. Camphor–3.4. Cuttle fish–1.8. Fish oil–1.5. Sake–0.83. Sea weed–0.61. Shoyu (soy)–0.39.

Palace of Agriculture (p. 119). "In the Palace of Agriculture the Japanese Exhibit occupies an area of 8,667 square feet." "Tea, one of the leading products of Japan, forms the most important exhibit of the space." "There is a large exhibit of shoyu or soy, a famous Japanese sauce made from beans. This sauce is in as common use in Japan as salt and pepper are in the United States. It is used as a relish on the table, also for cooking and salad dressing. Soy is wholesome and exceedingly cheap, which qualities, combined with its splendid flavor, make it a most desirable article of diet.

"Sake, the national drink, is also well represented in the exhibit."

The names of the members of the Japanese Commission and of the commissioners now in the United States are given on pages 112-13. he names of the members of the Japan Exhibit Association are given on page 113. Note: Nowhere is this long and detailed book is the name of Jokichi Takamine mentioned.

The Japanese Garden: Area, 150,000 square feet is described in detail (p. 114-15), as are each of the buildings in it. These include the Japanese Pavilion (the building materials for it "were brought from Japan. It was built entirely by native carpenters after the style of Daimyo's garden–Goten, of about 400 years ago. The architectural style of the building is Heike. The artistically curved roofs, majestically projecting one upon the other..."). Note: This was the building that was renamed Sho-Foo-Den / Sho-Fu-Den by Jokichi Takamine. Other buildings are the Observation Cottage and (standing by the lake) and a reproduction of the Kinkaku Temple in Kyoto (*Kinkaku-ji*, the Temple of the Golden Pavilion).

"The total space occupied by Japan [p. 115] covers 282,455 square feet. he area is three times as great as that covered by Japan at the Paris Exposition in 1900, and three times as large as Chicago [Illinois] in 1893."

"Soy brewers and trade marks" (p. 161, full page, with the trade mark of each shown large and clear): Kikko Sakai: Brewer K. Toyoda, Sakai, Osaka, Japan. Yamakawa-roku: Brewer R. Wakaye, Osaka, Japan. Kikko Mata: Brewer M. Kawamori, Sakai, Osaka, Japan. Mitsu Uroka: Brewer G. Tagashima, Kaidzuka, Idzumi, Japan. Uyeki: Brewer K. Uyeki, Osaka, Japan. Yama-Ju: Brewer M. Yamamoto, Osaka, Japan. Maruichi Jo: Brewer S. Masuda, Osaka, Japan. Maru Matsu: Brewer Y. Motsutani, Osaka, Japan. Hon Ichi: Brewer K. Yehara, Osaka, Japan. Sun: Brewer K. Shindo, Osaka, Japan.

Across the bottom of this page: "The virtue of the sauce and direction for use. The Japanese Soy with the Trade Marks is brewed from the very best Japanese [soy] bean, wheat and salt. The Soy is of dark brown color and is specially adapted for every kind of boiled, baked and fried fish; for chops, steaks and cutlets and cold meats; also for cooking of vegetables. The article possesses a particular taste and flavor and advances [enhances] the digestion.

"The Japanese Soy with these Trade Marks may be stored for a long period and is guaranteed never to turn bad.

"The article is sold for 6 to 9.60 yen per case of 4 *go* bottles, F.O.B. Osaka. An order to any of the brewers will receive prompt attention."

Page 166: 1/3 page display ad for Ueki Shoyu, Osaka. Page 180: ½ page display ad for "Best shoyu. Ota Shoyu Brewing Company, (912 Minamiota Machi, Yokohama, Japan) was established in 1850..." Its shoyu is known as "Fuji Shoyu." "Second medal in 1859 and first Silver Medal in 1903. Exported to Germany, America, Hawaii, Corea, Shanghai, Hong Kong, England, Canada, Australia, India, Singapore, etc., through G. Brandel & Co., No. 41 Yamashita Cho, Yokohama."

Page 189: Full-page ad for "Shoyu, Japanese sauce. Izumiyama Shoyu Brewing Co., Hachinohe Mutsu, Japan. Its two trade marks are shown.

Page 193: ½ page display ad for "Maru Sen Shoyu. Awarded medals and shohai [trophies] at the World's Exhibition, Paris, 1903, and others. Marusen Shoyu is brewed by Sutejiro Hosono, Kinatomura, Kitakanbara, Niigata ken, Japan.

Note: There was no World Exhibition or World's Fair or any such international exhibition in Paris in 1903, There was an *Exposition Universelle* in 1900 in Paris, and another in 1925.

Page 197: Full-page ad for Kameya Shoyu & Company, Nakaidzumi cho, Shidzuoka ken [Shizuoka-ken], Japan. A large photo shows Sokichi Tsukichi, proprietor, standing in a Western-style room with one hand on a chair. This shoyu is exported to the United States, Hawaii, Europe, China, and Corea [Korea].

53. *USDA Bureau of Plant Industry, Inventory.* 1905. Seeds and plants imported during the period from September, 1900, to December, 1903. Nos. 5501 to 9896. Seed and plant

introduction and distribution. No. 10. 333 p. Feb. 8. Also titled USDA Bureau of Plant Industry, Bulletin No. 66.

• ***Summary:*** Soy bean introductions: Glycine hispida.

5764-5766. "From Washington, D.C. Three varieties of soy beans from Japan, grown during the season of 1900 on the Potomac Flats.

"5764. Common. (S.P.I. No. 4912.)

"5765. Best White. (S.P.I. No. 4913.)

"5766. Best Green. (S.P.I. No. 4914.)"

6312/6314/6326/6333 -6336. "From the Tokyo Seed and Plant Company, Tokyo, Japan. Received April 20, 1901.

"6312. *Black Flat.*

"6314. *Yoshioka.*

"6326. *Rokugatsu.*

"6333. *Gosha.*

"6334. *Black Round.*

"6335. *Green Medium.*

"6336. *Bakaziro"* [*Bakajiro*].

6379. "Grown on the Potomac Flats, District of Columbia, under the direction of W.R. Beattie, from No. 3870."

6386/6396/6397/6414/6416. "From Pyeng Yang, Korea. A collection of seeds of economic plants which are cultivated in Korea. Presented by Rev. W.M. Baird. Received May 3. 1901.

"6386. *Black.*

"6396. *White.*

"6397.

"6414. 'Plant in May.' (Baird.)

"6416. *Black.*" Note:

Note 1. This is the earliest document seen (March 2021) concerning soybeans in Korea, or the cultivation of soybeans in Korea.

6556/6558-6561. "From China. Received through Dr. G.D. Brill, May 17, 1901. A collection of seeds and plants made during an extended trip through China in 1900. The notes regarding the various numbers are copied from letters written during this period, no separate descriptive list of the various introductions having been furnished. Doctor Brill's numbers are given.

"6556. (No. 57.) 'Much used for bean curd and oil all over central China. Probably as many of these are grown as all the other varieties together.' (*Brill.*)

"6558. From Hankow. (No. 59.) 'Used for bean curd and oil. Considered better than No. 6556.' (*Brill.*)

"6559. From beyond Chiu Niu. (No. 60.) 'Planted between the rows of rice and ripening late in the fall, after the rice is harvested. Used the same as No. 6556, only quality poorer. Will grow on very wet land.' (*Brill.*)

"6560. From beyond Chiu Niu. (No. 61.) 'Planted and used the same as No. 6559. Planted in July or August.' (*Brill.*)

"6561. From Hankow. (No. 62.) 'A black bean, used for same purposes as Nos. 6559 and 6560, but of better quality. Not planted with other crops.' (*Brill.*)"

8422-8424. "From Yokohama, Japan. Received through Dr. S.A. Knapp, February 24, 1902.

"8422. *Ita Name.* Early.

"8423. *Ita Name.* Medium.

"8424. *Ita Name.* Late." Note 2. This is the earliest document seen (March 2021) that contains the words/name "Ita Name," which make no sense in Japanese. Perhaps "Eda Mamé" was intended.

8489-8497. "From Washington, D.C. Received March 10, 1902. A collection of seeds grown on the Potomac Flats by Mr. W.R. Beattie from seeds furnished by the Office of Seed and Plant Introduction.

"8489. Grown from No. 6314.

"8490. Grown from No. 6333.

"8491. Grown from No. 6334.

"8492. Grown from No. 6386.

"8493. Grown from No. 6396.

"8494. Grown from No. 6336.

"8495. Grown from No. 6397.

"8496. Grown from No. 6416.

"8497. Grown from No. 6312."

8584/8586. "From Chin-kiang, China. Received through Dr. S.A. Knapp from Rev. Dr. S.P. Barchet, Shanghai, China, April 15, 1902.

"8584. 'A very prolific, nearly white variety used for making oil and also for food. It is sometimes ground into flour and used for making cakes.' (*Knapp.*)

"8586. 'A very oily variety, used chiefly for fattening purposes. Planted in July or August.' (*Knapp.*)"

8900. "From Anjo, Japan. Received through Messrs. Lathrop and Fairchild (No. 963, June 29, 1902), July 24, 1902. 'Twenty-six numbered seeds of a giant soy bean presented to the Department by Mr. K. Obata, director of the Tokai branch agricultural experiment station at Anjo, Japan, on condition that should any of the seeds prove to have inherited the characteristics of its female parent he is to have returned to him a fair quantity of the beans which it produces. All the beans have been numbered, and it is desired especially that a record of each be kept for information. This "most exceptional sport" ["an individual exhibiting a sudden deviation from type beyond the normal limits of individual variation usually as a result of mutation, esp. of somatic tissue"] from which these beans are taken measured 12½ feet in length and had a stem 1 inch in diameter at the base. It yielded about one-fifth of a gallon of beans, while ordinary plants, I am assured by Mr. Obata, give from 50 to 60 seeds only. Its root system is well developed, but whether unusual it is impossible to say, as it was dug before Mr. Obata saw it. The history of this "most remarkable sport" is as follows: Mr. J. Miyazaki, a descendant of a Samurai and now a second-hand clothier in the village of Okasaki [Okazaki?], found in his small back yard a soy bean which neither he nor his wife had planted

© Copyright Soyinfo Center 2021

purposely, but over which they quarreled, the wife wishing to pull it up because it grew to such unusual proportions and spread over the whole yard. Mr. Miyazaki, however, found in this abnormal plant something to interest him, and when the local district fair was held in Mukada in October he dug up the plant and exhibited it there, but he unfortunately and thoughtlessly ate up most of the beans. Mr. Obata, of the experiment station at Anjo, saw the plant at the fair, visited Mr. Miyazaki's place, and rescued the remaining handful of seed. He got samples of the soil where the plant grew and has sown about 20 seeds in this soil at the experiment station. I have seen and photographed this remarkable sport and think it worth of the most careful attention.' (*Fairchild.*)"

9344. "From Chiu-hua, China. Secured by Dr. S.P. Barchet, of the United States consulate, Shanghai, China, at the request of Dr. S.A. Knapp. Received January 22, 1903. *Chiu-hua.* 'In case of future reference to the bean, if you call this the *Chiu-hua* bean I shall know what is meant, in the absence of a botanical name, as I have not seen this bean anywhere else. It is sown broadcast in paddy fields before the rice is harvested. The moist ground favors the sprouting, and the standing grain shields the sprouting plant from the sun. By the time the rice is harvested the beans have taken firm roots and require no further care. Horses and cattle are very fond of them green or in the ripe state. The bean also makes a good food for man. This bean I think well worth a trial in the Southern States.' (*Barchet.*)"

9407-9418. "A collection of soy beans grown by Mr. W.R. Beattie on the experimental grounds on the Potomac Flats, from introduced seed.

"9407. Grown in 1902 from S.P.I. No. 4912.
"9408. Grown in 1902 from S.P.I. No. 4913.
"9409. Grown in 1902 from S.P.I. No. 4914.
"9410. Grown in 1901 and 1902 from S.P.I. No. 6312.
"9411. Grown in 1901 and 1902 from S.P.I. No. 6333.
"9412. Grown in 1901 and 1902 from S.P.I. No. 6334.
"9413. Grown in 1901 and 1902 from S.P.I. No. 6336.
"9414. Grown in 1901 and 1902 from S.P.I. No. 6386.
"9415. Grown in 1901 and 1902 from S.P.I. No. 6396.
"9416. Grown in 1901 and 1902 from S.P.I. No. 6397.
"9417. Grown in 1901 and 1902 from S.P.I. No. 6414.
"9418. Grown in 1901 and 1902 from S.P.I. No. 6416."

Note 3. This is the earliest document seen (March 2021) that clearly refers to the cultivation of soybeans in Washington, DC (on the Potomac Flats). This document contains the earliest clear date seen for the cultivation of soybeans in Washington, DC (1900).

Note 4. This is the earliest document seen (March 2021) that mentions the Potomac Flats, an experimental garden owned and used by the USDA in Washington, DC, before it purchased the Arlington Farm in 1900. Even before that, starting in 1865, there was an experimental garden around the original USDA building on The Mall. The Potomac Flats were acquired by the USDA in 1899. They were located in Washington, DC, on the banks of the Potomac River, probably in what is now Potomac Park.

Note 5. This is the earliest document seen (March 2021) concerning David Fairchild and soybeans. Address: Washington, DC.

54. Uyeno, K. 1905. Kankoku kôji no kenkyû hôkoku, dai ikkai [Report of examination of Corean (Korean) koji, No. I.]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 277. p. 203-12. March. [Jap; eng]
• ***Summary:*** Investigation of its composition, and its saccharifying action, power, and products. It is considered identical to the "Fonkio" and "Weekio" of northern China. Like Fonkio, it contains 2 varieties of Mucor, plus one other variety closely resembling these two. Address: Yakugakushi, Japan.

55. Southern Prolific: New U.S. domestic soybean variety. 1905. Seed color: Yellow (straw), hilum light brown.
• ***Summary:*** Sources: Tabor, Paul. 1923. "Soy beans for Georgia." *Georgia State College of Agriculture, Extension Circular* No. 90. 4 p. Feb. See p. 1-3.

Morse, W.J. 1927. "Soy beans: Culture and varieties." *USDA Farmers' Bulletin* No. 1520. 34 p. April. See p. 10. "Introduced under S.P.I. No. 37250 from Seoul, Chosen [Korea], in 1914... Seeds straw yellow with light brown hilum, about 2,710 to the pound; germ yellow; oil 18.1%." Address: USA.

56. Korentschewski, W.; Zimmermann, A. 1905. Sanitaer-hygienische Untersuchung des chinesischen Bohnenoeles [A sanitary-hygienic investigation of Chinese soybean oil]. *Chemiker-Zeitung* 29(58):777-78. July 22. [Ger]
• ***Summary:*** Some 20 different species of these beans are sold under the name 'doutsa,' some being used as human food, others as fodder for cattle, and others again for the extraction of the oil. A kind of vermicelli is also prepared from certain species. The oil is expressed by means of primitive plants in the Chinese factories and exported in large quantities to Japan and Korea. The method of extraction consists in first crushing the beans into caked masses by means of mill stones, then heating them on stone slabs until the appearance of vapors, and finally expressing them in an iron receptacle. As first obtained the oil is turbid, but after some time becomes clear, the deposit consisting of sand particles and vegetable fibres. Only the clear oil is exported, but the turbid oil is sold locally. It has a faint odor recalling that of Chinese wood (tung) oil, is bland to the taste, and of a dark brown colour. Four commercial samples examined by the authors (one being obtained direct from the factory in Kharbin [Harbin]) gave the following results:–Water, 0.3 to 1.80 per cent.; specific gravity at 15ºC, 0.9264 to 0.9287; solidification point, -14.6º to -15.3ºC; saponification value, 207.9 to 212.6; ester value, 203.9 to

© Copyright Soyinfo Center 2021

207.7; insoluble fatty acids, 93.6 to 94.28 per cent.; iodine value (Hübl), 114.8 to 137.2; solidification point of fatty acids, 16ºC to 17.3ºC; melting point of fatty acids, 20ºC to 21ºC; Maumené test, 102º to 116ºC; and acid value 1.86 to 15.46. It was concluded that the oil contained a large proportion of oleïn. Practical tests showed that the oil was readily absorbed by the system and possessed a high food value.

Note: This is the earliest document seen (March 2000) that mentions tung oil. Address: 1. Dr.; 2. Mag. pharm.; Both: Aus dem chemisch-bakteriologischen Laboratorium des I. Militaerhospitals in Charbin (Chemical-Bacteriological Lab., I. Military Hospital, Harbin, Manchuria).

• ***Summary:*** A German-language summary of a German-language article with the same authors and title published in 1905 in *Chemiker-Zeitung* 29(58):777-78. July 22. Address: 1. Dr.; 2. Mag. pharm.; Both: Aus dem chemisch-bakteriologischen Laboratorium des I. Militaerhospitals in Charbin (Chemical-Bacteriological Lab., I. Military Hospital, Harbin, Manchuria).

58. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1905. Trade of Korea. The Russian-Japanese War was helpful. No. 2359. p. 5-6. Sept. 13.

• ***Summary:*** Now that the war in the East is over, Korea will come in for a great deal of consideration and discussion, commercial, financial, and industrial. The year 1904 was one of the best in Korea's history. The war helped rather than hindered trade, the commercial highways being held open. Cereals yielded large crops and sold high, both Japan and Russia buying. Labor was abundantly supplied with work at good wages. Much of this had to do with the movement of troops. This brought in millions of dollars of unexpected and unusual money. It is interesting to note that the Koreans never had so much money to spend and that they spent it freely; hence any improvement in Korea or in the East is bound to be followed by advantages to foreign trade.

"One disadvantage, due doubtless to the war, and partly to the increased wages, was the increased cost of living. This advanced 50 per cent, in some cases fully 100 per cent.

"Railways were built in many parts at about $50,000 a mile, fully $8,000,000 being expended thereon. The gross value of the foreign trade was a little more than $26,617,487, of which $13,701,295 was for imports from abroad. The exports reached $3,466,752."

"Influence of Japan: A large part of the banking business is in the hands of Japanese and is tending more and more toward complete absorption by them. Everywhere progress and prosperity are marching hand in hand. Natural hindrances to trade are being overcome by scientific methods worthy of the West or by expedients worthy of the East. For example, the shallowness of the river at Chemulpo long hindered the arrival of large vessels." The Japanese are deepening it at considerable cost.

"The latest population figures give Korea 6,000,000 souls, including Ham Keung, a province in the north, under Russia before the war. Seoul, the capital, has 200,000 and is constantly increasing. There are 50,000 Japanese in the Kingdom."

The railway company controlling traffic between Seoul and Chemulpo increased freight charges significantly on July 1, with no advanced warning. "The Chinese and Japanese merchants of Seoul and Chemulpo were the principal sufferers. The latter, through their chambers of commerce, at once lodged a protest with the railway company."

"Opposition service organized: In opposition to the railroad these merchants have now organized a service from Chemulpo up the Han River to Seoul... For some years past there have been heavy annual shipments of [soya] beans and pease from Yongsan to Chemulpo, and the steamers running under the new arrangement will therefore be certain of a reasonable amount of return cargo."

60. The Russo-Japanese War (Feb. 1904-1905), the Treaty of Portsmouth (5 Sept. 1905), and the Japanese move into Korea (Important event). 1905.

• ***Summary:*** "The event that really won for Japan full status as a world power and equality with the nations of the West was its victory over Russia, the biggest, even if not one of the more advanced, of the Western powers. Russia in 1896 had obtained from Peking the right to build the Chinese Eastern Railway across Manchuria to its port of Vladivostok on the Sea of Japan, thus shortening the Trans-Siberian Railway, the rail link it had started in 1891 to construct across Siberia to the Pacific. When Russia obtained the lease of the Kwantung Peninsula in 1898, it also got the right to connect this line by a southward extension, the South Manchurian Railway, to the ports of the peninsula, Port Arthur and Dairen (Dalian in Chinese). These railway concessions gave Russia considerable control over Manchuria, and the Boxer crisis allowed it to overrun the whole area militarily. Its efforts to take Manchuria over completely, however, ended in diplomatic frustration, and it agreed to a phased withdrawal of its forces.

"Mutual suspicion and enmity steadily mounted between Japan and Russia... Japan broke off relations on February 6, 1904, started hostilities on February 8 with a night torpedo-boat attack on the Russian fleet in Port Arthur, and only two days later declared war."

In the 5-month war that followed, the Japanese navy destroyed its Russian counterpart to win the final victory. The mighty Russians were shocked by their overwhelming defeat at the hands of a little-known Madame Butterfly nation. "Both countries were exhausted by war, and the Russians were plagued at home by revolution. They both readily accepted President Theodore Roosevelt's diplomatic initiative and met to discuss peace terms in Portsmouth, New Hampshire.

"The Treaty of Portsmouth, signed on September 5, 1905, recognized Japan's 'paramount interest' in Korea, restored at least in theory China's sovereignty and administration in Manchuria, and gave Japan the Russian lease on the Kwantung Peninsula and the Russian-built South Manchurian Railway as far north as Changchun. The Japanese were eager to extract an indemnity from the Russians, but the latter were adamant on this point, and eventually Japan settled for the southern half of Sakhalin [Island] instead [below the 50th parallel north, which Japan called Karafuto]. It was the failure to win an indemnity that the Japanese public found so disappointing.

"Japan was now free of all foreign competitors in Korea." In Nov. 1905 Japan "secured a convention making Korea a Japanese protectorate and ending its diplomatic contact with other powers." In 1907 Japan extended control over the Korean government and disbanded the Korean army. "In August 1910 Japan quietly annexed Korea." Called Chôsen, "Korea was governed for Japan's strategic and economic purposes by Japanese officials under a military governor-general."

In its victory over Russia, Japan became the first non-white or non-Western nation to defeat a white or Western nation. In a mere 50 years Japan had transformed itself from an isolated underdeveloped country with no industrial base into a modern nation, a major military and industrial power.

Japan was now free of all competitors in Korea, and in November 1905 secured a convention making Korea a Japanese protectorate and ending its diplomatic contact with other powers. In 1907 the Japanese extended control over the Korean government, arranged that Japanese could serve as Korean officials, and disbanded the Korean army. The widespread rioting that greeted these moved was severely suppressed. In Aug. 1910 Japan quietly annexed Korea. "There was no protest from the powers, which generally approved what was judged at the time as an inevitable step in world progress. The Japanese called Korea Chôsen and governed it for their own strategic and military purposes by Japanese officials under a military governor-general.

With the annexation of Korea, Japan also became a major imperialist/colonial power, with important colonies in Korea and Taiwan, and predominant rights in South Manchuria. It entered World War I as Britain's ally and, although playing only a minimal military role, it picked up the German colonial possessions in East Asia and the Pacific, including Kiaochow Bay and the port of Tsingtao on the south coast of Shantung. "Japan sat at the Versailles Peace Conference as one of the victorious Five Great Powers–the only non-Western nation to be accepted as a full equal by the West. Thus the Meiji leaders had succeeded far beyond their fondest dreams."

61. Oshima, Kintaro. 1905. A digest of Japanese investigations on the nutrition of man: Miso (Document part). *USDA Office of Experiment Stations, Bulletin* No. 159. 224 p. See p. 28-30. [1 ref. Eng]

• ***Summary:*** "Miso: This material is prepared from a mixture of soy beans, barley [note that he does not say rice], common salt, and water by a slow process of fermentation. Although it is highly probably that the process of preparing miso was first introduced either from China or from Korea, the exact date of the introduction is not known. Mention is made of miso in a Japanese record of the latter part of the ninth century.

"In the extent to which it is used, miso surpasses all other preparations from soy bean. Among the rural population and wage-earners in general it forms an indispensable part of the daily menu; among the people living in cities, however, it is used somewhat less extensively. Its chief use is in making soup and in cooking vegetables. For this latter purpose, however, miso and shoyu are to a certain extent replaceable, and generally when more shoyu is used the amount of miso consumed is smaller.

"Since it is the general custom for the people in rural districts to prepare miso for their own use, no accurate statistics regarding the total quantity manufactured and consumed are available. It has been estimated that the daily consumption of miso per person in the rural districts is about 40 grams. In the statistics of 25 dietary studies described beyond (p. 131), with people living elsewhere than in the country, the average daily amount was 43 grams, but the range was from 13 to 100 grams.

"The production of miso depends primarily on the action of a fermenting agent known as koji. The process of preparing the koji used for miso is similar to that for sake-koji (see p. 36), except that for the latter only rice is used, whereas miso-koji may be made from either rice or barley. The object of preparing miso-koji is to propagate certain forms of fungi, of which *Aspergillus oryzae* is the principal one. The koji also contains diastatic and inverting ferments which change the carbohydrates of the raw materials into maltose, glucose, etc., and a proteolytic ferment which acts upon the nitrogenous bodies, converting them into simpler and more soluble materials. The yeast which causes alcoholic fermentation is also regularly present. Koji is dried and finely powdered before it is used.

"To prepare miso the soy beans must first be steamed, and upon this process depends largely the quality and especially the color of the final product. The steaming is continued usually twenty-five hours, at first with strong heat but later very gently. When the beans are properly steamed and cooked, they are rubbed into a thick, uniform paste, to which are added proper amounts of powdered koji, salt, and water. The whole mass is then well mixed and stored in a special vat. The temperature of the mixture is kept at about 15º to 20º C., though as the fermentation advances it often rises to 25º C.

"Different kinds of miso are distinguished by color, taste, and keeping properties, and are prepared by somewhat different processes, the differences consisting chiefly in the use of rice or barley koji, the amount of common salt added, a longer or shorter fermentation, and the temperature at which it takes place. Two of the most important kinds of miso are the following:

"*White miso.*–This material is white in color, contains a small amount of common salt, is fermented with rice-koji for three to four days, and may be preserved about ten days.

"*Red or sendai miso.*–This material is red in color, contains a relatively large amount of common salt, is fermented usually with barley-koji for one and one-half to two years, and may be preserved for several years."

A table shows the composition of white miso and red miso. Note: The source of this table is cited incorrectly. Address: Director, Hokkaido Agric. Exp. Station, Sapporo, Japan.

62. Takenob, Y. 1905. Japan Year Book. Tokyo: Japan Year Book Office. 430 p. See p. 68, 104, 123, 126, 130, 348, 375, 382. [Eng]

• ***Summary:*** This book gives statistics for the Japanese empire: Japan Proper, Korea, and Formosa. At the beginning of the book, before the title page, are many pages of large advertisements on unnumbered pages. Likewise at the back of the book. For example, a full-page ad for Mitsui Bussan Kaisha (Mitsui & Co. in Europe & America) states that the company was established in 1876, and that they are "General Commission Merchants" for the import of [soy] beans, bean cakes, cotton,..."

The population of Japan Proper (p. 14) was:

1873–33.3 million.
1883–37.0 million.
1898–43.7 million.
1903–46.7 million.

A table of "Weights, measures and moneys" is on the page after the Table of Contents.

Page 68. In chapter VII on "Finances" is a table titled "Budget for April 1905 to March 1906. Revenue." "Tax on Soy" [sauce] brought in revenue of an estimated 4.541 million yen in 1904 and 5.149 million yen in 1905.

Page 104. In the chapter on "Agriculture," a table shows production of beans, including Soja beans and red [azuki] beans, 1895-1903 (in 1,000 koku). Production of soja beans increased from:

2.94 million *koku* in 1895
3.16 million *koku* in 1896
2.99 million *koku* in 1897
3.10 million *koku* in 1898
3.10 million *koku* in 1899
3.41 million *koku* in 1900
3.10 million *koku* in 1899

© Copyright Soyinfo Center 2021

3.56 million *koku* in 1899
3.10 million *koku* in 1901
3.13 million *koku* in 1902
3.64 million *koku* in 1903.

Page 123. In the chapter on "Forestry and fishery" is a section titled "fish fertilizers" which states: "The demand of fish-fertilizers has lately become quite marked, so active indeed that the supply can hardly keep pace with it. A large quantity of bean-cakes from North-China [Manchuria] is therefore arriving in Japan to make good this deficit. The following table shows the average amount of our fish-fertilizers made at home and of Chinese bean-cakes imported, during the recent ten years. The average for the last 10 years of "Homemade fish fertilizers" is 38.891 million kwan [kan] valued at 7.592 million yen, compared with "Chinese bean-cakes" weighing 20.282 million kwan valued at 2.524 million yen. Note: The soybean cakes are much less expensive per unit weight than the fish fertilizers.

Page 126, 130. The chapter on "Manufacturing industry" states (p. 126) that the manufacture of sake and soy [sauce] were among the principal forms of manufacturing in Japan before the country was opened to foreign commerce. A table titled "Quantity and value of chief manufactured goods" (p. 130) gives the amount of soy [sauce] made each year from 1894 to 1902. The quantity increased from:

1.329 million *koku* in 1894
1.409 million *koku* in 1895
1.505 million *koku* in 1896
1.528 million *koku* in 1897
1.532 million *koku* in 1898
1.838 million *koku* in 1899
1.557 million *koku* in 1900
1.717 million *koku* in 1901
1.762 million *koku* in 1902

Page 348. The chapter on "War finance" explains how Japan is financing its present Russo-Japanese war. One way is through extraordinary special taxes, including an addition 1.13 million yen tax on soy [sauce]. is a "Budget for April 1905 to March 1906." The two main sources of tax revenue are Land tax 63.6 million yen, and Tax on liquors 60.5 million yen. Tax on Soy is only 5.1 million yen.

In the Appendix, page 13 (under Group VII) gives the import tariff list for "Beans, soja" and page 20 (under Group X) gives the import tariff for "Oil, bean." There is both a "General tariff" and a "Extraordinary special tax."

Page 368: A table gives statistics for "Beans and peas" exported from Korea, but none for soybeans alone. Address: Tsukiji, Tokyo, Japan.

63. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1906. Railroads in Korea. New lines bisecting the empire–American materials and methods. No. 2513. p. 1-5. March 16.

• ***Summary:*** "One of the great factors in opening up Korea to trade is the building of a system of railroads through the hermit nation by the Japanese. Vice-Consul-General Straight, of Seoul, supplies a complete description of these, of which the following is a condensation:

"The Seoul-Wiju Railroad was opened to the public for general traffic on December 1, 1905. With a few breaks at the larger streams, trains were running through from New Wiju, the northern, to Yongsan, the southern, terminus as early as April. The Japanese, in thirteen months, had constructed 310 miles of railway. Immediately after the declaration of war they had commenced their work, using for some distance the embankments and culverts which the Franco-Korean Company, after several years of sporadic effort, had constructed near Seoul."

"Resources in North Korea: The country tapped by the Seoul-Wiju Railroad is rich in rice, [soya] beans, millet, and barley, and is capable of much greater production than at present."

Page 5: "Japanese are now established in large numbers at all the important cities along the railroad and at the small places as well, and the number of immigrants is constantly increasing. The Koreans themselves are more prosperous than ever before, owing to the large expenditures by the Japanese forces, and it is probable that the natives will be better governed in the future and for the first time in many years able to profit by the results of their own industry. There are indications that the next few years will witness an unparalleled development and a transformation in the commercial conditions that have prevailed in the past."

64. Kaempfer, Engelbert. 1906. The history of Japan, together with a description of the Kingdom of Siam 1690-1692 (translated by J.G. Scheuchzer from the original edition of April 1727. 3 vols.). Glasgow, Scotland: James MacLehose and Sons. Vol. 1, xc + 334 p. Reprinted 1971 New York, NY: AMS Press Inc.

• ***Summary:*** Please see the original 1727 edition of this work for a long quote on soybeans, miso, shoyu, and azuki beans; it appears in this 1906 edition in Vol. 1, p. 187-88. Many of Dr. Kaempfer's botanical specimens may still be seen in the Natural History Museum, South Kensington. The front matter in this book is very interesting: The frontispiece shows a full-page portrait (illustration, painting) of Sir Hans Sloane. List of illustrations. Publisher's note. Biographical note of the Scheucher family, by Sir Archibald Geikie. To the King, by J.G. Scheucher. The names of the subscribers [alphabetical]. The author's preface. The life of the author, by the translator. An introduction, by the translator.

In the author's preface Kaempfer explains (p. xxix-xxxiii) that the Swedish Embassy, where he was secretary, was dismissed by the Persian Court. Since his native country Germany was at war, he decided to travel rather than to return home. He joined the Dutch-East India Company and

© Copyright Soyinfo Center 2021

went to Japan, where most visitors find it very difficult to obtain any information about the country, since all Japanese are obliged by solemn oath not to discourse with foreigners. But Kaempfer developed a rare friendship with his interpreters and the Japanese officers on his island (Deshima in Nagasaki Bay). He assisted them in the fields of medicine, astronomy, and mathematics, and in turn was able to learn about their country. Kaempfer was especially fortunate in gaining "the assistance of a discreet young man, by whose means I was richly supplied with whatever notice I wanted concerning, the affairs of Japan. He was about twenty-four years of age, well vers'd in the Chinese and Japanese languages, and very desirous of improving himself. Upon my arrival, he was appointed to wait on me, as my servant, and at the same time to be by me instructed in Physick and Surgery" (p. xxxii). The chief of the island allowed him "to continue in my service during the whole time of my abode in the Country, which was two years, and to attend me in our two journeys to Court, consequently four times almost from one end of the Empire to the other... As I could not well have obtain'd my end without giving him a competent knowledge of the Dutch language, I instructed him therein with so much success, that in a year's time he could write and read it better than any of our interpreters: I also gave him all the information I could in Anatomy and Physick, and farther allow'd him a handsome yearly salary, to the best of my abilities... There was not a Book I desired to see, on these and other subjects, which he did not bring to me, and explain to me, out of it, whatever I wanted to know."

A very interesting map of Japan shows each of the provinces and off-shore islands, with the name of each written in both English and Japanese characters (*kanji*).

Note: The long index in volume 3, which makes interesting reading, includes acupuncture, algae (marine, used for food), amasake (amazake, see sake), *Amoenitates Exoticæ*, atheists, Buddhism & pagan worship, cami [kami], Canagawa [Kanagawa], cannnib, hempstuffs, Corea [Korea], Cublai–Tartar monarch, culis (see coolies), Deshima (island of Kaempfer at Nagasaki), Dutch East India Company, Fide Jori [Hideyori], Fide Joshi [Hideyoshi], Gendsii [Genji], gokokf [go-kokufu, chief kinds of peas], herbals, Hirando, Isje [Ise], Jejas [Ieyasu], Kami, Kioto (see Miaco), Koja [Koya], Marco Polo, Mikado, moxa, Nagasaki, oil seeds, opium, paganism, paper made by Japanese, pulse, Pythagoras, Quannon [Kwannon], religion, sago, saki [sake], salt, sasen [zazen], secular monarchs [Shogun], sesamum (plant and oil), Siaka (Buddha), Shimonoseki, submarine plants, Tokaido, Tokio, transmigration of souls, umbrellas, Wilstach (Maria Sophia, wife of Dr. Kaempfer). Address: Physician to the Dutch Embassy to the Emperor's Court, Edo (Tokyo), Japan.

65. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1907. Southeastern Manchuria. Commercial prospects through opening of new railroad. No. 2779. p. 1-4. Jan. 28.
• ***Summary:*** "A lengthy report from Vice-Consul-General Charles J. Arnell, of Mukden, deals with the completion of the new Japanese railroad from Antung on the Korean border to Mukden, and the prospective industrial and commercial development of the southeastern Shenking Province, through which the new line passes. A summary of the report follows:

"The new Japanese railway from Antung to Mukden, a distance of 187 miles (100 as the crow flies), first constructed lightly for military purposes, has been rebuilt, though no tunneling will probably be done until the survey of the permanent railway has been made. The gage is 1½ feet. The rails and rolling stock were supplied by the Baldwin Locomotive Works. The system consists of 150 locomotives, and the two sizes of open freight cars carry two and five tons, respectively, the total carrying capacity at present being only 1,200 tons.

"Operations of railroad: The line was opened to general traffic, both freight and passenger, in August last. Two schedule-time runs are daily made from each end in addition to more or less regular ones between some of the intermediate points. The journey from Antung to Mukden requires two days."

"Agricultural development (p. 3): Agriculturally southeastern Shenking stands far from the head of the list, as compared with other parts of Manchuria, both in relative arable area and in fertility of soil. The principal products are maize, millet, and [soya] beans, and these seem to do scarcely more than supply the local demand, as none of them, except a small quantity of beans in the form of oil and cakes, ever reaches the seaboard for export.

"The export trade in bean cake here is in the hands of a Japanese firm, the Mitsui Bussan Kaisha, which buys up the total output of the four principal Chinese companies in Antung, the monthly figure averaging some 8,000 cakes. The manufactured bean products exported from Newchwang derived from this region are small... Whatever part of these products reaches a foreign market passes principally through Antung and Newchwang. It is doubtful that any great stimulus can be given in this region to these industries. Practically all of the arable land is already under cultivation. The valleys do not contain an unfilled spot, and many of the mountain slopes, where the surface soil is scarcely more than a foot in depth, are covered with small plats, ending only with the summits and reminding one of the 'box gardening' characteristic of Japan."

Note: This is the earliest document seen (March 2014) that mentions Mitsui (a major Japanese trading company and conglomerate) in connection with soybeans and Manchuria.

66. *Kansas City Star* (*The*) (*Kansas City, Missouri*). 1907. Bean cheese of the Orient: recipe for making a dish which is liked in Japan, China and Korea. May 20. p. 2.

© Copyright Soyinfo Center 2021

• ***Summary:*** "From the New York Tribune:

"Bean cheese, or bean curd, as it is sometimes called, is especially popular in Japan, China, and Korea, where it is often peddled in the streets. It is a thick white substance, of a jellylike consistency, and is called tofu in the Orient.

"The recipe for making it which is given herewith was taken from an agricultural report issued by the United States government. 'Soy beans (the most important of the Japanese legumes–the white or yellow variety) are soaked in water for twelve hours, then brushed [sic, crushed] between millstones of a uniform consistency. The mass is then mixed with three times its bulk of water and boiled for about an hour, after which it is filtered through a cloth. By this process nearly 30 per cent of the total proteine of the bean is dissolved and contained in the filtrate ready to be precipitated as tofu. The filtrate is white and opaque, somewhat resembling milk. To this is added with constant stirring about 2 per cent of the concentrated mother liquid obtained from the manufacture of salt from sea water, whereupon the albumenoid material is precipitated in combination with calcium and magnesium salts. After the liquid is filtered off the precipitate, which is tofu, is pressed in a wooden frame and then cut into cakes usually about ten centimeters broad, two thick and twenty-five long.

"'The residue from the boiled and filtered bean is known as kara [okara], or tofu cake, and contains a large quantity of proteine and carbohydrates. It is very good for material being used by poor people as an ingredient of miso soup.

"'If the milky filtrate mentioned above is boiled a sort of film [yuba] forms on the surface This film consists largely of coagulated albumenoids and fat and is sometimes prepared in large quantity. When dried it us used as an article of food known as yuba.

"'Tofu is generally prepared every day, and it is eaten in the fresh condition, with a little shogu [sic, shoyu], or soy sauce (a dark brown, moderately thick liquid very popular for use in cooking and as a relish or condiment; in odor and taste it is not unlike beef extract; prepared from soy beans, wheat or barley, salt and water, fermented), though it is also frequently cooked in shogu [sic, shoyu] or miso soup. Fried tofu, aburaage, is also a popular article for food. Tofu may be prepared for preservation and transportation. It is then cut in smaller pieces, frozen and then dried in the oven.

"Tofu is used extensively by all classes in Japan. Where fish cannot be obtained, it is an important source of proteine, and for Buddhist priests a popular and indispensable article of food.'"

67. Ebony: New U.S. domestic soybean variety. Synonym: Black Beauty (Piper & Morse 1910). 1907. Seed color: Black.

• ***Summary:*** Sources: Ball, Carleton R. 1907. "Soy bean varieties." *USDA Bureau of Plant Industry, Bulletin* No 98. 28 p. May 27. See p. 11, 13, 15-16. "Classification–Key to the varieties (p. 11): I. Black seeded: 2B. Seeds small, 4 to 6 or 7 mm long, round or broadly elliptical, pods about 1 inch long. Medium late, 115 to 120, 20 to 26 inches tall, long-branched, seeds elliptical, distinctly flattened = Ebony." "The very small-seeded variety known as Ebony is not to be had on the market, and it has apparently been obtained abroad but once. The original importation was from Ping-yang [Pyongyang / P'yongyang], Korea. In size of seed and pod it is, with the exception of Kingston, the smallest of all the black soy beans and one of the few very small-seeded varieties of any color... The name has reference to the color of the seeds. Numbers and sources of lots grown: Agrost. No. 1193, S.P.I. No. 6386; Agrost. No. 1541, S.P.I. No. 8492; Agrost. No. 1980, Agrost. Nos. 1193 and 1541, united; S.P.I. No. 6386, 'Black," Korea; S.P.I. No. 8492, grown from S.P.I. No. 6386; S.P.I. No. 9414, grown from S.P.I. No. 8492; S.P.I. No. 17254, grown from Agrost. No. 1980."

Piper, Charles V.; Morse, W.J. 1910. "The soy bean: History, varieties, and field studies." *USDA Bureau of Plant Industry, Bulletin* No. 187. 84 p. Dec. 31. See p. 43, 64, 75. Seed color: Black. S.P.I. No. 17254. "From Pingyang, Korea, 1901... Grown nine seasons. This variety was also received from Swatow, China, 1908 (S.P.I. No. 22886). Ebony has proved a valuable variety in southern Illinois and especially through the work of Mr. Ralph Allen, of Delavan, Illinois, has become well known as No. 9414 and also as 'Black Beauty.'"

Etheridge, W.C. 1912. "Report of Division of Agronomy." *North Carolina Agric. Exp. Station, Annual Report* 34:16-18. For the year ended June 30, 1911. Ebony was one of the earliest maturing varieties grown.

Reynolds, Will. 1914. "A crop with many profits: Soy beans are good for fertilizer, for pasture, for hay, for seed." *Country Gentleman.* March 21. p. 9. "Certain varieties of soy beans are better adapted than other to certain uses and conditions. The earlier-maturing varieties may be grown in Northern latitudes with more certainty of the crop's maturing than later ones." One variety that has done well in the North is Black Beauty.

Piper, Charles V.; Morse, William J. 1923. *The soybean.* New York, NY: McGraw-Hill Book Co. xv + 329 p. March. See p. 163, 164. "Introduced from Pingyang [Pyongyang], China, Chosen (Korea), 1901." "Black Beauty.–The same as Ebony." Note: This is the earliest document seen (Aug. 2004) which states that "Black Beauty" is a synonym for "Ebony."

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 10-11. Ebony is in the USDA Germplasm Collection. Maturity group: IV. Year named or released: 1907. Developer or sponsor: USDA. Literature: 01, 03. Source and other information: From Pyongyang, North Korea, in 1901. Prior designation: PI 6386. Address: USA.

68. Haberlandt: New U.S. domestic soybean variety. Dry

© Copyright Soyinfo Center 2021

edible variety. Synonym: White (Morse 1948). 1907. Seed color: Yellow (straw), hilum dusky brown.
• ***Summary:*** Sources: Note: The following entry shows that the Haberlandt variety existed by May 1905.

Ball, Carleton R. 1907. "Soy bean varieties." *USDA Bureau of Plant Industry, Bulletin* No 98. 28 p. May 27. See p. 12-13, 22. "Classification–Key to the varieties (p. 11): V. Greenish yellow seeded: 2. Medium late, about 120 days, 25 to 30 inches high, branches long, pods about 1¼ inches long, seeds medium large, roundish or broadly elliptical, hilum dark brown = Haberlandt." "A plot grown in 1905 at Baton Rouge, Louisiana, had foliage of a very light glaucous green, much resembling a plot of rape in color. The same appearance was also reported for this variety by the Virginia Agricultural Experiment Station... The time required for this variety to reach maturity varies from 110 to 130 days, the average time being somewhere near 118 to 120 days. Two seed yields secured were 12 9/10 and 13 3/10 bushels to the acre, respectively. The Haberlandt is one of the most promising varieties for hay, silage or green manuring, and for a cover crop. From the Tokyo it can be distinguished only by its earlier maturity, rather deeper greenish yellow seed and distinctly brown hilum. This variety was named in honor of Prof. F. Haberlandt, who first brought the soy bean to agricultural notice in Europe. His work was published in 1878 at Vienna. Numbers and sources of lots grown: Agrost. No. 1194, 'White,' S.P.I. No. 6396; Agrost. No. 1539, S.P.I. No. 8495; Agrost. No. 1540, S.P.I. No. 8493; S.P.I. No. 6396, 'White,' Ping-yang [Pyongyang / P'yongyang], Korea; S.P.I. No. 6397, Ping-yang, Korea; S.P.I. No. 8493, grown from S.P.I. No. 6396; S.P.I. No. 8495, grown from S.P.I. No. 6397; S.P.I. No. 9415, grown from S.P.I. No. 6397; S.P.I. No. 17263, grown from Agrost. No. 1539-1; S.P.I. No. 17271, grown from Agrost. No. 1194-1."

Piper, C.V.; Nielsen, H.T. 1909. "Soy beans." *USDA Farmers' Bulletin* No. 372. 26 p. Oct. 7. See p. 11. Haberlandt (Yellow) is one of the best out of more than one hundred sorts tested in the last three years. It is not yet on the market, but will probably be available by 1910.

Piper, Charles V.; Morse, W.J. 1910. "The soy bean: History, varieties, and field studies." *USDA Bureau of Plant Industry, Bulletin* No. 187. 84 p. Dec. 31. See p. 47, 75. Seed color: Straw yellow. • ***Summary:*** Japan imported oil cake worth the following amounts: $5,567,500 in 1905 and $7,748,900 in 1906. Japan's biggest trading partners in 1906: Imports (in million dollars): United Kingdom $51.0, United States $33.8, British India $31.4, China $27.7, Germany $21.1. Exports (million dollars): United States $62.3, China $59.9, France $19.5, Hongkong $13.5, Korea $12.3, United Kingdom $10.7. Address: Washington, DC.

70. Griffis, William Elliot. 1907. Corea: The hermit nation. 8th ed. Revised and enlarged. New York, NY: Charles Scribner's Sons. xxvii + 512 p. See p. 270. Illust. Index. 23 cm. 1st ed. 1882. [99* ref]
• ***Summary:*** This enlarged 8th edition is identical to the original 1882 ed. except that 4 pages of front matter (including a "Preface to the eighth edition") have been added, and the recent history of Korea to 1907 and the index have been updated, adding 50 pages to the end. A color fold-out map has been added, facing p. 506; it shows Korea, Tsushima, Shimonoseki, Karatsu, Hirado, Nagasaki, Goto Islands, northwest Kiushiu [Kyushu]. The information on soy remains unchanged, on p. 270. Address: Ithaca, New York. Formerly of the Imperial Univ. of Tokio, Japan.

71. Takenob, Y.; Takeda, G. 1907. Japan Year Book. Tokyo: Japan Year Book Office. 616 p. See p. 325, 327, 467, 584, 602. Third annual issue. [Eng]
• ***Summary:*** A full-page ad near the front of the book (on an unnumbered page) for "Mitsui Bussan Kaisha. (Mitsui & Co. in Europe and America.) Established 1876" states that they are "General Commission Merchants" for the... Import of [Soy] Beans, [Soy] Bean Cakes," etc.

Page 325. A table titled "Manure. Consumption" gives the approximate volume consumed in Japan at the end of

© Copyright Soyinfo Center 2021

1905 in 1,000 yen:

Night soil 53,000,000.
Stable manure 47,000,000.
Bean cakes [soy] 13,000,000.
Fish guano 10,000,000.
Artificial fertilizers 8,000,000...

Page 327. Chapter 14, "Agriculture" (p. 320-337) has a section that gives production data on "Soja beans" from 1900 to 1905 in *koku.*

3.562 million *koku* in 1900
4.069 million *koku* in 1901
3.136 million *koku* in 1902
3.647 million *koku* in 1903
3.710 million *koku* in 1904
3.261 million *koku* in 1905.

The same table gives production of "Red [azuki] beans which ranged from a high of 924,573 *koku* in 1901 to a low of 708,712 *koku* in 1902. Thus, in 1901 production of azuki beans in Japan was about 23% of that of soja beans [soy beans].

Page 467. In chapter 28, "Foreign trade" (p. 467-95), is a list for the "New import tariff schedule." "Import tariff," with an entry in Group II (Grains and seeds) for "Beans, soja." The tariff is 0.43 yen per 100 kin. On the next line is an entry for "Beans, red or white (small) (*Phaseolus subtrilobata*).

Page 605. A table gives the amount of ash, animal manure and [soy] bean cake used on cotton fields in Korea.

There is no information specifically on soja beans in the chapters titled Formosa, Karafuto [South Sakhalin Island], or Manchuria. However there are statistics for "Peas & beans" (1901-1905) in tables on pages 584 (Formosa [Taiwan], production in koku) and 602 (Korea, exports, 1902-1906, value in yen). Address: 1. Prof. at Waseda Univ. and Late of the *Japan Times;* 2. Editor of the *Pacific Ocean* and Late of the *Kokumin.* Both: 9, Yariya-cho, Ginza, Tokyo, Japan.

72. Ueno, K. 1908. [Investigation on Korean koji]. *Igaku Chuo Zasshi* (*Central Medical Journal*) 5:1534. March 26. [Jap]

73. Griffiths, E.A. 1908. Japan: Report for the year 1907 on the trade of the consular district of Shimonoseki. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4106. p. 1-15. Aug.

• ***Summary:*** A folded map shows the Consular District of Shimonoseki, comprising the prefectures of Yamaguchi, Hiroshima, Fukuoka, and Oita. Shimonoseki is a seaport city located just north of Kyushu, on the Shimonoseki Strait, in Yamaguchi prefecture at the southwest extremity of Honshu. Opposite Shimonoseki, on the northern tip of Kyushu, is the city of Moji. There are also two specially opened ports of Wakamatsu and Hakata–in northern Kyushu. At the center of the map is the Inland Sea, southwest of which is the large island of Shikoku.

In the section on "Imports" under "Manure" we read (p. 6) that the "increase in imports of oil cake "was very large, amounting to 20,732 tons in quantity and 146,052*l."* [British pounds sterling] in value over the figures for 1906. Fish manure was imported from Korea and 9,373 tons of phosphate rock was imported from Christmas Island. "This phosphate rock is manufactured into superphosphates for fertilizing purposes at the phosphate works situated at the western entrance to the Straits if Shimonoseki."

A table (p. 12-13) titled "Return of Principal Articles of Import into the Ports of Shimonoseki and Moji during the Years 1906 and 1907, and Average for the Five Years 1902-06" shows that import of "beans, pulse, &c." decreased 21,719 tons in 1906 to 19,077 tons in 1907, with 85.9% of the value coming from Corea [Korea] and 13.1% from China.

Four types of manure are imported (p. 13): The great majority is "oil cake," followed by fish, phosphates, and other. Imports of oil cake increased from 49,574 tons in 1906 to 70,306 tons in 1907; most of this came from China. Address: British Consul, Shimonoseki, Japan.

74. Hall, J.C. 1908. Japan. Bean oil industry: Sample of oil on view. *Board of Trade Journal* (*London*) 63:184-85. Oct. 22.

• ***Summary:*** Reports that "bean oil in Japan... is very simply manufactured from the soy or soja bean (*soja hispida*), grown there and also largely imported from China and Corea. The beans are thoroughly steamed and immediately pressed by machinery, the resultant oil being run into tanks. There it is allowed to settle and purify, the product being a light yellow oil, suitable as material for food and for industrial purposes. The residue is used as manure and as food for cattle. The total production of oil is about 700 tons per annum, the price averaging about 20 *l.* 4*s.* [£20 4 shillings] per ton. So far this oil has been consumed principally in Japan; recently, however, it has been exported successfully.

"A sample of the oil may be seen on application at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C." Address: I.S.O., British Consul-General, Yokohama, Japan.

75. *Monthly Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1908. Agriculture. Farm crops and methods. Japan. No. 337. p. 95-99. Oct.

• ***Summary:*** "Consul Hunter Sharp, of Kobe, transmits the following review of agricultural conditions in Japan,..." According to the 1906 census, Japan has a population of 48,304,397. "Sixty per cent of the people are agriculturists, and yet on account of the mountainous nature of the country, only about one-sixth of the total area is under cultivation."

"On the land known as rice fields, wheat, barley, or rape

© Copyright Soyinfo Center 2021

seed are sown about November, the crop being gathered the following June. Immediately afterwards the rice is planted, and is harvested in October. On the upland fields either wheat, barley, or rape seed is sown and harvested at the same season as above mentioned; after which corn, cotton, beans, panicum miliacum [millet], and various vegetables are sown, maturing at different times."

"Fertilizers freely used:... In 1906 the importation into Japan of oil cake alone amounted to $7,793,766, of which China supplied $7,436,958; ammonium sulphate, $2,637,751, to which Great, Britain contributed $2,543,264, while the United States sent nitrate of soda to the value of $34,236; oil cake, $3,823; and phosphorites, $74,211, aggregating $112,270." Note: We are not told what kind of oil cake the USA exported to Japan, but it was not soya bean cake.

"One year's crop: According to the statistics of 1906 the agricultural products of Japan are given as follows: Rice, the chief crop, has an acreage of 7,104,072, with a production of 229,794,826 bushels; barley comes next, with 3,359,238 acres and a production of 81,407,291 bushels; wheat, the principal crop in other grain-producing countries, occupies only 1,086,118 acres, with a yield of 19,664,325. An average crop for these three is about 30 bushels per acre. Other agricultural products are:" The first two crops shown in this large table are: Soy beans 17,655,973 bushels. Small red [azuki] beans 4,449,408 bushels.

A table titled "Exports of agricultural products" in U.S. dollars for 1902-1906 lumps together "Beans, pease, and pulse," which grew from $45,903 in 1902 to $76,051 in 1906. Exports of peanuts decreased from $175,585 in 1902 to $150,102 in 1906. Japan's largest agricultural export, tea, accounted for about 90% of total exports (worth $5+ million) during this period.

A table titled "Imports of agricultural products" in U.S. dollars for 1902-1906 lumps together "Beans, pease, and pulse," the second largest import category, which grew from $2,881,780 in 1902 to $4,839,708 in 1906. Most of these beans are supplied in about equal proportions by China and Korea. Japan's largest agricultural import, rice, accounted for about 70% of total imports (worth $13 to $39 million) during this period.

"Agriculture in Formosa and Sakhalin:... Japanese Sakhalin has a total area of 12,582 square miles, of which 89,296 acres can be cultivated, and in 1906 the population was 8,569. The agricultural products are barley, wheat, rye, oats, potatoes, peas, kidney beans, soja beans, red beans, hemp, flax, and vegetables. Of these the most successful are potatoes, barley, rye, oats, and wheat, and in a lesser degree peas, hemp, and flax." Soy beans are not mentioned under Formosa. Address: Washington, DC.

76. *Natal Agricultural Journal.* 1908. Oil from the soy bean. 11(11):1371. Nov. 27. [1 ref]

• ***Summary:*** An excerpt of almost the entire article by Mr. J.C. Hall (British Consul at Yokohama, Japan) from the *Board of Trade Journal* (*London*) of 22 Oct. 1908, p. 184-85. It describes the production and use of oil and meal from the soy bean (*Glycine hispida*), which is grown in Japan and also largely imported from China and Corea. Address: South Africa.

77. *USDA Bureau of Plant Industry, Inventory.* 1908. Seeds and plants imported during the period from July, 1906 to December 31, 1907. Nos. 19058 to 21730. No. 13. 192 p. Dec. 4. Also titled USDA Bureau of Plant Industry, Bulletin No. 132.

• ***Summary:*** Soy bean introductions: Glycine hispida.

19183/19184/19186. "From Manchuria. Received through Mr. F.N. Meyer, agricultural explorer, August 28, 1906. A collection of seeds as follows:

"19183. From Newchwang. '(No. 255a.) A small variety of the black soy bean. Used to make bean oil from, the remaining expressed material, known as bean cake, being exported to Japan and southern China as a very valuable fertilizer.' (*Meyer.*)

"19184. From Newchwang. '(No. 256a.) A large variety of the black soy bean. This is a very rare variety and is used for food: also for making a superior oil.' (*Meyer.*)

"19186. From Newchwang. '(No. 258a.) A medium-sized, greenish soy bean. This variety is the one most commonly used to extract bean oil from, the remaining yellow material, in the form of large, flat cheeses [actually cakes], being exported to different parts of Japan and especially to southern China as a very valuable fertilizer.' (*Meyer.*)" [Note: Piper and Morse (1910, p. 52) state that this variety was later named "Morse." They list no variety named "Virginia." But I. Cunningham (1984) states that this variety was later named "Virginia."]

19980-19987. "From Yokohama, Japan. Received through L. Boehmer & Co. [seedsmen], March 19, 1907.

"19980. Received under the name of '*Fuiri Mame,* the speckled soja bean.' [The scientific name is listed as Phaseolus vulgaris; the common name as bean. Clearly this is not a soy bean.]

"19981. Received under the name of '*Shiro Mame,* the white soja bean.'

"19982. Received under the name of '*Kuro Mame,* the black soja bean.'

"19983. Received under the name of '*Daizu* or *O-mane, Dolichos soja.*'

"19984. Received under the name of *Wase* or *Natsu Mame,* early summer bean.'

"19985. Received under the name of '*Nagate Mame,* middle late bean.' Note: Later referred to as Haberlandt.

"19986. Received under the name of *Okute Mame,* 'late bean.'

"19987. Received under the name of *Kuro-Teppo Mame,*

© Copyright Soyinfo Center 2021

round, middle-late bean.'

20011. "From Ko-bau, northern Korea. Received through Mr. Frank N. Meyer, agricultural explorer, February 20, 1907. '(No. 318a, Aug. 12, 1906.) A green variety of soy bean growing at high elevations. This variety is eaten as a food and is mostly grown in broad strips between buckwheat; a very late ripener. Seems to be the most northerly variety of soy bean seen yet and will do well in cool climes.' (*Meyer.*)"

20405-20412/20414. "From Siberia. Received through Mr. Frank N. Meyer, agricultural explorer, February 28, 1907. A collection of seeds, as follows:

"20405. From Khabarovsk. '(No. 643a, Nov. 15, 1906.) Round, yellow soy beans purchased in the market at Khabarovsk. The Chinese let these beans sprout and use the sprouts all winter as a vegetable. Oil is also extracted from this variety, and the cakes thus formed make a very nutritious food for horses.' (*Meyer.*)

"20406. From Khabarovsk. '(No. 644a, Nov. 15, 1906.) A yellow soy bean purchased in the market at Khabarovsk.' (*Meyer.*)

"20407. From Merkoechofka. '(No. 645a, Oct. 25, 1906.) A brown-black variety grown in eastern Siberia; does not scatter [its seeds] when ripe and is very late in ripening, as it is harvested in the last half of October. Is used for food, being boiled with millet. This variety seems to have come originally from more southern regions, as the season here is somewhat short for it.' (*Meyer.*)

"40408. From Khabarovsk. '(No. 647a, Nov. 8, 1906.) Black soy beans obtained from Mr. V.T. Kovaleff, in charge of the experiment station at Khabarovsk. These seeds came originally from Manchuria in 1899 and are ripening here to perfection, while the light and dark yellow varieties do not ripen well at all. Are used for food for domestic animals when boiled, and are also sometimes fed in the green state.' (*Meyer.*)

"20409. From Merkoechofka. '(No. 648a, Oct. 25, 1906.) Very small, brownish beans obtained from a farmer in Merkoechofka; said to have come originally from Manchuria.' (*Meyer.*)

"20410. From Merkoechofka. '(No. 649a, Oct. 25, 1906.) Very small, black beans obtained from a farmer in Merkoechofka; said to have come originally from Manchuria.' (*Meyer.*)

"20411. From Merkoechofka. '(No. 650a, Oct. 25, 1906.) Very small, dull-black beans obtained from a farmer in Merkoechofka; said to have come originally from Manchuria.' (*Meyer.*)

"20412. From Merkoechofka. '(No. 651a, Oct. 25, 1906.) Brown soy beans found mixed with No. 645a (S.P.I. No. 20406).' (*Meyer.*)

"20414. From Merkoechofka. '(No. 653a, Oct. 25, 1906.) Small, black soy beans obtained from a farmer in Merkoechofka; said to have come originally from Manchuria.' (*Meyer.*)"

20629/20699.

"From northern Europe, Siberia, and eastern Asia. Seeds collected by Prof. N.E. Hansen, of the agricultural experiment station, Brookings, South Dakota, in 1906 while traveling as an agricultural explorer for the Department of Agriculture on an extended trip through Scandinavia, Russia, Siberia and returning through China and Japan. Received March 1907.

"20629. From Manchuria. '(No. 109.) Variety *Hoo-an-dooh.* Used for human food and for fodder in Manchuria and brought from that country by a Russian student-soldier after the Russo-Japanese war.' (*Hansen.*)

"20699. From Ussurie [Ussuri] province, Pacific coast section, Siberia. '(No. 179.) From the farm of Mr. Fick, near Nicolsk.' (*Hansen.*)"

20797/20798. "Received through Mr. Frank N. Meyer, agricultural explorer, April 3. 1907.

"20797. From Shanghai, China. '(No. 722a.) *Black* soy beans obtained through Dr. S.P. Barchet, of the U.S. consulate at Shanghai. These beans come from Chin-hua-fu, Chekiang province, and are used apparently as a second crop on low-lying rice fields, and may as such be very valuable for the Southern States. They are mainly used as a food for domestic animals. It seems that they are sown broadcast after the sowing of the rice crop; specific details are not obtainable just now.' (*Meyer.*)

"20798. From Shanghai, China. '(No. 723a.) *Brown* soy beans obtained through Dr. S.P. Barchet, of the U.S. consulate at Shanghai. These beans come from Chin-hua-fu, Chekiang province, and are used apparently as a second crop on low-lying rice fields, and may as such be very valuable for the Southern States. They are mainly used as a food for domestic animals.' (*Meyer.*)"

20854. "From Harbin, Manchuria. Received through Mr. F.N. Meyer, agricultural explorer, April 11, 1907. '(No. 675a, Dec. 15, 1906.) Green soy beans; Chinese name *Ta shing toa.* These are boiled and used as food, and the sprouts of the germinated beans are also used as a vegetable throughout the winter months.' (*Meyer.*)"

20892/20893. "From Kobe, Japan. Presented by Hon. Hunter Sharp, American consul, who purchased them from J. Ikeda & Co., Tokyo, Japan. Received March 25, 1907.

"20892. White.

"20893. Green."

21079/21080. "Received through Mr. Frank N. Meyer, agricultural explorer, June 21, 1907.

"21079. From Tiëling, Manchuria. '(No. 693a, Jan. 18, 1907.) A light green soy bean; Chinese name *Shing toa.* This bean is used to produce bean oil and bean cake. The variety is very rarely seen.' (*Meyer.*)

"21080. From Tiëling, Manchuria. '(No. 694a, Jan. 18, 1907.) A dark green soy bean; Chinese name *Li dau shing.* This bean is used as a vegetable throughout the winter months, being eaten boiled after it has sprouted slightly.

© Copyright Soyinfo Center 2021

This variety is the most expensive of all the soy beans and is eaten by the better classes of Chinese; sent also from Harbin under No. 675a (S.P.I. No. 20854.)' (*Meyer.*)" Note: This is the earliest English-language document seen (Oct. 2004) that uses the term "dark green" to describe the color of a soybean.

[Notice the large number of seeds introduced by Frank Meyer during this period.]. Address: Washington, DC.

78. Agricultural Bureau, Department of Agriculture and Commerce. 1908. Agriculture in Japan. Tokyo: Agricultural Bureau, Department of Agriculture and Commerce. x + 455 p. See p. 225-29, 434, 439, 448, 453-54. No index. 23 cm. [Eng]

• ***Summary:*** A table of moneys, weights and measures (p. x) includes British equivalents of the following Japanese units: Money–*yen, sen, rin.* Length: *ri, chô, ken, shaku, sun.* Area: *cho, tan, sé, bu* or *tsubo, kô* (*9.724 tan*). Capacity / volume: *koku, tô, sho, go.* Weights: *kwan or kwamme, kin, momme.*

In Chapter 6 titled "Agricultural products," in section 2 on "staple food stuffs" is a subsection titled "Soja beans" (p. 225-29) which begins: "In point of production and use, soja beans occupy an important position among the various beans, they are extensively cultivated from the Hokkaido in the north to Formosa in the south. They find a congenial soil to prosper, the acreage for 1906 was 460,895 *cho* (1 cho = 2.45 acres) which with the exception of the acreage of barley (503,498 *chô*) is equalled by no other products from the upland fields. Their use is quite extensive. They are eaten boiled, baked and powdered while *soy, miso* and *tofu* (bean curd) made out of beans, are found even in the remotest villages. They are found on the table both of high and low. In making *soy* [*sauce*], a by-product in a shape of soy-cakes is obtained and may be used as excellent manure, while in making *tofu*, the remaining ingredients [okara] may be used as a subsidiary diet and as food for cattle. Soja beans may also be pressed, and its oil used for the purpose of diet and for various technical uses, while the residue forms excellent manure. The fresh stalks of soja beans may be used as forage or as effective green manure. In short, soja beans, either as an article of Japanese diet, or as agricultural manure or as food for cattle are indispensable.

Note 1. This is the earliest document seen (Nov. 2017) that contains the term "technical uses".

"The cultivation of beans under the circumstances was developed from ancient times, and numerous varieties are most extensively cultivated while by its peculiar nature of root, it absolves nitrogen from air so that high priced nitrogenous manure may be dispensed with, and therefore the cultivation of beans like other agricultural products do not exhaust the productive power of the soil, but on the contrary, it operates favourably to improve the soil. As for rotation of crops of wheat, millets, corns and potatoes, beans are indispensable. Seeds are sown early in the beginning of May."

Tables show: (1) Output of soja beans in Japan, 1897-1906." For each year is given the area (in *chô*), the production (in *koku*) and the yield (in *koku* per *tan*) (1 *koku* = 4.962 bushels; 1 *tan* = 0.245 acres). The area increased from 435,605 *chô* in 1897 to a peak of 482,044 *chô* in 1898, then slowly fell to a low of 446,844 *chô* in 1904, then rose to 460,895 *chô* in 1906. Production increased from 3,100,973 *koku* in 1897 to a peak of 4,069,619 *koku* in 1901, then slowly dropped to 3,557,592 in 1906. The yield in 1897 was 0.712 *koku* per *tan*, rising to a peak of 0.830 in 1904. Hokkaido has the largest area (43,924 *chô*) and production (392,140 *koku*). The principal soja bean producing districts are Ibaraki (33,000 *chô*), Saitama (29,000 *chô*), Iwate (26,000 *chô*), Nagasaki (26,000 *chô*), Kumamoto (26,000 *chô*), Niigata (22,000 *chô*). There is no prefecture where the production does not exceed 10,000 *koku.*

(2) "As mentioned above, soja beans are used either boiled, baked or powdered or as material for *tofu* (bean curd), frozen *tofu, soy* and *miso* (bean-cheese), and particularly the latter two products besides meeting with domestic demands, are exported abroad in large quantities, as may be seen in the following table." This table shows amount and value (in *yen*) of miso and soy [sauce] exported from Japan each year from 1903 to 1907, inclusive. Miso exports increased from 1,670,092 *kin* (1 *kin* = 1.322 lb) in 1903 to a peak of 5,199,957 *kin* in 1907 (a 3.1 fold increase in 4 years), while soy [sauce] exports increased from 1,974,119 *shô* (1 *shô* = 1.9 quarts) in 1903 to 4,403,851 *shô* in 1907 (a 2.2 fold increase). The total yen value of these two exports rose from 489,213 *yen* in 1903 to 1,354,517 *yen* in 1907 (a 2.8 fold increase). In American units: Miso exports increased from 2.20 million lb (worth $347,647) in 1903 to a peak of 7.50 million lb (worth $132,652) in 1905, dropping to 6.86 million lb (worth $135,833) in 1907.

Shoyu exports increased from 5.92 million lb (worth $204,959) in 1903 to 13.21 million lb (worth $541,425) in 1907. Note that in 1907 shoyu exports are worth about 4 times as much as miso exports.

(3) Because of increasing exports, Japan now needs to import soja beans from abroad. This table (p. 227) shows the amount and value of soybeans imported by Japan for the years 1903-1907, inclusive. They rose from 146,971 tons (worth $3.18 million) in 1903 to a peak of 193,479 tons (worth $4.92 million) in 1905, dropping to 177,365 tons (worth $4.79 million) in 1907. They are mostly imported from Manchuria and Korea. "While a greater portion of these imports is used as material for *soy and miso*, it is also used in making bean-cakes and is sown for obtaining green manure, or used as manure or for feeding cattle."

(4) This table (p. 228) shows the quantity and value of [soy] bean-cakes imported into Japan for the years 1903-1907, inclusive. The cake was used mostly for fertilizer. Cake imports rose from 216,198 tons (worth $3.81 million and representing 57.8% of all fertilizers) in 1903 to 367,210

© Copyright Soyinfo Center 2021

tons (worth $8.71 million and representing 44.8% of all fertilizers) in 1907. (5) This table (p. 229) shows acreage and production (output) of [soy] beans in Formosa [today's Taiwan]. Acreage doubled in 3 years from 11,226 *kô* in 1901 to a peak of 22,641 *kô* [53,886 acres] in 1904, then decreased slightly to 21,220 *kô* in 1906. Note 2. 1 *kô* = 9.724 *tan*, and 1 *tan* = 0.245 acres. Therefore 1 *kô* = 2.38 acres.

Production in Taiwan increased more than 3-fold from 44,661 *koku* in 1901 to 135,271 *koku* in 1904, then decreased slightly to 100,803 *koku* in 1906.

Note 3. This is the earliest document seen (May 2014) that gives soybean production or area statistics for Formosa / Taiwan.

Note 4. Production of soja beans in Formosa in 1904 was only 3.6% as much as production of soja beans in Japan in 1904.

The next section, titled "Red-beans" (p. 229-30) gives similar detailed statistics on acreage, production, and yield for azuki beans in Japan. *Sarashi-an* (the powdered red bean) is made in Osaka, Tokyo, Niigata, and Aomori. A second table gives annual imports of red [azuki] beans to Japan from 1903 to 1907. They are imported mainly from China, Korea, and British India.

In Chapter 9, titled "Agricultural products in commerce," section 2 is on imports to Japan. A table (p. 433-34) gives imports of the following grains and seeds (in quantity / piculs and value / yen) from 1903 to 1907: Italian millet, soja beans, red beans [azuki] (small white), and sesame seeds. Another table (p. 438) titled "Miscellaneous" includes imports of "bean's oil cake" for the same period. An explanation titled "Soja-beans" (p. 439) states: "Not only as foodstuffs, but also as a manure a large quantity of beans are consumed each year, as that from China and Korea a considerable amount is imported. Besides beans, bean-cakes are imported from China in large quantity." Imports of sesame seeds, rice, wheat and rape-seed are also discussed on the same page. In this same chapter, section 3 is on Exports and imports in Formosa. Soy is mentioned on pages 434, 439, 442, 448, 453-54. "Beans, Soja: The demand for soja beans in Formosa is enormous and as the Formosan product was not sufficient to meet the demand, a large amount is imported from abroad. Soja beans produced in Manchuria, and Chin-kiang [Chinkiang, Zhenjiang] are imported from China and Hongkong." "Oil, Beans [soybean oil]: This is principally produced in Manchuria and is brought here through China and Hongkong. Originally it was used as an [sic, for] illumination, but the demand has greatly increased as it is used in making cut tobacco" [to keep it moist]. Ground-nut oil is used for the same purpose (p. 453-54).

Note 5. The preface, by Chuzi [Chuji] Shimooka, explains that this book was compiled for the International Agricultural Association meeting to be held in Italy in the autumn. The compiler did not have time to explain all the terms [and units] adequately. Address: Tokyo, Japan.

79. Allen, Horace Newton. 1908. Things Korean: A collection of sketches and anecdotes, missionary and diplomatic. New York, Chicago, Toronto, London, Edinburgh: F.H. Revell Co. 256 p. See p. 74. Illust. (black and white photos). No index. 19 cm.

• ***Summary:*** Page 74: "Products.–The great product of Korea is rice, which is the staple of diet. Next come [soy] beans, which are largely used as a food for man and beast, being mixed with rice in the human dietary or used in the form of curd or cake [tofu], while they are indispensable for making the sauce so highly prized in Asia, and which is shipped abroad in vast quantities for the preparation of a celebrated English sauce as well as others, since it is the foundation for most of our sauces. Any one who patronizes a Chinese restaurant will be familiar with this bean sauce. Millet, rye, barley, oats, wheat and some poor corn, together with cotton and vegetables, form the chief farm crops raised in Korea after rice and beans."

Note 1. By "bean sauce" the author probably means "soy sauce," but he might also mean soybean jang (Korean-style soybean miso).

Note 2. The term "celebrated English sauce" clearly refers to Worcestershire sauce.

Preface: The author lived for 22 years "in China and Korea, including practically the whole period of the latter's diplomatic intercourse with the outside world,..." He spent 3 years in Korea as a medical missionary, 3 years in the Korean service, and 15 years in the diplomatic service of the United States government, "beginning as secretary of legation and ending as minister plenipotentiary." The poor Koreans are in desperate straits but opposition by them to their situation "seems at present to be unavailing if not suicidal." Sadly, the United States "deserted them in their time of need and ignored the solemn agreement we had entered into with them as an inducement for their abandoning the centuries-old position of exclusion and non-intercourse and emerging into the dazzling glare of treaty relations. Our treaty with Korea of May 22, 1882, in its first article, makes the following promise: 'If other Powers deal unjustly or oppressively with either government, the other will exert their good offices on being informed of the case, to bring about an amicable arrangement, thus showing their friendly feeling."

The U.S. disregarded this solemn pledge at the time of the Portsmouth convention; we violated our sacred covenant.

Chapter 16, "Political changes and probabilities."

1884–The "haughty Chinese drove the then inconspicuous Japanese so precipitately from the land that they left their dead in the streets to be devoured by the dogs" (p. 243); the Chinese continued their traditional domination of Korea.

1894-1895–First Sino-Japanese War, over domination of Korea; the Japanese won and in Oct. 1895 the treaty of Shimonoseki was signed. During this war the world got

© Copyright Soyinfo Center 2021

its first intimation of the excellence of Japanese military organization and power. But diplomatic mistakes in Korea by Japan, after her victory, enabled Russia to gain the upper hand. Yet Russia too made diplomatic blunders while for 10 years Japan prepared for another war over Korea.

1904-1905–Russo-Japanese war; Japan won, gained control of Korea, and drove Russia from the entire area except in the vicinity of Vladivostok. During the 20 previous years when Korea could have fortified the country, it "played at all manner of silly pastimes." Now Korea is Japan's to exploit for herself. The U.S. position in the area has been weakened. Japan's next great objective will surely be China; it is only a matter of time. Address: Toledo, Ohio; M.D., Late Envoy Extraordinary and Minister Plenipotentiary of the United States.

80. Colby, Frank Moore. ed. 1908. The new international year book: A compendium of the world's progress for the year 1907. New York, NY: Dodd, Mead and Company. [6] + 860 p.

• ***Summary:*** The section titled "Manchuria" (p. 475-76) states: "By the treaty of Portsmouth (September 1905) Manchuria was practically divided into a northern or Russian sphere of influence, and a southern or Japanese sphere of influence. The Russian section is crossed by the Trans-Siberian Railway, which runs from east to west for a length of 960 miles over Manchurian soil until it reaches Vladivostok; and by the Central Manchurian Railway, which runs southward from Harbin, on the Trans-Siberian, to Changchun, with a branch line of 70 miles from Changchun to Kirin. The Japanese section is crossed by the continuation of the Central Manchurian line from Changchun to Port Arthur and Dalny, now known as the South Manchurian Railway [sic], which was surrendered by Russia to Japan; by the new Japanese line from Antung to Mukden, 187 miles long... Extensions of the Chinese Northern Railways are permitted by Japan only on condition that the capital, if not Chinese, be borrowed from the South Manchuria Railway Company."

"The leading exports are [soya] beans, bean cake, and bean oil, raw wild silk, maize, and millet. Newchwang and Dalny are the principal ports (p. 476).

"History–Reorganization of the Province: On April 20, 1907, an Imperial Chinese edict reconstituted the government of Manchuria. Instead of three provinces governed by three separate Tatar rulers, the whole country was placed under one viceroy, with a governor in each province."

The long and interesting section on Japan (p. 420-30) contains a map of the country. The section on agriculture states: The percentage of land owned by the tillers of the soil is 50.21 in rice field and 60.93 in upland. The rest is rented by tenants. In 1905 the production of soya beans was 3,261,881 koku and of red beans [azuki] was 804,485 koku (1 koku = 4.66 bushels). There is also detailed information on: Population (47 million in 1903) and immigration, fisheries, religion, education, mining, forestry, number of establishments [businesses] and employees, manufactures (incl. vegetable oils; "The Japanese Government is the greatest employer of labor in the country"), foreign commerce, shipping, railways, post and telegraph, banks and money, government (a constitutional monarchy; the Imperial Diet consists of a House of Peers and a House of Representatives; in 1904, 1.67% of the population could vote), finance (in 1907-08 projected internal revenue taxes on alcoholic beverages, soy [sauce] etc. totaled 96,331,881 yen), army, navy. History: Political parties, relations with the United States (incl. persecution of Japanese in San Francisco, California), relations with Great Britain, with France, with Russia, navy and military development, territorial expansion (retention of some troops in Manchuria as "railway guards," gradual absorption of Korea, and conquest of interior portions of Formosa, expansion of lumbering along the Yalu river, opening of 16 cities and towns in Manchuria as 'places of international residence and trade').

81. Crowe, E.F. 1908. Japan: Report for the year 1907 on the trade of Japan. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4026. p. 1-86.

• ***Summary:*** "Export of soy (p. 35): This sauce was again sent in large quantities to those countries where the number of Japanese residents is on the increase. A new kind, said to have many advantages, and prepared by a lately-invented process, was put on the market during the year."

Annex I (p. 64-65) shows imports of "Beans, peas and pulse" to Japan (mainly from China and Corea) from 1902 to 1907.

Annex II (p. 76-77) shows "Return of principle articles of export from Japan during the years 1907 and 1906." Exports of soy [sauce] were worth £97,000 in 1906, increasing to £110,500 in 1907. The average value for the 5 years 1902-06 was £65,300; no quantities are given. Other leading exports were tea, cotton undershirts and drawers, saké, and fish. Address: Commercial Attaché to His Majesty's Embassy, Tokyo.

82. Tebbitt, -. 1908. China: Report for the year 1907 on the trade of Newchwang. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*). No. 4000. p. 1-14.

• ***Summary:*** A map shows South Manchuria, Corea [Korea], the Yellow Sea, and the Gulf of Pe-Chi-Li, with major rivers (Liao, Yalu), railroads, ports (Newchwang, Tiaren [Dairen]) and cities (Mukden, Antung, Kuan Cheng Tzu [K'uan Ch'eng Tzu], Seoul).

Table C shows the quantity and value of the principal exports from Newchwang during the years 1906-07. In order of export value in 1907, the leading exports are: Bean cake

© Copyright Soyinfo Center 2021

(£1,434,233 for 4,453,380 cwts.) [1 cwt = hundredweight = 112 pounds], beans, all kinds (£484,225 for 1,408,778 cwts.), [soy] bean oil (£236,481 for 287,402 cwts.), millet, tall and small (£229,967), silk, raw, wild (£193,787), ginseng (£45,279). The leading export, [soy] bean cake, is used for manure and sold mostly to Japan (78% of the total) and South China. Because of the increasing shallowness of the Liao River, especially in its upper reaches, the percentage of beans carried in junks is decreasing, while that carried by railways is increasing. Address: Acting Consul.

83. *USDA Bureau of Plant Industry, Inventory.* 1909. Seeds and plants imported during the period from January 1 to March 31, 1908. Nos. 21732 to 22510. No. 14. 64 p. Jan. 9. Also titled USDA Bureau of Plant Industry, Bulletin No. 137. • ***Summary:*** Soy bean introductions: Glycine hispida (Moench) Maxim. [Note the first use of this terminology in this publication.]

21754-21757. "From Paris, France. Purchased from Vilmorin-Andrieux & Co. Received January 3, 1908.

"21754. Yellow seeded.

"21755. *Ogemaw.* Extra early, brown seeded.

"21756. Black seeded.

"21757. Extra early, black seeded."

21818. "From Paris, France. Purchased from Vilmorin-Andrieux & Co. Received January 17, 1908. *Ito San.* Called by the French, *Yellow Etampes.*

21825. "From Hokkaido, Japan. Presented by Mr. K. Hashimoto, Kuchchau Agricultural Society, Abutagun. Received January 14, 1908. *Amherst* (?). 'Used in the manufacture of "soy," "miso," "tifu" [tofu], etc.' (*Hashimoto.*)"

21830/21831. "From Hokkaido, Japan. Presented by the Yokohama Nursery Company, Yokohama, Japan. Received January 24, 1908.

"21830. *Butterball.* Japanese name *Akita.*

"21831. Japanese name *Rumoi.*"

21946. "From Buitenzorg, Java. Presented by Dr. M. Treub, director of the Department of Agriculture. Received February 11, 1908. *'Zwarte kadelee'"* [black soybeans].

21999. "Received through Mr. F.N. Meyer, agricultural explorer for this Department at the Plant Introduction Garden, Chico, Cal., February 12, 1908. From Boshan, Shantung, China. '(No. 799a, Sept. 18, 1907.) A rare variety of soy bean, sparsely grown near Boshan. Chinese name *Ta ha tau.* Used by the higher classes as a vegetable in soups.' (*Meyer.*)"

22311/22312. "From Shanghai, Kiangsu, China. Presented by Rev. J.M.W. Farnham, Chinese Tract Society. Received March 11, 1908.

"22311. Black. 'Similar to *Nuttall* but larger.' (*Nielsen.*)

"22312. Yellow."

22317-22322. "From Erfurt, Germany. Purchased from Haage & Schmidt [seedsmen]. Received March 16, 1908.

"22317. Probably *Butterball.*

"22318. *'Giant Yellow.'* Probably *Amherst.*

"22319. Brown.

"22320. *Samarow.* Like No. 17260.

"22321. Probably *Cloud.*

"22322. *'Early Black* from Podolia [Ukraine].' Probably *Buckshot."*

22333-22337. "Grown at Arlington Experimental Farm, Virginia, season of 1907. Received March 19, 1908.

"22333. *Baird.* 'This variety was mixed with *Brownie* when received from Pingyang [Pyongyang / P'yongyang], Korea. This mixture was given S.P.I. No. 6414. The two varieties were grown together under these numbers, 9417, 17256, and Agrost. No. 1542, respectively. The two varieties were separated in the 1907 seed from Arlington Farm, and *Baird* given the above new number, *Brownie* remaining as No. 17256.' (*Nielsen*).

"22334. Flat black. 'Received from Mr. H.B. Derr, Agricultural Experiment Station, Champaign, Illinois. The original source of the seed is not known. It is quite similar in growth to *Nuttall*, but the seed is not the same shape, being flatter and larger.' (*Nielsen.*)

"22335. Yellow. 'Received from Mr. H.B. Derr, Agricultural Experiment Station, Champaign, Illinois, where it was grown as *Illinois Medium Yellow.* It is very similar to *Hollybrook*, and perhaps is the same, but appears different on account of having been grown farther north.' (*Nielsen.*)

"22336. *Guelph.* 'Received from Mr. H.B. Derr, Agricultural Experiment Station, Champaign, Illinois. Original seed was procured from the Agricultural Experiment Station, Wooster, Ohio.' (*Nielsen.*)

"22337. *Guelph.* 'Received from Mr. H.B. Derr, Agricultural Experiment Station, Champaign, Illinois. Original seed was procured from the Agricultural Experiment Station, Fayetteville, Arkansas' (*Nielsen.*)."

22379-22381. "From Canton, Kwangtung [province], China. Presented by Dr. J.M. Swan, Cooks Hospital. Received March 20, 1908.

"22379. Yellow.

"22380. Black.

"22381. Green mixed with yellow and a few brown."

22406/22407. "From Hongkong, China. Presented by Mr. S.T. Dunn, Botanical and Forestry Department. Received March 26, 1908. [Note: It is not clear whether or not they were ever cultivated in Hongkong. These two soybeans (#22406 and #22407, both black seeded) were later given the names "Hongkong" and "Nigra" respectively, and introduced to the USA in about 1910].

"22406. Yellow.

"22407. Black."

22411-22415. "From Naples, Italy. Purchased from Dammann & Co. Received March 25, 1908.

"22411. *Samarow.*

"22412. Black. 'Similar to *Cloud.*' (*Nielsen.*)

© Copyright Soyinfo Center 2021

"22413. Brown.

"22414. Yellow. 'Similar to *Acme.'* (*Nielsen.*)

"22415. Giant yellow."

"Glycine soja Sieb. & Zucc." [Note the first mention of this species.] 22428. "Grown at Arlington Farm, Virginia, season of 1907, under C.V.P. No. 0474. Received March, 1908. 'Original seed presented by the Botanic Gardens, Tokyo, Japan. A near relative to the soy bean, but a spreading or decumbent plant, abundantly provided with large root nodules. Has considerable promise as a cover or green manure crop.' (*Piper.*)"

22498-22501. "From Hangchow, Chehkiang, China. Presented by Dr. D. Duncan Main, through Mr. J.M.W. Farnham, Shanghai, China. Received March 26, 1908.

"22498. Yellow. Similar to No. 18619.

"22499. Yellow.

"22500. Green. Similar to No. 17857.

"22501. Black."

22503-22507. "From Yokohama, Japan. Purchased from L. Boehmer & Co. Received March 31, 1908. The following seeds with Japanese names quoted; varietal descriptions by Mr. H.T. Nielsen:

"22503. *'Teppo Mame.'* Yellow, similar in appearance to *Amherst*, No. 17275.

"22504. *'Kaze Mame.'* Green.

"22505. *'Gogwatsu Mame.'* Yellow, similar to *Haberlandt*, No. 17271.

"22506. *'Maru Mame.'* Yellow.

"22507. *'Vieuri Lei.'* Green, similar to *Yosho*, No. 17262." Address: Washington, DC.

84. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*). 1909. Trade of Dalny. Both imports and exports show large increases. No. 3382. p. 12-13. Jan. 16.

• ***Summary:*** "Consul Roger S. Greene transmits a statement of the trade of Dalny for the half year ended June 30, 1908, compiled from the returns published by the Kwantung government-general, which he summarizes: The export trade for the half year amounted in value to $7,048,742, as compared with $4,381,441 during the first half of 1907."

"The following is a summary of the exports and imports at Dalny (Dairen), during the half years ended June 30, 1908 and 1907, by countries of destination and origin:" A table shows exports to and imports of all goods from Japan, China, Korea, and America and Europe. Imports from Japan were larger than exports to Japan.

"The largest items of export for the first half of 1908 were bean cake, amounting to $3,021,392, against $1,575,741 for the same period of 1907; beans, $2,462,862, against $1,863,670; and raw wild silk, $1,126,723, against $17,700." Address: Washington, DC.

85. Austin: New U.S. domestic soybean variety. 1909. Seed color: Yellow (olive).

• ***Summary:*** Sources: Piper, C.V. 1909. Re: Sending you a list of 186 varieties of soybeans we grew at Arlington Farm last season. Letter to Prof. H.A. Morgan, Director, Tennessee Experiment Station, Knoxville, TN, March 17. "Previous to the issuing of Professor Mooers' bulletin we had named the greenish-yellow seeded variety, #17263, Austin, retaining the Haberlandt for our #17271, Number 17263 you have as Agrostology #1539, while #17271 you have under Agrostology #1194. If it were not for the fact that we have already used these names I would reverse them in favor of the conclusion that Professor Mooers has reached, but under the circumstances it seems to me that it will make less confusion if our conclusion here is adopted. Of these two varieties, the Austin is decidedly superior under Arlington Farm conditions, and we had intended to grow it in quantity for distribution. It is, therefore, very interesting to note that at Knoxville you consider #17271, Haberlandt, as better than the Austin."

Piper, C.V. 1909. Re: Soybean varieties. Letter to Prof. A.T. Wiancko at Experiment Station, Lafayette, Indiana, April 2. 1 p. "A year ago I sent you the following list of varieties of soybeans: #16789. Brooks. 17252. Flat King. 20854. Tashing. 17263. Austin. 17862. Sherwood. 19186. Morse. "I am anxious to learn the results you secured..."

Piper, C.V.; Nielsen, H.T. 1909. "Soy beans." *USDA Farmers' Bulletin* No. 372. 26 p. Oct. 7. See p. 11. "Austin (Greenish Yellow): The Austin is a vigorous though not coarse medium-late variety, growing 3 to 4 feet high, with numerous branches but none close to the ground. It can be easily harvested with machinery and is an excellent seed producer." This variety is one of the best out of more than one hundred sorts tested in the last three years. It is not yet on the market, but will probably be available by 1910.

Piper, Charles V.; Morse, W.J. 1910. "The soy bean: History, varieties, and field studies." *USDA Bureau of Plant Industry, Bulletin* No. 187. 84 p. Dec. 31. See p. 45, 75. Seed color: Olive yellow. S.P.I. No. 17263. "From Pingyang, Korea, 1901... Grown nine seasons. This variety was also distributed under Agrostology No. 1539." "The best varieties of soy beans (p. 75): Medium late–Austin, 17263."

Hall, J. Ed. 1914. "Soy bean a profit maker: Missouri farmers should give this new crop a trial." *Missouri Ruralist* 13(6):7. March 20. "Since making a two-year test of 10 varieties, we have decided that the Austin and Perley's Mongol are best adapted to central Missouri conditions. The Austin is a rank grower, producing large amount of well filled pods. One great advantage the Austin has over other varieties is the fact that they do not shatter so badly. The beans are of a rich green color."

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 8-9. Austin is in the USDA Germplasm Collection. Maturity group: V. Year named or released: 1909.

• ***Summary:*** Discusses the moulds in Corean [Korean] koji (mostly *Aspergillus oryzae, Rhizopus tritici,* and *Rhizopus tamari?*), and yeasts in the mash of Corean alcoholic beverages. The koji moulds or fungi possess, "as regards starch, strong saccharifying power, so that the saccharification of starch contained in the raw material can be accomplished by them." For one of the yeasts he proposes the name *Saccharomyces coreanus.* Address: Botanical Inst., Tokyo Univ., Japan.

87. *Revue Indochinoise.* 1909. Fabrication de l'huile et du tourteau de fève Soja [Production of soy oil and soybean cake]. 11:1046-47. Oct. [Fre]
• ***Summary:*** The extraction of oil from the soybean (*L'extraction de l'huile de la fève Soja*)–*Soja hispida*–which is found in Japan and which is imported to Japan in large quantities from China and Korea, is a very simple operation. The beans are steamed then crushed in mechanical presses; the oil flows out and is collected in reservoirs. It is allowed to stand for a while and is then refined. The result is an oil with a clear yellow color which can be used for the table or for industry. The remaining cake can be used as fertilizer or as a feed for animals.

Total production of the oil is about 700 tonnes per year and the average price is about 20 pounds sterling and 4 shillings per tonne. Up to the present, this oil has been consumed mainly in Japan, however recently it has been exported with success.

Note: This is the earliest French-language document seen (Sept. 2003) with the word *tourteau* or the term *tourteau de fève Soja* in the title, used to refer to soybean cake.

88. Meyer, Frank N. 1909. Re: Resumé of work as a USDA agricultural explorer. In: Letters of Frank N. Meyer. 4 vols. 1902-1918. Compiled by Bureau of Plant Introduction, USDA. 2444 p. See p. 811-13. Letter of 2 Nov. 1909 from Berlin, Germany.
• ***Summary:*** Meyer filled out this form for USDA as he was passing through Berlin on the way to his second expedition, which started in Russia. "Salary: $1,600 per annum. 1. Education: An ordinary school education up to 14 years of age. After that much private tuition in Foreign languages, in Botany, Drawing (mechanical and landscape), Arithmetic and Measuring, Principles of plant propagation, etc.

"2. Experience: From 14th to 16th years as a pupil in the Botanic Gardens of Amsterdam, from 16th to 23rd year as an gardener and assistant to Prof. Hugo de Vries in his special experimental garden. From 23rd to 25th year as a gardner in commercial nurseries in England, especially having learned the culture of fruits and vegetables under glass and the culture of fruit trees against walls and fences as is practiced in the countries of Northern Europe.

"3. Departmental Service: From October 23, 1901 to August 31, 1902, as a gardener in the Department greenhouses at Washington D.C. Resigned September 1, 1902. September 15, 1902, re-entered Departmental service again in the Plant Improvement Garden at Santa Ana, California. Worked there as a propagator and all-around gardener. Resigned on account of very unsatisfactory conditions at the garden and improper treatment by Mr. P. Pierce, in charge, on April 1, 1903. Worked as head gardener in a carnation and palm nursery in Montecito, California, from April 1903 until March 15, 1904. Made journeys of study in California, Mexico, and Cuba from March 16, 1904, until August 1, 1904. Worked in the St. Louis Botanical Gardens from August 1, 1904 until July 1, 1905, as a propagator of mainly herbaceous plants. Was also member of the Jury on Forestry at the World's Fair in St. Louis during September 1904. Re-entered Department service for the third time on July 10, 1905, as an agricultural explorer. Left Washington, D.C. on July 27, 1905, and returned to the same city July 7, 1908, having visited in these three years parts of Japan, Korea, Eastern and Northern China, Manchuria and Eastern Siberia and collected nearly 2000 numbers of various plans and seeds.

"4. Results accomplished: Valuable varieties of Chinese fruits, vegetables, cover crops and ornamental plants introduced. From February 1909 until July 1909 having written his observations on Chinese agri- and horti-culture in a series of four bulletins which are in course of publication.

"5. Special qualifications. These questions can hardly be answered by the undersigned himself."

"8. Value. To be answered by those in charge."

Location: University of California at Davis, Special Collections SB108 A7M49. Address: USDA Plant Explorer.

89. Carson, John M. 1909. Soya bean and products: Japan (Document part). *Special Consular Report* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) No. 41. Part 5. p. 13-16. Erroneously numbered Special Consular Reports, Vol. XL.
• ***Summary:*** Vice-Consul-General E.G. Babbitt of Yokohama writes: "The soya bean, or soja bean, as it is known here (Common Japanese name 'daidzu' [daizu]), is cultivated throughout the Empire of Japan. The total area of cultivation is in the neighborhood of 1,200,000 acres, or about 3.8 per cent of the total area devoted to the cultivation of rice and other cereals and grains. The soya bean is often cultivated, not in fields by itself, but in rows along the edges of rice or

© Copyright Soyinfo Center 2021

wheat fields. These edges are, as a rule, very soft, for they have been previously plowed, and little labor is required in planting... In harvesting the plants are uprooted, and, after being dried in the sun for several days, flails are used to separate the beans from the pods. The flails are of a very primitive type, with bamboo handle and of light weight. Female and child labor is invariably employed in flailing.

"The kinds of fertilizers used differ by districts. In the prefecture of Miyagi, for example, straw ashes and superphosphate of lime are commonly employed, while in the prefecture of Akita wood ashes, superphosphate of lime, and horse dung are used."

The average yield of soybeans in Japan over the past 10 years is 15.30 bushels per acre. For the year 1907 the highest yield is from Ishikawa prefecture, 21.62 bushels/acre, whereas the lowest yield is from Okinawa prefecture (Loochoo Islands, south of Kiushu [Kyushu]), 8.48 bushels/acre. During 1908 huge amounts of soya beans (3.3 million piculs; 1 picul = 132.277 pounds weight) were imported to Japan from China, Kwantung, and Korea, with small amounts coming from Asiatic Russia. Large amounts of soya-bean cake (7.760 million piculs) were imported from China and Kwantung, with small amounts coming from Asiatic Russia and none from Korea. "The total imports of bean oil in 1908 amounted to only 49,993 pounds, valued at $1,325."

"The soya bean is one of the most important articles of food in Japan. The beans are cooked in various ways, while in brewing soy (shoyu), in the manufacture of miso (pea or bean cheese), tofu (bean curd), koya-tofu (frozen bean curd), and natto (steamed beans) they are the chief ingredient. They are also manufactured into flour and make up the principal part of many Japanese sweetmeats. All these foodstuffs are daily used in Japanese homes.

"To a limited extent soya beans are used as horse or cattle food, being sometimes boiled and mixed with straw, barley, bran, etc."

The vice consul of Kobe states that in 1908 Japan produced 18,812,228 bushels of soya beans. Small amounts are exported "to Hawaii, the United States and Canada for use by the Japanese resident in those countries as an article of food." Three factories in the Kobe district make bean cake, largely from imported, lower-cost soya beans. "The beans are first crushed flat, then put into a big container and steamed, after which they are put into a steam press to extract the oil and to be made into cakes. The cakes come in circular pieces, a yard in diameter and an inch thick, each weighing about 50 pounds. The oil is used for lubricating machinery. The cake is used only as a fertilizer and is not fed to animals as it causes their hair to fall off."

Note 1. This is the earliest document seen (Feb. 2004) stating that soya bean oil can be used as a lubricant.

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "koya-tofu" to refer to dried-frozen tofu.

Note 3. This is the earliest document seen (Aug. 2011) in *Chemist and Druggist* in which the toxicity of a soy product is discussed or alleged, namely soya cake "is not fed to animals as it causes their hair to fall off." Address: Chief of Dep.

90. Lewkowitsch, Julius. 1909. Chemical technology and analysis of oils, fats, and waxes. 4th ed. Entirely rewritten and enlarged. 3 vols. London: Macmillan and Co., Ltd. See vol. II, p. 122-24. [7 ref]

• ***Summary:*** The section titled "Soja bean oil (Soy-bean oil, Bean oil, Chinese bean oil)" (Vol. II, p. 122-24) gives details about the soja bean, "a plant indigenous to China, Manchuria, Korea, Japan, Formosa, and Indo-China,... The seeds contain 18 per cent of oil and about 30-40 per cent of proteins. The industry of the soja bean forms one of the most important manufactures of Manchuria and Japan."

In Manchuria, the expressed meal is made into bean cakes (Chinese *Téou-fou-tcha*) which are exported in large numbers. The Japanese make shoyu and miso from soja beans. "Efforts have been made to ship soja beans to Europe, but on account of the deterioration which they undergo on the long voyage [through the tropics and especially through the Red Sea], as also on account of the difficulty of disposing of the cakes, attempts in this direction have been abandoned."

Two tables give physical and chemical characteristics based on the investigations of: (1) Morawski and Stingl; (2) De Negri and Fabris; (3) Shukoff (from seed grown in an experimental station in South Russia); (4) Lane (who found 80.26% of liquid fatty acids).

Vol. II also discusses many other major and minor oils including: Linseed oil (p. 39-60), hemp seed oil (p. 76-77), sesamé oil (beniseed oil, gingelli oil, teel oil, p. 167-79), almond oil (p. 233-40), and arachis oil (peanut oil, earthnut oil, ground nut oil, p. 244).

Julius Lewkowitsch lived 1857-1913. Address: Ph.D., M.A., F.I.C., Consulting and analytical chemist, and chemical engineer, examiner in "soap manufacture" and in "fats and oils" to the City and Guilds of London Inst.

91. Jones, W.J. 1910. Manchurian development: The railways and the beans (Continued–Document part II). *Grey River Argus* (*West Coast, New Zealand*). Jan. 3. p. 4.

• ***Summary:*** (Continued): "The process of distribution. The bean, which is commonly known as the Sakura oil bean in South Manchuria, and the Soja bean in Vladivostock [Vladivostok], has the appearance of the wild pea. It is now principally grown in the districts from Ta-shih-chao to the immediate south of Harbin for practically the whole breadth of the country, along the Antung route, and in many parts of Korea. The Kwancheng-tzu district has the distinction of being the greatest bean-producing centre and Chang-

© Copyright Soyinfo Center 2021

chun exists entirely for and upon beans. The processes through which the crop goes after leaving the hands of the producer are particularly interesting. The beans are taken by the farmers in Chinese carts to the nearest villages and are there exchanged with the innkeepers, who are also the storekeepers, for cloth and the ordinary requirements of housekeeping, a certain percentage of the purchase-money being received in cash. The innkeepers take the beans to the larger towns, and there effect a bargain with the merchants, receiving in return supplies to replenish their stock. The merchants in their turn convey the produce to the principal distributing centres, such as Tiehling, Changchun, and there sell it to the innkeepers, who own large yards where, the beans are stored. The proportions of the business may be gauged from the fact that these yards are 20 or 30 acres in extent. The receptacles are curious bins called tuns, constructed of straw, each 120 ft high and capable holding 150 tons. The last pre-export stage of all is reached when they are sold to the local merchants in Dairen or Newchwang at so much per *dan* (480 1b). The currency in which the farmer deals is the *tiao* (equal to from 5*d.* to 6*d.*). The dealers in the ports pack their produce into gunny bags holding 187 1b, and the consignment is then ready for steamer.

"What the bean produces: The first process in the treatment of the bean is the extraction of the oil. The Chinese, with their loyalty to primitive methods, use a hand press which is not so satisfactory as the efficient machinery of the European merchants, and the latter obtain not only 6 per cent more oil, but from 3 to 4 per cent of butter-fat, which is used in the manufacture of confectionery. From 9 to 10 per cent of oil is extracted by the hand-press and 15 to 16 by machinery. The oil is of various samples, the refined article almost equalling in quality fine olive oil, while the crude article is used by the Chinese for food and lighting. From about forty-eight pounds of beans forty pounds of bean cake and between four and five pounds of oil are obtained, the extra weight being released during the steaming process in manufacture. The beans cost in Manchuria about 5*s* per picul (133 1/3 pounds). The oil is sold at 17*s* per picul and the bean cake at 2*s* 3*d* to 2*s* 6*d* per picul.

"The future of the beans: Towards the end of last season the railway carried 6,000 tons per day to the ports, and it is estimated that this year the amount will be increased by 1,000 tons daily. This looks like business and the merchants would tell you that the prospects are promising. The bean cake is an excellent fertilizer, and an inexpensive one, and might find its way in increasing thousands of tons into countries to which it has not hitherto been exported. But there are difficulties to contend with and possibilities to consider which make trading in beans somewhat of a gamble. The fluctuations in the price of silver may cause a difference in values of as much as 40 per cent in the short period elapsing between sale and delivery. There is also a lack of confidence, consequent upon there being so many rivals on the market as oil-producing seeds. These are problems which may be solved to the satisfaction of bean merchants, and if so, there is a great future for beans and their by-products in Europe and other parts of the world. So far as China and Japan are concerned it is certain that their demand will increase annually by material quantities, at any rate this would appear to be the belief of those interested in the business, judging from the extension of the area placed under cultivation."

• ***Summary:*** Mentions the molds *Aspergillus oryzae* and *Rhizopus Tamari.* Address: Botanical Institute, Tokyo.

93. Sagnier, Henry. 1910. Le soja et ses produits [The soybean and its products]. *Journal d'Agriculture Pratique* 74(1):307-10. March 10. [4 ref. Fre]
• ***Summary:*** The soybean was a curiosity in Europe until 2-3 years ago, when large amounts started to be imported. The prince A. d'Arenberg, president of the Suez Canal Society, told the National Society of Agriculture, that prior to 1908 no soybeans had passed through the Suez Canal, yet in that year 35,000 tons passed through it. It seems that the new commerce has been stimulated by the expansion of the crop in Manchuria and Korea, under Japanese influence. Most of the imports have gone to England and northern Europe. In England, the oil is used to make soaps and the cakes are fed to livestock.

Recently it was announced that the Chinese government, preoccupied with the expansion of exports, would have manifested the intention to prohibit these exports in view of preventing a shortage of soybeans in the interior of the country.

"The Chinese are now greatly expanding their efforts to make known in Europe the advantages to be gained from soya and from the products that can be extracted from its seeds. I recently had the occasion to present to the National Agricultural Society of France a study written by Mr. Liyuying [Li Yu-ying], delegate of the government of China for several missions. It was titled *Le soja, utilisation alimentaire, thérapeutique, agricoles et industrielle.* This study was accompanied by samples of yellow and black soybean seeds, and by the principal products which can be extracted from this plant: flour, bread for diabetics, cake (*gâteau*), seasoning sauce (*sauce condimentaire*), confections (*confitures*), raw milk (*lait cru*), cooked and sweetened milk (*lait cuit et sucré*), cake for livestock feed, (*tourteau pour l'alimentation du bétail*), fresh cheese (*fromage frais* [tofu]), and smoked cheese (*fromage fumé* [smoked tofu]).

"These products originated from processing imported soybeans. They have been prepared at a test factory (a photo,

© Copyright Soyinfo Center 2021

p. 309, shows the interior) set up just outside of Paris, at Vallées, near Asnières. Li Yu-ying's study gives complete details on these products" which are made from imported soybeans. This factory, named *Caséo-Sojaine*, "has been established by the agents of a civil society constituted in China under the name of *Société biologique de l'Extrême-Orient* (Far Eastern Biological Society). Made up of physicians, scholars (men of letters), and businesspeople, this society would seem to have as its principal goal/object to make known and have used in Europe the pharmaceutical and agricultural products of the Far East [East Asia]."

Note: This is the earliest document seen (May 2011) that mentions the Far Eastern Biological Society (*Société biologique de l'Extrême-Orient*)

The author concludes by discussing soymilk (*lait de soja ou lait végétal*), soybean cakes (*les tourteaux d'huilerie*), and a brief history of the soybean in France.

Illustrations (p. 308, both from Li Yu-ying 1910, p. 11-12) show: (1) Mature soy bean plant with pods. (2) Close-up of soy bean pods and seeds.

Photos (p. 309, from Li Yu-ying 1910, p. 36-38) show: (1) A partial view of the interior of Li Yu-ying's soyfoods manufacturing plant at Vallées (Seine). (2-3) Soy milk and soy flour viewed under a microscope.

94. Japan, Bureau of Agriculture (Norinsho, Nomukyoku), Dep. of Agriculture and Commerce. 1910. Outlines of agriculture in Japan. Tokyo: Agricultural Bureau, Department of Agriculture and Commerce. 132 p. March. Illust. No index. 23 cm. [Eng]

• ***Summary:*** This book was compiled to acquaint foreigners with agriculture in Japan. Company name with diacritics is: Nôrinshô, Nômukyoku. A map near the front shows Japan and its empire (incl. Korea, Formosa, Kwantung, Karafuto, and the Kurile Islands, with an inset pie chart showing the value of Japan's agricultural products). Oval photos show Japan's six top agricultural officials, including Baron K. Oura, Minister of the Dept. of Agriculture and Commerce, C. Shimooka, Director of the Agricultural Bureau, and Dr. Y. Kozai, Director of the Imperial Experiment Station.

A full-page table shows the moneys, measures and weights of Japan with English equivalents.

Contents of the first part of the book: Introduction: Geographical location, area, population, topographical position, climate. 1. General remarks. 2. Condition of farmers. 3. Condition of agricultural land.

The section titled "Upland fields" (p. 18) states: "Upland fields are those portions of land being located in high and dry places which by wanting means of irrigation could not be converted into paddy fields. The utilization of these fields is commonly made by the rotation system and crops are raised twice a year. The commonest instance is that barely, naked barely, and wheat are raised as the first crop in winter whereas soja beans, sweet potatoes and millets are raised during the summer as the second crop." The profits from upland fields are generally smaller than from lowland / paddy fields. The average yield of soja beans over the past 10 years is given in Japanese units (p. 19).

In Japan only cows and horses are kept as work animals. In 1907 Japan had 1,008,922 cows and 2,204,031 horses. But they were used more for their manure than for plowing.

A table (p. 28) shows the value (in yen) of the principal commercial fertilizers in Japan from 1905 to 1907. "Soja bean cakes" (a key source of nitrogen) is by far the largest, averaging 12.9 million yen for these three years, followed by superphosphate of lime, mixed manure, rape-seed oil cakes, herring cakes, bone dust, and cotton-seed oil cakes. Note 1. This is the earliest English-language document seen (July 2016) that uses the term "cotton-seed oil cakes" (plural or singular) to refer to cotton-seed cakes.

A table (p. 37) gives the cultivated area (in 1,000 *cho*) of major Japanese crops in 1887, 1892, 1897, 1902, and 1907. In 1907 rice had by far the largest area (2,906), followed by naked barley (694), barley (658), soja bean (471), wheat (444), mulberry tree (390), sweet potato (288), Indian millet (202), rape seed (143), small red bean ([azuki], 135). Soja bean area remained almost unchanged between 1887 (466) and 1907 (471).

A table (p. 39) gives average yield (in *koku/tan*) of the same major Japanese crops for the same years shown in the previous table. Yield of soja beans rose from 0.698 in 1887 to 0.777 in 1907. Since 1 *koku* = 4.963 bushels and 1 *tan* = 0.245 acres, the 1907 yield is 15.74 bushels/acre.

A table (p. 40) gives the production (in 10,000 koku) of the same major Japanese crops for the same years shown in the previous table. Production of soja beans rose from 325 in 1887 to 366 in 1907. Since 1 *koku* = 4.963 bushels, and 10,000 *koku* = 49,630 bushels, then 366 *koku* is 18.164 million bushels. The next table (p. 42) shows the value (in yen) of each of these agricultural products in 1905-07, and a table (p. 46) compares the cultivated area of each of these crops with rice; soja beans are 16.2% of rice.

In the section on "Food crops" (p. 47+) is a detailed discussion of each. Concerning "Soja bean" (p. 50-51) we read: "The use of this bean is extremely extensive since they are used for the purpose of supplying to the people low priced starchy food by being made into *miso* (pea cheese), soy, *tofu* (bean curd), and other food-stuffs required by the Japanese. The residue obtained from making these food-stuffs from the bean is used for the purpose of feeding cattle or of pressing oil while as manure it is highly valued. Soja bean is easily cultivated requiring less amount of manure and labour. It is therefore cultivated all over the country and occupies the principal position among summer crops of upland fields. Within recent years the demand for it has considerably increased at home and also the export of various food-stuffs prepared out of bean has shown some increase so that no small amount of bean is imported either

© Copyright Soyinfo Center 2021

from China [Manchuria] or Korea. The amount imported actually reaches 10,000,000 *yen.* Over and above these, the import of bean cakes is approximately figured at 20,000,000 *yen* so that the domestic output has somewhat been affected."

Also discusses: Barley and naked barley. Indian millet, Barnyard millet and sorghum. Small red bean [azuki] ("A large amount of small red bean is used as a material for cakes [confections], Hokkaido being the principal producing district." p. 51). Flax and hemp. Green manure crops, incl. *genge* (*Astragalus sinicus, umagoyashi* (*Medicago denticula*)), soja beans, etc.

Note 2. This is the earliest English-language document seen (March 2006) that uses the term "small red bean" to refer to the azuki bean.

Chapter 4, titled "Animal industry and poultry" (p. 69+) contains many statistics which may be of interest to vegetarians. Japanese traditionally ate fish rather than meat. "Even at present, the amount of meat consumed per capita a year does not exceed 1.7 pounds while that consumed in America is 150 pounds and in England 118 pounds per capita." etc.

Page 70 contains 4 tables with statistics about the number of cattle, horses, swine, sheep and goats, from 1897 to 1907. The number of slaughter houses decreased from 2,163 in 1897 to 938 in 1907. During this same period the number of slaughtered horses increased from 41,049 to 65,655 and the number of slaughtered swine increased from 107,034 to 177,351.

Note: An excellent history of meat eating in Japan, by Zenjiro Watanabe, is available online at http://www.kikkoman.co.jp/kiifc/foodculture/pdf_09/e_002_008.pdf.

In 1906 the government perceived the necessity for developing a poultry industry in Japan so it established a poultry plant as a branch of the Imperial Stock Breeding Farm in the suburbs of Tokyo (p. 75).

A table (p. 85) shows imports of principal agricultural products (quantity and value) each year from 1906 to 1908. Imports of soja beans increased from 286 to 352 (x 10,000 piculs) during this period, while imports of [soja] bean cake increased from 433 to 776. Both were imported mainly from China. However "the output of *soy* [sauce] and *miso* made of soja bean is exported to the amount of 1,200,000 yen, while bean cake forms the principal fertilizer in Japan" (p. 86).

Page 95: The Imperial Agricultural Experiment Station, with its headquarters near Tokyo, under the direct control of the Minister of Agriculture and Commerce, "originated in 1886 and the system was practically completed in 1893." Address: Tokyo.

95. Brenier, Henri. 1910. La question du soja [The soya question]. *Bulletin Economique de l'Indochine* (*Hanoi*) 13(83):105-28. March/April. Series 2. [22 ref. Fre]

• ***Summary:*** This is an in-depth look at the relevance of the soybean to France, both now and in the future. It is prompted by the rapid growth of soybean imports to Europe from Manchuria. The author has a good knowledge of the literature on soybeans and a familiarity with the crop in the field in French Indochina and China.

Contents: 1. Soybean cultivation: Species and varieties, major soybean producing countries (China, Japan, Korea, Indochina), other countries (Java and the Dutch East Indies, France, USA. The Imperial Institute of London is conducting trials in the Cape of Good Hope and Natal [South Africa], in British West Africa, and in Gambia), methods of cultivation and yield. 2. Commerce: Exports of soybeans and soybean cake (beancake, *tourteaux de soja*) from China and especially Manchuria (Newchwang, Dairen/Dalny, Antung, Ta tung kow, Suifenho {Suifenhe / Sui-fen-ho}), importing countries in 1908 in descending order of amount imported (Russian ports on the Pacific [Vladivostok], for re-export to Europe). Exports. Prices 3. Soybean utilization: Chemical composition, use as a forage plant and for improving the soil, use in human foods (tofu, shoyu, Worcestershire sauce, tuong [Annamite soy sauce], miso, natto, soymilk), the soybean as an oilseed (yield of oil from various oilseeds), soybean cakes. Conclusions.

Page 109 discusses soybeans in Indochina, according to information received from M. Crevost, Curator of the Agricultural and Commercial Museum of Hanoi, and from the article by Bui-quang-Chiêu (Dec. 1905). The names of the soybean are different in the various parts of Indochina. In Cochin China (especially in the provinces of Chaudoc and Baria), in Annam (sporadically), and in Tonkin it is called *dau-nanh* or *dau-tuong* (*Tuong* is a sauce made with soybeans, described later under "Uses"). In Cambodia (*Cambodge*) it is called *sandek sieng.* The variety most widely cultivated in Indochina seems to be one with a yellowish-white color, more oblong than round, a little flattened (*soja platycarpa* of Harz [1880, 1885] (?)), different therefore from the fine (*belle*) varieties of Manchuria and Japan that are well rounded and pure yellow.

A table (p. 112) shows soy bean grain exports (in 1,000 metric tons) from different Manchurian ports for the years 1905-1908. The author notes that Indochina could be exporting soybeans to France. One factor that stimulated the large exports of soybeans from Manchuria in 1908 (besides an excellent harvest in 1907) was a program to suppress the cultivation of opium by expansion of soybean acreage (p. 113). The author uses the scientific name *Phaseolus radiatus* to refer to the *petit haricot vert* (probably mung bean). He observed soybeans planted in mixed culture in Szechuan.

Page 115: In 1908 tables show total exports to foreign countries were as follows: Soybean seeds (*Soja en graines*)*:* 285,180 tonnes (metric tons). Soybean cakes (*Tourteaux de soja*)*:* 469,800 tonnes. Total: 754,900 tonnes, worth 78 million French francs.

Page 115: In 1908 official statistics are first given for exports to Europe (in tonnes): Great Britain 69,200, France

© Copyright Soyinfo Center 2021

21,390, Holland 7,290, Italy 4,140, Belgium 1,760, Germany 670, Russian ports on the Pacific [such as Vladivostok] (for reexport to Europe, primarily to England it seems) 100,000. Total: 204,440 tonnes.

Page 116 notes that the rise of soybeans in Manchuria is due in part to the power of the Japanese commercial house Mitsui Bussan Kaisha and the large English oil mills, which joined to develop an industry that had not previously existed. At the end of 1906, Mitsui, which had a dominant commercial role in Southern Manchuria, sent one or two trial shipments of soybeans to England. Mitsui was followed mainly by the British trading houses (Samuel & Samuel, Jardine, Matheson), then by the Germans (Otto Reimers, Arnhold Karberg & Co), and the Russians. Continued suppression of opium growing led to further expansion of soybean cultivation.

A table (p. 117) gives the price of soybeans (per picul of 300 catties = 180 kg), soybean cake (per 10 cakes of 53 catties each or 318 kg for the 10), and soybean oil (per picul of 100 catties = 60 kg) in New chwang [Newchwang] taels and in French francs in the average year from 1882-1891, and in the year 1897. Prices were up in 1897.

Page 124 states: "A factory was recently founded near Paris (at Saint Germain en Laye), with Chinese capital, for the preparation of a series of products derived from soya: milk, *"caséo-sojaïne,"* cheese [tofu], sauce, and sweet soya preserves (*confiture* (*?*) *de soja*)*."* A footnote states: "I owe this curious piece of information to the amicability of the secretary of *Ecole française d'Extrême-Orient,* Mr. Ch. Maybon, who pointed it out in the January 1910 issue of the *Bulletin de l'Association amicale franco-chinoise.*

A table (p. 125) shows that the soybean gives the lowest yield of oil of all major oilseeds: copra (from coconut) yields 67-70% oil, sesame seeds 50-56%, poppy seed (*pavot*) 43-50%, castor oil plant 42-50%, rapeseed (colza) 42-45%, linseed 43%, peanuts 35-47%, cottonseed 21-26%, soybeans from Manchuria 16-18%.

Note: This is the earliest document seen (March 2000) that describes *caséo-sojaïne* as a product. Yet this may well be a mistake since its source of information is given as *Bulletin de l'Association Amicale Franco-Chinoise* (Jan. 1910)–which uses the term to refer to a business name. Address: Inspecteur-Conseil des Services Agricoles et Commerciaux de l'Indochine.

96. *Times* (*London*). 1910. The soya bean: Its importance in Manchuria. July 19. p. 63, col. 4.

• ***Summary:*** This is part of a 96-page Times Supplement on "The Empire of Japan." Contents: Introduction–The bean trade in Manchuria. Its introduction to European markets. The growth of exports. The home consumption remains large. Efforts to secure foreign markets. A word of caution. The trade in England (Total: 2,500 words).

"The history of the growth of the bean trade in Manchuria is as captivating as the story of the rise of Jack's famous beanstalk of our nursery days. It reads more like a fairy tale than a page from the Board of Trade Returns. Only after one has travelled through the region where the Soya bean reigns supreme, and has seen the wharfs and the warehouses, the stations and the platforms laden with bags of beans, and noted the thousands of queer looking stacks with pagoda-like roofs with which the country is dotted, and that serve as temporary storehouses for the produce whilst awaiting shipment, does one realize that it is not a fable, but a veritable fact in the history of international commerce. Nevertheless, more than the ordinary amount of imagination is required to grasp the fact that the first commercial consignment of soy beans was sent to Europe in 1906 and the requirements for the coming season are estimated at a million tons. At the minimum price of £6 10*s.* per ton, this means a business of £6,500,000, or something like 70 millions of silver dollars. That an industry of such vast proportions should at a time like this spring up in a few years indicates that all the opportunities of commerce are not closed to those who have courage and foresight enough to search for new openings for trade.

"Its introduction to European markets: The development of the Soya bean is of such recent date, and has been so intimately connected with Japanese enterprise, that a few facts in regard to its rise and progress may be of interest in this issue of *The Times.* The credit for the introduction of this useful article of commerce is undoubtedly due to Messrs. Mitsui and Co., the well-known Japanese financial and industrial firm, who sent their first trial shipment of beans to England in the winter of 1905-06. This consignment was not successful owing to imperfect packing. A second shipment met with better results and led to a succession of large orders. The beans were found to be valuable both for the extraction of oil and also in the shape of cake for feeding cattle."

Note 1. This is the earliest document seen (March 2021) stating that Mitsui and Co. sent soybeans to Europe in 1906.

"Excellent biscuits have also been made out of one variety of these beans. The United Kingdom was at once able to take advantage of this newly-found import because of its admission free of duty, the high tariff on such produce precluding the Soya beans from access to Germany, France, and other Continental countries. So great was the demand that by the end of the season of 1908, the Mitsui Company had exported to Europe 200,000 tons of these beans, and both this concern and the Yokohama Specie Bank, operating in conjunction, are said to have made very handsome profits on these transactions. In the season of 1909 the sales to Great Britain alone are stated to have reached 400,000 tons and several other important firms have entered the field, including the well-known firm of Samuel Samuel and Co. The Liverpool Chamber of Commerce estimates the consumption value of a ton of these beans in London at £6

© Copyright Soyinfo Center 2021

10*s.*, and a British Consular report concludes that England alone will in the future be able to take one million tons of beans annually.

"The growth of exports: However this may be, figures supplied me by Messrs. Mitsui give the total exports for the season of 1908-1909 (from the three ports of Dairen, Newchwang, and Vladivostok) at 788,916 tons and of bean cake (94 per cent. of which went to Japan) at 681,446 tons. Of the beans, 397,156 tons, or 51 per cent., went to Europe, 30 per cent. to China, and 19 per cent. to Japan. That the export of these beans continues to increase is shown from some data furnished to me when in Japan by the Statistical Department of the South Manchuria Railway Company, which indicate that for the year ended March, 1910, the export of beans from Dairen reached 622,000 tons, and that of bean cake 22,000 tons. These figures show that the export of the first consignment of beans to England in 1906 has secured for Manchuria an extensive international trade. The same authority estimates the bean crop 'of all kinds' in Manchuria for the year ended November, 1909, at 1,700,000 tons and the supply of bean cake at 900,000 tons.

"The home consumption remains large: Whilst the Soya bean has thus suddenly come into international fame, its uses and virtues have long been known in the Far East. The oil of the bean has been used throughout China as an article of food and for other purposes. The cake is valuable as a fertilizer for rice and sugar cane fields, and the figures given above show the enormous quantities of the cake exported to Japan, a country which, according to Government estimates, is obliged to spend £12,000,000 annually on fertilizers of various kinds. In Manchuria the Soya bean is primarily used for the extraction of oil and for the manufacture of cake; it is also made into vermicelli and similar articles of food. Manchuria seems to have a natural monopoly in the growing of this bean for export. The other producing countries, Japan and Korea, require all they are able to raise for domestic consumption, whilst the production of the French possessions in Asia, of Asia Minor, and of West Africa is said to be neither large nor promising enough to be of much account for export. Down to the present time, the Soya bean has not been successfully produced elsewhere, though experimental efforts to grow this particular bean in other parts of the world are in progress."

Note 2. This is the earliest document seen (March 2021) suggesting that soybeans may be growing or have been grown in Asia Minor [which is today the large eastern part of Turkey], or the Middle East. A similar and earlier, but weaker, suggestion appears in an article titled "The Ubiquitous Bean," in the *Manshu Nichi Nichi Shinbun* (Dairen) of 25 Nov. 1909. That article states that "Asia Minor... produced something like Beans" [perhaps Soya Beans]. Continued.

97. *Times* (*London*). 1910. The soya bean: Its importance in Manchuria (Continued–Document part II). July 19. p. 63, col. 4.

• ***Summary:*** Continued. "Efforts to secure foreign markets: The Treaty Port of Manchuria half a century ago began the exports of beans, bean oil, and bean cake. It is strange that the potency of the little green bean–it looks more like a dried pea than the bean grown in England–which is furnishing three railway systems with freight, hundreds of vessels with cargoes, three ports with business, and starting up new industries in the North of England should have remained so long undiscovered by Europeans. Even now its advantages appear to have been forced upon the attention of England by a Japanese merchant who, failing his first efforts, made a second attempt to introduce the Soya bean into Europe.

"These beans raised by industrious Chinamen toiling incessantly for a few pence a day are generally brought to the river in carts and shipped in junks in the summer time, while in the winter they are often brought for miles along very bad roads by cart to Newchwang.

"After the building of the railways it was natural that these exports should gravitate more and more to the maritime outlets of these lines at Dairen, Vladivostok, and, to a lesser extent, to Newchwang, which last port, as will be seen in an article elsewhere in this issue, is still receiving the bulk of its consignments by means of junks and by carts. The Newchwang exports consisted of oil and cakes which were manufactured by the aid of numerous crude Chinese oil presses worked with mule power–the oil going to China and the cakes to Japan.

"As soon as the bean assumed an international importance, Newchwang lost its monopoly of the trade. As recently as 1907 almost all the beans available for export–namely, 120,000 tons–were exported *via* Newchwang. Of the 800,000 tons exported last year half went by way of Dairen, and the remainder from Vladivostok and from Newchwang. In the export of bean cake Newchwang still holds the first position because of her numerous Chinese oil presses, together with one modern factory. Extensive up-to-date factories capable of extracting a greater percentage of oil are however being established–of these, two are at Dairen–and unless Newchwang shows more enterprise than one observes in a visit to the city, she will soon lose the first place in the bean cake trade.

"The quantity of oil in the Soya bean varies from 16 to 17 per cent., and by some chemical processes I believe even 19 per cent has been extracted. Of course nothing like this amount is obtained even in the excellent mills which I visited at Dairen. To what extent the extraction of practically all the oil would impair the value of the cake as a fertilizer is difficult to say. These are questions which will have to be dealt with in the future. For the present, the industry is still in its infancy, so far as the application of applied chemistry and modern methods are concerned.

"A word of caution: In case the story of the rise of the

© Copyright Soyinfo Center 2021

Soya bean industry should prove too alluring to British merchants of a speculative turn of mind, and not provided with a knowledge of the methods of doing business in the Far East, it may be well to mention that it would be quite useless to start an office at some point like Dairen or Changchun in order to buy beans in the local market. The only way is to travel into the interior, to visit the country markets and to buy in small quantities for silver coins of low value, that is, 20 or ten cent pieces. The Chinese silver dollar is only worth 85 *sen* Japanese money, or 1s. 9d. [1 shilling, 9 pence], and 5 of the 20 cent silver pieces are worth about 2½*d.* less than the Mexican or Chinese dollar. The Japanese by purchasing the beans with the little silver coins obtain them cheaper than would be possible for an English firm which was paying for them in silver dollars. For some unaccountable reason, the Chinese producer prefers the small coin though its value is 10 per cent. less. This is not generally known, for one naturally assumes that ten 10 cent silver coins or five 20 cent coins make equally one silver dollar–but I discovered that such was not the case in the bean district of Manchuria.

"The trade in England: The soya bean now constitutes an important part in the Hull import trade, and has provided a new source of revenue for the shipping industry. It is estimated, indeed, that already the cost of the freight to British ports has reached over a million sterling. The imports into Hull last year were about 200,000 tons. Good judges are of opinion that the rapidly increasing import trade into Europe must ultimately have a serious effect upon the seed industry, and is likely to particularly affect the imports of cottonseed.

"The bulk of the soya beans imported into Hull are the yellow beans, and those engaged in the seed trade in the Hull district have a good opinion of the new bean. It is to the cattle grower, rather than to the oil trade, that the advent of the soya bean into this country is of importance, for the cake is cheaper than cottonseed cake and is at the same time richer in those constituents for which cake is used. The value of soya oil is also being widely recognized by soap manufacturers, and there is a notable tendency to employ it in preference to cotton oil.

"The beginnings of an export trade from Hull with the Continent are now in evidence. A considerable quantity of soya cake has already been exported from Hull, and if some further reduction in the price of the cake could be brought about a large export trade would undoubtedly be created. Continental dairy farmers are now employing soya meal, with which, apparently, experience has been quite satisfactory. Inquiries made at Hull show that the mills have had their capacity severely taxed by the advent of the soya bean, and imports during the present year have been on a constantly growing scale. With the breaking down of the prejudice of British farmers, which is gradually coming about, a real boom in the soya bean trade would appear to be imminent."

98. Crowe, E.F. 1910. Japan. Report for the year 1909 on the trade of Japan. *Diplomatic and Consular Reports, Annual Series* (*Foreign Office, Great Britain*) No. 4511. 86 p. July.
• ***Summary:*** "Imports of manures.–The question of manures forms one of the most interesting items of 1909. A detailed table showing the quantities and values imported during the past three years will be found in Table 1 (B), page 61. Bean cake, of course, heads the list as regards value. The total amount imported in 1909 was 575,180 tons, worth £2,283,700, or £3 19*s.* 4*d.* a ton, as compared with 461,950 tons, worth £2,220,000 in 1908, or an average of £4 16*s.* 1*d.* a ton.

"Next comes the sulphate of ammonia, but in this item there was a big drop from 66,445 tons, valued at £898,000, to 45,835 tons, worth 604,700, while in the case of both phosphate rock and fish guano there was a decrease of about £100,000. Nitrate of soda made a small gain.

"It is a well-known fact that bean cake has for years occupied the position of the most popular imported fertiliser in Japan. Now, however, that the United Kingdom, and the Continent of Europe and America to a lesser extent, have become purchasers of Manchurian beans the questions arises as to whether Japan will be able to continue to buy bean cake in huge quantities if the price rises appreciably. In studying this question two factors should not be lost sight of; one is that Japan is herself a large grower of soya beans, having, according to the latest available returns (1908) over 1,200,000 acres under cultivation, producing annually some 19,000,000 bushels of beans, while the other is that Japan imports very large quantities of soya beans from China and Corea [Korea].

"The greater part of these beans is used for the purposes of human food, *i.e.*, the making of "soy," "miso," and bean curd, but a portion, by no means small, is used also as a fertiliser.

"The Russo-Japanese war had such an effect in curtailing the supplies of beans and cake that to arrive at a just appreciation of the position it is necessary to go back a good many years." A table (p. 18) shows imports of [soy] beans and bean cake (in piculs; 1 picul = 132.27 lb), the value of each, and the average price of silver each year from 1900 to 1909. Imports of [soy] beans increased from 1,575,022 piculs in 1900 to a record 3,623,377 piculs in 1909. Imports of bean cake increased from 2,280,687 piculs in 1900 to a record 9,663,036 piculs in 1909. The average price of silver fell by about 16% during this period. "Should the price in future be forced up very high in consequence of British and other demand, the presumption is that Japan would turn to sulphate of ammonia if the cost per unit of nitrogen therein were to be less than in the bean cake. On the other hand it must be remembered that the removal of duty on sulphate of ammonia in the United States of America means that that country will probably absorb large quantities

© Copyright Soyinfo Center 2021

of the British output and that Japan will have to pay a bigger price if she wants a share of this fertiliser.

"Thus the outlook for nitrate of soda becomes a good deal brighter and now that, owing to the subsidised Japanese line which runs to South America, it is possible to get cheap direct rates of freight, it looks as though the nitrate of soda will be a serious competitor to the other nitrogenous fertilisers, except in the matter of wet rice cultivation."

Page 31 shows the shares of principal countries in the import and export trade of Japan during the years 1908 and 1909. Japan's biggest imports came from the United Kingdom, followed by the USA, then China. The biggest customer of Japan's exports was the United States, followed by China then France (p. 31). Japan's biggest port (in terms of value of imports and exports) was Yokohama, followed by Kobe than Osaka (p. 37). Japan's population at the end of 1909 was estimated at 49,769,704 (not including Formosa or Karafuto [Japanese Sagalien]). Japan's most valuable exports in 1909 were tea, followed by rice then fish. Exports of "Soy" [sauce] rose from £110,500 in 1907 to £111,100 in 1909.

Summarized in *J. of the Board of Agriculture* (*London*), Aug. 1910, p. 410.

Note: This is the earliest document seen (Oct. 2017) that gives statistics concerning industrial utilization of soybeans–in this case soybean meal used as a fertilizer in Japan. Address: Attaché, British Embassy, Tokio [Tokyo].

• ***Summary:*** [Subtitle in Dutch:] Enrichment for Exploitation at a Trial Dairy Farm in Horn [a town in the Netherlands]. Report from 1909. (*Bereeiniging tot Exploitatie eener Proefzuivelboerdrij te Horn. Verslag over het Jaar 1909**) (* Footnote: The plan for these experiments was designed by Dr. K. H. M. von der Zande and the trials were also carried out at the beginning under his leadership.)

For several years, a concentrated feed has experienced strong sales on the feed markets. It is obtained from the soybean (*Sojabohne*), which is native to East Asia: the so-called "soybean cake" (*Sojakuchen*). As a result of its low price with a high content in nutritional components, it has found its way specifically into the fodder for dairy cows. For that reason, it has been suggested to study the influence of these feed cakes on the milk yield and on the qualities of the butter and cheese.

"The soybean (*Glycine L., Soya hispida*), which is native to East Asia, thrives in Japan and China as well as on Java and in British India, and it is occasionally also found in Europe and North America. While those with a good knowledge of this plant differentiate more than two hundred varieties of it, among which are found seeds with every sort of color, in China and Japan only two or three varieties of this bean are planted at the agricultural level. In recent years, the cultivation of this crop has spread across nearly all of tropical and subtropical Asia. Its use is very multifaceted in Asia. When prepared in a variety of ways, it serves as a food for humans, in a certain preparation as the soy sauce (*Sojasauce*) which is esteemed everywhere as a seasoning for dishes, and finally the famous plant cheese [probably tofu] of the East Asians is prepared from it. During the Russo-Japanese War, the soybean first and foremost made it possible for the Japanese administration to feed the men and the horses. On the part of some, the soybean was recommended as a food for those with diabetes because of its low starch content. But the most distinguished use that is made of this crop is the obtaining of oil. The fat content amounts to between 13 and 26 pct., with an average of 19 pct. Incidentally, in moderate latitudes the fat content appears to be lower than in the hot zone. Otherwise, the average composition of the soybean is as follows: 10 pct. water, 33 pct. protein, 5 pct. ash, 4.5 pct. cellulose, and 27.5 pct. carbohydrate.

With regard to the preparation of oil, the soybean currently forms an important export article for East Asia. Last year in Vladivostok, the price amounted to 4 [British] shillings 8 pence for 50.8 kg. In England, the price for 100 kg of beans amounts to approximately 13 [German] marks. The primary export is directed toward England, but other European countries also already receive important quantities. When the oil has been pressed out of the beans, approximately 7 pct. fat remains behind in the cakes. Upon extraction with a fat-dissolving agent, such as petroleum ether, the so-called "soybean meal" (*Sojamehl*) is obtained with approximately 2 pct. fat content. The oil serves various

© Copyright Soyinfo Center 2021

purposes, but principally for the preparation of soap. Even in its homeland, above all else in Manchuria, it seems that the beans are used primarily for the obtaining of oil. The cakes serve as livestock feed there, but also as fertilizer in tea plantations or as export to Europe, where they of course frequently arrive in spoiled condition. England imports such large quantities (150,000 [metric?] tons in the last two years) that the Japanese government has had its attention drawn to this export article and has ordered the building of large oil mills in Manchuria and Korea. For that reason, the transport of such overseas soybean cakes (*Sojakuchen*) ought to already multiply greatly in the coming period. It can only be hoped that with the shipping, greater care is used than has been thus far. According to its chemical composition, soybean cakes are approximately at a level with sesame cakes in terms of the ranks of the best concentrated feeds. According to Nils Hansson (*Värdet af Sojakakor och Sojamjöl vid Utfodringen af Mjölkkor* [The Value of Soybean Cakes and Soybean Meal with the Feeding of Dairy Cows], Stockholm 1909), the average composition is 11.1 pct. water, 43.3 pct. crude protein, 6.1 pct. crude fat, 34.0 pct. carbohydrate, and 5.5 pct. ash, while as the average of 25 analyses in 1909 at the trial station in Hoorn [a town in the Netherlands], the following figures were found: 12.7 pct. water, 40.6 pct. crude protein, and 7.7 pct. crude fat. O. Kellner found the nutrients in soybeans in Japan to be digestible as crude protein at 89 pct., crude fat at 90 pct., carbohydrates at 69 pct., and cellulose at 36 pct. If the digestibility of the nutrients in the cakes is reckoned as being the same as that of the beans, and if a reduction factor for the digestion work is assumed to be 98 pct., then according to the Dutch analyses, soybean cakes contain: 36.1 pct. digestible protein and 6.9 pct. digestible fat. And according to the Swedish studies, they contain 23.5 pct. digestible starchy components, from which a starch value of 71.8 pct. results, while Kellner indicates a starch value of 71.8 pct. for linseed cakes and 77.5 pct. for peanut cakes. It can therefore be assumed that soybean cakes possess approximately the same fodder value as linseed cakes, provided that they do not differ through specifically favorable or unfavorable effects.

As far as the value of soybean cakes is concerned as fodder for dairy livestock, trials were carried out in Ungarisch-Altenburg [today's Mosonmagyaróvár, Hungary] in which those cakes were compared with malt sprouts. The result of these trials was that more milk was obtained from the soybean cakes, and on top of that, it was of a better quality. These trials, which were not very detailed, provided the impetus at the last annual meeting of the Association for the Support of a Dairy Farming Trial Station (*Vereinigung zur Unterhaltung einer milchwirtschaftlichen Versuchsanstalt*) in Hoorn to set up detailed studies on the value of soybean cakes as fodder for dairy cows in comparison to the linseed cakes that were most common.

At this point, we will pass over the very comprehensive analysis material of this work that comprises seventy pages of reports. And we will limit ourselves to providing the results that were achieved with the group feeding of ten selected cows that were each of the same variety with regard to the content of the milk and the quality of the butter and cheese that were made from it. The trials were divided into three periods: the pretrial period, the trial period (equal to the main period), and the post-trial period.

During the actual trial period from January 10 to March 28, the cows of Group 1 received 3 kg of soybean cakes instead of 3 kg of linseed cakes that they had received up until then, while the cows of Group 2 continued to receive the same quantity of linseed cakes. Since the soybean cakes were just as gladly received by the cows as the roughly broken-up linseed cakes, the transition to the main trial began after a short pretrial period from January 3 to 10.

The Total Yield of the Two Feed Groups of Ten Cows Each

During the entire duration of the trial, the state of health of the cows was excellent, and disorders that were caused by the soybean cakes as had supposedly been observed at other locations did not appear. A laxative effect that has been ascribed to the oil could not be perceived. With the soybean group (*Sojagruppe*), the manure in general did in fact appear to be somewhat softer than with the linseed cake group, but it was only in one week that the barn attendants noticed thin manure only with the soybean group. That may perhaps be in relation to the fact that extremely moldy hay had to be fed which, in connection with the soy oil (*Sojaöl*), caused the mild diarrhea.

[Note: A series of tables follows comparing the group of cows fed only with linseed cakes and the group transitioned to be fed with soybean cakes, providing the raw data and then the conclusions from those data. The tables compare average daily milk yield, drop in milk yield over the course of the trial, a statistical analysis thereof, the total yield in milkfat and dried substance, the drop in the yield of fat over the course of the trial, the statistical analysis thereof, the average fat yield, the average daily yield in dry substance, the drop in the yield of dry substance over the course of the trial, and the statistical analysis thereof. On the whole, the tables indicate lower yields with the cows in the soybean cake group.]

[Conclusion drawn from the last table:]

The same difference exists here as with the milk yield by quantity, namely, a greater inclination of the soybean group to a reduction with respect to the pretrial and post-trial periods, while during the first half of the main period, this group provided more dry substance than the linseed cake group. A loss of 0.4 pct. can be reckoned with for the soybean cake feeding (*Sojakuchenfütterung*) in comparison to the linseed cake feeding.

(Conclusion to follow.) Address: Horn Society for Experimental Dairy Farm Operation, Netherlands.

101. *Nature* (*La*) (*Paris*). 1910. Fromages végétaux [Vegetable cheeses]. 38(2, Supplement):134. Sept. 24. [Fre]
• ***Summary:*** A vegetable cheese is prepared from potatoes by the peasants of Saxony and of Thuringia [both in eastern Germany; Sachsen and Thueringen in German]. The "natto" of the Japanese (*Le "natto" des Japonais*) is made from soybeans. This type of beans (*haricots*) is boiled for about 5 hours then placed in little packets of straw. The packets are placed in a cave, in the middle of which a fire is lighted. The cave is closed and after 24 hours the little cheeses are ready to eat. Since the soybean contains a rather large quantity of legumin, or vegetable casein, natto is rich in nitrogen, the same as real cheese (it contains 7.3 to 7.5% nitrogen).

"The truth requires us to close by adding that we have tried to make these cheeses [natto] without complete success. The natto is easy to prepare, contains the usual quantity of nitrogen, and has a suitable consistency. But it may be because we used seeds imported from Korea, that is to say rather old ones, that it has a very strong flavor, like (by the way) the soybean itself, that a European palate would not be able to tolerate." Address: France.

102. Takahashi, Teizô. 1910. Yamasa Shoyu Jozosho (The "Yamasa" brand soy brewery.) Main office: Choshi, Chiba Prefecture (Document part). In: Japan's Industries: And Who's Who in Japan. 1910. Osaka, Japan: Industrial Japan. vi, iii, 687 p., iv p. See p. 156-58. Undated. Translated from unpublished Japanese manuscripts. 29 cm. [Eng]
• ***Summary:*** "History: The Hamaguchi Soy Company, which was formed in 1906, with a capital of ¥500,000, is the continuation of a very old firm founded 265 years ago [i.e., in about 1641] by the brothers Kichiyemon and Gihei Hamaguchi, ancestors of the present Mr. Kichiyemon Hamaguchi, the proprietor of the firm. These two brothers, natives of what is now Wakayama Prefecture, settled down in Chôshi, and opened a soy brewery, which has gone on progressing from that day to this. In 1825, the Yamasa brand was one of those accorded the privilege of being called 'The Best Soy' by the Tokugawa Shogunate.

Note: This is the earliest document seen (Feb. 2012) which states that a brand of soy sauce named Yamasa existed as early as 1825. The name of the company that makes this brand is not clear. Nor does this article state when the present company, Yamasa Shoyu Jozosho, was founded. We believe this company was founded in 1928.

"Mr. Goryo Hamaguchi, the father of the present proprietor, after a visit to Europe and America, in 1833, introduced some radical changes in the brewing of soy in his brewery, by an application of the most scientific principles. Mr. Kichiyemon Hamaguchi, the present head of the firm, continued the same enterprising policy of his father, and the business began to extend very much in consequence. In 1894 the firm was appointed supplier of soy to the Imperial Household by special warrant. On being transformed into a partnership concern, the business of the firm increased considerably, while experts were engaged to conduct scientific investigations. Dr. Kendo Saito, the well-known scientist, was entrusted with the study of soy fermentation.

"At present the firm owns two breweries, installed with steam plants, and employing over 600 hands. The annual output is approximately 8,000,000 gallons. Tokyo, Yokohama, and other large business centres, consume great quantities of the 'Yamasa' brand, and much of it is exported to Great Britain, the United States, Germany, Australia, China, Korea, Hawaii, and Vladiovstock. The soy which goes abroad is contained in bottles of artistic appearance, well packed in boxes. The Hamaguchi Company was the pioneer in the export trade of soy, this being due to Mr. Goryo Hamaguchi's tour in 1883, when he made a special study of the foreign taste for the Japanese sauce.

"As above mentioned, 'Yamasa' brand soy is supplied to the Imperial Household by special warrant. A great honour was done the firm when His Highness Prince Kan-in, the President of the Fifth National Industrial Exhibition, paid a visit of inspection to the brewery. In 1907 their Imperial Highnesses, Princes Kitashirakawa and Higashikuni went over the brewery, and made some observations highly complimentary to the proprietor. In the same year a further honour was done the proprietor, when he was appointed supplier of 'Yamasa' soy to His Imperial Highness the Crown Prince of Korea.

"Space does not permit of a full list of the prizes won by the company at various exhibitions. 'Yamasa' brand soy was awarded a first prize at every one of the five National Exhibitions which have been held in Japan. Abroad, either a gold medal or the Grand Prix was awarded at each of the following Exhibitions: Chicago [Illinois / Columbian] International Exposition, 1893; Paris International Exhibition, 1899; The Asia Exhibition (Hanoi, French Indo-China), 1903; St. Louis [Missouri] International Exposition, 1904; Milan Exhibition [Italy], 1905; and Seattle Exhibition, 1909.

"Mr. Kichiyemon Hamaguchi, the President of the company, was born in Wakayama Prefecture in 1862, and was educated at Keio University. In 1900 he made a tour round the world, and since his return has done much to assist in extending the nation's commerce and industry. In order to enlarge his business he converted it into a company, and owing in great part to his energy and enterprising spirit, the company has proved a conspicuous success. Indeed, the whole soy industry has profited by his labours. A gentleman of excellent character and reputation, he has sat in both Houses of the Legislature. Mr. Hamaguchi has been ably assisted in his work by Mr. Kichibei Hamaguchi, a director, and Mr. Tetsujiro Midzushima, the superintendent of the works, as well as by an industrious and efficient staff."

Angled aerial view of "The 'Yamasa' Brand Soy Brewery;" smoke rises from two tall smokestacks. Address: PhD in Agriculture (*Nogakuhakushi*), Prof. at Tokyo Imperial Univ., Japan.

103. Takahashi, Teizô. 1910. Higeta Shoyu Jozosho (The "Higeta" brand soy brewery.) Main office: Choshi, Chiba Prefecture (Document part). In: Japan's Industries: And Who's Who in Japan. 1910. Osaka, Japan: Industrial Japan. vi, iii, 687 p., iv p. See p. 152-53. Undated. Translated from unpublished Japanese manuscripts. 29 cm. [Eng]

• ***Summary:*** History: The 'Higeta' is one of the brands of soy made in Choshi. The concentrated kind of soy from which it is derived was first brewed in the second year of Genna (1616) by a brewer named Gemba Tanaka. After the quality had been greatly improved, a new variety of the brand was made in the second year of Bunsei (1819), known as 'Horai.' When the metropolis was moved from Kyoto to Tokyo in 1868, the firm was honoured by being appointed supplier of soy to the Imperial Household. Since then the business has greatly increased. In 1898 the firm, in conjunction with the Iwasaki and Hamaguchi concerns, started an experimental laboratory, under superintendence of Dr. Ryojun Tawara, and a staff of experts, in which a study was made of soy fermentation. As a result of the investigations, much improvement was effected in the quality of soy generally. In that year, 1898, the Imperial Household ordered a special supply of the 'Higeta' brand, and this fact, coupled with the improved methods of salt refining, greatly extended its sale. When the grand military manoeuvres were held in the vicinity of Kumamoto in 1902, attended by His Majesty the Emperor, an order was placed with the firm to supply the army with bottled soy; to commemorate this honour the brewer has sold bottled soy ever since.

"During the Russo-Japanese war, 'Higeta' soy was used by the Army Department for seasoning canned foods sent to the front. In 1905 a new kind of soy bottle, with a screw stopper, was made for the troops. Soy was afterwards sold to the public in this form. Since then the firm has gone on flourishing, nothing being left undone to maintain the quality of the brand, and improve it if possible.

"The firm possesses two breweries, fitted up with steam engines, and employing altogether 320 workmen. The 'Higeta' brand soy is used all over the country, especially at Tokyo and Yokohama. It goes also to the United States, Canada, Siberia, China, Korea, Hawaii, the Philippine Islands and the Straits Settlements [later Singapore], being much appreciated in all these markets.

"In addition to being suppliers to the Imperial Household, the brewer has been honoured in other ways. At the Milan Exhibition of 1906, the 'Higeta' brand, which was selected by the Japanese Department of Agriculture and Commerce as a typical soy, was awarded the highest order of the Grand Prix; besides this, the soy was presented to Their Italian Majesties by the Japanese Commissioner for the Exhibition, and they are reported to have expressed to him their high appreciation of its flavour. The following are the principal honours conferred upon the firm by various exhibitions:

"A First Prize at each of the five National Exhibitions.

"The Grand Prize at the Chicago [Illinois] Exhibition, 1890.

"A Gold Medal at the Asian Exhibition (Hanoi, French Indo-China), 1903.

"The highest Grand Prize at the St. Louis [Missouri] Exposition, 1904.

"The Grand Prize of Honour at the Seattle Exposition, 1909.

"Mr. Gemba Tanaka, the proprietor, who was born in 1871, studied political economy at Keio University. On succeeding to the business of his ancestors, he entered into his work with enthusiasm, and by his strenuous exertions did much to extend the sale of the 'Higeta' brand. Owing to the esteem in which he is held in the district, Mr. Tanaka has been elected to represent the highest taxpayers of his prefecture in the House of Peers."

A large photo shows "the interior of a Choshi soy brewery."

Note: This is the earliest document seen (April 2001) concerning Higeta Shoyu. Address: PhD in Agriculture (*Nogakuhakushi*), Prof. at Tokyo Imperial Univ., Japan.

104. Takahashi, Teizô. 1910. Kushigata Shoyu Jozosho (The "Kushigata" brand soy brewery.) Main office: Noda, Chiba Prefecture (Document part). In: Japan's Industries: And Who's Who in Japan. 1910. Osaka, Japan: Industrial Japan. vi, iii, 687 p., iv p. See p. 165-67. Undated. Translated from unpublished Japanese manuscripts. 29 cm. [Eng]

• ***Summary:*** "History: As will be seen by the accompanying articles, most of the soy brewers of Noda are distinguished by the surname of Mogi, and the family of Mr. Hichizayemon [Shichizaemon, Hichizaemon] Mogi, proprietor of the firm of 'Kushigata' brand soy is, in fact, the head and originator of all these distinguished so brewing firms of the same name. One of the ancestors of the Mogi family was a distinguished Samurai in the service of the celebrated warrior and statesman–Toyotomi Hideyoshi–and his daring and deeds of valour are matters of history. With the overthrow of the Toyotomi family he laid aside his sword and entered the field of business. It was 290 years ago that the founder of the firm, the ancestor of Mr. Hichizayemon Mogi settled in Noda as a soy brewer. His distinguished personality and lineage gained for him the deep respect of the inhabitants and he was appointed the headman of the place, thus being called upon to engage in public business as well as his own. At this period, soy was brought over from Osaka to Tokyo, the capital of the Tokugawa Shoguns. The quality of this sauce, however, was very inferior and in view

© Copyright Soyinfo Center 2021

of this Mr. Mogi instructed a member of this branch of the family–Mr. Saheiji Mogi–to brew the 'Kikkôman' soy as an experiment. The results having proved very satisfactory, that brand was brewed on a large scale, and Mr. Mogi subsequently inaugurated the brewing of the 'Kihaku' brand, the two firms being allowed to engage in the brewing of so-called Noda Soy on an extensive scale. These two brands of soy having proved very well suited to the tastes of the citizens of Yedo, the demand increased to such an extent that the output was hardly sufficient to meet the demand. Such being the case, Mr. Hichizayemon Mogi himself engaged in the brewing of soy also. The ripe experience gained by supervising the work of the branch firms in brewing superior varieties of soy proved very valuable to him, and his business also proved a very great success, the name of the new brand of soy 'Ichiyama' becoming quite celebrated within a comparatively short period of time. However, another new branch of the Mogi family's firm being inaugurated under the proprietor-ship of Mr. Yuyemon Mogi, the brand 'Ichiyama' was transferred to the new firm so as to ensure its prosperity and the brand 'Kushigata,' at present in use, was then adopted. Such proceeding may appear somewhat strange, but it was in compliance with the legacy left by the ancestors of the Mogi family that the various branches should unite for the general sharing of profits in their business undertakings. At the time when the fame of the 'Kushigata' brand was at its height, in 1871, the whole premises of firm were unfortunately destroyed by fire. This proved a great blow to the fortunes of the firm but the present proprietor, by dint of sheer energy and perseverance, succeeded in retrieving the lost fortunes of the firm, the yearly output at present far exceeding the former production. Although the yearly output of the main house of Mogi ('Kushigata' brand soy) is below that of the branches, namely the 'Kihaku' and other brands, it has been entirely owing to the good will of the former that the latter firms have been enabled to attain their present prosperous state, the outcome of the traditional legacy of the Mogi family having been carried out by the head of the house

"Present conditions: The firm has at present two factories, the number of hands employed being 600. The factories are provided with two sets of boilers and steam engines for motive power. The firm produced about 5,270,000 gallons of soy per year, of which about 336,000 gallons are exported to foreign countries, the places of destination being Hawaii, Australia, China, Korea, Canada, British Columbia, the United States, the Philippine Islands, and the Straits Settlements [today's Singapore]. The export trade shows a tendency to increase year by year.

"Honours Awarded: The following are some of the principal prizes and medals awarded to the 'Kushigata' brand soy at the various exhibitions where the firm's products have been shown:–The National Industrial Exhibition from the First to the Fifth. First Prize on each occasion. International [Columbian] Exposition held in Chicago [Illinois], 1893. Gold Medal. International Exhibition held in Paris, 1899. Gold Medal. St. Louis International Exposition [Missouri], 1904. Grand Prix. Alaska-Yukon International Exposition at Seattle, 1908. Grand Prix.

"Proprietor: The present proprietor of the famous firm of the 'Kushigata' brand is Mr. Hichizayemon Mogi, who is the eleventh of the line. Although he is yet young, he places business before pleasure, strictly adhering to the precepts of his ancestors and is devoting his entire energy to the development of his business and the improvement of the particular brand for which the firm is responsible. Having selected a most favourable locality he is, at present, constructing a new factory with the producing capacity of 2,000,000 gallons per year, which promises to be the best equipped factory of its kind in Japan. The machinery employed is to be of the latest pattern, and it is intended that electricity be used as the motive power."

A photo (p. 166) shows "The pumping machinery of soy." Around the pump are many brick walls. Address: PhD in Agriculture (*Nogakuhakushi*), Prof. at Tokyo Imperial Univ., Japan.

105. Gilbert, A.W. 1910. Soy beans and fertilizer question. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 13(79):55. Oct. 5. [1 ref]

• ***Summary:*** The following is an extract from the *National Review,* of Shanghai, China: "It is well known that soy-bean cake has for years been the most popular fertilizer in Japan. Now, however, that the United Kingdom, and the Continent of Europe and America to a less extent, have become purchasers of Manchurian beans, the question arises whether Japan will to be able to buy bean cake in huge quantities if the price rises appreciably. In studying this question two factors should not be lost sight of: One is that Japan is herself a large grower of soy beans, having according to the latest available returns (1908) over 1,200,000 acres under cultivation, producing annually some 19,000,000 bushels of beans, while the other is that Japan imports very large quantities of soy beans from China and Korea. The greater part of these beans is used for the purpose of human food–i.e., in making of 'soy,' 'miso,' and bean curd–but a portion by no means small is used also as a fertilizer.

"The Russo-Japanese war had such an effect in curtailing the supplies of beans and cake that to arrive at a just appreciation of the position it is necessary to go back a good many years. In making such a review it will be noted that, both in the case of beans and of cake, the amounts imported in 1909 were record importations, but that the average price was the lowest since 1903. Should the price in the future be forced up very high in consequence of British and other demands, the presumption is that Japan would turn to sulphate of ammonia, if the cost per unit of nitrogen

© Copyright Soyinfo Center 2021

therein were less than the cost of bean cake. On the other hand, it must be remembered that the removal of the import duty on sulphate of ammonia in the United States of America means that the United States will probably absorb large quantities of the British output, and that Japan will have to pay a higher price if she wants a share of this fertilizer. Thus the outlook for nitrate of soda becomes a good deal brighter, and now that, owing to the subsidized Japanese line to (South) America, it is possible to get cheap freight rates, it looks as though (Chilean) nitrate of soda will be a serious competitor to the other nitrogenous fertilizers, except in the matter of wet rice cultivation.

"There is a point which, though obvious enough to those intimately connected with the trade, is sometimes overlooked in general discussions on the subject of bean cake, viz., that the British farmer can afford to pay a proportionately higher price for cake than the Japanese farmer, the reason being that in the United Kingdom the cake, after serving for provender, turns into a fertilizer, whereas in Japan it is employed as a fertilizer directly, without any intermediate use.

"As regards rock phosphate, most of the supplies have hitherto come from Ocean and other islands. Owing, however, to the new fertilizer law which prohibits any admixture in Japan of earth and sand with rock, it will probably be found that the phosphate from the above-mentioned islands, being pure and expensive, will be displaced by the cheaper varieties of rock from Tennessee and Algiers, which are naturally mixed with impurities." Address: Vice-Consul, Nanking.

106. *Los Angeles Times.* 1910. Fertilizers for Japan. A scarcity of soy beans makes a market for Tennessee rock phosphate. Oct. 13. p. I13.
• ***Summary:*** "It is well known that soy-bean cake has for years been the most popular fertilizer in Japan. Now, however, that the United Kingdom, and the Continent of Europe and America to a less extent have become purchasers of Manchurian [soy] beans, the question arises whether Japan will continue to be able to buy bean cake in huge quantities if the price rises appreciably.

"In studying the question, two factors should not be lost sight of: One is that Japan is herself a large grower of soy beans, having according to the latest available returns (1908) over 1,200,000 acres under cultivation, producing annually some 19,000,000 bushels of beans, while the other is that Japan imports very large quantities of soy beans from China [Manchuria] and Korea. The greater part of these beans is used for the purpose of human food–i.e., in making of 'soy' [sauce], 'miso,' and bean curd [tofu]–but a portion by no means small is used also as a fertilizer.

"The Russo-Japanese war had such an effect in curtailing the supplies of beans and cake that to arrive at a just appreciation of the position it is necessary to go back a good many years." In 1909 Japan imported record amounts of beans and cake, but "the average price was the lowest since 1903. Should the price in the future be forced up very high in consequence of British and other demands, the presumption is that Japan would turn to sulphate of ammonia, if the cost per unit of nitrogen therein were less than the cost of bean cake."

The "British farmer can afford to pay a proportionally higher price for cake than the Japanese farmer," since in the UK the cake, "after serving for provender [feed], turns into a fertilizer [manure], whereas in Japan it is employed as a fertilizer directly, without any intermediate use. "

107. *Oil, Paint and Drug Reporter.* 1910. The soya bean and the fertilizer question. 78(17):41. Oct. 24. [1 ref]
• ***Summary:*** "An extract from the *National Review of Shanghai*, regarding the relation of the soya bean to the fertilizer question, has been sent to the Department of Commerce and Labor by Vice-Consul A.W. Gilbert from Nanking. The discussion of the subject by the Review is as follows:" There follows a long excerpt.

108. *Times* (*London*). 1910. Soy bean as a fertilizer. Nov. 21. p. 14, col. 6.
• ***Summary:*** "Several subjects of importance to this country are discussed in the *Daily Consular and Trade Reports* published by the Bureau of Manufacturers, Department of Commerce and Labour, Washington [DC]. A note upon soy beans as a land fertilizer is particularly noteworthy in view of the doubt expressed in this country last year as to their manurial value."

There follows a summary of: Gilbert, A.W. 1910. "Soy beans and fertilizer question." *Daily Consular and Trade Reports* (U.S. Bureau of Manufactures, Department of Commerce and Labor). Oct. 5. p. 55.

109. Piper, Charles V.; Morse, W.J. 1910. The soy bean: History, varieties, and field studies. *USDA Bureau of Plant Industry, Bulletin* No. 197. 84 p. Dec. 31. Includes 8 plates showing plants, pods, and seeds, and an excellent 6-page index. [27 ref]
• ***Summary:*** Contents: Botanical history and identity of the soy bean. Botanical classifications of soy-bean varieties. Varietal characteristics of soy beans: Habit of growth, foliage, pubescence, flowers, pods, seeds. Frost resistance. Period of maturity (soybeans were planted at the Arlington Experimental Farm, near Washington, DC, from 3 June 1905 to June 1909). Changes in life period (soybeans were planted at the Arlington Farm in 1902). Pollination and hybridization. Mutations. Nomenclature and classification. Early agricultural history in the United States. Varieties introduced in the United States independently of the Department of Agriculture or previous to 1898: Enumeration, Ito San, Mammoth, Buckshot, Guelph, or Medium Green, Butterball, Kingston, Samarow, Eda, Ogemaw, or Ogema.

© Copyright Soyinfo Center 2021

Varieties grown in Europe (p. 32-33; Early history, Samarow, Etampes, Chernie [from Khabarovsk, Siberia], "Yellow Riesen," Buckshot, "Yellow," "Brown," Butterball, S.P.I. No. 5039. European seed companies carrying soybeans include Dammann & Co., Naples, Italy; Haage & Schmidt, Erfurt, Germany; Vilmorin-Andrieux & Co., Paris, France).

The soy bean in Asia (p. 34-35): Asiatic sources of soy beans, list of varieties with SPI numbers from each of the following countries and places: Siberia (South Usuri [Ussuri], Khabarovsk, Merkoechofka), Manchuria (Newchwang, Harbin, Tieling), Korea (Pinyang, Ko-bau), Japan (Tokyo, Kobe, Yokohama, Hokkaido, Anjo), China (many places), Formosa (Taihoku), Cochin China (Saigon), India (Darjiling [Darjeeling] and Khasi Hills–Assam; Pithoragarh–Kumaon Dist.; Safipur, Hasangani, Ranjitpurwa–Unao, Uttar Pradesh; Etawah, Manipuri–Uttar Pradesh; Cawnpore, Dehra Dun, United Provinces; and Poona Bombay), Java (Buitenzorg), Celebes (Macassar).

Desirable characters in soy-bean varieties (p. 36-37): Considerations governing choice, habit of the plant ("Erectness of stem with upright or ascending branches is a prime requisite of a desirable variety. A tall habit is also important, as dwarf varieties usually bear pods very close to the ground, so that many will be left on the stubble..."), coarseness (a coarse, woody stem makes mowing difficult. However slender varieties often have small pods and seeds, often with vining tips and a tendency to lodge), ability to retain leaves, color of the seed ("Yellow or green seeds are preferable to darker colors, as the shattered seeds are more easily found by hogs pasturing the field or stubble"), shattering, resistance to disease ("In sections where nematodes and cowpea wilt occur most soy-bean varieties are seriously affected by both these diseases"), nonfilling of pods. Synopsis of the groups (plants bushy vs. twining). Synopsis of the varieties (within each group lists the total number and acquisition numbers of varieties with various colored seeds and germs: Group I–190 varieties (seeds straw-yellow, germ yellow–71 varieties; seeds olive-green, germ yellow–45 varieties; seeds chromium-green, germ green–17 varieties; seeds brown to olive, germ yellow–28 varieties; seeds black, germ yellow–18 varieties; seeds black, germ green–7 varieties; seeds bicolored, germ yellow–4 varieties). Group II–4 varieties. Group III–8 varieties. Group IV–76 varieties. Group V–7 varieties.

Of the 285 varieties in the five groups, 152 varieties (53.3%) have yellow (straw-yellow or olive-yellow) seeds, 55 varieties (19.3%) have black seeds, 44 varieties (15.4%) have brown seeds, 24 varieties (8.4%) have green seeds, and 10 varieties (3.5%) are bicolored).

Catalogue of soy-bean varieties (by S.P.I. number, from no. 480 in 1898 to no. 27,501 in 1909; p. 39-74). In 1908 USDA acquired soybean seeds from Vilmorin-Andrieux & Co. (Paris, France), Haage & Schmidt (Erfurt, Germany), and Dammann & Co. (Naples, Italy) (p. 57-60).

The best varieties of soy beans (p. 75, in 7 groups from very early to very late). Explanation of plates. Index.

The "Catalogue of soy-bean varieties" (p. 39) is "a complete list of soy beans imported by the United States Department of Agriculture, arranged chronologically in accordance with the sequential S.P.I. (Seed and Plant Introduction) numbers assigned to them by the Office of Foreign Seed and Plant Introduction." These numbers start at #480 (imported from South Ussuri, Siberia, in 1898) and end at #27501 (imported from Shanghai, Kiangsu, China, in 1909). Concerning No. 21825 (p. 58): "From Hokkaido, Japan, 1908... This variety is said to be used principally in the manufacture of 'soy,' 'miso,' 'tifu' [sic, tofu], etc. It has also been obtained again from the same place and grown under Nos. 21830 and 21831."

"The best varieties of soy beans" (p. 75) lists 35 varieties, each with a name and S.P.I. number, arranged in seven groups based on time to mature, from "Very early.–Ogemaw, 17258" to "Very late.–Barchet, 20798; Riceland, 20797 (In 1908 at Biloxi, Mississippi, it displayed astonishing diversity)." This list is "based primarily on the results at Arlington Experimental Farm [in Virginia], but those obtained in cooperation with various experiment stations have also been given due consideration:

"Very early.–Ogemaw, 17258.

"Early.–Early Brown, 25161 (from Indiana Agric. Exp. Station, 1909); and Vireo, 22874.

"Medium early.–Chernie, 18227; Auburn, 21079 A; Merko, 20412 (from Merkoechofka, Siberia); Elton, 20406; Chestnut, 20405 B.

"Medium.–Ito San, 17268; Medium Yellow, 17269; Tashing, 20854; Shingto, 21079; Swan, 22379; Brindle, 20407; Sedo, 23229; Lowrie, 22898 A.

"Medium late.–Brooks, 16789; Flava, 16789 A; Cloud, 16790; Ebony, 17254; Haberlandt, 17271; Peking, 17852 B; Wilson, 19183; Taha, 21999; Austin, 17263.

"Late.–Mammoth, 17280; Edward, 14953; Acme, 14954; Flat King, 17252; Tokyo, 17264; Hope, 17267; Hollybrook, 17278 (from Arkansas Agric. Exp. Station, 1904); Farnham, 22312.

"Very late.–Barchet, 20798; Riceland, 20797."

Note 1. Matsuura (1929 and 1933) cites this as the world's earliest publication on soybean genetics: "Recording segregation of seed- and flower-color in its natural hybrids."

Page 11 notes that soybeans named "New Japan peas" were obtained from Norway (Source: Martens 1869). Page 20 notes that the Ogemaw variety of soybeans, which takes 92-97 days to mature, was obtained in 1908 from the Idaho Agricultural Experiment Station, where it had been grown for several years. Note 2. This document contains the earliest date seen for soybeans in Idaho, or the cultivation of soybeans in Idaho (about 1906).

Page 20 also notes that Buckshot variety of soybeans, which takes 92 days to mature, was obtained in 1908 from

© Copyright Soyinfo Center 2021

the Minnesota Agricultural Experiment Station, where it had been grown for several years. This is the second earliest document (April 2004) seen concerning the cultivation of soybeans in Minnesota. "Potomac Flats" is not mentioned in this report.

Concerning "Habit of Growth" (p. 12-13), the author states: "All soy beans are strictly determinate as to growth; that is, the plants reach a definite size according to the environment and then mature and die. The great majority of the varieties are erect and branching, with a well-defined main stem (Plates I and III)... In other varieties the stems and branches, especially the elongated terminals, are more or less twining, and usually weak, so that the plant is only suberect or even procumbent (Plates I-III)."

Photos show: (1) Plants of a wild soy bean grown in a greenhouse in a pot. (Fig. 1) (2) Plants of a wild soy bean from Soochow, China, grown at the Arlington Experimental Farm.

(3) Plants of a soy bean from Cawnpore, India. (4) Rows of different varieties of soy beans at Arlington Farm.

(5) Plants of seven varieties of soy beans, showing types of habit: Meyer 17852, Peking 17852 B, Austin 17263, Pingsu 18259, Unnamed 22504, Hollybrook 17278, Haberlandt 17271. (6) The same seven varieties shown in plate 4 after hanging in a dry room for 6 months.

(7-8) Eleven soy bean pods, ranging in size and shape.

(9) 36 varieties of soy bean seeds, showing variation in size and form.

Note 3. This is the most important document ever published on early soybean varieties in the USA.

Note 4. This is the earliest document seen (Dec. 2018) that uses the word "determinate" to describe the growth habit of soybeans. Determinate plants terminate main stem elongation at, or soon after, the onset of flowering. Indeterminate cultivars continue main stem elongation several weeks after beginning flowering. Determinate / indeterminate is a genetic trait.

Note 5. This is the earliest publication see (Aug. 2011) written jointly by Piper and Morse, two of the most influential early advocates of the soybean in the USA. It is also the earliest document by or about Morse in connection with soybeans. Morse graduated from Cornell University, New York, on 20 June 1907 and 2 days later reported for duty at the Bureau of Plant Industry in Washington, DC, to work under Dr. C.V. Piper.

Note 6. This is the earliest document seen (Feb. 2004) in which Piper or Morse mention miso, tofu, or the use of soy beans as a coffee substitute.

Note 7. This is the second earliest document seen (July 1998) that uses the word "shatter" (or "shattered" or "shattering") in connection with soybeans. The earliest document (in 1854) used the word "shatter" in a very general sense. This document uses it more precisely, as the title of a section and for comparing varieties (p. 36): "When grown for grain alone, shattering is a serious fault. Some varieties, like Guelph, shatter inordinately; others, like Peking, scarcely at all... As a rule the varieties with large pods and seeds shatter much worse than those with small pods and seeds..."

Note 8. This is second the earliest English-language document seen (Oct. 2004) that uses the term "germ" to refer to a part of a soy-bean seed. The germ or embryo is the part of the seed inside the seed coat.

The section titled "Seeds" (p. 15) states: "The germs or embryos of soy-bean seeds are yellow, except in the green-seeded and part of the black-seeded sorts, in which they are green." Address: 1. Agrostologist; 2. Scientific Asst., Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

110. Hosie, Alexander. 1910. Manchuria: Its people, resources, and recent history. Boston, Massachusetts: J.B. Millet. x + 320 p. Illust. Index. 25 cm. Oriental Series Vol. 14

• ***Summary:*** This book is similar in many ways to the 1901 edition with the same title except: (1) It contains 25 more total pages. (2) Chapters 7-10 in the 1901 edition have the same titles, are in the same order, and contain most of the same information as chapters 4-7 in the 1910 edition. (3) Most of the information on soybeans and soyfoods in this 1910 edition is identical or similar to that in the original 1901 ed, but usually on different pages. For example, the long, excellent section on tofu and related products on pages 183-84 in the 1901 edition is identical to that on pages 78-79 in this 1910 edition. And the description of how a traditional crush-stone mill and wedge press are used to make bean-cake and bean-oil, on pages 218-24 of the 1901 edition is identical to that on pages 121-27 of this 1910 edition. Many more such examples could be cited. (4) There is extensive and very interesting new information on railways, which are discussed at great length in this 1910 ed.; they are found in a separate record in this database as a "document part."

Editorial note by Charles Welch (p. ix-x): The whole world is now closely linked together as newspapers keep us informed of the events in far-of lands. Manchuria was practically unheard of until the last two wars which Japan had to fight there against China (1894-1895) and Russia (1904-1905). Port Arthur fell easily when held by the Chinese, but its strong defense by the Russians "turned the eyes of the world to the citadel which lay at the point of the far Eastern peninsula called Manchuria." The Trans-Siberian Railway, started in 1889, ran east-west, eventually connected St. Petersburg (the capital of Russia from 1712 to 1918) to the Pacific Ocean port of Vladivstok–a distance of 5,772 miles. The Chinese Eastern Railway, started in 1897, ran north-south, connecting Mukden and Port Arthur. The building of these two railroads has shown to the world the great wealth of Manchuria, a province of China.

The war between Japan and Russia was fought in large

© Copyright Soyinfo Center 2021

part because Russia claimed special exclusive rights to mining, timbering, etc. in Manchuria. Japan fought for an "open door" policy in this wealthy region, the right to trade and commerce in Manchuria. Sir Alexander Hosie has been a resident of China for practically 40 years.

The Chinese call Manchuria the Tung-san-shêng (Three Eastern Provinces); it "is an agglomeration of petty Tartar or Manchu principalities, lying to the north-east of China Proper" (p. 3).

Soy beans or [soy] beans, bean oil, bean cake, or soyfoods are mentioned or discussed on the following pages of this 1910 edition: 69 (outer leaves of kao-liang or tall millet are woven into mats used for packing loads of grains and beans), 71 (barley in large amounts is ground with peas or beans as a ferment in the distillation of native spirit {*Shao chiu*} from tall millet / kao-liang), 75-80 (beans are the most important agricultural crop for external trade, and the second most important article of cultivation after kao-liang. The most important bean, considered together with its products bean-cake and bean oil, is the soy bean–*Glycine hispida;* discusses the many varieties of soy beans and soy bean products), 82 (Mao-Tou, soy beans cultivated as a garden bean for food), 84 (soy bean is one of six plants grown in Manchuria whose seeds yield oil), 101 (each skein or hank of silk is dipped in bean-flour water), 121-28 (how the oil is expressed from soy beans; Recent prices of soy beans and products. 1896 bean oil factory driven by steam), 142 (how boats carry soy beans and other export crops down the Liao River each spring after the ice breaks up), 146-47 (value of exports of soy beans and products; total value in Manchuria), 168 (the flourishing bean-oil and bean-cake industry at Dalny started in 1908, practically speaking), 172 (the 1907 depression in Manchuria's soy bean market), 174 (the 1907 depression is now over and the outlook for American goods in Manchuria is hopeful), 181-84 (value and amount of exports of soy beans and products from Dalny and other ports, mostly in 1908; ports of destination and uses at each), 196 (the matting, woven by hand from the outer sheaths of millet stalks, that rises high around every large cart carrying loads of loose beans and millet), 208-11 (city of T'ieh-ling on the Liao and its growing importance in the soy bean trade; met 1,000 carts heavily laden with produce from the interior), 216 (a large cart carrying beans and pulled in an ongoing sort of race by mules or ponies, has overturned, and the beans are scattered all over the roadway; such accidents are taken as a matter of course, and the way is cleared so that traffic can resume), 234 (Yi-t'ung [pinyin: Yitong, in central Jilin province] Chou, like T'ieh-ling [pinyin: Tieling], is a great storehouse for beans and grain, and there is extensive trade between the two cities), and 237 (met several caravans laden with empty "bean-oil boxes." Beans are carried from Newchwang by boats when the river is open and by carts when it is closed by ice).

Also discusses (see index): Job's tears or pearl barley. *Phaseolus radiatus* (the ray-fruited dwarf bean [azuki] which is red or white). Hemp (*Cannabis sativa*) and Abutilon hemp, the true hemp plant, *Abutilon avicennæ,* both valuable fiber crops. Sesamum seed. Ground-nuts [peanuts] (*Arachis hypogæa,* L.) Seaweed. Address: British Consul-General at Tientsin [Tianjin, China].

111. Hosie, Alexander. 1910. Manchuria: Its people, resources, and recent history. Railroads (Document part). Boston, Massachusetts: J.B. Millet. x + 320 p. Illust. 25 cm. Oriental Series Vol. 14

• ***Summary:*** Railroads in Manchuria are discussed at great length in this book. These include the Chinese Eastern Railway Co., the Siberian Railway (incl. the Trans-Baikal and the Southern Ussuri sections), South Manchuria Railway, Trans-Manchurian Railway, and the Trans-Siberian Railway.

The South Manchuria Railway, the newest, is discussed in the most detail, especially in Chapter 7, titled "Trade of Manchuria" (p. 138-191). Page 145: "In addition to the purely foreign imports, however, there should be mentioned an item of $10,000,000 worth of railway materials imported from the United States by the South Manchuria Railway Company, on which no duties were paid, and which was omitted from the Chinese Customs Returns."

Page 149: "Although considerable interest in the mineral deposits of Manchuria has been evinced by American, British, and German engineers during the year, but little has been accomplished by them toward the development of the country's mineral resources. The South Manchuria Railway Company, on the other hand, has pushed forward development work on the Fu-shun (pinyin: Fushun) coal mines with great energy, and extensive additions to the equipment of the mines have more than doubled the output" daily during the year from 500 tons the beginning to 1,200 tons by the end of December. The Fu-shun coal mines constitute one of the chief assets of the Company."

Page 153. "Railway developments: The South Manchuria Railway has been standardised and the installation of new rolling stock has greatly increased the road's carrying capacity. Under the narrow-gauge regime the line's daily carrying capacity was about 2,000 tons, whereas at the present time, with its standard gauge, new American rolling stock, and improvement in its freight service, the capacity is more than 6,000 tons. Similar improvement has been made in the passenger service."

Page 154: "These trains are thoroughly modern in every respect, the cars and locomotives being of the latest designs of American make. Each train is composed of a mail car, a Pullman sleeper, a diner, and a combination day coach and baggage car. In addition to these improvements the South Manchuria Railway Company has established a weekly steamship service between Dalny and Shanghai, which shortens the time of travel between the latter city and Manchuria by two to five days, and will also bring about a

© Copyright Soyinfo Center 2021

reduction of freight rates. The Company is already issuing through bills of lading between Shanghai and Manchurian points."

Page 162: "The net increase of the Japanese population in Manchuria for the year 1908 was 14,149, of whom 5,296 settled in the leased territory and 8,853 scattered throughout the country, mostly along the line of the South Manchuria Railway. A conservative estimate of the number of Chinese immigrants during the year would place the figure at 25,000, the majority of the newcomers being of the agricultural class, who have come to Manchuria to find permanent homes and have settled in the fertile regions surrounding Fakumen and Chengchiatun. Should the plans of the Government for the settlement of waste lands meet with success, the number of Chinese arrivals will rapidly increase."

Page 165: "The general plans sanctioned by the management of the South Manchuria Railway provide for a northern terminal at Suchiatun, a station on the main line of the South Manchuria Railway some 10 miles south of Mukden. Suchiatun is already the junction of the branch line to the Fu-shun collieries, having the necessary yards and transshipping facilities. By making Suchiatun instead of Mukden the terminal of the line the company will obviate the necessity of bridging the Hun River and at the same time will save several miles of track."

Page 169-70: "First place in the import trade of Dalny is held by goods from Japan, which were valued by the customs last year at $6,824,440, but which Japanese figures place at $8,429,393. This total is made up of a large variety of articles, from lumber and railway material to notions and a great part simply represents the supplies of food, clothing, furniture, etc., drawn from Japan by Japanese residents in Manchuria for their own use. Of the staple goods for the Chinese market, the most important are cotton goods and cigarettes."

"The United States is second in the import list, with $3,762,653, according to customs figures, or about 32 per cent. This was almost entirely trade with the Japanese in Manchuria, and was made up mainly of supplies for the South Manchuria Railway Company. The figure seems to be too small, as the value of railway supplies ordered in America and received during 1907 and 1908 was approximately $10,409,000, of which much less than half came in during 1907. The explanation may be that entries of duty-free goods for the railway or for general consumption in the leased territory are less carefully prepared, as to details, by the consignees."

Page 171: "The domestic goods brought in from Chinese ports were valued at $1,310,622. The rails, locomotives, bridge work, and most of the cars purchased on the first orders for supplies for the South Manchuria Railway were bought in the United States and delivery was completed in 1909. Of the new purchases under this head, the most important were an order placed in Russia for some 6,600 tons of steel rails worth about $250,000, a new electric-power outfit costing $135,000, ordered in the United States; rails, cars, and trucks for the Dalny street railway, ordered in Germany and England and costing approximately $277,000; and a gas-generating plant and distributing pipes, purchased in Germany and Great Britain, respectively."

Page 182-83: "Coal seems destined to become an important item among the exports, but the business is still in an experimental stage. In 1908 shipments to foreign countries amounted to 4,686 long tons. Already the South Manchuria Railway Company has a contract for furnishing coal to the mail steamers of the Osaka Shosen Kaisha, which come here twice a week from Osaka and Kobe. The price has not been made public, but it would seem to be not far from $2.75 to $3 per ton delivered on board, and at this low cost it is said to be quite satisfactory. With the exception of $239,828, representing the customs valuation of [soy] beans shipped to England, and $1,209 for exports to Korea, the entire foreign export trade of Dalny is with Japan, the total value of exports to that country being $4,574,057."

Page 186: "In August, 1908, the South Manchuria Railway Company began a weekly freight and passenger service between Dalny and Shanghai, and while little business offered at first, both the number of passengers and the freight tonnage seem to be steadily increasing, as the railway company is making special efforts to develop this line by selling through tickets and by offering through bills of lading to interior stations at moderate rates.

"The trade to South China ports continues in the hands of two leading British coasting lines, whose business has greatly increased of late, so that they have had as many as eight ships in port at one time loading cargo or waiting for berths." Address: M.A., F.R.G.S., Once Acting British Consul, Tamsui; Now at Aberdeen (Scotland or Hong Kong).

112. Clerget, Pierre. 1911. La question du Soja [The question of the soy bean]. *Revue Generale des Sciences* (*Pures et Appliquees*) 22(3):100-01. Feb. 15. (Chem. Abst. 5:1637). [2 ref. Fre]

• ***Summary:*** Contains a brief description of the soybean and discusses its commercial importance, distribution, soil requirements, the value of the oil and its uses, and the composition and commercial value of the cake. During the past 2 years, the large amounts of soybeans exported from Manchuria to Europe have called attention to this plant. It is cultivated all over China, but especially in Manchuria (in the Liao Valley, where it is the second most important crop after sorghum), Japan, Korea, and Indo-China. In China it is often cultivated with maize; it demands a great of work, care, and good soil. The main exports come from the Manchurian ports of Newchwang and Dairen, and from Vladivostok. In 1908 some 859,200 tonnes of soybean and cake were exported from Manchurian ports, up from only 88,900 tonnes in 1905. Until 1908, Japan was the principal outlet for Manchurian

© Copyright Soyinfo Center 2021

soybeans (615,900 tonnes), but at the start of that year, exports to Europe began: 69,200 tonnes to Great Britain, 21,390 tonnes to France, 7,290 tonnes to Holland, etc.–for a total of 204,440 tonnes.

According to chemical analyses made at the Colonial garden of Nogent-sur-Marne, Manchurian soybean seeds contain 17.64% oil and 33.5% protein; yellow varieties contain more oil than black varieties. The soybean is used as a forage plant and for soil improvement, but its most important role in China and Japan is as a human food among people who consume little meat. According to Bloch (1908), it is most widely used in making a sauce [soy sauce] and a cheese [tofu]. It is also used to make numerous pastes and a sort of soymilk (*lait de soja*).

It also has industrial uses, thanks to its oil content of 16-18%. Indigenous mills can obtain only 8-10% oil, but modern hydraulic presses can obtain 12-14%. The oil and cake have made the soybean rise so rapidly on European markets. The oil, which has an agreeable smell and taste, is widely employed for culinary purposes in Manchuria. In England, as in France, it is used in making soap and margarine. It is more drying than cottonseed oil and can likewise be used in making paints. Soybean cakes (*Les torteaux de soja*) would give the same results as cottonseed cakes in terms of milk yield from dairy cows. As a fertilizer, they are used throughout Japan and on the sugarcane plantations of southern China.

The soybean could be introduced to Indo-China where, even if it has to compete against Manchurian soybeans, it could be service locally for soil improvement in the rice fields and as a food in the densely populated districts where there is hardly any room for animals, or where the animals have been decimated by disease. Address: Professeur à l'Ecole supérieure de Commerce (Graduate School of Commerce) de Lyon [France].

• ***Summary:*** Contents. Introduction. The plant: origin and history, species and varieties, culture, and production: USA, Japan, Manchuria, France, England, China, Korea, Indochina (it is cultivated for the needs of the population in Cochin China {especially in the provinces of Chaudoc and Baria}, Annam, Tonkin, Cambodia), Formosa, Java, India, Africa. The soybean–a food plant: The plant, the seed, large table showing many analyses from many countries of the chemical composition of many soybean seed varieties.

Introduction to food products made from soybeans in East Asia. Shoyu [soy sauce] (and koji). Miso. Natto (from Japan). Le Tao-yu (a Chinese condiment also widely used in Japan. It is a thick, clear liquid [sometimes] made from black-seeded soybeans) Tao-tjiung (doujiang, from China). Tuong (from Annam). Tofu. Li Yu-ying. Table showing composition of powdered soymilk, fresh tofu, and soy flour.

The soybean–an oilseed plant. The soybean as an oilseed in the Far East. Table showing exports of soybean cake and oil from various Manchurian and Chinese ports in 1908 and 1909. The soybean as an oilseed in Europe and the United States. Table showing imports of soybeans to various British ports in 1909 and 1910 (the leading port by far is Hull, followed in 1909 by Liverpool, London, Bristol Channel, Scotland, and Other ports {Rochester, etc.}). Table showing exports of soy oil from Great Britain in 1910: To Germany, Austria, Australia, USA, Belgium, Denmark, Egypt, France, Holland, Italy, the Indies (*Indes*), Norway, Russia, Sweden, other, total (115,372 barrels, each weighing 175 kg). Discussion of soy oil and cake in most of the above countries.

Trade in soybean seeds: Mitsui Bussan, Manchuria, England, China, Japan. Soybean cake.

Soy oil: Physical and chemical properties. Applications and uses as food and in industry: Margarine, for illumination, soaps, as a drying oil, paints and varnishes, linoleum, artificial rubber. An extensive bibliography is at the end of the last article in the series.

Note: This is the earliest document seen (March 2021) concerning the cultivation of soybeans in Cambodia. This document contains the earliest date seen for the cultivation of soybeans in Cambodia (April 1911). Earlier documents imply that soybeans were being cultivated in Cambodia by 1900, and it is highly likely that they were being cultivated for at least a century before that time. Address: Ingénieur-chimiste E.C.I.L., France.

114. *USDA Bureau of Plant Industry, Inventory.* 1911. Seeds and plants imported during the period from April 1 to June 30, 1910. Nos. 27481 to 28324. No. 23. 88 p. April 29.

• ***Summary:*** Soy bean introductions: *Glycine hispida* (Moench) Maxim.

"27498-27501. Grown at Arlington Experimental Farm, Virginia, season of 1909. Numbered for convenience in recording distribution, April 14, 1910. Seeds of the following. Notes by Prof. C.V. Piper:

"27498. 'Chromium green; late. Grown under temporary number 0867, from seed found in cowpea No. 23307, from Peking, China.'

"27499. 'Straw yellow; very late. Grown under temporary number 0869, from Mr. W.W. Williams, Ingang, Fukien [Fujian], China.'

"27500. 'Straw yellow; very late. Grown under temporary number 0888, from Rev. J.M.W. Farnham, Shanghai, China.'

"27501. 'Olive yellow; very late. Grown under temporary number 0889, from Rev. J.M.W. Farnham, Shanghai, China.'"

© Copyright Soyinfo Center 2021

"27531/27537. From San Giovannia Teduccio, near Naples, Italy. Purchased from Messrs. Dammann & Co. Received April 11, 1910. Seeds of the following:

"27535. Brown."

"27553/27558. From Choon Chun, Korea. Presented by Mr. J. Robert Moose. Received April 4, 1910. Seeds of the following:

"27557. Yellow seeded."

"27704/27713. From Hankow, China. Presented by Mr. A. Sugden. Received April 14, 1910.

"27707. Yellow seeded."

"28048/28058. From Manchuria. Procured by Mr. Edward C. Parker, agriculturist, Bureau of Agriculture, Industry and Commerce, Mukden, Manchuria. Received June 2, 1910. Seeds of the following; descriptive notes by Mr. Parker:

"28049. Large yellow. *'White Eyebrow* soy bean. Chinese name, *Paimei.* A well-known and famous variety of the soy bean grown over large areas on the alluvial bottom lands of the Liao Ho River in Manchuria. This seed sample came from valley lands near Kwangning, 42º north latitude, where the variety has been commonly grown for several centuries. Valuable in America as foundation stock for selecting and breeding improved varieties of oil-producing seeds.'

"28050. Small yellow. 'Small, round soybean. Chinese name, *Chinyuan.* This variety is grown in Manchuria as far as 47º north latitude. This seed sample came from a district northeast of Harbin, Manchuria, 46º north latitude. The beans of this variety, grown in northern latitude, are highly prized because of their heavy weight and large percent of oil. This variety should be especially valuable to plant breeders in the upper Mississippi Valley.'

"28051. Black. 'Black curd bean. Chinese name, *Heitou.* Commonly grown in central Manchuria. This seed sample comes from Mukden, Manchuria, 42º north latitude. These beans are principally used for the production of bean curd. The beans are soaked, ground into coarse meal, and a filtrate formed that is coagulated with salt. The coagulated mass is pressed into a curd with stones. A meal made from these beans is mixed with corn meal for baking cakes.'"

28052 is Adzuki bean (*Phaseolus angularis* (Willd)). "Red bean. Chinese name, *Hungchiangtou.* Commonly grown in Central Manchuria for human food."

28053 is mung bean (*Phaseolus radiatus, Lutou*) and 28054 is hemp. The latter is grown in large quantities in Manchuria for the production of fiber. Address: Washington, DC.

115. *Farben-Zeitung.* 1911. Die Aussichten fuer Sojabohnenoel [The prospects for soybean oil]. 16(50):2810. Sept. 9. [Ger]

• ***Summary:*** The soybean oil industry (*Sojabohnenölindustrie*) has been deemed important enough by the Chinese customs authorities to dedicate a so-called "yellow book" to it. In it, it is indicated that the Changchun-Kirin [today's Jilin City, China] Railway which is currently under construction will have the consequence of opening up the Sungari region [today's Songhua River region] in approximately two years. And when the railroad is extended as far as the border with Korea, then that promises to make extensive new areas available for the cultivation of the soybean (*Sojabohnenkultur*). The competition for this product on the part of Europe shows no traces of letting up, and in North America, as well, a good area for sales ought to open up.

The export of soybean oil (*Sojabohnenöl*) from Dalny [today's Dalian, China] in the first five months of this year massively exceeded that of the same period of 1910, as it reached 24,449 metric tons in comparison with 8,550 metric tons. The price at that port was set at 4.94½ silver yen at the beginning of July, while at the end of the year it amounted to 3.16. There are 42 bean mills in Dalny which can press 22,850 piculs [an Asian measure of weight, equal to around 60 kg each] of beans every day and produce from them 2,050 piculs of oil along with 45,700 pieces of bean cakes. The bean growers in that district are therefore not completely reliant upon the foreign demand. The premium that was recently placed by the Japanese government on exported bean oil may have the consequence of an increase in the bean export to the empire of the Mikado.

• ***Summary:*** This series of articles, published in book form in 1912, is one of the earliest, most important, influential, creative, interesting, and carefully researched documents ever written about soybeans and soyfoods. Contents: Introduction. Origin and history of the soybean. Soybean culture. 1. Species and varieties of soybeans (botanical characteristics, species {vernacular names in Asia}, varieties {from China, Japan, India, Indochina, Hawaii, United States, and Europe}). 2. Needs of the soybean: Climatic (temperature, humidity), geographical area and varieties grown (in Asia [Manchuria, Japan, Formosa, Korea, Indochina], America, Guyane ("En Guyane, le soja mûrit" [ripens or matures]. Note: This probably refers to French Guiana [*Guyane française*], where Sagot and Raoul reported in 1893 that soybeans had been grown successfully), Europe [France, Italy, Russia], Southeast Asia (*Océanie* / Oceania) [Philippines, Java, Borneo], and Africa [Algeria, Tunisia,

© Copyright Soyinfo Center 2021

South Africa]), agrological needs of the soybean (physical, chemical).

"Oceania.–The soybean has been cultivated for a very long time in the Philippines, Java, and Borneo" (p. 194).

Illustrations (line drawings) show: Soybean plant with roots (p. 182). Soybean pods and beans (p. 183). A table (p. 191) and a graph (p. 192) show trade of soybeans, soybean cake, and the total of the two from five Manchurian ports (Newchwang, Antung, Ta-tung-ho, Dairen, and Suifenho [Suifenhe]) from 1905 to 1909; all have increased dramatically. Also contains 12 other tables from other sources. Note that this influential series of articles, like its predecessor by Itie in the same journal, were in large part prompted by the huge rise in imports of soybeans to Europe, starting in 1908. The contents of these articles is almost identical to that of the book by the same name, published in 1912, which see. Address: 1. Counseiller de 1ere classe au Ministère de l'Agriculture de la Chine; 2. Ingénieur agricole (G.).

117. Williamson, A.A. 1911. Commerce of the Liaotung Peninsula. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 14(255):535-40. Oct. 31.

• ***Summary:*** "The Dalny (Manchuria) consular district comprises the entire territory held under lease by Japan from China, lying at the extreme southern end of the Liaotung Peninsula, and is known and officially designated by the Japanese as the Kwantung Province. Its area is given as 205 square 'ri,' or 1,220.57 square miles, and it has a population of 462,399 or 379 persons per square mile.

"The country is very hilly in the southern part of the Province, the elevation, however, seldom reaching over 900 feet above the sea. Toward the north the surface gradually becomes more level and partakes of the nature of the flat bean fields of north Manchuria."

"Dalny, the chief city and port of Kwantung Province, is said to have the finest wharves in the Far East, vessels drawing up to 28 feet being moored alongside the quay. Goods can be discharged from a ship and placed aboard the freight cars, which run out onto the wharves, in one operation. While ice forms in the protected parts of the bay at Dalny, it never becomes sufficiently thick to interfere with navigation, so that the port is open the year round and, Dalny being the southern terminus of the main line of the South Manchuria Railway, the advantages offered are at once evident."

The export returns for 1910 "show a decided decrease in shipments of beans and bean cake. The causes of this are undoubtedly the (for the farmers) favorable preceding year and the outbreak of plague with which the country was smitten during the export season. The first caused the farmers to sell rapidly in 1909 and to hold back in 1910; the latter, because of isolation and segregation measures, brought traffic to a standstill. Undoubtedly the bean season will, in the end, show no falling off, as the estimates of production which have been obtainable show a considerable increase in cultivation."

The section titled "The export trade" states that "the Chinaman" has a strong hold upon the trade passing through Dalny; a high percentage of the imports came in the shape of native products and "the export trade with native products showed the greatest increase, over 90 per cent." A table shows "the principal articles exported through the Maritime Customs at Dalny during 1909 and 1910 by steamer and by junk." For 1909 and 1910 by steamer: Bean cake 615,252,933 / 526,030,267 pounds. [Soya] beans 981,274,267 / 713,489,867 pounds. [Soya] bean oil 19,021,067 / 31,642,267 pounds. For 1909 and 1910 by junk: Bean cake 22,398,000 / 28,863,733 pounds. [Soya] beans 43,657,007 / 13,827,333 pounds. [Soya] bean oil 2,679,000 / 2,864,133 pounds.

Under "Soya-bean trade," another table shows the destination of these three products (in pounds) during 1910 from the Dairen customs district, as given in the Imperial Chinese Maritime returns: Bean cake: Japan (incl. Formosa) 443,406,267 (99.9% of overseas total). Korea 307,333. Total overseas 443,730134. Chinese ports 111,163,866 (20.0% of grand total). Grand total 554,894,000.

[Soya] beans: Egypt 302,240,800 (#1). Japan 192,499,733 (#2). United Kingdom 59,455,867 (#3). Other: Denmark, Hongkong, Netherlands, Straits Settlements [today's Singapore]. Total overseas 603,120,800. Chinese ports 124,196,400 (17.1% of grand total). Grand total 727,317,200.

Bean oil: Japan 17,208,133 (#1). Belgium 6,097,200 (#2). Other: Denmark, Egypt, Hongkong, Netherlands, Straits Settlements. Total overseas 27,829,333. Chinese ports 9,677,067 (25.8% of grand total). Grand total 37,506,400.

A 3rd table shows prices of the three products month by month in 1910 in U.S. currency as reported by the Manshu Juyo Bussan Yushutsu Kumiai (Manchurian Staple Products Export Association). For bean cake, the price is per 61.33 lb. For soya beans and oil per 133.33 lb.

"There are still no American export and import houses in this district, and until some thoroughly American house opens here, trade with the United States will necessarily remain half-hearted, being in the hands of natural competitors." The main export from this district to the USA is soya bean oil, of which $93,974 was exported in 1910; only $8,532 worth of soya-bean cake was exported. Address: Vice Consul, Dalny, Manchuria.

118. *Queensland Agricultural Journal*. 1911. Soya beans. 27(4):187. Oct. [1 ref]

• ***Summary:*** From Tropical Life: "Last year Corea [Korea] exported £584,500 of Soya beans, mostly to Japan. The Corean bean is said to be superior to its Manchurian rival,

© Copyright Soyinfo Center 2021

and so large an increase in its export (£200,000, or more than 30 per cent. over 1909) has released that quantity of Manchurian beans, required for the Japanese manufacturers of soya, &c., and enabled them to be sent to Europe, where the demand is rapidly increasing." Address: Australia.

119. King, F.H. (Franklin Hiram). 1911. Farmers of forty centuries, or permanent agriculture in China, Korea and Japan. Madison, Wisconsin: Mrs. F.H. King. ix + 441 p. Preface by Dr. L.H. Bailey. Portrait. Illust. Index. 20 cm. Reprinted in 1927 by Harcourt & Brace (NY, 379 p.). Facsimile reprint by Rodale Press, 1972.

• ***Summary:*** A superb, classic work which Wendell Berry called "one of the richest sources of information about peasant agriculture... one of the pioneer books of organic farming." Dr. Franklin Hiram King (lived 1848-1911; his portrait photo faces the title page) was former chief of USDA's Division of Soil Management. This is his journal, filled with many fine photos, of a voyage in the early 1900s through coastal China, Korea, and Japan. King was impressed by the productivity and efficiency of Chinese agriculture, and the strength and hardiness of the people.

Page 10: "It was not until 1888, and then after a prolonged war of more than thirty years, generaled by the best scientists of all Europe, that it was finally conceded as demonstrated that leguminous plants acting as hosts for lower organisms living on their roots are largely responsible for the maintenance of soil nitrogen, drawing it directly from the air to which it is returned through the processes of decay. But centuries of practice had taught the Far East farmers that the culture and use of these crops are essential to enduring fertility, and so in each of the three countries the growing of legumes in rotation with other crops very extensively for the express purpose of fertilizing the soil is one of their old, fixed practices."

In Japan: "How the fields are crowded with crops and all the land is made to do full duty... even the narrow dividing ridges but a foot wide, which retain the water on the rice paddies, are bearing a heavy crop of soy beans" (p. 31, photo p. 33).

In China, in printing blue on white cotton calico cloth, a thick paste of lime and freshly-ground soy bean flour was used. A stencil was placed on top of the cloth. "The paste was then deftly spread with a paddle over the surface and thus upon the cloth beneath wherever exposed through the openings in the stencil... The paste is permitted to dry upon the cloth and then the bolt has been dipped into the blue dye the portions protected by the paste remain white. In this simple manner the printing of calico has been done for centuries" (p. 122-23). A photo (p. 123) shows a stone mill, pulled by a blindfolded donkey, "in common use for grinding beans and various kinds of grain."

"Sprouted beans and peas of many kinds and the sprouts of other vegetables, such as onions, are very generally seen in the markets of both China and Japan, at least during the late winter and early spring,..." (p. 134).

In a section titled "Economy of Vegetable Diet" (p. 134-35) the author notes that these people "are vegetarians to a far higher degree than are most western nations, and the high maintenance efficiency of the agriculture of China, Korea, and Japan is in great measure rendered possible by the adoption of a diet so largely vegetarian." From every 100 lb of dry substance (feed) eaten by various kinds of livestock, only 4 pounds of flesh is returned for human food from cattle, only 5 lb from sheep and 11 lb from swine. "In view of these relations, only recently established as scientific facts by rigid research, it is remarkable that these very ancient people came long ago to discard cattle as milk and meat producers; to use sheep more for their pelts and wool than for food; while swine are the one kind of the three classes which they did retain in the role of middleman as transformers of coarse substances into human food."

Pages 145-48 describe how cotton seed is crushed and pressed to make cotton seed oil and cotton seed cake–one of the most common family industries in China. Page 226 notes that small farmers in Shantung province grow wheat, barley, large and small millet, sweet potatoes and soy beans or peanuts. Shelled peanuts are sold in gunny sacks. Pages 256-57 give a similar description for soy beans and peanuts used to make oil and cakes in Shantung, China, with a photo (p. 256) of the large stone mill. The "bean and peanut cakes," also used for fertilizer in Japan and China, are about 18 inches in diameter and 3-4 inches thick.

The section titled "Rotation of Crops" (p. 309) states of Nara, Japan: "To secure green manure for fertilizing, soy beans are planted each year in the space between the rows of barley, the barley being planted in November. One week after the barley is harvested the soy beans, which produce a yield of 160 kan per tan, or 5,290 pounds per acre, are turned under and fitted for rice."

The chapter titled "Manchuria and Korea" notes of Lwanchow [Heibei], Manchuria (p. 348-49): "The planting here, as elsewhere, is in rows but not of one kind of grain. Most frequently two rows of maize, kaoliang or millet alternated with the soy beans and usually not more than 28 inches apart, sharp high ridge cultivation being the general practice." A photo (p. 348) shows carts pulled by donkeys or horses piled high with sacks of soy beans at Lwanchow, Chihli, China, ready for export.

Note: As of 2020, Lwanchow is in Hebei province, in northeastern China.

When King's train reached Sinminfu [Xinmin in Liaoning province on the Mukden-Tientsin railroad] he saw "the first extensive massing of the huge bean cakes for export, together with enormous quantities of soy beans in sacks piled along the railway and in the freight yards or loaded on cars made up of trains ready to move." They soon arrived at "another station where the freight yards and all of

© Copyright Soyinfo Center 2021

the space along the tracks were piled high with bean cakes and yet the fields about were reflecting the impoverished condition of the soil through the yellow crops and their uneven growth on the fields.

"Since the Japanese-Russian war [1904-05], the shipments of soy beans and of bean cake from Manchuria have increased enormously. Up to this time there had been exports to the southern provinces of China where the bean cakes were used as fertilizers for the rice fields, but the new extensive markets have so raised the price that in several instances we were informed they could not then afford to use bean cake as fertilizer" (p. 357).

Page 368: King is discussing country life in Korea as seen from the window of his train: "The valley beyond was occupied by fields of wheat where beans [probably soy] were planted between the rows. Thus far none of the fields had been as thoroughly tilled and well cared for as those seen in China, nor were the crops as good."

In Japan (p. 378-79): "Where bean cake is used as a fertilizer, the applications may be at the rate of 496 pounds per acre, carrying 33.7 pounds of nitrogen, nearly 5 pounds of phosphorus and 7.4 pounds of potassium." A table shows that typical fertilization for each crop of paddy rice, in pounds per acre, is: Manure compost 5,291. Green manure from soy beans 3,306. Soy bean cake 397. Superphosphate 198. The soy bean cake provides the most nitrogen (27.8 lb/acre). A photo (p. 420) shows peanuts being grown in the Tokyo plain (Chiba prefecture, July 17). "Peanuts, sweet potatoes and millet were the main dry land crops then on the ground, with paddy rice in the flooded basins" (p. 422). Address: Former Prof. of Agricultural Physics, Univ. of Wisconsin, and Chief of the Div. of Soil Management, USDA, Washington, DC.

• ***Summary:*** Chapter 47, titled "The Soya Bean," begins: "The history of the growth of the bean trade in Manchuria is as captivating as the story of the rise of Jack's famous beanstalk of our nursery days. It reads more like a fairy tale than a page from the Board of Trade Returns. Only after one has travelled through the region where the Soy Bean reigns supreme, and has seen the wharves and the warehouses, the stations and the platforms, laden with bags of Beans, and noted the thousands of queer-looking stacks with pagoda-like roofs with which the country is dotted, and which serve as temporary storehouses for the produce while awaiting shipment, does one realise that it is not a fable, but a veritable fact in the history of international commerce... And the manifold uses, agricultural and industrial, as well as dietary, to which the bean can be put, invest this generous vegetable with increasing importance, and the future of the Bean crop with romantic mystery."

• ***Summary:*** This issue gives statistics for the Japanese empire: Japan Proper, Korea, and Formosa.

Page 320. In the chapter on "Agriculture." A table shows production of soy beans, potatoes, and sweet potatoes, 1904-1908 (in 1,000 koku). Production of soy beans increased from:

3.710 million *koku* in 1904
3.261 million *koku* in 1905
3.517 million *koku* in 1906
3.667 million *koku* in 1907
3.842 million *koku* in 1908. Address: Japan.

122. Takushoku Kyoku, Japan. 1911. Daizu ni kansuru chôsa [Survey of soybeans]. Tokyo: Takushoku Kyoku. 2 + 6 + 406 p. 23 cm. Series: Takushoku Kyokuhô no. 25. [Jap]*
• ***Summary:*** This survey was conducted in Manchuria, Chosen (Korea), and Japan. *Takushoku* means "colonization," so the survey was conducted and published by the colonization office. Includes bibliographic references.

Note: This is the 2nd earliest known book about soybeans written in Japanese.

123. Morse, W.J. 1912. Re: Promising varieties of soybeans grown at Arlington. Letter to Miss M.G. Austin [USDA BPI], Feb. 10. 2 p. Typed, without signature (carbon copy).
• ***Summary:*** "The following list represents some promising varieties of soybeans grown in quantity at the Arlington Experimental Farm and Virginia Agricultural Experiment Station in 1911."

The varieties are 32890 Duggar, 32891 Austin, 32906 Virginia, 32907 Peking, 32908 Chestnut, and 32909 Auburn.

For each a full description is given; the description of Duggar is typical.

"32980 Duggar. Grown under No. 17268 C. at Virginia Experiment Station, Blacksburg, Virginia, 1911. A field mass selection at Arlington Experimental Farm in 1907 out of S.P.I. No. 17268, Ito San. An olive-yellow seeded variety of medium maturity found especially promising in Alabama and Virginia.

"32891 Austin. The progeny of S.P.I. No. 17263 grown

© Copyright Soyinfo Center 2021

under No. 17263 at Virginia Experiment Station, Blacksburg, Virginia, 1911; originally from S.P.I. No. 6397 from Pingyang, Korea. This variety was also distributed under Agrostology No. 1539. A later olive-yellow seeded variety found especially promising in Virginia. Tennessee, and Southern Pennsylvania.

"32906 Virginia. Grown under No. 19186 D. A pure field selection at Arlington Experimental Farm in 1907 out of S.P.I. No. 19186 from Newchwang, Manchuria, 1906. A medium late brown seeded variety of considerable promise

"32907 Peking. Grown under No. 17852B. A pure field selection at Arlington Experimental Farm in 1907 out of S.P.I. No. 17852, Meyer, from Peking, China. A medium late variety with small black seeds. Very prolific and especially promising as a hay variety.

"32908 Chestnut. Grown under number 20405 B. A field mass selection at Arlington Experimental Farm in 1907 out of S.P.I. No. 20405, Habaro, from Khabarovsk, Siberia, 1906. A medium early brown seeded variety of promise in the more Northern states.

"32909 Auburn. Grown under number 21079 A. A field mass selection at Arlington Experimental Farm in 1907 out of S.P.I. No. 21079, Shingto, from Tieling, Manchuria, 1907. A black seeded variety of medium maturity found especially promising in Pennsylvania and New York."

Location: National Archives, College Park, Maryland. Record group 54–Bureau of Plant Industry, Soils and Agricultural Engineering. Subgroup–Div. of Forage Crops and Diseases. Series–General Correspondence, 1905-29. Box 92–Morgan-Morse.

Sent to Soyinfo Center by Matthew Roth of Rutgers Univ., March 2012. Address: Scientific Assistant, Bureau of Plant Industry, USDA, Washington, DC.

124. *Oesterreichische Monatschrift fuer den Orient: Hauptteil 1912* (*Vienna*), *Austria-Hungary.* 1912. Ostasien: Japan [East Asia: Japan]. No. 10. Oct. Page 117, col. 2. [Ger]
• ***Summary:*** According to a communication dated mid-September 1912, in Korea the harvest in soybeans (*Soyabohnen*) was estimated at about 4.12 million *hl* (hectoliters), 7.7% more than in the year 1911.

125. *Grey River Argus* (*West Coast, New Zealand*). 1912. Milk made by machinery: Dairies turned into factories. Germ free and cheaper than cow's milk. Dec. 9. p. 1.
• ***Summary:*** "The familiar sign 'Milk from our own dairies' may soon be supplanted in London by the announcement 'Milk from our own factories.'

"This startling development of man's struggle to improve on nature is the result of the discoveries of Dr. Saner and Dr. Gooseell [sic, Gössel; Goessel], two German scientists, who claim to be able to make by machinery milk that is superior to that supplied by the cow.

"A demonstration of this synthetic milk was given at Dane's Inn House, London, in October, in the presence of medical men and Press representatives. Apart from a sort of clinging taste after drinking it, the synthetic draught passed the palate test. It went a little better with coffee.

"The inventors of synthetic milk have been experimenting in Germany for three years, and they claim they have now produced a perfect substitute for the natural article. Analysts in Germany have reported favourably on the new product.

It is claimed that the new milk is:–Free from bacilli; More wholesome than natural milk; Made in various grades to suit the infant or the adult; Easily standardised; And that it is much, cheaper than the natural article.

"The raw material is said to be purely vegetable, one of the main ingredients being the Soya bean, which is grown in Japan and Corea [Korea], and much used in those countries. As to the process of manufacture. Mr. Faulding stated that various vegetables were put into a machine and subjected to great heat. In plain English the machine does the work of the cow, the raw material, in the scientific sense, being exactly the same as that which supplies the natural article. It takes about seven hours to turn out the finished milk, and it is proposed to 'brew' twice a day.

"The plant is not costly, and taking an average of the various grades of strength the inventors intend to make, the price to the public will be 3*d* per quart. Cheese [tofu] can also be made from synthetic milk, which would be sold for about 3*d* a pound.

"The substitute will not make butter, but it is possible that it may be used in the manufacture of margarine.

"Synthetic milk also gives cream, but it takes longer to make it, as the fat is more evenly distributed than in the case of natural milk.

"Other claims made for synthetic milk are that it is not touched by hand throughout the process of manufacture and that it is not exposed to the atmosphere while being made, except for the brief period required for bottling.

"This, the inventors claim, makes it absolutely free from bacilli [bacteria], and thus, it is claimed, the substitute will greatly diminish consumption [tuberculosis] and other illnesses which are due to or aggravated by, tuberculosis milk.

"It is said that the new milk will keep good twice as long as cow's milk, but as it will be offered for sale in bottles of all sizes, this is not very material.

"If the invention is favourably received it is intended to build a factory in London."

The section titled "Extent of the work of the Office of Foreign Seed and Plant Introduction" states: "To stimulate this research and make it possible for a growing number of enthusiasts to breed plants with intelligence, the Office of Foreign Seed and Plant Introduction has been importing from various parts of the world the wild relatives of our cultivated plants and such promising wild forms as seem to offer a chance for domestication.

"When one canvasses the whole world for the varieties of one of our cultivated plants it is surprising to find how many forms there are. In 1907, for example, when the systematic work of bringing in soybean varieties for the Office of Forage-Crop Investigations first began, there were known in this country only 23 varieties. In a recent bulletin of the Bureau of Plant Industry 300 are mentioned as having been tested (Footnote: Piper & Morse. 1910. "The soy bean: history, varieties, and field studies." *USDA Bureau of Plant Industry, Bulletin* No. 197. See p. 24). These forms have been gathered since 1907 from the bazaars of oriental villages or bought from peasants in Japan, India, China, Siberia, Chosen (Korea), and the Dutch East Indies by trained explorers, American consuls, missionaries, or special correspondents." Address: Agricultural Explorer in Charge of Foreign Seed and Plant Introduction.

127. Giles, Herbert Allen. 1912. A Chinese-English dictionary. 2nd ed., revised & enlarged. 2 vols. Shanghai, China: Kelly & Walsh, Ltd.; London: Bernard Quaritch. 33 x 26 cm. Reprinted in 1964, 1978. [4 ref. Eng; chi]

• ***Summary:*** These two massive volumes, each weighing about 9½ lb, contain more than 1,800 pages and 13,848 Chinese characters. Contents of Vol. I: Part I. By the same author (25 books). Dedication. Preface. Extracts from preface to first edition. Dialects (The romanized pronunciation of each character is given in Cantonese, Hakka, Foochow, Wênchow, Ningpo, Peking, Mid-China, Yangchow, and Ssuch'uan {Szechwan} dialects, as well as in Korean, Japanese, and Annamese, each being distinguished by its initial letter). Tables: Insignia of official rank, the family names, the Chinese dynasties, topographical, the calendar, miscellaneous (the Chinese digits, the Chinese decimal system). The 214 radicals. Radical index. Part II. A Chinese-English dictionary (p. 1-1711, in two volumes). Examples of soy-related characters:

*Chiang* (p. 149, No. 1220). "A soy made by mixing salt with bean flour. Sauce." Fourteen compounds using this character are given, including: Bean sauce, soy. Pickled bean curd. Bean sauce. Soy is of two kinds, the clear and the thick. Dry relishes. Soy [sauce] colour–a dark reddish drab. He won't use money for vinegar to buy soy.

*Ch'ih* (p. 249, No. 1996). "Salted fruits, etc., dried and used as relishes." Four compounds incl.: Salted beans. Soy, sauce.

*Fu* (p. 458, No. 3686). "Rotten; putrid; worthless." Eleven compounds and sayings include: Bean curd, see No. 11,417. Bean curd officials–a term of contempt applied to certain of the poorer classes of official servants who are compelled to feed largely on this cheap food. Also explained as flabby or unenergetic officials. A Mongol name for cheese. A kind of milk made from beans (milk + fu) [Note 1. Probably fermented tofu].

*Huang* (p. 635, No. 5124). Yellow. Compounds: Yellow beans.

*Mao* (p. 955, No. 7,679). "Hair, down, feather." But the word *Maodou* ("Hairy beans") = edamame does not appear here.

*Ta* (p. 1,294-96, No. 10,470). "Great." But the word "Great bean" = soybean does not appear here.

*Tou* (p. 1,412, No. 11,417). "Beans; pulse." See also No. 11,412. Thirty compounds, incl.: Bean-sprouts. Bean-curd. A cheap restaurant (a bean-curd restaurant). Like making bean curd–very tedious. A tongue like a knife, but a bean-curd heart (soft). Bean-cake. Bean oil. Big bean, black bean, or yellow bean = the soja or soya bean (*Glycine hispida*, Max.), used for making bean-curd, soy, oil, etc. Ground-nuts.

*Yu* (p. 1,661, No. 13,409). "Oil, fat, grease." 45 compounds incl. Oil, salt, soy, and vinegar = condiments generally. Sesamum-seed oil. Linseed. Wood oil. An oil factory. Oil dregs. But "bean-oil" = soybean oil does not appear here.

Note 2 (see p. vii): Other earlier important Chinese dictionaries are: Morrison (1819, English). Medhurst (1843, English). Williams (1874, American). Giles (1892, English). Giles lived 1845-1935.

Note 3. Unfortunately, the pronunciation of the compounds is not given (as in Mandarin). Address: Prof. of Chinese, Univ. of Cambridge, Cambridge, England; and sometimes H.B.M. Consul at Ningpo.

128. Kawakami, Kiyoshi Karl. 1912. American-Japanese relations: An inside view of Japan's policies and purposes. New York, Chicago, Toronto, London and Edinburgh: Fleming H. Revell Co. 370 p. Index. 22 cm.

• ***Summary:*** The author argues for naturalization rights for Japanese in America. Contents: Introduction. Book I: The Manchurian question (p. 23-142). Book II: The Korean question (p. 143-284). Book III: The immigration question.

In Chapter 4, titled "Chinese diplomacy in Manchuria," Kawakami argues that by defeating Russia in the Russo-Japanese war of 1905, Japan (at great sacrifice) saved China from dismemberment by foreign powers (p. 81): "Suppose Japan had not dared to combat Russia, what would have become of Manchuria, and indeed of China? With the Three Eastern Provinces irretrievably lost to China, other powers would not have hesitated to follow the suit of Russia and slice for themselves such regions as they had fixed their covetous eyes on. The defeat of Russia at the point of the Japanese bayonet, therefore, meant the prevention of

© Copyright Soyinfo Center 2021

the dismemberment of China, which would have become imminent had the Muscovite been allowed to stay in Manchuria."

In Chapter 6, titled "Japan's commercial advance in Manchuria and the 'Open Door' (p. 113-20), Kawakami discusses soybeans and Japan's policy in Manchuria. He argues convincingly that, since May 1906, Japan has followed an "Open Door" policy toward Manchuria, "... that China's sovereignty should be respected and the principle of equal opportunity for all nations should be adhered to with the utmost sincerity. In spite of all the harsh judgments passed by foreign critics, I do not hesitate to assert that Japan has been faithful to this fundamental policy sanctioned by the throne." Japan has promoted her own interests in the "Three Eastern Provinces" and allowed other nations to do likewise. Indeed: "Japan has subsidized her steamship lines to Manchuria, installed commercial museums in various important Manchurian towns in order to advertise her merchandise, sent commercial agents to inquire into the Manchurian markets, and, what is more important, has become a most liberal purchaser of Manchurian products, thus establishing close business relations with the native producers and merchants. These, reinforced by the advantage which she enjoys over Western nations in geographical position and the cost of production and transportation, have enabled her to push her trade in Manchuria with remarkable success.

What is the secret of Japan's secret of commercial success in Manchuria? This question Westerners usually answer with the hackneyed two words–cheap labor." This is true, however, the main reason is "that Japan, of all foreign nations, has been the only customer for Manchurian products..."

Kawakami believes that the only man who perceives the crux of the Manchurian question is George Bronson Rea, as described in his article of March 1910 titled "Beans: The solution of the commercial situation in Manchuria," published in his periodical the *Far Eastern Review* (Shanghai).

"The real basis of Japan's success in Manchuria is, Mr. Rea believes, the operation of the fundamental economic law, that the country consuming the major portion of the exports of another country holds the most advantageous position in supplying its necessary imports. Now Japan has for years been the chief consumer of Manchuria's principal export, consisting of [soy] beans and bean cake." Before the Russo-Japanese war, Chinese traders controlled this trade. But since Japan's victory in the war, all that has changed. "Japan began an aggressive campaign to gain control of the Manchurian trade, and success soon crowned her efforts. Says Mr. Rea:

"Under these conditions the foreign merchants and their agents in the interior are placed at a disadvantage from the outset. As they could not penetrate into the interior and purchase beans by an exchange of commodities, they are reduced to selling their wares for cash–the one thing the nation was short on."

"Not a few critics have been at pains to create in Europe and America the impression that Japan discriminates against foreigners in Manchuria in shipping and railway rates. The subsidized shipping of Japan, as one of such critics insinuates, carries Japanese goods at a minimum charge, subject to further rebates as quantities rise, from the place of manufacture to the port of Tairen [Dairen], thence the goods are carried at special rates to their selling place over the tracks of the South Manchuria Railway. In Mr. Rea's opinion, such charges and insinuations fall short of the mark in explaining the loss of the Manchurian market for American and European products, and he sums up the whole situation in these words:

"It is a far cry from high diplomacy to the humble soya bean, yet we hold to the belief that the past and present commercial situation and ultimate solution of the vexatious Manchurian question are bound up in the control of this one product."

In the next sentence, Mr. Kawakami writes: "That really furnishes the key to the Manchurian question."

Note 1. In the index, the soya bean is indexed under "Manchurian bean," and not under "soy" or "soya."

Note 2. Kiyoshi "Karl" Kawakami (1873-1949) was a Japanese Christian journalist who was born in Yonezawa, educated in the law in Japan, and was for a short time involved in newspaper work in that country. In 1901 he came to the United States and studied at the universities of Iowa and Wisconsin. In 1905, engaged in journalism, he traveled extensively in China, Siberia, and Russia. He was a correspondent for leading newspapers in Tokyo and a frequent contributor to American magazines and newspapers. (Continued).

"32890-32891. From Blacksburg, Va. [Virginia]. Grown by the Virginia Agricultural Experiment Station. Received February 27, 1912. Seeds of the following; quoted notes by Mr. W.J. Morse:

"32890. '*Duggar.* Grown under No. 17268C at the Virginia Experiment Station, Blacksburg, Va., 1911. A field mass selection at Arlington Experimental Farm in 1907 out of S.P.I. No. 17268, *Ito San*. An olive-yellow seeded variety of medium maturity found especially promising in Alabama and Virginia.'

"32891. '*Austin.* The progeny of S.P.I. No. 17263 grown under No. 17263 at Virginia Experiment Station, Blacksburg, Va., 1911; originally from S.P.I. No. 6397 from Pingyang [Pyongyang / P'yongyang], Korea. This variety was also distributed under Agrostology No. 1539. A late olive-yellow seeded variety found especially promising in Virginia, Tennessee, and southern Pennsylvania.'

"32906-32909. The following list represents some promising varieties of soy beans grown in quantity at the Arlington Experimental Farm, Virginia, in 1911. Numbered March 4, 1912, for convenience in recording distribution. Seeds of the following; quoted notes by Mr. W.J. Morse:

"32906. '*Virginia.* Grown under No. 19186D. A pure field selection at Arlington farm in 1907 out of S.P.I. No. 19186, from Newchwang, Manchuria, 1906. A medium-late brown-seeded variety of considerable promise.'

"32907. '*Peking* Grown under No. 17852B. A pure field selection at Arlington farm in 1907 out of S.P.I. No. 17852, *Meyer,* from Peking, China. A medium-late variety with small black seeds. Very prolific and especially promising as a hay variety.'

"32908. '*Chestnut.* Grown under No. 20405B. A field mass selection at Arlington Experimental Farm in 1907 out of S.P.I. No. 20405, *Habaro,* from Khabarovsk, Siberia, 1906. A medium-early brown-seeded variety of promise in the more northern States.'

"32909. '*Auburn.* Grown under No. 21079A. A field mass selection at Arlington Experimental Farm in 1907 out of S.P.I. No. 21079, *Shingto,* from Tieling, Manchuria, 1907. A black-seeded variety in Pennsylvania and New York.'" Address: Washington, DC.

131. Curtice, Raymond S. 1913. Dairen. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 16(177):597-608. July 31. See p. 604-05.

• ***Summary:*** This is part of a larger article on "Commerce and industries of southern Manchuria" (p. 593+). The section on Dairen begins: "The Dairen (Dalny) consular district compromises the southern end of the peninsula of Liaotung, the southernmost part of Manchuria, and embraces the whole of the Kwantung Leased Territory, which was originally leased to Russia by China in 1898. The unexpired term of the lease was ceded to Japan by Russia at the close of the Russo-Japanese War."

The section titled "Bean trade" (p. 604) notes that there has been a marked decrease in the trade of soybeans and products from Dalny. The reasons for this have already been given. A table shows exports for the calendar year 1912 of bean cake, [soy] beans, and bean oil (in tons of 2,000 lb) to various countries. Most of the bean cake (302,402 tons) is sent to Japan. Most of the [soy] beans are also exported to Japan (101,903), followed by Hong Kong (9,694), Great Britain (5,700), Dutch Indies [today's Indonesia] (2,829), and Netherlands (1,108). The largest amount of [soy] bean oil is sent to Belgium (13,550), followed by Japan (7,636), and Great Britain (1,116). Small amounts of beans and/or products are exported to: United States (oil only), Singapore / Straits, etc., Sweden, Germany, France, Russia (Pacific ports), and Chosen (Korea). For bean cake: Total to foreign countries 302,551. Total to Chinese ports 76,172. Grand total (1912) 378,723. For [soy] beans: Total to foreign countries 121,3241. Total to Chinese ports 61,304. Grand total (1912) 182,629. For [soy] bean oil: Total to foreign countries 23,493. Total to Chinese ports 13,973. Grand total (1912) 37,467. Corresponding totals are given for 1910 and 1911. "The fact that the share taken by the Chinese ports was so much greater proportionally in 1912, in all three items, was due to the lessening of the European demand." "It is expected that a new factor in the export trade of bean cake will be introduced when the new chemical process of extracting the oil is put into operation, for the residue, now in the form of bean cake, will be in a powder, and will be capable of shipment through the tropics without decaying. This should open up profitable markets in America and Europe for this article."

The section titled "Bean milling the chief industry" (p. 605) begins: "The industries of this consular district

© Copyright Soyinfo Center 2021

center around the [soy] bean trade and the South Manchuria Railway Co. Gives statistics by bean mills on production of bean cake and oil in 1910, 1911, and 1912. The Chinese have 40 [soy] bean mills in operation with a combined capital investment of $528,500, while the Japanese with their six mills of most modern construction total $1,687,000. Although most of the Chinese mills are operated by crude methods, still it is significant that their combined output during the season just past (October–April) was $8,308,098. The output of five modern Japanese mills (one having been destroyed by fire) during the same period was $2,360,170." Address: Vice consul.

132. Keimatsu, Katsuzaemon. 1913. Daizu no ôyô hômen ni tsukite [Problems of application of soy-bean]. *Chosen Igakkai Zasshi* (*Korean Medicine*) No. 8. p. 1-5. Dec. [Jap] Address: Yakugaku Hakase.

133. Takenob, Y.; Kawakami, K. 1913. Japan Year Book. Tokyo: Japan Year Book Office. 702 p. See p. 163-64, 230, 351, 356, 358, 438, 654, 659, 672, 690. Eighth annual issue. [Eng]

• ***Summary:*** In chapter 11, "Agriculture" (p. 155-77) is a table titled "Beans, sweet potato and potato (p. 163) which gives "Soy bean" production in Japan for 1906-1910 (in *koku*).

On page 164 we read: "The three daily articles of diet for all classes, viz. soy [sauce], *miso,* and *tofu* are manufactured from this bean..."

In chapter 15, "Industry," is a paragraph titled "Soy" (p. 230) on the patented Suzuki process for brewing soy [sauce]. "For soy the prefecture of Chiba, which is contiguous to Tokyo municipality, heads all other places on the list. Parched wheat mixed with salt and beans is a principal ingredient. The process is still far from scientific, requiring about 12 months before the liquid is ready for sale. It is also costly, as it does not admit so much labor-saving appliances. To obviate these advantages, several patented processes, notably that by Mr. Suzuki, have been tried, but they do not seem to have attained ideal perfection. It was on the strength of the Suzuki process that a company backed with yen 2,500,000 paid up was started, in 1907, and the 2-months' brewing, the chief merit of the invention, was started. It is to be regretted that this first machine-brewing has failed to produce the soy which can compare with the old process soy in taste and flavor, and that the company has been wound up."

In Chapter 25, "Home trade" is a table (p. 351) titled "Prices of principal commodities in Japan," which includes prices for 1905-1911 in yen for soy beans (per *koku*), soy [sauce] (per *koku*), and miso (per *kwan*).

In Chapter 26, "Foreign trade" is a table (p. 356-58) titled "Imports" (in 1,000 yen). Under the heading "Staples articles of over yen 1,000,000" (p. 356) is given the value of soja bean imports for 1908-1912. Under the heading "Trade with China (p. 359) is given the value of imports of "beans" and of "oil-cakes" for 1906-1911.

In chapter 30, "Finance," is a paragraph (p. 438) titled "Tax on Japanese soy" [sauce].

In chapter 34, "Chosen (Korea)," a table (p. 654) on "Exports (in 1,000 yen), under the heading "Foreign trade" has data on exports of beans and peas for 1906-1912 (in yen).

In the same chapter, under the heading of "Agriculture" is a paragraph (p. 659) which states: "Barley and soya bean.–Barley covers 421,828 cho, yielding 4,194,425 koku. Beans are exported chiefly to Japan for manufacturing soy. The acreage is 358,000 cho and the yield [production] 1,925,000 koku. Export to Japan amounted to about 3,500,000 yen in 1909."

In Chapter 35, "Taiwan (Formosa)," under the heading "Agriculture," a table (p. 672) titled "Agricultural products" has production data on "Beans and peas" (in 1,000 *koku*) for 1905-1909.

In Chapter 37, "South Manchuria," is a paragraph (p. 690) titled "The soya bean" which states: "The fame of Soya bean has spread all over the world since 1906 when the Mitsui Bussan first shipped a trial consignment to England. As substitute of cotton seeds for extracting oil the bean met with a favorable reception not only in England but in Germany, France and elsewhere, and the following year the enterprising firm received large orders. The yield [production] of [soya] bean in Manchuria is between 1,500,000 and 2,000,000 tons and the output of bean-cakes about 1,000,000 tons. In 1909 the export amounted to 800,000 tons of which about 50% went to Europe, 30% to China and 20% to Japan. The export is made through Dairen, Newchang (which monopolized it before the export to Europe began), and Vladivostock [Vladivostok], the first claiming about one half and the other half is divided between the two ports." Address: Prof. at Waseda Univ. and Late of the *Japan Times,* Japan.

134. *Hawaiian Gazette* (*The*) (*Honolulu, Hawaii*). 1914. Six soy factories located in Honolulu: Product promises to rival that of Japan. Jan. 9. p. 8, col. 6.

• ***Summary:*** "An investigation carried out yesterday showed that there are six soy factories in Honolulu manufacturing about 2500 five-gallon tubs per month. They give employment to forty or fifty skilled laborers. One of the largest of these factories [Yamajo Soy Co.], on Pua lane, Palama, manufactures about three-fifths of the local product, or from 1300 to 1500 tubs per month."

Note 1. The names of the other five makers are not given, perhaps because they are all small, and combined make only 40% of the local soy sauce.

The daizu or soy beans used to make this soy sauce is imported from Korea; wheat, salt, and a "special variety of

© Copyright Soyinfo Center 2021

yeast" [sic, mold] are also used. "The fermentation room contains forty or fifty 2000-gallon wooden vats filled to the top" with the thick mixture. The mixture ferments slowly for from nine to twelve months. When the gas bubbles no longer form, the mixture is pronounced pau [finished or done]. It is then ladled into a great rectangular vat holding the contents of five or six of the tuns and is then filtered in bag presses with a lever arm made of a tree-trunk about three feet in diameter and thirty feet long, to which additional weight is added. When the filtered soy no longer drips from the presses the liquor is boiled in huge cast iron caldrons, to thicken it and preserve it from spoiling. When it boils down to the right consistency, it is measured into tubs that are manufactured on the premises from California cedar. The press-cake is a valuable fertilizer that finds ready sale to the rice and taro growers.

The yeast [sic, koji] that is used in soy manufacture is grown in a series of concrete chambers that are heated to a controlled temperature by means of charcoal braziers.

"The quality of the local product is said to be improving every year and the soy brewers say it is only a matter of time until the Honolulu made soy will entirely supplant the Japanese imported soy."

Note 2. This article raises several questions: (a) In about 1914, what was the ratio of Japanese to Chinese living on Oahu? (b) Chinese like and use soy sauce as much as Japanese. But the two types of soy sauce are quite different. Did the Chinese import theirs from China? Buy the local Honolulu Japanese soy sauce? Make their own in Hawaii?

Note 3. In 1890, there were 1,791 Chinese and Japanese (lumped together) who were *citizens* of the Hawaiian kingdom. The "alien" population far surpassed them in numbers which were:

Chinese 15,301

Japanese 12,360

Total population of Hawaii was 89,900.

Thus, in 1890 the ratio of Chinese to Japanese in Hawaii was roughly 55% to 45%. (Source: 1890 census of the Hawaiian Kingdom. http://www.hawaiiankingdom.org/info-census1890.shtml).

According to the 1910 census, the total population of Hawaii was 191,874. This included 79,675 Japanese and 21,000 Chinese. So there were almost four times as many Japanese as Chinese in the Islands. Source: http://www.altiusdirectory.com/Travel/hawaii-demographics.php

135. Griffin, R.C. 1914. Animal and vegetable oils: Their preparation and uses–I. *American Machinist* 40(6):239-41. Feb. 5.

• ***Summary:*** "Synopsis–The most valuable animal oils for lubrication are lard oil, neatsfoot oil, tallow oil, whale oil, sperm oil, and porpoise oil. All of these were formerly used for lubricating purposes, but now have given way to a great extent in this field to mineral oils."

"Animal and vegetable oils are often called 'fixed oils,' because in contradistinction to mineral oils they cannot be volatilized or distilled without decomposition. Chemically speaking, they are all glycerides of fatty acids. The glycerides are neutral substances, whereas the fatty acids are, as the name implies, of an acid nature. A simple differentiation for the layman between neutral oils, that is, glycerides, and fatty acids, is this: When treated with caustic alkalies they both form soaps and a secondary product; but in the case of the glycerides this secondary product is glycerin, whereas in the case of fatty acids it is simply water."

"Sperm oil is the lightest and the most fluid and castor oil the heaviest and the most viscous of the fixed oils. Certain of the vegetable oils, when exposed to the air, rapidly absorb considerable oxygen, forming thin, elastic, varnish-like films. Such oils are called drying oils, of which the best known is linseed oil, largely used in paints. Other vegetable oils show no tendency to form such films and these are called nondrying oils. There is also a third class of oils, called semidrying, which, as the name indicates, falls between the drying and nondrying classes. For lubrication, either nondrying or semidrying oils must be used, such as olive oil, rape oil, and castor oil. It is important, moreover, that all oils used for lubrication should be as free as possible from fatty acids."

"Animal oils are, as a rule, either nearly colorless or yellow; vegetable oils occur in various shades of yellow or green."

There follow long sections on the following oils: Linseed, China-wood or tung, soja-bean, cottonseed, rape, olive, and caster. The section titled "Soja-bean oil" states: "This oil is also variously known as soy-bean oil, Chinese-bean oil, and simply 'bean oil.' It is obtained from the seeds of a plant which grows largely in Japan, Korea, and China. In truth the soja-bean industry is one of the staple industries of Manchuria and of Japan. The oil is largely used in those countries for edible purposes, but has recently been finding more and more use in this country as a paint and varnish oil in connection with linseed oil. When exposed to the air it dries slowly with the formation of a thin skin. Its value as a paint oil has not been definitely settled as yet, but it is claimed to have valuable properties in varnish making. Its color varies considerably through several shades of brown and yellowish brown, according to the care with which it has been prepared. It has about the same specific gravity as linseed oil, but its drying properties are considerably inferior. It belongs, in fact, to the class of semidrying oils, and not to the class of drying oils."

136. Hanson, George C. 1914. Commerce and industries of Kwantung. *Daily Consular and Trade Reports* (*U.S. Bureau of Foreign and Domestic Commerce, Department of Commerce*) 17(153):7-17. July 1. See p. 11-12, 15-16.

• ***Summary:*** "The Dairen (Dalny) consular district embraces

© Copyright Soyinfo Center 2021

the Kwantung Leased Territory (Japanese), comprising the tip of the Liaotung Peninsula and the islands adjacent thereto... Its area is 1,221 square miles and its population in 1913 was 517,147, of whom 469,651 were Chinese [90.82%], 47,381 Japanese [9.16%], and 115 foreigners."

A table (p. 8) of "Foreign trade by countries" shows that the lion's share of its imports (71.5% of gross value) come from Japan, followed by Germany, UK, Belgium, and USA.

A table (p. 11) shows "Shipments from Manchuria into Kwantung during 1912 and 1913, including: Bean cake 103,787 / 127,690 tons. [Soy] beans 553,438 / 622,205 tons. Beans (small=azuki) 16,794 / 16,297. Sauce, bean and soy 50 / 78 pounds.

The export trade in soybeans and products expanded. A table (p. 12) shows the "native exports" (to within China; quantity and value), including bean cake, [soy] beans, and bean oil.

The section titled "Last year's improvement in bean trade–unfavourable outlook" includes a table which shows exports (incl. reexports) of [soy] beans and bean oil "in 1913, by countries of destination. Exports of bean cake to foreign countries increased in 1913 to 527,507 short tons, of which 520,947 tons went to Japan and the remainder to Chosen [Korea]. The amount shipped to Chinese ports was 38,629 tons in 1913, as against 76,172 in 1912." "A large proportion of the bean oil shipped to Japan is transshipped to the United States." Address: Vice Consul, Dalny (Dairen), Japanese Leased Territory.

137. Piper, C.V.; Morse, W.J. 1914. Five Oriental species of beans. *U.S. Department of Agriculture Bulletin* No. 119. 32 p. Sept. 2. [22 ref]

• ***Summary:*** The five beans are the adsuki [adzuki, azuki] bean, the rice bean (*Phaseolus calcaratus*), the mung bean (*Phaseolus aureus*), the urd (*Phaseolus mungo*), and moth bean (*Phaseolus acontifolius*). Soy is mentioned only briefly.

"The adsuki bean (*Phaseolus angularis* (Willd.) W.F. Wight; Pl. I) is much cultivated for human food in Japan and Chosen [Korea] and to a less extent in China and Manchuria, but is apparently unknown in India and elsewhere in Asia. No mention of its cultivation in Europe has been found in agricultural literature. Next to the soy bean it seems to be the most important legume grown in Japan." In 1910 345,634 acres of adsuki beans were grown in Japan, compared with 1,171,438 acres of soy beans.

The first knowledge of the adsuki, or atsuki [azuki] bean to Europeans is the brief description by Kaempfer (1712). Kaempfer's drawing of the plant was later published by Banks (Kaempfer, 1791). This illustration is excellent and unmistakable. Willdenow (1801), named the plant *Dolichos angularis* on the basis of Kaempfer's description and illustration.

The adsuki bean was grown at Arlington Farm, Virginia, in 1906 (6 varieties), 1908, 1909, 1912, and 1913 (8 varieties).

Use in Japan: In Japan the adsuki commands a higher price than any other bean, the varieties with maroon-colored seeds being most widely used. "Adsuki-bean meal is sometimes prepared simply by grinding the dry beans and then removing the seed coats with sieves. More commonly, however, a wet process is employed. The wet process seems to vary somewhat in different parts of Japan, but consists essentially of 4 stages: 1. Boiling the beans until soft, usually after a preliminary soaking. 2. Crushing the cooked beans. 3. Removing the skins by forcing the mass through sieves or by putting the bean paste in cold water, when the skins are easily separated. 4. Drying the bean paste. The fresh, undried bean paste is called *an* and the dried product *sarashi-an.*

In whatever way prepared, the bean meal is eaten in soups and gruels of various kinds, often sweetened. It is also used for making various kinds of cakes and confections. Adsuki beans are also eaten popped like corn, as a coffee substitute, and candied by boiling in sugar. The last product is called *amanatto.* The flour is also used for shampoos and to make facial cream. "The use of beans to make sweetmeats seems to be purely a Japanese invention."

"Among the seed brought back from Japan by the Perry expedition in 1854 was a 'red-seeded bean.' (Browne, 1855, p. XV.) The identity of this bean has never been definitely determined, but it was doubtless the most common form of adsuki bean.

"Two varieties of the adsuki bean were tested at the Kansas Agricultural Experiment Station in 1891 by Prof. C.C. Georgeson (1891). Both of these had red seeds, one having the pods 'white,' the other 'black.' The white-podded variety yielded 16.3 bushels per acre; the black-podded, 8.7 bushels. In thrashing, the beans were found to crack easily, and so they were flailed. The beans were tested only as human food. 'These beans have been submitted to several housekeepers for trial, who all, with two exceptions, give them most favorable recommendations.' The professor of household economy, in a letter to Prof. Georgeson, praised the beans highly both for use in soups and baked."

"S.P.I. No. 226. A maroon-seeded variety from North China, March, 1898, under the name 'wei-tou (vay-do).' No cultural notes." Address: 1. Agrostologist in Charge; 2. Scientific Asst., Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

138. *Chemist and Druggist* (*London*). 1914. Corean soya-beans. 85(14):499. Oct. 3. Series No. 1810.

• ***Summary:*** In the lower left corner is a short "filler" paragraph which states (p. 499): "The exports [of soya beans] from Corea during 1913 amounted to 98,341 tons, against 100,919 tons in 1912 and 88,151 tons in 1911. The values, however, in 1913 were 54,652 *l.* [British pounds sterling] more at 565,142 *l.* against 510,490 *l.* in 1912."

Note: Soybeans / Soya are mentioned in the Trade

Report section of many, many issues, but the references are not listed in the volume indexes (with the exception of the last entry above).

139. Agricultural Bureau, Dep. of Agriculture and Commerce Japan (Norinsho, Nomukyoku). 1914. Outlines of agriculture in Japan. Tokyo: Agricultural Bureau, Department of Agriculture and Commerce. 20 + 35 p. Dec. No index. 15 x 22 cm. [Eng]

• ***Summary:*** See next page. Name of organization with diacritics is: Nôrinsho, Nômukyoku. The structure of this book is unusual. The table of contents (p. 1-3) is followed by a list of "illustrations" [all photographs] (p. 1-2), a colored map of Japan and pie chart, 20 unnumbered pages of black-and-white photos, and finally the text in four chapters (p. 1-34).

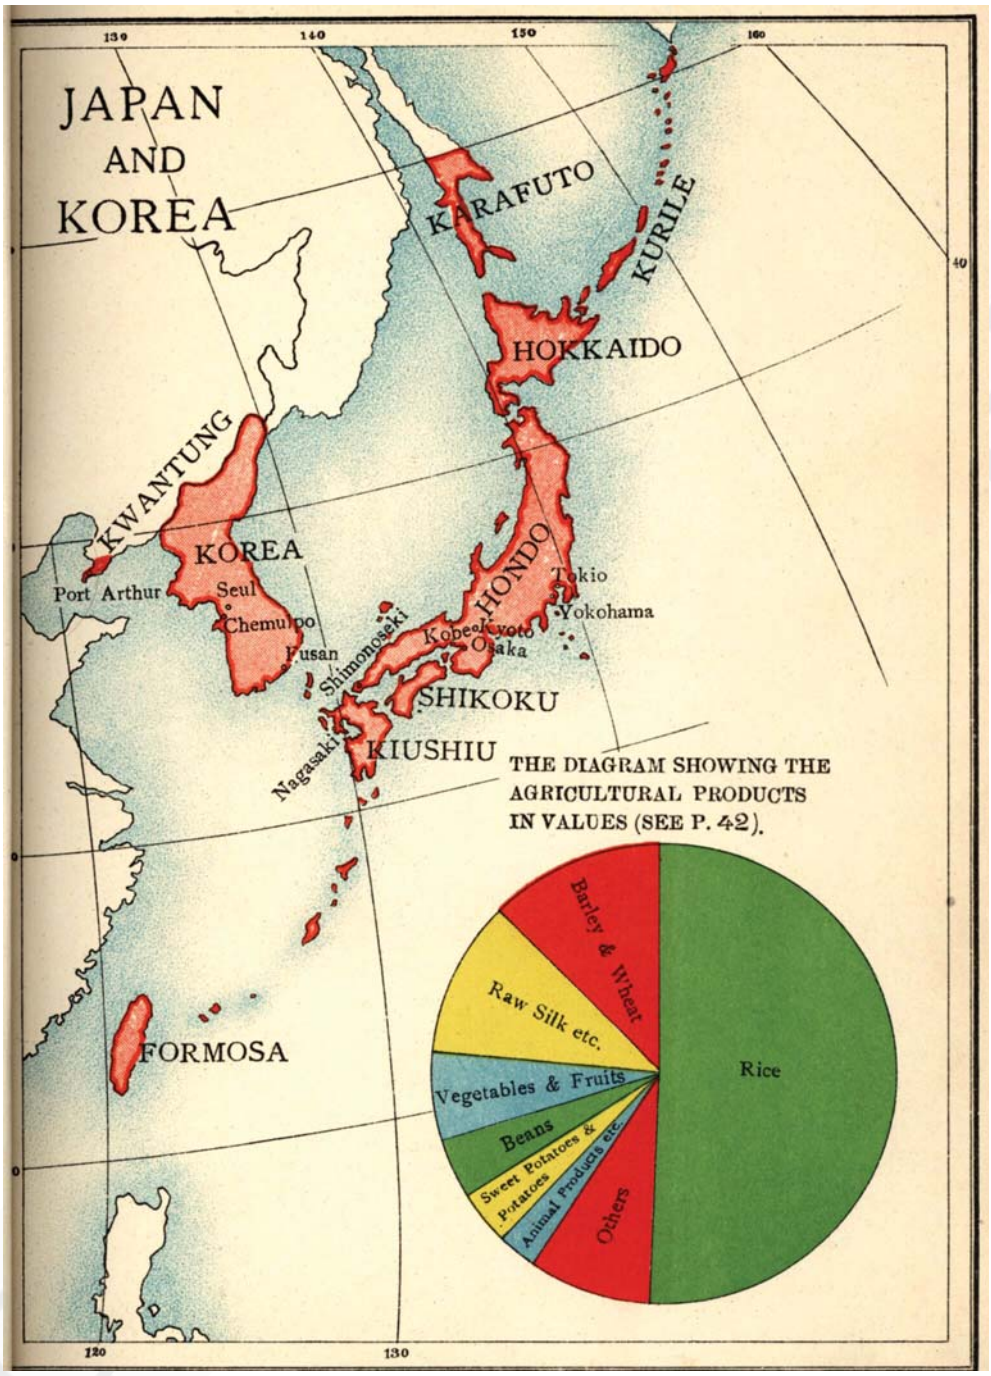
The pie chart (average of the 3 years 1910-1912, excluding Chosen, Taiwan, and Karafuto) shows the percentage of agricultural products in value; Rice has about 60% of the total value, followed by barley, naked barley and wheat, cocoon and silk worm eggs, and vegetables. Leguminous beans are one of the smallest categories.

Interesting photos include:

(1) The hall [building] of the Imperial Department of Agriculture and Commerce. (2) The Agricultural College of Tokyo University (fields, with buildings in the background). (3) The Agricultural College of Tohoku University (trees and walkways, with buildings in the background). (4) The Imperial Agricultural Experiment Station. (13) Interior of filiature at Okaya, Nagano prefecture (many women kneeling in two long rows like machines behind silk spools). (15) Silk conditioning house. (16) The sericulture institute. (20) Shibuya live-stock breeding farm, and long-tailed fowl (on a perch with a 9-foot tail).

Chapter 1–Condition of agriculture. At the end of 1912 about 60% of all households in Japan are farming households. Of these 5,510,000 farming households, 32% have occupations in addition to farming–primarily sericulture, followed by making items from straw (fancy matting, braids), tea manufacture, then chicken raising. There are three classes of farmers: Land-owners, peasant proprietors (32% of total number of farmers; cultivate their own land), and tenants (28% of total number; rent farms from land-owner). Both peasant proprietors and tenant farmers (40% of total). About 15% of Japan's land is under cultivation. Of this, about half is taken up by paddy fields (for raising irrigated rice) and half by upland fields. Many paddy fields give two crops a year. Soja beans are mostly grown as a summer crop on upland fields in rotation (p. 5). Because of the smallness of its scale, Japanese agriculture traditionally relied mostly on human labor. But in recent years the number of farm animals has increased. In late 1912 there were 2,290,000 of which 1,220,000 were horses, 1,070,000 cattle, and 300,000 swine. About 20 years ago, fertilizer meant mainly human excrement, weeds, and stable manures, plus small amounts of oil-cake [soja bean cake], fish-guano, and rice bran. Today the value is three times what it was 10 years ago, and now includes soylees [okara]. "Of these market manures, the bean cake, which is imported from China and Kwantung Peninsula, is most important and demanded the sum of 25 million yen [25% of the value of all fertilizers]. Next came the various composition manures [chemical fertilizers], the material of which is imported in large quantities, and super-phosphates of lime" (p. 8). There are more than 10,400 agricultural cooperatives in Japan with 1.16 million members; they are promoted by the Co-operative Societies Law of 1900. There are four types: Credit, Purchase, Sales, and Productive Societies (p. 9).

Chapter 2–Agricultural products. The value of all agricultural products is estimated at 1,720 million yen for the 3 years preceding 1912. These fall into six groups (value shown in million yen): 1. Cereals (incl. soja beans)–1,246 (72.4% of total). 2. Industrial crops (incl. tea, rape, tobacco, sugar cane)–65.3 (3.79%). 3. Horticultural products (fruits, vegetables, and flowers)–196.8 (11.4%). 4. Livestock and poultry–42.27 (2.45%). 5. Cocoons and silkworm egg cards–164.2 (9.5%). 6. Miscellaneous–5.1 (0.03%). Looking now at the value of individual cereals in million yen: Rice 966.4 (56.2% of total of 6 groups). Naked barley 74.2. Barley 63.3. Wheat 52.5. Soja beans 35.95 (2.1% of total). Indian millet 15.84. Miscellaneous 38.1.



A table (p. 12-13) shows the acreage of the principal crops (in units of 1,000 *cho*) at 5-year intervals from 1887 to 1912. For soja beans: 466 in 1887, 443 in 1892, 435 in 1897, 466 in 1902, 471 in 1907, 475 in 1912. Thus, the are planted to soja beans was roughly static. For small red bean [azuki] it was: 109 in 1897, 129 in 1902, 135 in 1907, 136 in 1912. So azuki area was about 25-28% of soja bean area.

Another table (p. 13-14) shows the yield of the principal crops (in units of 10,000 *koku*) at 5-year intervals. For soja beans: 325 in 1887, 311 in 1892, 310 in 1897, 313 in 1902, 366 in 1907, 351 in 1912. Again, fairly static. By comparison, between 1887 and 1912 the average yield of wheat increased by 70%, naked barley by 39%, barley by 38%, and rice by 26%–but only 8% for soja beans.

Japan's top three export items (value on 1,000 yen) are raw silk (166,963), tea (12,639), and sugar (10,384). The main imports are cotton (193,735), rice (32,128), soja bean cake (for manure; 27,469), sugar (20,694), wool (14,531), and soja beans (8,571). Peanuts are exported to the USA.

Chapter 3–Agricultural administration. The highest organ is the Department of Agriculture and Commerce, which is divided into five sections. The highest organ of agricultural research is the Imperial Agricultural Experiment Station; there are 39 local agric. exp. stations. Agricultural statistics are compiled at the Section of Correspondence in the Secretariat of the Department. A statistical report on all matters concerning agricultural products is issued once a

© Copyright Soyinfo Center 2021

© Copyright Soyinfo Center 2021

year.

Chapter 4–Outline of agriculture in the colonies. I. Agriculture in Formosa. Rice is the principal crop, followed by sugar cane, sweet potatoes, tea, beans, and peanuts. No statistics are given. II. Agriculture in Chosen [Korea]: A table (p. 32-33) shows area (in 1000 *cho*) and production (in 1,000 *koku*) in 1912: Rice 980 / 8,969. Indian millet 403 / 3,118. Barley 386 / 4,293. Soja bean 375 / 2,452. Wheat 169 / 1,094. Small red bean (azuki) 165 / 835. The largest export from Chosen in 1912 was rice, followed by soja beans. But the largest export from Chosen to Japan was soja beans, worth 4,917,000 yen. III. Agriculture in Karafuto (the Japanese name for Sakhalin Island). In 1875 it came entirely under Russian control when Japan ceded it in exchange for the Kuril / Kurile Islands. It was occupied by Japan in 1905, and the southern half (below 50ºN) was granted to Japan by the Treaty of Portsmouth, which ended the Russo-Japanese War. It was returned to the USSR in 1945 after the Allies defeated Japan in World War II. It is too far north to grow soybeans. But barley, naked barley, wheat, oats, rye, and rape grow well.

Note: This is the earliest document seen (May 2021) that gives clear soybean production statistics for Korea. Address: Tokyo, Japan.

140. Takenob, Y. 1914. Japan Year Book. Tokyo: Japan Year Book Office. 740 p. See p. 345, 400, 433-34, 439-40, 442, 689, 692, 705, 718. Ninth annual issue. [Eng]

• ***Summary:*** This annual book was first published in 1905. Facing the Preface is a table of Japanese weights, measures and moneys. In chapter 16, "Agriculture" (p. 337-57) is a table titled "Beans, sweet potato and potato (p. 345) which gives "Soy bean" production data in Japan for 1908-1912 (in *koku*).

3.892 million *koku* in 1908
3.766 million *koku* in 1909
3.396 million *koku* in 1910
3.693 million *koku* in 1911
3.511 million *koku* in 1912.

The next paragraph contains information on soy [sauce], *miso*, and *tofu* similar to that in the 1913 year book.

In chapter 20, "Industry," is a table on soy [sauce] production in Japan from 1908-1911, and a paragraph (p. 400) on the patented Suzuki process for brewing soy [sauce].

In Chapter 22, "Trade" is a table (p. 433-34) titled "Prices of principal commodities in Japan," which includes prices for 1907-1912 in yen for soy beans (per *koku*), soy [sauce] (per *koku*), and miso (per *kwan*).

In Chapter 23, "Foreign trade" is a table (p. 439) titled "Imports" (in 1,000 yen). Under the heading "Staples articles of over yen 1,000,000" (p. 438) is given the value of soja bean imports for 1911-1913. In a table titled "Soja bean" (p. 442), under the heading "Staple exports and destinations (in 1,000 yen)" (p. 440) is given the value of soja bean exports to China, Kwantung, India, and other places for 1911-1913.

In chapter 35, "Chosen (Korea)," under the heading "Agriculture" (p. 691) is a paragraph (p. 692) titled "Barley and soja bean," which gives acreage and yield for soja (year not specified) with the value (in yen) of exports to Japan in 1912.

In Chapter 36, "Taiwan (Formosa)," under the heading "Agriculture," a table (p. 705) titled "Agricultural products" has production data on "Beans and peas" (in 1,000 *koku*) for 1911-1912.

In Chapter 38, "South Manchuria," is a paragraph (p. 718) titled "The soya bean" which has information on South Manchuria's soya bean yield, [soya] bean-cake output, amount exported for specific years, and production of various milling centres.

In the advertisements at the rear (p. xiii) is a full page ad for Higeta Shoyu, showing many medals: "Patronized by the Imperial Household. Trade mark. The celebrated Japanese sauce. Established in 1616. Manufactured by G. Tanaka, Chioshi [Choshi], Chiba-ken, Japan." Address: Prof. at Waseda Univ. and Late of the *Japan Times*, Japan.

141. Terry, Thomas Philip. 1914. Terry's Japanese empire: Including Korea and Formosa, with chapters on Manchuria... A guidebook for travelers. Boston and New York: Houghton Mifflin Co.; London: Constable & Co., Ltd.; Tokyo: Kyo-Bun-Kwan, Ginza, Shichome. cclxxxiii + 799 p. See p. 515. Maps. Index. 16 cm. [75 ref]

• ***Summary:*** This guidebook, after its 283-page introduction, is organized geographically into: 1. Central Japan. 2. Northern Japan. 3. Yezo, the Kuriles, and Saghalien. 4. Western Japan. 5. Kyushu and the Loochoo and Goto islands. 6. Korea, Manchuria, and the Trans-Siberian Railway. 7. Formosa (Taiwan) and the Pescadores. Abbreviations (p. ix). List of maps (13).

In the Introduction: Japanese inns (p. xxxvi, xxxix-xl): The best food is not always to be had in the most pretentious places. In certain modest inns, where the rooms are as bare as a monk's cell, and the general appearance of austerity might argue a strict economy, there will often come, as an agreeable surprise, dainty food served in dishes that delight the lover of beautiful porcelain or lacquer. Later the traveler may learn that the place enjoys fame for some savory specialty–eels boiled in soy, broiled crayfish, stewed octopus, buckwheat-macaroni, or the like."

"Food is served in the guest's room on a lacquered tray... One of the soups may be made of... lobster, or seaweed, in which case it is amazingly thin and unpalatable; the other of beans [miso], bean curd or something of that nature. Salt is not provided unless asked for. Many of the dishes are cooked in soy; a tiny dish of which is supplied for dipping bits into before eating them."

Japanese food (p. xliii-xlvii): "Rice is a luxury with thousands of the peasants; it takes the place of bread with the

© Copyright Soyinfo Center 2021

well-conditioned; and wherever it is eaten to the exclusion of other foods it produces (because the thin phosphorous skin is polished off it) the prevalent beriberi. The proportion of animal food is small. Beans eaten in a variety of ways occupy a conspicuous place in the food of all classes and they supply the nitrogenous matter essential to those who rarely eat meat and who do not get the casein obtained by cheese-eating peoples. The soy-bean (*daizu; omame*) ranks first in extent, variety of use, and value among the pulse of Japan, and in point of nutriment is quite near to meat. It contains nearly two fifths of its weight in legumin, nearly one sixth in fat, and is rich in nitrogen. It is to the Nipponese what frijoles are to Mexicans and garbanzos (chick-peas) to Spaniards. Of the numerous varieties some are made into curd [tofu], and into the widely celebrated bean-sauce (the Worcestershire of Asia) called shoyu (sho, soy; yu, oil), and which is almost as indispensable as rice. It forms the daily relish of the rich man and the beggar, and is in as general use as tea and tobacco."

Fish (sakana)... Teriyaki: Fish in a sauce of soy, mirin, and sugar... Sashimi: raw fish cut in thin slices and eaten after being dipped in shoyu.–Kabayaki: fish which is first steamed then dipped into soy and roasted (or eels cut open on the dorsal line, covered with soy mixed with sugar, and roasted). The latter dish, usually called Unagi-no-kabayaki, is a favorite with the Japanese,..."

"Rice:... Azuki-meshi: rice and red pea-beans mixed (boiled).–Mochi: small dough-cakes made of rice and sold throughout Japan.–Sushi: a general name for food of boiled rice and fish, eggs, vegetables, etc., seasoned with vinegar and soy...–Inari-zushi: fried tofu stuffed with chirashi-zushi.

Note: This is the earliest English-language document seen (April 2013) that contains the term *Inari-zushi.*

- Maki-zushi: boiled rice and other vegetables rolled and wrapped in a sheet of the sea weed called Asakusa-nori...–Kombu-zushi: fish seasoned with vinegar and wrapped in a piece of the edible seaweed known as Laminaria japonica. A differentiation of this popular food is the Kombumaki: baked or roasted fish wrapped in kombu, then tied, and boiled in sugar and soy.

Various:... Tsukudani: small fish boiled in soy and used as a relish or condiment (named for Tsukudajima, a place in Tokyo famous for its preparation).–Oden: a stew (greatly enjoyed by the proletariat) of fried bean-curd, lotus-roots, potatoes, etc." Ame and midzu ame.

"Soup (shiru): Tôfu-jiru: bean-curd soup.–Miso-shiru: bean-soup with vegetables."

Railways–Dining cars (p. lxxxiv): Discusses "The unique and not unpalatable bento,–a sort of national sandwich,–put up (usually cold) in thin, flat, twin boxes (bento-bako) of dainty white wood (1 in. high, 5-7 in. long), along with a paper napkin (kuchifuki) and a pair of chop-sticks (hashi), and sold at many stations, is distinctively Japanese and widely popular... Besides the full box of plain boiled rice, the ordinary (15 sen) bento contains usually... a few boiled black beans (nimame)... seaweed (kobu)..." Rice cakes (mochi) with the kernel of yokan, or sweet [azuki] bean paste, which usually forms their center.

Buddhism (cxc): Again the rice-flour cake [mochi] is offered at the domestic altar. It now takes the form of a lotus-petal with capsule of [azuki] bean-paste." (an).

Yokohama (p. 13): "The return gifts from the emperor and princes included...jars of soy [sauce]; coral and silver ornaments;..."

Tokyo (p. 199): "The hill beyond the intersecting roadway is called Suribachi-yama because of the similarity in shape to a suribachi–an earthenware vessel in which bean-soup [miso soup] is prepared."

Nikko–Shops: "... the kuri-yokan (so-called from the chestnuts mixed with the sweetened bean-paste [azuki]) is good and cheap (10 sen)."

Kyoto–The Shinto Shrine of Inari. There are many local festivals, the most important of which is the Inari-matsuri which usually falls on June 5. There are trick riders on horseback and decorated sacred cars [carts] are "placed in the procession, and the day is devoted to general jollity–and pocket- picking. On this occasion the people eat Inari-zushi, or fried tofu stuffed with boiled rice, since tofu [fried, as aburage] is the favorite food of the fox popularly believed to be the messenger of Inari (and by extension, the God of Rice)."

Kyoto–Miidera (p. 504-05): Travelers visit Benkei's Iron Pot (*Benkei-no-shiru nabe*), a very old, rusted, and broken contraption (about 5 ft. wide and 3 deep) resembling a soap-boiler, and from which Yoshitsune's devoted servitor (and popular hero) is supposed to have eaten his bean-soup [miso soup]–which may well be doubted."

Kyôto to Kôya-San (p. 515): For the Western traveler there is "a tiny kitchen, a blessed refuge wherein, if he is making a prolonged stay, he may cook his un-Christian food without the vegetarian priests knowing (or caring) that such a sacrilege is being committed! Meals are served in one's apartment; the food is purely vegetable, and after the second day distressfully unpalatable. Fish, flesh, fowl, butter, cheese, eggs, milk, bread, coffee, and other necessaries of life are absent, and are replaced by seaweed, greens, bamboo-shoots, cabbage, daikon in various unappetizing forms, and other garden-truck which one eats as a novelty the first meal and rejects with an involuntary tightening of the throat when it is offered at the second and third. In addition there are flabby mushrooms boiled in very thin water without seasoning; the omnipresent boiled rice without sugar, milk, or salt; a bean-curd (*tofu*) for which one acquires a liking only after much patient effort; a yellow substance (known as *yuba*) made of the skin of bean-curd, and looking and tasting like thin sheet rubber;..."

Kobe excursion–The Tansan Hotel (p. 630): The strawberries and other ground fruits and vegetables, which

© Copyright Soyinfo Center 2021

grow nearly all the time in this favored spot, are enriched with [soy] bean-cake only [no human excrement is used] (as a precaution against typhoid)."

Korea (p. 725): "Among the dishes dear to the native heart are pounded capsicum, bean curd [tofu], various sauces of abominable odors, a species of sour kraut (kimshi [kimchi]), seaweed, salt fish, and salted seaweed fried in batter."

Manchuria and the Trans-Siberian Railway (p. 756): "Considerable [soy] bean-cake and furs, and vast quantities of lumber, etc., come down the river from upper Manchuria and Siberia."

Also discusses edible seaweed (p. xliv, 330): Japanese food: "Seaweed in almost endless variety enters largely into foodstuffs. Not only are the giants of the marine flora taken up and utilized in various ways, but also the more delicate red and green sorts–the use of which has been adopted by other nations. Most of the edible green and red algae bear the generic term nori, while the words *umi-kusa*, or *kai-so* (which also means *bêche-de-mer*), are used for algae in general. Many of the weeds are eaten fresh, others in soup. Some are dried or pickled and eaten in vinegar. They usually appear in commerce in the form of little packages, to the sale of which special stores are dedicated. Certain varieties are converted into jelly."

Yezo–fisheries: "Certain of the many varieties of edible seaweed which flourish along the Japanese coast are found in Yezo, particularly the circumpolar tangle (*Laminaria*) and seawracks (*Fucus* species), which prefer cold water and a heavy surf. For this reason sea-algae add considerably to the value of the Yezo exports."

Note: The author resided for almost 12 years in Japan and made repeated journeys on foot (and otherwise) from one end of the country to the other. Address: F.R.G.S. [Fellow of the Royal Geographical Society, England].

142. Ide, Hayamizu. 1915. Daizu shushi-chû no jiyasutaze ni tsuite. I. [On the diastase of soybean seeds. I]. *Chosen Sotokufu Chuo Shikenjo Hokoku* (*Korean Governor-General's Central Research Laboratory, Report*) 1(1):2-1 to 2-19. March. [Jap]
Address: Gishu [Japan].

143. *Bulletin Economique de l'Indochine* (*Hanoi*). 1915. Surface cultivée et production du Soja au Japon de 1904 à 1913 [Area cultivated and production of soybeans in Japan from 1904 to 1913 (and in Korea from 1909 to 1912)]. 18(112):260. March/April. [Fre]
• ***Summary:*** This table for the years 1904 to 1913 inclusive in Japan gives for each year: Area cultivated (in *cho;* 1 *cho* = 2.451 acres). Soybean production (in *koku;* 1 *koku* = 180 liters = 47.6 gallons). Average yield (in *koku* per *tan;* 1 *tan* = 0.245 acre). The cultivated area rose from 446,843 *cho* in 1904 to a peak of 495,802 *cho* in 1908, then fell to 475,284 *cho* in 1913. Production rose from 3,710,459 *koku* in 1904 to a peak of 3,892,934 *koku* in 1908, then fell to a low of 2,993,095 *koku* in 1913. Yield fell from a peak of 0.830 in 1904 to a low of 0.629 in 1913.

A second table gives statistics for soybean production in Korea from 1909 to 1912. The area cultivated rose dramatically from 280,090 *cho* in 1909 to a peak of 375,340 *cho* in 1912. Production also rose sharply from 1,533,027 *koku* in 1909 to 2,452,203 *koku* in 1912.

Note: This is the 2nd earliest document seen (March 2014) that gives clear soybean production statistics for Korea. Address: Hanoi.

144. Porter, Robert Percival. 1915. Japan, the new world-power: Being a detailed account of the progress and rise of the Japanese empire. London, New York, Toronto, Melbourne and Bombay: Humphrey Milford, Oxford University Press. xxiv + 789 p. Illust. Seven colored maps. Index. 23 cm. [ soy ref]
• ***Summary:*** Japan (regardless of race and colour) intervened in the Great War on the side of her ally Great Britain. They worked together successfully against Germany in the siege of Tsing-Tau in 1914 from Oct. 31 to Nov. 7.

Near the front of the book is a table of "Weights, measures and moneys, for Japan, Great Britain, and the USA."

Page 149-50: "The annual average number of immigrants from Japan is about 20,000. Roughly, half go to China and the United States of America... Since 1907 two batches of Japanese emigrants, under 2,000 in all, have gone to Brazil, the majority of which have been under contract with the Sao Paulo Government to work in the coffee plantations." There are now about 155,000 Japanese in the United States. Since a 1907 agreement between Japan and the USA, immigration of Japanese labour to the USA has been restricted. Some Japanese have tried to enter the USA by going first to Mexico. There are not more than 2,000 Japanese in Canada at present.

Page 232: In Japan: "The necessity for increased military and naval expenditure, which rose in connection with Korea in 1881, called for considerable additional revenue. Fresh military taxes were therefore levied; income-tax was introduced along with indirect imposts [taxes] on soy [sauce], tobacco, confectionery, and stamps, and the tax on *sake* was raised, augmenting the receipts to such an extent that the Government was able in 1886 to reduce the land-tax again. But following the war with China [1894-95] it became necessary to establish occupation and registration taxes, to raise again the *sake* tax, and to create a Government monopoly of leaf tobacco."

A table (p. 233) shows how the ordinary State revenue of Japan was derived in the financial years 1898-99 and 1909-10. The two main sources of revenue were: Land tax (38.4 and 85.7 million yen respectively) and liquor tax

© Copyright Soyinfo Center 2021

(33.0 and 91.5 million yen). By comparison, the soy tax was relatively small: 1.54 and 4.73 million yen.

Page 235-36: "The tax on liquors is levied upon (a) brewers of *shurui* (alcoholic liquor), which is divided into five classes, viz. *seishu,* or refined *sake, dakushu,* or unrefined *sake, shirozake,* or white *sake, mirin,* or sweet sake, and *shochu,* or distilled sake; (b) brewers of beer; and (c) wine and alcohol and alcoholic liquors other than sake or beer."

"Soy tax: The soy tax is levied upon manufacturers of this sauce at the rate of about 1 3/4 yen per *koku.* A tax on soy for household use was introduced in 1900, and ranges from 50 sen to 4 yen per *koku,* according to the amount manufactured. No more than 5 *koku* of soy per annum may be made for household use."

Page 240: A full-page table shows the "Budget for financial year 1911-12." The main sources of "Ordinary revenue" are liquors tax (88.7 million yen), land tax (75.1 million), customs duties (50.5 million), and tobacco monopoly (50.5 million yen). Revenue from the soy [sauce] tax is 4.6 million yen. The sugar excise is 14.7 million yen.

Page 261-62: "The upland fields, being for all intents and purposes unirrigable, are only to a very limited extent utilized for the cultivation of rice. Rotation crops are, however, raised twice a year, usually barley, 'naked barley,' and wheat as winter crops, and soya (more properly soja), sweet potatoes, and millets as summer crops." A key unit of area in agriculture is one *tan* = 0.245 acre. On [lowland] paddy fields, nationwide over the past 10 years, the average yield per *tan* is 7.913 bushels of rice and 6.668 bushels of barley, which may be considered a representative winter crop. "Upland fields, upon the same basis, produce 6.638 bushels of barley as a summer crop and 3.756 bushels of soya bean."

Another key (larger) unit of area in agriculture is one *cho* = 2.45 acre.

A table (p. 263) shows the total area, production, and yield of 17 major crops in Japan in 1897 and in 1910. Both years, the leading crop (by far) in area was rice, followed (in 1897) by barley, naked barley, wheat, and soya bean. For 1897 the three figures for soya beans were: 1,067,000 acres under cultivation, 15,381,000 bushels total production, and 14.41 bushels per acre yield. For 1910 the three figures for soya beans were: 1,137,000 acres, 18,834,000 bushels total production, and 16.56 bushels per acre yield.

Statistics for "small red bean" [azuki] are also given: For 1897 268,000 acres under cultivation, 3,069,000 bushels total production, and 11.45 bushels per acre yield. Thus, in 1897 and 1910 the production of soybeans was roughly 5 times the production of azuki beans.

Chapter 15, "Agriculture," contains a section titled "Soya bean" (p. 264-65): The soya, or soja, bean is well enough known in England as a cattle-food, but in Japan its application is by no means limited to this use. It is the basis of the Japanese sauce, soy, of which enormous quantities are brewed; of *miso,* or bean cheese [sic], used extensively for soup and in cookery in general; and of *topu* [sic, tofu], or bean curd, a cheap, highly nutritious and very popular article of diet. The residue from these manufactures is used both as fertilizer and as cattle food, or, alternatively, an oil of some value may be obtained from it. It is the principal summer crop of the upland fields, and its cultivation, which requires less fertilizer and less labour than other products, is general throughout Japan and particularly in Hokkaido. But the supply is far from equal to the demand, and a large quantity of beans and bean cake is imported from Chosen and Manchuria, the value of the present importation amounting to £3,000,000 annually.

"Among other beans the small red bean is largely cultivated, especially in Hokkaido, and is used for cakes and confectionery, and boiled with rice on occasions of ceremony. The Japanese are very fond of peas, horse-beans, and kidney-beans, which are grown as a stolen crop after rice in the paddies and just before it in the upland fields."

Page 269: "A comparison of the relative positions of human and animal labour in paddy fields and upland farms for the years 1903 and 1908 (the latest year for which figures are available) shows that the area tilled exclusively by human labour still forms a very large proportion of the total, though it tends steadily to decrease." "Manual labour is plentiful and it is chiefly by reason of its abundance that the intensive system can be carried on. Rice-growing requires, for instance, the labour of 17 men and 9 women per *cho* (2.45 acres), barley and wheat 11 men and 6 women, tobacco 25 men and 23 women, soya bean 7 men and 5 women, and so on. Farmers, in the vast majority of cases, are their own labourers, and those who may be distinguished as 'professional labourers' are a very small class."

Page 292: Sea-weeds: "Chief among the sea-weeds used as food is that known as 'Kombu' (*Laminaria*). It grows mostly on the shores of Hokkaido and the south-east of Honshiu [Honshu], and is eaten sliced into very thin shreds. 'Kanten' is made by dissolving the weed Tengusa in water and exposing the resulting gelatinous infusion to the action of cold by night and the sun by day. Only the Chinese use it as food, however; in the West it is a substitute for gelatine, isinglass, starch, and the like. Other sea-weeds are used as paste."

Page 319: "Japan is self-supporting in silk weaving, the preparation of national liquors, soy brewing, matches, porcelains, and some other articles."

Page 450: A history and discussion of the South Manchuria Railway Co.

Page 583: "A Rescript of Emperor Daigo, issued in 930, said:–'We have seen that many sick people are lying by the roadside and that no one gives them shelter. We order that they shall be supplied with shelter and with food. There shall be given daily to a man or a woman one *sho* of rice, one

© Copyright Soyinfo Center 2021

*shaku* of fine salt, and one *go* of soy [sauce]..."

Page 692: Hokkaido. "Of the food crops, the soya bean and the small red bean [azuki] are the most important." Agriculture "now constitutes Hokkaido's principal source of wealth," yet fisheries have long been important.

Chapters 44 and 45 (p. 699-733) are about Manchuria; soya beans are discussed at length. The Japanese government wisely selected Baron Goto to reorganize the South Manchurian Railway.

Chapter 47 (p. 745-57), "The Soya Bean," is basically the same as that found in the 1911 edition titled "The Full Recognition of Japan." Address: Queen Anne's Mansions, London, England.

145. Takenob, Y. 1915. Japan Year Book. Tokyo: Japan Year Book Office. 789 p. See p. 349, 391, 401-02, 436, 634, 714, 716-17, 730, 743. Tenth annual issue. [Eng]

• ***Summary:*** This book gives statistics for the Japanese empire: Japan Proper, Korea, and Formosa.

The population of Japan Proper (based on the census taken every 5 years) was:

1898–45.4 million.

1903–48.5 million.

1908–51.7 million.

A table of "Weights, measures and moneys" is on p. xxxii (near the front).

Page 349. In the chapter on "Agriculture," a table shows production of soy beans, sweet potatoes, and potatoes, 1911-1913 (in 1,000 koku). Production of soy beans decreased from:

3.69 million *koku* in 1911, to

3.51 million *koku* in 1912, to

2.99 million *koku* in 1913.

Note: The decrease of soy bean production in Japan during this period was due mainly to imports of soy beans from Manchuria and Korea (see below).

The text below the table states: "Among subsidiary farm crops there is perhaps nothing which plays so important a part in the Japanese kitchen as soy beans. The three daily articles of diet for all classes, viz. *soy, miso,* and *tofu* are manufactured with this bean either in part or wholly, The tofu (bean curd) is one of the most popular articles of diet, being cheap and highly nutritious; the miso makes Japanese soup and is used in various other ways. The soy is indispensable in Japanese cooking. Then for extracting oils, [the cake] as manure, and food for horses, beans are equally important. The supply being insufficient, quite a large quantity comes in from Manchuria and Korea. In Japan Hokkaido is the principal centre of production. Red beans [azuki], also very extensively produced in the northern island, are used for making confectionery, are boiled with rice on ceremonious occasions, and for other purposes. Peas and horse-beans, whether green or fully ripe, are favorite food-stuffs in Japan, and they are extensively cultivated as a second crop after rice and as a forerunner to rice, indigo, etc. on upland farms. Groundnuts are among a few subsidiary farm produce that go abroad, mostly to U.S.A. In Japan they are used by confectioners and also for pressing oil..."

Pages 390-91. A table titled "Industrial companies classified by amount of investment" states for "Soy and miso." Number of companies: 251. Paid up capital: 5.9 million yen. Reserves: 580,000 yen.

Page 401-02. In the chapter on "Industry" under "Brewing industry" we read: "The brewing industry in Japan comprises sake, beer and soy, for wine is still insignificant and as yet enjoying the benefit of non-taxation. The two indigenous industries of sake and soy are still primitive in process, and various new methods, several of them patented, have so far failed, especially as regards soy.

Page 402. "Soy.–For soy the prefecture of Chiba, which is contiguous to Tokyo municipality, heads all other places on the list as to output. Parched wheat mixed with salt beans is a principal ingredient. The process is still far from scientific, requiring about 12 months before the liquid is ready for sale. It is also costly, as it does not much admit labor-saving appliances. To obviate these advantages have been tried several patented processes, but most of them have failed. The collapse of the short-lived Nippon Soy Co., started in 1907 near Osaka with 2,500,000 yen paid up, has dampened the cause of scientific process of soy brewing."

A table shows annual production of sake, beer, and soy (in koku) from 1912-13 to 1914-15 (three years). Note: Since all three of these are taxed by the federal government, careful records are kept. Sake averaged 4.32 million *koku* (the largest output). Soy averaged 2.37 million *koku* (roughly half of sake). Beer averaged about 0.219 million *koku* (by far the smallest).

A 2nd table gives exports of these three products during the same years. Sake averaged 3.61 million *sho* (100 *sho* = 1 *koku* = 47.6 gallons). Soy averaged 3.15 million *sho.* Beer exports (in 1914) were by far the smallest: 117,000 pints, 377,000 quarts, and 22,000 casks of 1 *sho* each. Note: "Beer brewing first started about 1876 in Hokkaido. The brewing was at first under the tutelage of German experts... At present there are four or five breweries, the Dai Nippon, Kirin, and Kabuto."

Page 465. A table titled "Prices of commodities in Japan" (1911-1913) includes the following for 1913:

Rice 21.01 yen per koku.

Barley 7.93 yen per koku.

Soja beans 11.54 yen per koku.

Red bean [azuki] 16.02 yen per koku.

Soy [sauce] 23.85 yen per koku.

Miso 0.37 yen per kwan [kan; 1 kwan = 3.75 kg].

Page 518. A table titled "Carrying trade on main routes" shows that China was exporting a lot of Soja beans and [soja] bean cake to Japan. China (including Manchuria) had exports to Japan worth 142.3 million yen and imports from

© Copyright Soyinfo Center 2021

Japan worth 80.5 million yen.

Page 634. In the chapter on "Finance" under "6. Tax on Japanese soy" we read: "The tax is assessed both on the soy manufactured for sale and on that for home consumption. In the former the tax is yen 1.75 [per koku] for refined soy and yen 1.65 for the unrefined soy and in the latter it ranges between the two extremes of yen 4.00 and yen 0.50 according to quality.

Page 714. In chapter 35, "Chosen (Korea)," under the heading Foreign Trade," is a table on "Staple exports" (in 1,000 yen) which has data on "Beans and peas" for 1910-1914.

Page 717. In the chapter on "Chosen (Korea): Agriculture," under "Barley and Soja Bean" it is stated that "Soja and other beans are exported chiefly to Japan for manufacturing soy [sauce]. Acreage of soja beans in Korea is 553,077 *cho* and the yield 3,345,472 *koku.*" Note: 1 *cho* = 2.45 acres and 1 *koku* = 47.6 gallons or about 6 gallons. Thus, in English units, in Korea 1,355,039 acres produce 20,072,832 bushels, for a yield of 14.8 bu/acre.

Note: This is the earliest document seen (Jan. 2005) that gives soybean production or area statistics for Korea (which has been a "province" of Japan since 1910).

Note: Japan was importing a lot of soybeans from its colony, Korea, in 1912. Korea had exports to Japan worth 20.9 million yen and imports from Japan worth 27.1 million yen (p. 518).

Page 730. In Chapter 36, "Taiwan (Formosa)," under the heading "Agriculture," a table (p. 730) titled "Agricultural products" has production data on "Beans and peas" for 1912-1913. The beans were probably mostly soy beans.

102,000 *koku* in 1912

137,000 *koku* in 1913

In Chapter 38, "South Manchuria," is a paragraph (p. 743) titled "The soya bean" which has information on South Manchuria's soya bean yield, [soya] bean-cake output, amount exported for specific years, and production at various milling centres (almost same wording as 1914 Year Book). Address: Japan.

146. Davis, John K. 1916. Foreign bean production and trade: Manchuria–Antung export statistics. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 19(42):694-705. Feb. 19. See p. 703-04.

• ***Summary:*** "It is impossible to secure estimates of the acreage of beans in this district that sufficiently approximate accuracy to be worth recording. The only available figures from which estimates can be made are the customs statistics of the total exports of beans of all kinds from this port, which of course include soya as well as purely edible beans."

A table shows direct exports of beans from Antung directly to foreign countries from 1912 to 1914. Only soya beans and "red beans" [azuki] are exported in large amounts. For "Yellow (soya)" beans: 4,899,866 pounds in 1912. 8,404,533 pounds in 1913. 21,025,4666 pounds in 1914. Clearly a huge increase. For "Red" [azuki] beans. 4,175,600 pounds in 1912. 4,647,200 pounds in 1913. 3,344,533 pounds in 1914. A decrease.

"While there are no figures showing exactly the destination of the beans exported from Antung it is commonly known that the larger part of the edible as well as the soya beans exported is sent to Japan and Korea (Chosen)." Address: Consul, Antung, China.

147. Latham, F.P. 1916. Soy beans as a cereal: Soy beans a great crop for southern farmer. *Progressive Farmer* (*The*) (*Raleigh, North Carolina*) 31(8):254-55. Feb. 19. See also p. 286 (Feb. 26) and p. 342 (March 4).

• ***Summary:*** "The first mention of the soy bean in this country was in the early part of the 19th century; however, it attracted little attention prior to 1854, when 2 varieties were brought to this country from Japan by the Perry expedition. It followed that other varieties were found and introduced, among them that 'old standard,' the Mammoth Yellow, which came to our shores sometime previous to 1882. The success with Mammoth furnished an encouraging lead to our diligent research workers, resulting in the importation into this country by the Department of Agriculture of some 800 distinct varieties."

As a cereal, it is widely produced in Japan, China, Korea, and Manchuria. "By certain processing of the ground beans a milk is extracted which is not such a poor substitute for the real article; from this a cheese [tofu] is made that resembles in texture and nutrient value, our cottage cheese. Another product is a heavy, rich sauce [miso], similar to our peanut butter, which is consumed in large quantities. Soys occupy the place in the diet of these people that navy and lima beans do in our own, and are prepared in a like manner. They furnish the brown man his 'peanut.' By the simple process of soaking in salt water, then roasting they at once become a close competitor of the famous American delicacy."

"So far as I have been able to ascertain there is but one mill in the United States built for and operating exclusively on soy beans. The Pacific Oil mills, of Seattle, Washington, have build up a lucrative business in this line and only get foreign beans for crushing, its output of both oil and meal meeting a ready demand in the West. That such can be done profitably in the South is no longer a question. The fact has already been demonstrated by several cotton oil mills in eastern North Carolina... If these satisfactory results can be obtained in mills not constructed for the purpose of handling beans, it is entirely reasonable to suppose that specially constructed machinery will in time be installed that will further enhance the profits accruing from such operations."

A portrait photo shows F.P. Latham.

Note 1. This is the earliest document seen (Aug. 2011)

© Copyright Soyinfo Center 2021

that mentions Pacific Oil Mills of Seattle, Washington.

Note 2. This is the earliest of many articles seen (Aug. 2011) that likens tofu to cottage cheese, or roasted soybeans to peanuts. Address: Belhaven, North Carolina.

148. Meyer, Frank N. 1916. Re: Autobiographical sketch and resumé of work as a plant explorer for USDA–to be considered for membership in the Botanical Society of Washington, DC. In: Letters of Frank N. Meyer. 4 vols. 1902-1918. Compiled by Bureau of Plant Introduction, USDA. 2444 p. See p. 2176-77. Letter of 15 March 1916 to Mr. Stephen Stuntz, David Fairchild's botanical assistant. • ***Summary:*** "Born in Amsterdam, Holland, November 29, 1875.

"Had an ordinary public school education; at the age of 14 entered the Botanical Garden of the University of Amsterdam as a pupil in Botanical Gardening; after two years entered the Experimental Garden of Professor Hugo de Vries, became his assistant; later had private and public tuition from 16 until 20 years of age in various subjects, such as French, English, German, landscape gardening, technical drawing, botany, physics, chemistry, etc.

"Became a student of botany and horticulture in the University of Groningen, Holland, for six months; returned to Amsterdam, had charge of the experimental work of Prof. de Vries, followed his lectures on Plant Breeding and Botanical Physiology for several years; botanized in Holland for several summers; accumulated a large herbarium of plants of the Netherlands.

"Resigned from the University of Amsterdam in March, 1899. Spent two and one-half years in travelling in Holland, England, France, Belgium, Germany, Italy and Switzerland.

"Immigrated to the United States of America in October, 1901. Found employment with the U.S. Dept. of Agriculture; resigned in September, 1902. Went to California, found employment again with the Department at the Plant Introduction Garden at Santa Ana; resigned again in March, 1903. Was in the florist business in Santa Barbara, California, from April, 1903 to March, 1904.

"Left California for Mexico in April, 1904. Walked across Mexico from San Blas to Vera Cruz; went to Cuba, also to the southern United States. In August, 1904, entered the employ of the Shaw Botanical Garden at St. Louis [Missouri]; was a member of the jury on Forestry at the World's Fair in 1904. Resigned in July, 1905, from the Shaw Botanical Garden to enter service of the Department of Agriculture as an Agricultural Explorer. Collected and travelled in China, Japan, Korea, Siberia, Russia, Central Asia, etc. for c.a. nine years–am still at it.

"Wrote a bulletin on Agricultural Explorations in the Fruit and Nut Orchards of China, Chinese Plant Names, also many minor papers.

"Intentions are to roam for many more years, primarily in China."

Note: Stephen Stuntz was David Fairchild's botanical assistant.

Location: University of California at Davis, Special Collections SB108 A7M49. Address: USDA Plant Explorer.

149. *USDA Bureau of Plant Industry, Inventory.* 1916. Seeds and plants imported by the Office of Foreign Seed and Plant Introduction during the period from October 1 to December 31, 1913. Nos. 36259 to 36936. No. 37. 95 p. March 25. • ***Summary:*** Soy bean introductions: *Soja max* (L.) Piper. (*Glycine hispida* Maxim.)

"36576. From Fakumen, Manchuria. Presented by Dr. S.A. Ellerbeck, Mukden Hospital, who secured them from Mr. F.W.S. O'Neill, Fakumen. Received November 1, 1913. 'A bean called *white eyebrow bean.* This is the nearest I can obtain to the bean you mention. It is said that this bean produces plenty of oil. The name seems to arise from the white edge from which the sprouts come.' (O'Neill.)

"36643-36653. From Newchwang, Manchuria. Presented by Mr. George F. Bickford, vice consul. Received November 24, 1913. Quoted notes by Mr. Bickford.

"36646. 'Green soy beans, *Ching tou.* From Chang Chun, north of Mukden.'

"36647. 'White eyebrow soy bean of the Fakumen meadow land.'

"36648. 'White eyebrow soy bean, *Pei mei.* From Sze Ping Kai, northeast of Mukden.'

"36649. 'Golden yellow soy beans, *Chin hwang tou.* From north of Mukden.'

"36650. 'Yellow soy bean, *Hwang tou.* From Liao River Valley.

"36651. 'Golden round soy bean, *Chin yuan* or *Chin yuan tou.* From north of Mukden.'

"36652. 'Yellow soy bean, *Yuan tou.* From Kung Chuling, south of Harbin. Round.' Note: Kungchuling, Chilin -> Gongzhuling, Jilin.

"36653. From Peh tuan lin tza, northern Manchuria. Presented by Mr. N. Kristiansen, at the request of Dr. S.A. Ellerbeck, Mukden Hospital. Received November 29, 1913. 'Manchurian bean, from Heilung chiang [pinyin: Heilongjiang], northern Manchuria.' (Kristiansen.)"

"36718/36810. From China. Collected by Mr. Frank N. Meyer, Agricultural Explorer for the Department of Agriculture. Received November 28, 1913. Quoted notes by Mr. Meyer.

"36785. '(No. 1972a. Peking, China. September 29, 1913.) The original wild soy bean, which occurs in North China here and there in hedges, copses, between shrubbery,

© Copyright Soyinfo Center 2021

and between reeds (*Phragmites communis*) on the drier places, where it turns itself around any support available. The beans are blackish and very small and are inclosed [sic] in small pods, which are quite hairy, though looking typically like some of the smaller cultivated varieties of soy beans. The poorest of the Chinese eat the young pods when boiled, but the plant at large is considered a weed and is gathered only when large quantities are found, in which case it is fed to domestic animals as a fodder. Of value possibly as a fodder plant when sown out among erect-growing vegetation, like barnyard millet, Johnson grass, and corn. Chinese name *Mau doh*, meaning 'hairy bean'.'"

"36809. '(No. 1996a. Peking, China. October 30, 1913.) A rare, brown and black striped variety of soy bean, used roasted as a delicacy. Very wholesome, apparently, and worthy of trial by the American public. Could be slightly salted and buttered and sold like pop corn and peanuts. Chinese name of this bean *Ghu pee doh*, meaning 'tiger-skin bean.'

"36829/36840. From Pying Yang, Chosen (Korea). Presented by Mr. Charles L. Phillips, Presbyterian Mission. Received December 10, 1913. Quoted notes by Mr. Phillips.

"36829-36837. 'The soy bean in Korea is usually sown in the fields with millet. In the early spring, after the millet has reached the height of 2 or inches, the beans are dropped in between the hills of the grain, all of which is sown in rows and cultivated with the Korean ox plow. Beans of this kind produce best in heavy clay soil rather than in light, stony ground. These beans serve as food for man and beast and are used most extensively throughout this whole northern country. For man, bread and cake are baked with these beans, a sloppy cereal dish is cooked, and, of course everywhere soy is made. Especially with the yellow varieties, bean spouts are grown during the winter, which furnish a fresh vegetable dish for the people when green things are scarce. The beans are put in an earthen dish and daily sprinkled with water and kept in the warm living room of the house, where they are quickly sprouted and send long shoots out from the dish. These sprouts are a great relish. They are boiled and eaten with rice and millet. For fodder, the beans are fed in the pod to the cattle and horses, but in cold weather are most often boiled and fed as a hot mash.'

"36829. 'No. 1. Yellow. This is the most common of all soy beans in Korea.'

"36830. 'No. 2 Small Yellow.'

"36831. 'No. 3. Black.'

"36832. 'No. 4. Green. These beans are also roasted and popped like our pop corn or like roasted chestnuts. A great favorite among the Korean children.'

"36833. 'No. 5. Brown. Rarely grown in northern Korea.'

"36834. 'No. 6. Brown and black.'

"36835. 'No. 7. Black and yellow.'

"36836. 'No. 8. Mottled green and black.'

"36837. 'No. 9. Black with white spots. Called sometimes in this province 'widowers' beans.'"

"36846-48. From Dalny, Manchuria, Presented by Mr. Albert W. Pontius, American consul. Received December 10, 1913.

'A large variety of beans is grown in Manchuria, and together with their resultants, bean cake and bean oil, they constitute by far the most valuable item in the export trade of the three provinces. In the month of April they are sown by hand in drills and the crop is ripe in September; but as regards the beans of commerce there is an exception, namely, the small green bean known as *Lu tou* (*Phaseolus aureus* Roxb. [Roxburgh, mung bean]), which ripens as early as July and can be sown again in that month and gathered early in October. The Chinese distinguish the beans of commerce by their colors. At the end of March or beginning of April the ground fertilizer (night soil and animal manure) is spread over the fields in the furrows in which the previous season's beans were cultivated. The soil in the old ridges is then turned with the ordinary shallow native plow, the new ridges being formed where the fertilizer has been spread. The ground is broken with a wooden roller drawn by a mule, the tops of the ridges being partly leveled. A line marker is then used on the leveled ridges, this implement marking a shallow trench, preparing the ground for seeding purposes.

"The planting of beans in Manchuria takes place during the month of April. The seeding is effected in two manners, the beans being sown in light furrows or in finger holes placed uniformly apart. The former method is quite simple and requires no explanation; in the use of the latter method, the finger holes are about 9 inches apart, four or five seeds being dropped in each hole. The amount of seed used differs in the various districts, a higher altitude requiring a proportionately larger quantity of seed. The following shows the different quantities of seed used in the varying latitudinal districts of Manchuria: Liaotung Peninsula (district south of Tashihchiao), thirty to forty-five hundredths of a bushel per acre; Mukden, Tiehling, and Kaiyuan, from forty-five to sixty hundredths of a bushel per acre; Kirin [pinyin: Jilin], from sixty-five to eighty hundredths of a bushel pre acre; Heilungchiang [pinyin: Heilongjiang]; eighty hundredths of a bushel or more per acre. The first breaking and weeding of the soil takes place from six to ten days after seeding and when the sprouts are from 3 to 4 inches in length. Weeding is subsequently effected during intervals of four or five days (every ten days in northern Manchuria). Native hoes and rakes are used for weeding, the ground being broken with a wooden plow drawn by a horse or mule. The period of harvesting is from the latter part of September to the beginning of October, the bean plants being cut close to the roots, a stone roller or wooden flail being used in hulling. The average crops per acre by districts are estimated as follows: In southeast Manchuria and the coast of the Yellow Sea the yield is from 10 to 15 bushels per acre; in the Liao

© Copyright Soyinfo Center 2021

River valley, Changtu, Kaiyua, Tiehling, and Mukden the yield is from 40 to 50 bushels per acre; at Kirin the yield is from 24 to 26 bushels per acre; and in Heilungchiang (Amur district) the yield is from 17 to 22 bushels per acre.' (Pontius).

"36846. 'Yellow bean. *Pai mei,* 'white eyebrow,' from the white scar on the saddle, or point of attachment to the pod. This variety is highly prized for the quantity of oil or fat which it contains. Shipped from Fanchiatun station, near Changchun, south Manchuria.' (Pontius.)

"Yellow bean. *Hei chi,* 'black belly,' from the dark-brown scar on the saddle. This variety is highly prized for the quality of oil or fat which it contains. Shipped from Kinchou station, leased territory.' (*Pontius.*)

"36848. 'Green bean. *Ching tou.* This variety is said to yield more legumin in the manufacture of bean curd than the yellow bean, but the quality is inferior. It is also boiled and used as food.' (*Pontius.*)

"36901-06. From Peking, China. Presented by Mr. John McGregor Gibb, Peking University. Received December 26, 1913. Quoted notes by Mr. Gibb.

"36901. 'Iron Pod.'

"36902. 'Small golden flower.'

"36903. 'The yellow four in a pod.'

"36904. 'Big, white eyed.'

"36905. 'White, flower, short stalks.'"

"36906/36912. From Dalny, Manchuria. Presented by Mr. Albert W. Pontius, American consul. Received December 26, 1913. Quoted notes by Mr. Pontius.

"36906. 'Black soy bean. Shipped from Suchiatun station.'"

"36913/36924. Presented by Mr. Lewis S. Palen, Harbin, Manchuria, Received December 29, 1913. Quoted notes by Mr. Palen.

"36914-36919.

"36914. '(From Tsitsikhar, Manchuria. November 5, 1913.) Yellow. White-eyebrow variety, *Ta pai mei.* This bean is used for oil, bean curd, sauces, and bean sprouts. This sample is from about 100 miles east of this neighborhood. This variety is found mostly west of Kaiyuan and Tiehling on the South Manchuria Railway. The estimated yield is from 936 to 2,574 pounds per acre, and the price roughly estimated at 46 cents gold per bushel of 60 pounds on the market.'

"36915. '(No. 2. Changchun, Manchuria. November 1, 1913.) Yellow. Golden, round variety, *Chin yuan tou.* This bean is used for oil, bean curd, sauces, and bean sprouts. It is the variety most generally found scattered all over the bean districts of Manchuria. The estimated yield is from 936 to 2,574 pounds per acre, and the price is roughly estimated at 46 cents gold per bushel of 60 pounds on the market. The Chinese are most casual in their estimates of yields.'

"36916. '(No. 3. Kirin, Manchuria. November 1, 1913.) Large green variety, *Ta ching tou.* A bean with green epidermis and green interior. The percentage of oil is less than that of the yellow. Used as bean curd, and as bean sprouts boiled with vegetables. The estimated yield is from 936 to 2,574 pounds per acre and the price slightly less than that of the yellow, roughly, 3 per cent.'

"36917. '(No. 3. Changchun, Manchuria) Small green. Green epidermis and yellow interior.'

"36918. '(No. 4. Changchun, Manchuria. November 1, 1913.) Large black variety, *Ta wu tou.* The oil equals about 75 per cent of that from the yellow. Mostly fed to horses and cattle. In some places officials prohibit the use for oil, in fear of the cost of feed being too greatly enhanced. It grows best and is much used on wet and marshy lands, where the yellow and green varieties will not do well. The yield is about the same as that of the yellow. The price is from 1 to 2 per cent higher than the yellow, owing to the Japanese demand at Dalny. The Chinese do not know the reason why it is preferred to the yellow.'

"36919. '(No. 5. Tsitsikhar, Manchuria. November 5, 1913.) Flat, black variety, *Pien wu tou.* The oil equals about 75 per cent of that from the yellow. Mostly fed to horses and cattle. In some places officials prohibit the use for oil, in fear of the cost of feed being too greatly enhanced. The sample comes from about 100 miles to the northeast of here. It will do well in very wet ground. The price is estimated at about 50 cents gold per bushel of 60 pounds on the Tsitsikhar market, which is slightly lower than the price of the yellow.'" Address: Washington, DC.

150. Kuraz, Rudolf. 1916. Ueber den Anbau einiger Oelpflanzen: 4. *Soja hispida* Moench [On the cultivation of some oilseeds: 4. The soybean]. *Pharmazeutische Post* (*Vienna; later renamed Pharmaceutische Post*) 49(31):317-20. April 15. [5 ref. Ger]

• ***Summary:*** Note: This is a good introduction to and summary of earlier publications on the soybean, with many partial in-text citations.

The coarse-haired soybean (*rauhhaarige Sojabohne*) (*Soja hispida* Moench.) is an annual legume which, depending upon the variety, reaches a height of 40 cm to 1 m, and under favorable conditions even more. It is a very foliose (*blattreich*) plant. The color of the leaves is bright green, and sometimes also dark green. Their form varies. They are long stemmed, tripinnate (*dreizählig gefiedert*), and thickly covered with stiff hairs. The color of the hairs is for the most part brown, and less often whitish gray. The upright and branched stem is likewise thickly covered with hairs. The blossoms are minute and colored white to dark purplish red. They sit together for the most part in a cluster of from two to eight. They are odorless. The fruits are pods that are bivalvularly dehiscent (*zweiklappig aufspringend*), somewhat constricted [or threaded] (*eingeschnürt*) between the seeds, bent a little bit in the shape of a sickle, and very numerous. Most of them sit along the main axis, they are for the most

© Copyright Soyinfo Center 2021

part covered with brown hairs, and contain from one to four seeds, the size and color of which are different. The shape of the seeds is more or less spherical or oblong, the diameter is from 4 to 8 mm, and the thickness is always smaller than the width. The color of the seeds is straw yellow, olive yellow, olive green, green, brown, or black. Depending upon the variety, the weight of one hundred seeds amounts to from 8 to 20 g. Deviations upwards as well as downwards also occur.

The soybean is currently cultivated primarily in China, above all else in Manchuria, as well as in Japan, Korea, Formosa [today's Taiwan], and India. In addition, considerable cultivation areas are dedicated to the plant in the Philippines as well as on Java and Borneo. More or less successful agronomic trials outside of Asia have been carried out thus far in particular in Italy, Russia, France, North America, and then in Algeria and Tunisia.

In Austria, Haberlandt (*Die Sojabohne* [The Soybean], Vienna, Carl Gerold's Sohn, 1878) undertook to make the soybean known. Even though his agronomic trials were to the greatest degree accompanied by success, the plant still did not become established. Why that is the case is hard to say. In more recent times, interest in soybeans (*Soja*) has awakened with us once again. Among others, it has been in particular Fruwirth (*"Die Sojabohne"*) ["The Soybean"], *Fühlings Landwirtschaftliche Zeitung* (Fühling's Agricultural Journal, 1915, vol. 3/4) who has devoted himself to it. This year, our committee is carrying out its third year of agronomic trials with the yellow-seeded soybean under an order from the Imperial-Royal Ministry of Agriculture (*k.k. Ackerbauministerium*). A report about it will appear at the end of the year. And in the agricultural practice, there are those who are newly occupied with this important legume.

The varieties of the soybean are extraordinarily numerous. Thus, for example, just the soybeans (*Soja*) that are grown in China today have close to four hundred varieties. This also appears to be understandable if one thinks that as Li-Yu-Ying [also known as Li Shizeng, Li Yuying, Li Yu-Ying, Li Yu-ying] (*Le Soja, sa Culture,* etc. [The Soybean, Its Cultivation, etc.], Paris, Chalamel, 1912) indicates, this important oil and food plant has already been cultivated for five thousand years. For Austrian conditions, it is only a few early-maturing varieties that come into consideration for cultivation for the purpose of obtaining seeds.

Even though the soybean is capable of demonstrating a significant capacity for adaptation with regard to climate, even the earlier varieties do in fact require a total temperature [heat units] (*Gesamttemperatur*) of 2,300ºC. for good maturation. In general, this temperature does not need to be too high at all (in July and September, an average of around 17 to 20º), but it should be distributed as evenly as possible and last for a sufficiently long time. In particular, the autumn should be evenly warm (in September, an average of 14º). The success of soybean cultivation (*Sojakultur*) is less dependent upon the quantity of precipitation. The soybean withstands dryness and even the greatest drought very well. Lasting wet weather during the vegetation period, on the other hand, has the consequence that the seeds sometimes do not mature completely. Even the autumn may not be too wet. For that reason, areas with a dry summer are in general more favorable for the cultivation of the soybean for the purpose of obtaining seeds than those with a wet summer. The soybean is relatively resistant to frost in the spring and autumn. According to Fruwirth, the majority of the forms are only killed off at -2.7ºC, and some even withstand this temperature. Soybeans that were planted by us even withstood a frost of -2.5ºC in 1915 without undergoing any considerable damage. The yellow varieties appear to be the least sensitive to the cold. In general, it can be said that the early-maturing soybeans can be grown anywhere in areas with a winegrowing climate with satisfactory success.

For the more northern areas of Austria, it is in fact only the very early varieties that can be planted in warm, protected areas. However, even in this case, it appears to be advisable in the name of caution to be convinced of the cultivation capability of the plant first by means of trials at a small scale before going on to plant large areas. In southern areas of our monarchy, on the other hand, good harvest results may be expected with certainty.

With regard to the soil conditions, the soybean is likewise very capable of adaptation. In this regard, it does not make any especially high demands and it provides good yields on a variety of soils. It is only the case that the soil must not stick together too much, because otherwise the entire development of the plant–along with the maturation, as well–will be significantly delayed. Wet areas are likewise unsuitable for the soybean. It thrives best on a light, very well loosened, dry, deep, porous and sandy loam soil. It also seems to require a sufficient calcium content. The area should always be as free as possible, but within that context also warm, sunny, and protected from the wind. Since the soybean extracts a significant quantity of nutrients from the soil, it is necessary for the field that is to be planted to be rich in plant nutrition that can be easily assimilated. On poor soils, it is therefore necessary to see to the proper addition of nutrients. Within that context, it is above all else phosphoric acid that comes into consideration, since it is capable not only of bringing about an increase in and enlargement of the seed harvest, but also substantially supporting the exploitation of the potassium fertilizing that is provided at the same time. According to Lechartier, sufficient quantities for one hectare are 200 kg of superphosphate (16%) or 400 kg of Thomas meal (*Thomasschlacke*), 200 kg of potassium salt, and around 100 kg of Chile saltpeter [sodium nitrate] (*Chilisalpeter: sic, Chilesalpeter*). In most cases, though, it is possible to do without nitrogen fertilizing, since that nutrient almost always remains ineffective. But the fertilizing

© Copyright Soyinfo Center 2021

should not be unbalanced. However, soybeans should never be planted on fresh barn manure fertilizer, but rather always only one or two years thereafter.

As a field crop, the soybean finds a good position [in a crop rotation] after grain. In general, though, it may be planted after any crop. Since during its vegetation period, it does not allow weeds to come up and therefore keeps the ground clear, and since like all legumes, it collects nitrogen to a certain degree, it also constitutes a good prior crop [in a crop rotation] for any crop. It is usually the case that grain is planted again after soybeans. It can, however, be planted on the same field for several years in a row without the yield decreasing notably.

In terms of the preparation of the soil, a proper loosening of the surface soil is to be attended to. For that purpose, a deep plowing is carried out in the autumn. The field than lies in coarse furrows over the winter. In the spring, a good crumb cover (*Krümmeldecke*) is produced with a cultivator (*Exstirpator*) and then, before sowing, with the harrow. If soybeans are to be planted after grain, then on lighter soils the stubble is simply plowed under in the autumn.

According to Fruwirth, the germination of the soybean only takes place with an average temperature of 9 to 10ºC.

Even though the germinated seedlings are not especially sensitive to lighter frosts, it is not necessary to hurry with the sowing, since the seeds that are planted later usually easily catch up with those that were planted earlier. Because of the rather long lifespan of the plant, though, on the contrary it is not advisable to delay the sowing too long, since in that case, the soybeans are no longer capable of developing properly before the blossoms set. According to trials by Haberlandt, with later sowings (from May 19 onward), the size of the seeds and their absolute weight decreased more and more.

For that reason, the sowing is only to be carried out most expediently once the soil has warmed sufficiently and no great return of cold is to be feared. In our areas, the last week of April through the first week of May is the most suitable time. In southern areas, the planting can of course take place correspondingly earlier; in Dalmatia, for example, already as early as the beginning of March. For the cultivation, only the nicest and largest seeds should be used (Continued).

152. Kawakami, K.K. 1916. The people's safety valve (Letter to the editor). *San Francisco Chronicle.* July 17. p. 14.
• ***Summary:*** "The Chronicle disclaims responsibility for the utterances in this column."

"Japanese influence on the Asian continent has benefited and will continue to benefit American trade." For example, since the "inauguration of the Japanese regime in Korea," American exports to Korea have expanded dramatically. They increased 20 times in the decade from 1902 to 1913. "This is all the more remarkable considering that America buys practically nothing from Korea." In short, Japan did not slam closed Korea's doors.

The situation in Manchuria is somewhat different. "Though Manchuria, after Japan's advent there, bought a great deal of American rails, rolling stock, kerosene and flour, Japanese cotton goods have to a considerable extent replaced American cottons. This, however, is due mainly to the fact that Japan has been almost the sole buyer of Manchuria's premier product, beans, and their by-products, bean cake and bean oil, amounting in value to some $20,000,000. The secret of Japan's commercial success in Manchuria lies chiefly in the operation of the fundamental economic law that the country consuming the major portion of the exports of another country holds the most advantageous position in supplying its necessary imports." Address: San Francisco.

153. Murakami, Kamekichi. 1916. Bean-curd and the process for making same. *U.S. Patent* 1,195,843. Aug. 22. 3 p. Application filed 11 March 1916. 5 drawings.
• ***Summary:*** The inventor, a citizen of Japan, describes the process and apparatus for making "bean cubes" from "beans known as the 'soy' bean, raised largely in Korea and Japan and to some extent in California." Illustrations (line drawings) show: (1) Two views of one of the cubes. (2) A vertical sectional view of the stone grinder or mill, in which the soaked beans are ground with water. (3) A similar view of a lever press for pressing the soymilk from the pulp. (4) A box in which the "bean jelly" is formed; it has drainage holes in the sides and bottom. (5) Detailed views of the bottom and one side of the forming box.

The ground beans are slowly poured into boiling water; the mass of bean paste is kept in a boiling condition for 15-20 minutes. During boiling a mixture of 3 parts slaked lime and 7 parts edible vegetable oil is added, causing the foam on the surface to sink. Salt water or nigari is used as the coagulant, and it is added in 4 steps.

Note: The person who wrote the final patent apparently had difficulty understanding the process Mr. Murakami was describing. He wrote "skins" instead of okara or pulp, and wrote "pulp" instead of soymilk. Address: Seattle, Washington.

154. Piper, C.V.; Morse, W.J. 1916. The soy bean, with special reference to its utilization for oil, cake, and other products. *U.S. Department of Agriculture Bulletin* No. 439. 20 p. Dec. 22. [9 ref]

Manchuria. Soy beans in Japan. Soy beans in Europe. Soy beans in the United States. Methods of oil extraction. Soy-bean meal as human food. Soy-bean meal as stock feed. Soy-bean meal as fertilizer. Uses of soy-bean oil. Analysis of important varieties of soy beans. Possibility of developing a manufacturing industry with American-grown soy beans.

"Analyses of important varieties of soy beans (p. 16-17):... In determining the range in the oil and protein contents of over 500 varieties grown in the variety tests at Arlington Farm, Virginia, the percentage of oil was found to range from 11.8 to 22.5 [Tokyo had 20.7% and Biloxi had 20.3% oil] and of protein from 31 to 46.9 [Chiquita had 46.9% protein]... At the present time the Mammoth Yellow variety is the most generally grown throughout the South and is the one used in the production of oil. The yellow-seeded varieties, which are most suitable for the production of oil and meal, contain the highest percentage of oil.

"Environment has been found to be a potent factor in the percentage of oil in the same variety. Considerable differences occur in oil content when soybeans are grown in different localities. The Haberlandt variety grown in Mississippi, North Carolina, Missouri, Virginia, and Ohio gave the following percentages of oil, respectively: 25.4, 22.8, 19.8, 18.3, 17.5; while the Mammoth Yellow variety grown in Alabama, South Carolina, Tennessee, North Carolina, and Virginia gave, respectively, 21.2, 19.6, 19.5, 18.4, and 18.8. Variety tests conducted in various parts of the country indicate a higher percentage of oil with the same variety for southern-grown seed. Similar results have been obtained in Manchuria, the North Manchurian beans showing an oil content of 15 to 17 percent and the South Manchurian beans from 18 to 20 percent."

Photos (both by Frank N. Meyer) show: (1) A fleet of junks carrying soy beans to Newchwang, Manchuria.

(2) Coolies at Newchwang, carrying loads of soy beans from junks to big stacks.

An outline map of the USA (p. 8) shows the area to which the soy bean is especially adapted for growing for oil production. The area of double hatching shows that it is especially well suited to the Deep South. The northern boundary of the area where it is "less certain of profitable production" includes the southern one-third of Ohio, Indiana, and Illinois, and most of Missouri. On the west, the "less certain" area includes the eastern one-third of Nebraska, Oklahoma, and Texas.

Tables show: (1) "Exports of soy beans, bean cake, and bean oil from the principal ports of South Manchuria (Antung, Dairen, Newchwang), 1909 to 1913, inclusive." (2) "Quantity and value of exports of soy beans and soy-bean oil from Japan to foreign countries, 1913 and 1914." The countries are: China, United Kingdom, France, Germany, Belgium, United States, Hawaii, British America, Australia, other countries. (3) "Quantity of imports of soy beans, soy-bean cake, and soy-bean oil from Dairen, Manchuria, into Japan, 1911 to 1914, inclusive. The greatest imports were of soy-bean cake, followed by soy beans, with only small amounts of oil.

(4) "Quantity and value of imports of soy beans, bean cake, and bean oil by European countries, 1912 to 1914, inclusive." The countries are: Austria, Belgium, France, Germany, Italy, Netherlands, Russia, Sweden, United Kingdom. In 1912, the UK imported the most soy beans, while Netherlands imported the most cake and oil. (5) "Quantity and value of imports of soy beans, soy-bean cake (Footnote: Includes bean cake [perhaps fermented tofu or canned regular tofu], or bean stick [probably dried yuba sticks], miso, or similar products, with duty, 40 per cent) and soy-bean oil into the United States, 1910 to 1915, inclusive." The quantity of soy bean imports was greatest in 1915 with 3.837 million lb. The quantity of soy-bean cake imports was greatest in 1913 with 7.005 million lb. The quantity of soy-bean oil imports was greatest in 1911 with 41.106 million lb. "Prior to 1914 soy beans were not classified separately in the customs returns" (p. 9). (6) "Composition of soy-bean flour in comparison with wheat flour, corn meal, rye flour, Graham flour, and whole-wheat flour."

(7) "Value of a short ton of soy-bean cake and other oil cakes in the principal European countries" (Incl. cottonseed, linseed, peanut {Rufisque}). Countries: Germany, United Kingdom, Netherlands, Denmark, Sweden. (8) "Analyses [nutritional composition] of soy-bean meal and other important oil meals." (Incl. Cottonseed, linseed (old and new processes), peanut (decorticated), sunflower seed). (9) "Fertilizing constituents [nitrogen, ammonia, phosphoric acid, potash] of soy beans, soy-bean meal, and cottonseed meal."

(10) Analyses for protein and oil of important varieties of soy beans grown at Arlington Farm (Virginia), Newark (Delaware), and Agricultural College (Mississippi). The varieties are: Mammoth, Hollybrook, Manchu, Haberlandt, Medium Yellow, Ito San, Chiquita, Tokyo, Lexington, Guelph, Black Eyebrow, Shanghai, Peking, Wilson, Biloxi, Barchet, Virginia. Note 1. "At the present time, the Mammoth Yellow variety is most generally grown throughout the South and is the one used in the production of oil" (p. 16). (11) "Acreage, production, and value per ton of cottonseed in the boll-weevil states." "Since the boll weevil first entered Texas in 1892," it has steadily decreased production of cottonseed. The soy beans offers a good replacement. (12) "Comparative prices per ton of cottonseed and soy beans on the European market, 1911 to 1914, inclusive." Soy beans are usually slightly more expensive.

Note 2. This is the earliest published document seen that contains soy-related photos by Frank. N. Meyer.

Note 3. This is the earliest document seen in which William Morse describes soy milk, or mentions natto, or correctly mentions tofu.

Note 4. This is the earliest document seen (March 2021)

that mentions the soybean variety Lexington. Address: 1. Agrostologist in Charge; 2. Scientific Asst. Forage-Crop Investigations, USDA, Washington, DC.

155. Piper, C.V.; Morse, W.J. 1916. The soy bean, with special reference to its utilization for oil, cake, and other products: Soy beans in Japan, in Europe, and in the United States (Document part). *U.S. Department of Agriculture Bulletin* No. 439. 20 p. Dec. 22. See p. 4-7. [2 ref]
• ***Summary:*** "Soy beans in Japan (p. 4): The soy bean is cultivated quite extensively throughout the Empire of Japan and occupies about 3.8 per cent of the total area devoted to the cultivation of rice and other cereals. In many districts it is cultivated not in fields by itself, but in rows along the edges of rice and wheat fields. Although not grown to any considerable extent as a main crop by the Japanese farmer, the average annual production is about 18,000,000 bushels. In quality the beans raised in Japan are said to be superior to those of Manchuria and Chosen [Korea] and are used exclusively in the manufacture of food products. The imported beans, of which very large quantities are obtained from Manchuria and other Asiatic countries, are used principally in the manufacture of bean cake and oil."

"The soy bean forms one of the most important articles of food in Japan. It is one of the principal ingredients in the manufacture of shoyu (soy sauce), miso (bean cheese), tofu (bean curd), and natto (steamed beans). The beans are also eaten as a vegetable and in soups; sometimes they are picked green, boiled, and served cold with soy sauce, and sometimes as a salad. A 'vegetable milk' is also produced from the soy bean, forming the basis for the manufacture of the different kinds of vegetable cheese. This milk is used fresh and a form of condensed milk is manufactured from it. All of these foodstuffs are used daily in Japanese homes and for the poorer classes are the principal source of protein. To a limited extent, soy beans are used as a horse or cattle feed, being sometimes boiled and mixed with straw, barley, and bran."

"Soy beans in Europe (p. 6): The soy bean was first introduced into Europe about 1790 and was grown for a great number of years without attracting any attention as a plant of much economic importance. In 1875 Professor Haberlandt, of Vienna, begun an extensive series of experiments with this crop and strongly urged its use as a food plant for man and animals. Although interest was increased in its cultivation during the experiments, the soy bean failed to become of any great importance in Europe. At the present time it is cultivated only to a limited extent in Germany, southern Russia, France, and Italy."

"Soy beans in the United States (p. 7): Although the soy bean was mentioned as early as 1804 (Footnote: Willich, A.F.M. American Encyclopedia, 1st Amer ed., v. 5, p. 13. Philadelphia, 1804), it is only within recent years that it has become a crop of importance in the U.S. At the present time the soy bean is most largely grown for forage. In a few sections, such as eastern North Carolina, however, a very profitable industry has developed from the growing of seed... The yields of seed to the acre in various sections of the United States range from about 15 bushels in the Northern States to about 40 bushels in the northern half of the cotton belt. The average yield in eastern North Carolina is about 25 bushels, although many fields produce 35 bushels or more to the acre..." Note: This is the earliest U.S. document seen (June 2003) that cites the 1804 publication by Willich [and James Mease] concerning the soybean in Philadelphia. Note that this article appeared 112 years after 1804.

"The first extensive work in the U.S. with the soy bean as an oil seed was entered upon about 1910 by an oil mill on the Pacific coast. The beans, containing from 15-19% of oil, were imported from Manchuria, and the importations, most of which are used in the manufacture of oil and cake, have gradually increased, as shown in Table V. The oil was extracted with hydraulic presses, using the same methods employed with cottonseed and linseed. It found a ready market, as a good demand had been created for this product by soap and paint manufacturers, which up to this time had been supplied by importation from Asiatic countries and England. The soy cake, ground into meal, was placed on the market under a trade name and was soon recognized as a valuable feed by dairymen and poultrymen. The use of the cake has been confined almost wholly to the Western States, owing principally to the high cost of transportation."

"An industry which promises to be of importance in a further utilization of the soy bean is the manufacture of 'vegetable milk.' At the present time a factory in New York State is being equipped for this purpose." Address: 1. Agrostologist in Charge; 2. Scientific Asst. Forage-Crop Investigations, USDA, Washington, DC.

156. Williams, C.B. 1916. Soy-bean products and their uses. *North Carolina Agricultural Experiment Station, Circular* No. 34. p. 1-7. Dec.
• ***Summary:*** Contents: Introduction. First commercial crushing from domestic beans (started on 13 Dec. 1915 by the Elizabeth City Oil and Fertilizer Company of Elizabeth City, North Carolina). Soy-bean oil. Uses for the oil. Soy-bean meal. Composition and exchange value of the meal. Prices paid for beans by the oil mills. Soy-bean oil industry in England, Manchuria, and Japan. Importation of oil. Soy-bean meal as feed. Soy beans and products for human food.

This Circular begins: "In order that any people may maintain their soils in the highest state of productivity in an economical way it will be necessary that proper systems of crop rotation are used, and in these rotations it will be necessary to bring in leguminous crops at as frequent intervals as practicable. For North Carolina conditions one of the crops of this nature that may be used to good advantage in all parts of the State is the soy bean. If properly

© Copyright Soyinfo Center 2021

handled, this crop may be used as the means of adding to the productivity of the soils as well as to increase the net returns from the farm. Recently there has been a marked interest throughout this State and the South in the growing of soy beans." A "new outlet for the beans has developed from the crushing of the seed by a number of oil mills of the State..." The spread of the boll weevil should lead to increased interest in the soy bean.

"This crop was introduced into the State something like thirty-five years ago, yet very little was heard of it, outside of very limited areas, until quite recently, when a campaign was begun to induce the cotton oil mills of the State to use beans for crushing purposes in the same general way that cotton seed had been used for many years before. This campaign not only opened the eyes of the oil crushers to the possibilities of the soy bean in a commercial way, but of the farmers, also, to the great opportunities of this crop.

"During the spring of 1915 farmers, particularly in the Eastern part of the State, were casting about to find a crop or crops that might be substituted, satisfactorily, for cotton, as the price of this latter crop during the previous fall had been, in many cases, below the cost of production. Many farmers increased their acreage of soy beans, and as a result of this increase at least a million bushels or more of beans were produced last year." Something like 80,000 to 100,000 bushels of soy beans were used by the cotton oil mills of the State during the past fall, winter, and spring.

"The first commercial manufacture of soy-bean oil and meal from domestic soy beans in the United States was started on December 13, 1915, by the Elizabeth City Oil and Fertilizer Company of Elizabeth City, North Carolina.

"From the start this mill operated night and day solely on soy beans until it had crushed it supply of about 20,000 bushels. This mill was able to crush about twenty tons during each twenty-four hours...

"It is understood that before the mill had ground a single bean they had contracted their entire output of oil to one of the leading manufacturers of the country at fairly reasonable prices. It, too, had no difficulty in selling its entire output of soy-bean meal, most of it going to a fertilizer manufacturer. From a ton of the beans this mill was able to secure something like 32 to 35 gallons of oil and about 1,650 pounds of meal... Other oil mills in North Carolina that crushed more or less soy beans during the past season were those located at New Bern, Hertford, Winterville, Washington, Wilson, Farmville, Lattimore, and at a few other places."

"Soy-Bean Oil (p. 3): One of the chief products secured in the crushing of the beans is the oil. This oil has wide usefulness at the present time in the commercial world. The amount of oil in the beans amounts to from 17 to 20 per cent. This oil, when expressed from good, sound beans is practically neutral, and about 95 per cent of it is saponifiable. It consists chiefly of the glycerides of the fatty acids. These acids are made up of about 15 per cent palmitic, 56 per cent oleic, 19 per cent lenolic, and 5 per cent lenolenic acids. The presence of the unsaturated acids (oleic, lenolic, and lenolenic) impart to the oil drying properties. The oil, although more efficient in drying properties than cotton-seed oil, is less so than linseed oil. It is classed among the semi-drying oils.

"In a bushel of Mammoth Yellow soy beans there are ordinarily contained about 11 pounds or 1.42 gallons of oil, weighing 7.72 pounds per gallon. The oil mills at present are able, by expression methods, to get out only 70 to 75 per cent of the total amount of oil contained in the beans. By the use of appropriate solvents, such as gasoline, practically all of the oil might be removed. This latter method has never gained much headway in this country as a means for extracting oil from cotton seed, and it will probably be some time, if ever, before it will generally be used as a commercial method. From an economic standpoint the method most commonly used with cotton seed by Southern oil mills will most likely be the one that will be most generally practiced in soy-bean oil extraction. At present those mills that have apparently been most successful in manufacturing oil and meal from soy beans are those which are equipped with expellers or screw presses.

"Uses for the oil: At the present time the oil is used in this country chiefly in the manufacture of soaps, varnishes, paints, enamels, linoleums, and water-proofing materials. It has entered, also, to some extent in the manufacture of edible salad oil and butter substitutes. The untreated oil may replace linseed oil completely, with quite satisfactory results, in the manufacture of soft soaps; but it can only partially take the place of cotton-seed oil in making hard soaps. This is because the soap made from soy-bean oil is of a somewhat softer nature than that manufactured from cotton-seed oil. After hydrogenation the oil has a wider field of usefulness and may, in some cases entirely replace linseed oil or other drying oils with very satisfactory results. As the untreated oil is of a semi-drying nature, it may be used only when mixed with linseed oil for the manufacture of paints, varnishes, and enamels. In making paints, if the proportion of the soy-bean oil to the total oils present does not exceed 20 to 25 per cent, there does not seem to be any inferior qualities developed in the paint, any more than when linseed oil alone is used. In this respect the soy-bean oil is superior to cotton-seed oil, as it has not been found that the latter oil can be used for this purpose. It is not improbable that with the use of suitable dryers soy-bean oil may in the future find more extended use for this purpose. When the oil is properly refined it will yield about 10 per cent glycerine as a by-product in the manufacture of soaps. This glycerine has been found to be equal in value to that recovered from other soap-making fats, such as tallow, cotton-seed oil, cocoanut oil, etc. It is significant of the possibilities of the use of this oil that more than $5,000,000 worth of it was imported into the United

© Copyright Soyinfo Center 2021

States this year from other countries, chiefly from Asia.

"Soy-bean meal: The meal secured from crushing the beans is the most valuable product and will have the widest usefulness. That secured from the crushing of yellow-colored beans is of a bright yellow color while that produced from the brown and dark colored beans is of a somewhat darker shade. Meal, too, that has been treated with ordinary solvents, employed for this purpose to remove the oil, is of a brighter color than are those meals from which the oil has been removed by heating and pressure. The oil, however, secured by a solvent process would be of a darker color. The soy-bean cake secured by expression methods, has a pleasant taste, not unlike malted milk, and when ground into meal may be used, at the present time, chiefly for feeding to livestock or for fertilizing purposes. The meal as a feed is highly concentrated and nutritious, and all kinds of stock seem to relish it when fed to them properly. It should not be fed in large quantities for any great length of time, because of its highly concentrated nature. As a fertilizer it acts satisfactorily. Much of the meal produced by the oil mills of the State during the past year seems to have been sold, without any difficulty, to manufacturers for the making of mixed fertilizers." Continued. Address: Chief, Div. of Agronomy, North Carolina Agric. Exp. Station.

157. Williams, C.B. 1916. Soy-bean products and their uses (Continued–Document part II). *North Carolina Agricultural Experiment Station, Circular* No. 34. p. 1-7. Dec.

• ***Summary:*** (Continued): "Composition and Exchange Value of the Meal: From the fertilizer standpoint, soy-bean meal is richer in plant-food constituents than is cotton-seed meal. From available analysis, the meal on an average contains 7.48 per cent nitrogen, 1.4 per cent phosphoric acid, and 1.83 per cent potash. All these constituents contained in soy-bean meal should be in about as available form-for use by crops as they are in cotton-seed meal. Based on these percentages, an exchange, purely from the fertilizer standpoint, of about 1,500 pounds of soy-bean meal of average composition for 2,000 pounds (33 1/3 bushels) of beans would be about equal in money value. Where the farmer makes an exchange, he should, however, secure at least enough above this amount to cover well the cost of delivery of the beans to the mill. The meal, being a very concentrated product, should always sell as high, or higher, than cotton-seed meal, as it is usually richer in protein than the latter.

"Prices Paid for Beans by the Oil Mills: The price which the mill men can pay for soy beans will be governed to a large extent by the prices they are able to secure for the soy-bean oil and meal. If these products bring good prices the mills ought to be in a position to pay the farmer a good price for his beans. During the past fall farmers generally were able to secure from the oil mills from $1 to $1.15 per bushel. In some cases as high as $1.25 per bushel was paid. It may be of interest in this connection to know that during 1913 and 1914 the British Oil Mills, located mainly at Hull, England, paid from $1.00 to $1.17 per bushel for Asiatic beans. During 1915 the price paid at the mills at Hull varied from $1.04 per bushel in January to $1.82 per bushel at the end of the year.

"Soy-Bean Oil Industry in England, Manchuria and Japan: In England, the oil from the soy bean is extracted largely by a secret process owned by an oil extracting company of Hull. By this process the seed are ground finely and are then treated directly by means of a solvent, which is thought to be benzine. Afterwards the oil is removed from the solvent by distilling off the latter, the solvent being used over and over again in the extractive process. The meal after treatment is dried and ground finely. The meal is of a bright color, is sweet in taste, and has a pleasant odor. By this process not more than 1 per cent of oil is left in it, the remaining meal running from 43 to 45 per cent of protein. It has practically the same number of feeding units as has meal derived directly from soy-bean cake, and it sells in Europe for practically the same price per ton. This industry in Manchuria and Japan is one of the most important and profitable. In 1911 more than 1,500,000 tons of oil were exported from these countries. Most of the oil is secured from the bean by processes of expression. Some of these methods are quite crude, especially those used by the natives.

"In the modern mill in Manchuria the soy beans are crushed in large quantities by steam-driven rollers. The crushed seed are then carried down funnels to the oil extracting room, where they are steamed by vapor, which can be regulated at will, the process being rapid, owing to the force at which the steam plays upon the wafers. In some of the mills it has been found to be more satisfactory to discard steam pressure in extracting the oil, and use hand pressure, as it is done in the mills of the natives, the reason for this being that hydraulic pressure is so quickly finished, notwithstanding the fact that a much less flow of oil is secured than by the slower hand process. The bean cake, with as much oil as is left in it after hand pressure, is not in the best condition for fertilizing purposes. By use of gasoline extraction the whole of the oil may be secured, the oil being of a clear, pure color, and hardly bearing any resemblance at all to the dark, muddy oil secured by the old hand-press method.

"The machinery used by the larger operators of England, Continental Europe, as well as of Japan, Korea, Manchuria, and China, is of Anglo-American manufacture, which is the kind ordinarily used in the expression of oil from cotton seed. In 1910 Stewart and Chard secured patents in England for a special machine which was particularly adapted for breaking up the beans. This machine has been very useful in solving some of the difficulties experienced in the soy-bean crushing industry in England.

"In England soy-bean oil for general purposes is not refined, as is cotton-seed oil in America, by the use of caustic

© Copyright Soyinfo Center 2021

soda, but by means of sulphuric acid and fuller's earth.

"Processes of refining soy-bean oil for edible purposes have been devised, but these, like those used for extracting the oil from the seed, have been kept secret; but they are thought in most cases to be by means of superheated steam."

"Importation of oil: In this connection it may be of interest to know that for the five years ending with 1916 there were imported into this country more than 174,000,000 pounds of soy-bean oil, which represented crushings amounting to more than 12,000,000 bushels. Of these, 47.6 per cent came through the port of New York; 36.1 per cent through Seattle [Washington]; 9.6 per cent through San Francisco [California]; 2.2 per cent through Philadelphia [Pennsylvania]; 1.6 per cent through Boston [Massachusetts]; 1.1 per cent through Chicago [Illinois]; and 1.3 per cent through all other ports of the United States. In 1916, 75 per cent of the importations came through the ports of Seattle and of San Francisco, the chief port of entry being Seattle, with 62.9 per cent of the total importation. During 1916 more than 98,000,000 pounds of soy-bean oil came in from other countries, 99.9 per cent of the total coming from Asia. Of the total amount imported from Asia, almost 72 per cent were shipped from Japanese ports. The total importations during 1916 were valued at little more than $5,000,000. It is interesting to note that at this time (October 20), because of the advance in linseed oil and the increased demand for soy-bean oil, strictly prime quality soy-bean oil is bringing 9.75 cents per pound or about 75 cents per gallon f.o.b. New York.

"Soy-Bean Meal as a Feed: The Animal Industry Division of this Station has been conducting considerable experimental work during the past year to determine the feeding value of soy-bean meal when fed to hogs and chickens. From results secured at the Branch Station in Edgecombe County, they conclude that both for rapidity and economy of gains this meal has proven itself as a superior product for part of the ration for hogs.

"In feeding trials with young chicks at the Pender Test Farm they found that when soy-bean meal was fed in equal quantities with wheat shorts and cracked corn mixed with sweet milk, the soy-bean meal proved to be a most valuable feed, and was found to be equal in value in the ration to rolled oats as a growth producer.

"They have found, too, in their experiments this year with pigs, that where one-third of the ration by weight consisted of soy-bean meal, and the other two-thirds of cracked corn, the bodies of the pigs became firmer than was the case with a parallel lot fed a ration made up of two-thirds cracked corn and one-third wheat shorts. From the results thus far secured by them, they have been led to conclude that soy-bean meal when fed properly does not produce soft-bodied hogs, as has been thought by some" (Continued). Address: Chief, Div. of Agronomy, North Carolina Agric. Exp. Station.

158. Williams, C.B. 1916. Soy-bean products and their uses (Continued–Document part III). *North Carolina Agricultural Experiment Station, Circular* No. 34. p. 1-7. Dec.

• ***Summary:*** (Continued): "Soy Beans and Products for Human Food: "Soy beans, before crushing, and the meal secured by crushing, seem to have great possibilities in the way of different human foods. They are not only rich in food nutrients, but when properly prepared make very appetizing products.

"From the soy beans themselves, or from meal after the oil has been largely removed, macaroni, milk, cheese, a coffee substitute, and flour for making biscuits and muffins may be secured. The soy-bean flour gives best results when mixed in the proportion of 1 to 3 with wheat flour or corn meal.

"In China and Japan the soy bean has been largely used for human consumption from the earliest times. In Europe and America it has been used to some extent, in recent years, for this purpose. In this country some enterprising manufacturers are putting out prepared pork and beans, part of all of the beans being soy beans. A regular preparation of these which the writer has tried proved to be of as high grade as could be desired.

"In Eastern countries the beans are used largely to take the place of beef in the diet of the people. Because of their richness in protein they are used to supplement rice, which is deficient in this nutrient. Tofu (vegetable cheese), Natto, yuba, and miso are staple foods made from soy beans.

"Muffins made from soy-bean flour have been found to be very palatable. To make these, take about ½ cupful of soy-bean flour, about 1½ cupfuls of wheat flour, ½ teaspoonful of salt, 2 eggs, 1 teacupful of sweet milk, two rounded teaspoonfuls of baking powder, and 1½ tablespoonfuls of melted (but not hot) butter. These should be beaten well together, adding the melted butter last. Then bake in gem pans placed in a hot oven. This quantity will make about twelve muffins.

"The chief value of the flour lies in its high content of protein (muscle-forming material) and mineral matter, one pound of it containing as much protein as two pounds of meat. Bread made from the soy-bean flour in Germany, where it is being largely used at the present time, secures about the same amount of food value as six dollars spent for meat. The flour seems to have especial value in the preparation of foods for delicate infants which have difficulty with digesting cows' milk, and for persons suffering with diabetic troubles."

A diagram (p. 7) shows "Products secured from the crushing of a ton of soy beans by the oil mill, and the material made from these products." One ton yields 1,650 lb of meal, 32 gallons of oil, and 120 lb of trash and moisture. From the meal one can make food (human and animal), fertilizer, and celluloid. The human food can be macaroni, flour, sauce, milk, cheese, coffee, and lard. From the oil one

can make food (cooking oils, butter [margarine?]), paints, enamels, blown oil (linoleum, India rubber substitutes, varnishes), and soap stock (soaps, glycerine).

Note: This is the earliest English-language document seen (Aug. 2016) that contains a diagram of this type. Address: Chief, Div. of Agronomy, North Carolina Agric. Exp. Station.

159. Morse, W.J. 1917. Re: 300 soy bean varieties introduced from China, Manchuria, Japan and Korea in winter of 1914. Letter to Prof. C.B. Williams, Experiment Station, Raleigh, N.C., Jan. 4. 2 p. Typed, without signature.

• ***Summary:*** "Dear Prof. Williams: During the winter of 1914 this office received about 300 introductions of soy beans from China, Manchuria, Japan and Korea. Variety tests conducted with these introductions showed that most of these were new sorts and very few identical with each other or with previous introductions. These varieties have now been tested out at Arlington Farm [Virginia] for three years and many of them show very great promise either as hay or seed varieties in comparison with those varieties now generally grown in this country. These varieties have been analyzed for oil and protein and it seems possible to obtain excellent oil varieties for southern conditions.

"In view of the great interest now taken throughout the South with the possibilities of the soy bean as an oil seed, we think it an opportune time to begin to test about 40 of the very best of the above-mentioned introductions at the southern stations. Our plan would be to test out a rod row of each of these, using as a check the Mammoth Yellow variety. Careful data should be kept on each variety as to yield of hay and seed and perhaps the most essential characteristics of the variety, as maturity, habit, etc. The analysis work can be arranged with the Bureau of Chemistry here, and no doubt valuable data gathered on the best oil-producing strains. For taking notes on these varieties at the different stations we have a uniform note-book which contains printed forms covering the essential points of the test. Two books would be furnished each station so that records could be had by this office and also by the station.

"We shall appreciate it very much if you will write us in the near future your opinion regarding such as test.

"Yours very truly..."

Sent to Soyfoods Center by Jacob Jones of Purdue Univ., Aug. 1998. Address: Scientific Asst., Bureau of Plant Industry, Washington, DC.

165. *International Review of the Science and Practice of Agriculture* (*International Institute of Agriculture, Rome*). 1917. International trade in feeding stuffs: Annual Review No. 3. 8(4):489-551. April 1. See p. 490-91, 502-05, 535-43. [29 ref]

• ***Summary:*** The Introduction begins: "This third *Annual Review* gives the *International Trade in Feeding Stuffs* up the end of 1916 as far as the present conditions allow, and according to the scheme established in the send Review (1).

"Two new headings have been introduced: soya and soya-cake, brewing residues; for these are given, under the heading *coefficients*, the factors used to calculate the production of concentrates on the basis of the available supply of raw materials."

The section titled "Production of concentrated foods for livestock," under coefficients (p. 491), states: "Soya cakes–For countries importing soya, the production of cakes has been estimated at the rate of 80% of the net importation."

Three tables (p. 502-04) give figures in metric tons for 1912 to 1916. The first table, titled "Trade in soya [soybeans]" (p. 502) gives figures as follows: (a) Producing countries: China (exports), Korea (exports), and Japan (production, imports, exports). (b) Importing countries: Germany, Belgium, Denmark, United States, France, Netherlands (imports and exports), United Kingdom (imports and re-exports), Russia, and Sweden. The largest exporter of soybeans in 1912 is China (661,004 tonnes), followed by Korea (98,674). The largest importer in 1912 is United Kingdom, followed by Germany, Netherlands, Denmark.

The second table, titled "Trade in soya cake" (p. 503) follows the same format with the same countries as the first table. The largest exporter of soya cake in 1912 is China (493,477 tonnes), followed by Korea (1,063). The largest importer is Japan (518,056), followed by Netherlands (23,852).

The third table, titled "Production of soya cake in importing countries" (p. 504) gives estimated figures for Germany, Belgium, Denmark, United States, France, Netherlands, United Kingdom, and Russia. The largest producer in 1912 was the United Kingdom (143,431 tonnes), followed by Germany (77,014) and Denmark (27,185).

166. *Weekly News Letter* (*USDA*). 1917. Use native soy beans. Imported soy beans are mixture of many varieties and undesirable for seed. 4(47):8. June 27.

• ***Summary:*** "During the past few months very large quantities of Manchurian and Korean soy-bean seed have been received at Pacific coast ports and distributed to some extent in different parts of the United States. Although imported mainly for industrial purposes, it has been brought to the attention of the United States Department of Agriculture that some of the seed has been offered for planting purposes at prices much below those of American-grown beans. Much of this seed is exceedingly undesirable. The farmer is advised not to plant imported seed, as disappointment with the crop will almost certainly result.

"Throughout the Orient where the beans are largely produced the seed is bought up by the merchants and stored at railway stations. No grading is attempted, the stored beans being of all varieties and mixed more or less with sand and trash. The exporters buy the beans from the merchants simply by weight, but before shipment the beans are graded only as to color of seed and cleaned. Nearly every lot contains several varieties resembling each other only in seed color.

"The United States Department of Agriculture has tested over 1,000 varieties of soy beans received from different parts of the Orient, and the majority of these are much inferior to the best varieties commonly grown in the United States. Even small lots of imported seed have been found more or less mixed, in some cases as many as 12 distinct varieties being found in one sample... Such seed sometimes produces plants ranging from 10 to 30 days apart in time of maturity.

"In the United States much attention has been given to the breeding of pure adapted varieties, and there are now about 20 satisfactory sorts on the market." Address: Washington, DC.

167. *USDA Bureau of Plant Industry, Inventory.* 1917. Seeds and plants imported by the Office of Foreign Seed and Plant Introduction during the period from January 1 to March 31, 1914. Nos. 36937 to 37646. No. 38. 105 p. Aug. 17.

• ***Summary:*** Soy bean introductions: *Soja max* (L.) Piper. (*Glycine hispida* Maxim.)

"37036-37058. From Chusan, Chosen (Korea). Presented by Rev. George H. Winn, Presbyterian Mission. Received Jan. 28, 1914.

"37036 and 37037. Soja max (L.) Piper. (*Glycine hispida* Maxim.)

"37036. 'No. 1. *Yulgochi* bean. Very hardy, will grow and produce where the ordinary beans will not amount to much.'

"37037. 'No. 2. *Kambool*. Very commonly found in the markets.'

"37038 and 37039. Phaseolus angularis (Willd.) W.F.

© Copyright Soyinfo Center 2021

Wight. Adzuki bean."

"37040 to 37055. Soy bean.

"37040. 'No. 5. Brown mottled bean; carefully cultivated and given sufficient fertilizer.'

"37041. 'No. 6. Brown. Planted around the edges of the rice fields or where there is a small corner that can be utilized, they are very hardy and will grow and produce where the ordinary beans will not amount to much.'

"37042. 'No. 7. Large white-eyed bean; carefully cultivated and given sufficient fertilizer.'

"37043. 'No. 8. Large green bean. The larger beans are all carefully cultivated and given sufficient fertilizer.'

"37044. 'No. 9. Black mottled brown bean. As a rule, the smaller beans are planted around the edges of the rice fields or where there is a small corner that can be utilized. They are very hardy and will grow and produce where the ordinary beans will not amount to much.'

"37045. 'No. 10. White mottled black bean; carefully cultivated and given sufficient fertilizer.'

"37046. 'No. 11. Ordinary green bean. As a rule, these beans are planted around the edges of the rice fields or where there is a small corner that can be utilized. They are, however, often planted in fields. They are very hardy and will grow and produce where the ordinary beans will not amount to much.'

"37047. 'No. 12. Brown mottled bean; often planted around the edges of rice fields and where there is a small corner that can be utilized; very hardy and will grow and produce where ordinary beans will not amount to much.'

"37048. 'No. 13. Large blue bean; carefully cultivated and given sufficient fertilizer.'

"37049. 'No. 14. Large black bean; carefully cultivated and given sufficient fertilizer.'

"37050. 'No. 15. Small black bean; grown around the paddy fields. It is cultivated in larger areas because it is supposed to be extra nourishing, and some seem even to suppose it has medicinal properties, but I fear there is not much to it.'

"37051., 'No. 16. The larger beans are all carefully cultivated and given sufficient fertilizer.'

"37052. 'No. 17. The red bean; carefully cultivated and given sufficient fertilizer.'

"37053. 'No. 18. Black mottled yellow. Small beans which are planted around the edges of the rice fields or where there is a small corner that can be utilized; very hardy and will grow and produce where the ordinary beans will not amount to much.'

"37054. 'No. 19. Maroon bean. One of the larger beans, all of which are carefully cultivated and given sufficient fertilizer; but this is not very commonly found.'

"37055. 'No. 20. Ordinary white bean. One of the larger beans; carefully cultivated and given sufficient fertilizer.'"

"37062 and 37063. Soy bean. From Harbin, China. Presented by Mr. Southard Warner, American consul, at the request of the American consul at Newchwang. Received Feb. 5, 1914.

"See report on the 'Soya Bean of Manchuria,' 1911 [by Norman Shaw, Dairen].

"37062. Grown south of Harbin.

"37063. Grown north of Harbin."

"37069 to 37083. From Tientsin [Tianjin], China. Presented by Dr. Yamei Kin, Peiyang Woman's Medical School and Hospital. Received Feb. 6, 1914.

"37074 and 37075. Soy bean.

"37074. '*Yüeh ya tou,* literally 'moon-tooth' bean, so called from the edge of the green peeping outside of the black thick skin like the crescent moon in the sky. Is largely used for making bean sprouts, which they say requires a bean that is not mealy or farinaceous, as that kind becomes mushy in the process of germination and has no taste left. Also is good for feeding animals, requiring to be lightly steamed before feeding, not boiled, for then the oil escapes and the flavor is lost. This kind is valued for its oil, which it contains in a great amount, and for making bean curd. This must be grown in a well-drained clay soil; black or moist earth will not do.'

"37075. '*Cha tou.* Specially used for making bean curd and bean sprouts.'"

"37077. Soy bean. '*Huang tou.* Used for making bean curd as well as starch and vermicelli.' Note: #37078 is Mung bean (*Phaseolus aureus* Roxb. [Roxburgh], *Lü tou*).

"37080. Soy bean. '*Ching tou.* Used only for the oil expressed and fodder purposes.'"

"37228 to 37325. Soy bean. From Seoul, Chosen (Korea). Presented by Mr. George H. Scidmore, American consul general. Received Feb. 17, 1914.

"'I submit the following information, which has been obtained, for the most part, from the Director of the Department of Agriculture, Commerce, and Industry, of the General Government of the Chosen. The same officer has very kindly supplied samples of 98 varieties of soy beans.

"'The usual period during which the seed is sown extends from the middle of May to about July 10. In case the sowing is postponed till the latter part of that period, the fields from which wheat has already been harvested are used. The soil is first prepared by plowing and is then shaped into small hemispherical hillocks about 4 ft in diameter. The seed is then planted in drill holes on the top of these hillocks, 6 or 7 inches being left between drill holes and 5 or 6 seeds being sown together in a hole. As a general rule, no manure or other fertilizer is used, but when it is desired to enrich the soil ashes are most commonly employed. After the plants have sprouted sufficiently, the shoots are thinned out so as to leave two or three only to each drill hole. This process takes place at the time of the first weeding. The ground surrounding the plants is gone over with a hoe or other implement two or three times to turn over the soil and to weed the field. The process outlined above gives briefly the

© Copyright Soyinfo Center 2021

method of cultivation generally in use throughout Chosen, and is applicable whether the beans are planted in separate fields by themselves or in the same fields with other crops.

"'It is used mainly for its food value, the oil, and the residue as a fertilizer after the oil has been expressed. It is valuable as a food product for both men and cattle, the latter finding it a very excellent fodder when the whole plant is used. The principal food products for human consumption derived from the soy bean are bean paste [jang, Korean miso], soy [sauce, kan jang], bean curd, meal, etc.'" There follows a long list of 98 new soybean introductions from Korea, grouped by seed color; the first four are representative of the rest:

"37228. 'A1. *Six Months.* Yellow. From South Chusei Province, Koshu district.'

"37229. 'A2. *Widower.* Yellow. From North Heian Province, Seisen district.'

"37230. 'A3. *Broad River.* From South Heian Province, Junan district.'

"37231. 'A4. *White.* Yellow. From North Zenra Province, Chinan district.'

"37232. 'A1. *Early Yellow.* Yellow. From North Heian Province, Kokai district.'

Note: This is the earliest English-language document seen (April 2021) that uses the term "bean paste" to refer to Korean soybean paste (*jang*).

Other interesting names among these 98 introductions from Korea are: *Rengyo Egg, Large-Grained White, White Rat's Eye, Rich and Virtuous, Large Date, Indigo, Bluish, Barbarian Blue, Clasped Hands, Clear Blue, Black Rat's Eye,* and *Thousand Tied.* A tally of the seeds by color shows: Yellow 35. Green 22. Gray 17. Black 16. Striped 8. Note that Yellow seeds comprise only 35.7% of the total by color. Address: Washington, DC.

168. *USDA Bureau of Plant Industry, Inventory.* 1917. Seeds and plants imported by the Office of Foreign Seed and Plant Introduction during the period from January 1 to March 31, 1914. Nos. 36937 to 37646. Continued. No. 38. 105 p. Aug. 17.

• ***Summary:*** Continued: "37326 to 37376. From Pyeng Yang, Chosen (Korea). Presented by Rev. W.M. Baird, Union Christian College, through the American consul. Received 17 Feb. 1914.

"'Bean seeds. I have been unable to find out their characteristics. Many kinds of seeds are grown here. I was able to secure some privately; also at one of the public exhibitions I was able to secure from Honorable Matsunagi, governor of this province, who was the patron of the fair, samples of all the seeds exhibited there, but without descriptions.' (Baird.)

"37326 to 37356. Soy bean. 37326. Green. 37327. Brown. 37328. Small black. 37329. Large black. 37330. Cream with tan markings. 37331. Small black. 37332. Large black. 37333. Small green. 37334. Chocolate color, large. 37335. Cream mixed with brown and green. 37336. Chocolate color. 37337. Green. 37338. Cream with black saddle. 37339. Black with white veining. 37340. Green. 37341. Yellow. 37342. Small brown. 37343. Black and white. 37344. Small yellow. 37345. Large yellow. 37346. Black. 37347. Small brown. 37348. Small black. 37349. Yellow. 37350. Dark brown. 37351. Small dark brown. 37352. Black. 37353. Greenish yellow. 37354. Yellow. 37355. Yellow. 37356. Dark brown. There follows (37357 to 37366) ten adzuki beans of many colors.

"37395 to 37404. From Kongju, Chosen (Korea). Presented by Rev. Wilbur C. Swearer, Methodist Episcopal Church. Received Feb. 26, 1914. Quoted notes by Mr. Swearer.

"37396 to 37404. Soy bean.

"37396. 'No. 2. *Date* bean. Round brown bean. Sown during the first part of April and reaped at the end of Aug. or the first part of Sept. Cultivated about the same as the *cherry pea* [S.P.I. No. 37395], only in hills about a foot apart. None of these beans do well if planted too close together. This bean fertilizes the ground well; grows to a height of 2 ft. Pods are short and rough and contain 3 or 4 beans each. None of the soy beans are pole beans. This bean is much smaller than usual, owing to the fact that last summer there was very little rain.'

"37397. 'No. 3. *White Chestnut* bean. Round yellowish white bean. A favorite with the Koreans. Cultivated the same as the *Date* bean [S.P.I. No. 37396]. Used as food for animals and people. Appearance of vines similar to the *Date* bean.'

"37398. 'No. 4. *Big Green* bean. Round, flat, yellowish green. Sown in June and harvested in Oct., they grow 2 ft high. Cultivation similar to that of the *Date* bean [S.P.I. No. 37396]; pods are also similar.'"

"37399. 'No. 5. *Black-Eyed* bean. Small, yellowish, green bean, with black eye. Can be sown in drills; beans 2 or 3 in apart. The Koreans take these beans after they are dried and place them in water in the house and eat them after they have sprouted, sprout and all, as a vegetable.'

"37400. 'No. 6. *Rat's-Eye* bean. Small, round, black bean. Sown in the last part of April, in hills several inches apart, they grow 1 ft high. There are four or five beans in a pod. The people sometimes eat them raw, claiming they have medicinal properties. Usually they are sprouted and eaten as a vegetable.'

"37401. 'No. 7. *Black Chestnut* bean. Round, flat, black bean. Sown either in April or in June, they are fed to animals or are eaten. This bean is much smaller than usual, owing to the fact that last summer there was very little rain.'

"37402. 'No. 8. *Castor Oil* bean. So named because the Koreans think it resembles the bean of that plant. Black, with the skin cracked and white streaks showing through. This is also a favorite with the Koreans, both for animal food and for man. This bean is much smaller than usual, owing to the fact

© Copyright Soyinfo Center 2021

that last summer there was very little rain.'

"37403. 'No. 9. *Large Black-Green* bean. Round, dark-green and black. Sown in the middle of May. Cultivation similar to that of the *Date* bean [S.P.I. No. 37396]. This bean is much smaller than usual, on account of lack of rain the past summer.'

"37404. 'No. 10. *Pheasant-Leg* bean. So named because the marking on it resembles those on the leg of a Mongolian pheasant. Small, round, brown bean. Sown the last part of May, not too close together. People eat them usually after they have sprouted them in the house.'"

"37563. Soy bean. From Songdo, Chosen (Korea). Presented by Rev. W.G. Cram, the Anglo-Korean School. Received March 19, 1914. *White Manchurian soy bean."*

"37570 to 37576. From Vladivostok, Siberia. Presented by Mr. John F. Jewell, American consul. Received March 16, 1914. Seeds grown in the Ussuri district along the Ussuri Railroad; quoted notes by Mr. Jewell.

"37570 to 37574. Soy bean.

"37570. 'No. 1. Chinese bean, grown in the village of Chernigovka by P.J. Monostirniy.'

"37571. 'No. 2. Chinese bean, grown in the village of Petrovka.'

"37572. 'No. 3. Chinese bean, grown by St. Troitzky monastery at Shmakovka.'

"37573. 'No. 4. Yellow bean, *Ko-yi.'*

"37574. *'Khei.'"* Address: Washington, DC.

169. Langdon, William R. 1917. Bean and pea crops in the Hokkaido. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 20(193):654-55. Aug. 18. Submitted June 15.

• ***Summary:*** "The island of Hokkaido is Japan's principal producing district for beans and peas. An increased foreign demand for these products, which resulted from the war [World War I], stimulated production in Hokkaido enormously. The high prices that foreign purchasers are willing to pay for beans and peas, it is said, have created large fortunes for some of the Hokkaido growers.

"The areas under cultivation for the growing of these products in Hokkaido during 1916 were: Soya beans, 207,344 acres; small red beans, 107,539."

"Last year's production and prices: The production of beans and peas in Hokkaido in 1916 in long tons of 2,240 pounds each, by varieties was: Small red beans (*akashozo* or *adzuki*), 27,000; medium red beans (*dainagon*), 2,200; soya beans (*daizu*), 89,000...; large red beans (*kintoki*) 18,000...; total production of all kinds of beans and peas, 219,460 tons. These statistics were compiled by the local administration of Hokkaido."

A substantial increase in area cultivated to beans and peas in Hokkaido is expected next year, but the "1917 crop of soya beans in Hokkaido and the mainland of Japan is expected to be about the same as that of 1916."

"The total beans and peas for Japan proper, excluding Chosen [Korea] and Taiwan, in 1915, according to the official statistics of the Japanese Department of Agriculture and Commerce was: Soy beans, 18,848,283 bushels, valued at $16,247,118; small red beans [azuki], 4,771,183 bushels, valued at $5,002,667..."

A table shows total exports of beans and peas from Japan in 1915 and 1916. Exports of soya beans were 1,056,616 pounds worth $25,009 in 1915, and 1,715,347 pounds worth $38,823 in 1916. Address: Vice Consul, Yokohama, Japan.

170. H.W.C. 1917. Hope farm notes: Cow peas vs. soy beans. *Rural New-Yorker* 76:1008. Aug. 25.

• ***Summary:*** The author is conducting a contest between "Black-eye cow peas and Wilson Early Soy bean... to see which is more valuable as a food or manurial plant... I think the Soy bean will finally come out ahead." It stands upright and is easier to harvest. "The Soy beans are not generally eaten as food, though they can be used in various ways. As stock food they are very useful."

"They even make an artificial milk out of the bean." After the war between Japan and Russia, the "crop has made it possible for Korea and Manchuria to get on the map as respected and prosperous provinces. Just as Alfalfa has made the strip of limestone land through Central New York rich and famous, I believe the heavy culture of Soy beans will bring back prosperity to any section where the soil has begun to fail and where Red clover and Alfalfa have not done well. I do believe that dairymen and poultrymen have in this Soy bean a plant which will come close to solving the problem of providing fat and protein foods."

"This Wilson's Early Soy is a small black bean. I have carried a handful in my pocket. Whenever I meet some friend moping around with what they call a grouch, I offer him a few beans. 'Here try my new remedy for that tired feeling. Nature's true remedy for the liver; swallow them whole. Don't stop to chew!'

"In many cases people have become so used to dosing that they will swallow three of these raw beans. They do look something like a black capsule. In some instances I have met these parties a few days later and they say: 'That was fine dope you gave me. Where do you get it? I want more!' I have no doubt that a black Soy bean with full faith will do more for health than a barrel of medicine taken because one has acquired the dope habit." Address: New York.

171. *Board of Trade Journal* (*London*). 1917. Japan (Corea). Inspection of rice and soya beans for export. 99:326. Nov. 8.

• ***Summary:*** There are new regulations concerning the inspection of soya beans exported from Corea, or from one province of Corea to another. "H.M. Consul-General at Seoul (Mr. A.H. Lay C.M.G.) has forwarded a translation

© Copyright Soyinfo Center 2021

of amended regulations (published in the 'Official Gazette' of 8th September) for the inspection of rice for export to foreign countries or to Japan or for conveyance from one province of Corea to another. These regulations (Order No. 62 of the Government-General of Corea), which take effect from 1st October, 1917, are more detailed than those they replace (i.e., Order No. 4- of 1915), and provide for the grading of rice into five classes, viz.–superior, first, second, and third class, and that which does not come up to standard and the exportation or conveyance of which is consequently prohibited. The Order does not for the time being apply to the Provinces of Kogen (Kong-won) and North and South Kankyo (Hambyeng), the three divisions of the country in which the production of rice is less than elsewhere.

"H.M. Consul-General has also forwarded a translation of Order No. 63 of the Government-General, which applies to the whole of Corea and takes effect from 1st October, 1917, making regulations for the inspection of soya beans, these regulations being practically identical with those contained in the above-mentioned Order referring to rice.

"The above-mentioned translations may be consulted by British firms interested at the Department of Commercial Intelligence, 73, Basinghall Street, London, E.C. 2." Address: British Consul-General at Seoul.

172. Morse, W.J. 1917. Re: Soybean varieties and recipes. Letter to Prof. C.O. Cromer, Associate in Crops, Purdue University, Lafayette, Indiana, Nov. 8. 1 p. Typed, without signature (carbon copy). [1 ref]
• ***Summary:*** "Dear Professor Cromer: I have your letter of November 3, advising that you will send me seed of all the varieties of soy beans that matured with you–that is, of those varieties requested in the previous letter. I shall be very glad to give you the results of the analyses as it will not be contrary to the policy of the office to give such information where seed is obtained from and grown by an experiment station.

"Concerning the recipes for using soy bean flour or meal, I am taking pleasure in enclosing a few of the best ones. I might say that the Office of Home Economics has in press at the present time a publication treating quite fully on the digestibility and uses of the soy bean meal. This publication also gives a considerable number of recipes. It is quite likely that this publication will be ready for distribution before the new year.

"Very truly yours, Scientific Assistant (WJM:P)"

Series–Correspondence with State Agric. Exp. Stations, 1899-1923. Box 12–Illinois-Indiana. Folder–Indiana Experiment Station–#6.

Sent to Soyfoods Center by Jacob Jones of Purdue Univ., Aug. 1998. Address: Scientific Asst., Forage Crops Investigation, Bureau of Plant Industry, Washington, DC.

173. *Board of Trade Journal* (*London*). 1918. Japan (Corea). Soya beans. 100:778. Jan. 3.
• ***Summary:*** "H.M. Consul-General at Seoul writes that the 1917 crop of soya beans in Corea is estimated at 14,094,545 bushels, as compared with 14,668,197 bushels in 1916. The decrease in the crop is attributed to scarcity of rain in the spring." Address: British Consul-General at Seoul.

174. *Chemische Umschau.* 1918. Technologie: Fettgewinnung, Fettwirtschaft [Technology: Obtaining fats and oils, and their economics]. 25(5):53-54. May. [Ger]
• ***Summary:*** Soybean oil: During the years 1912-1914 England imported 192,000 tonnes (metric tons), 78,000 tonnes, and 72,000 tonnes of soybeans, and Germany imported 96,000, 106,000, and 64,000 tonnes of soybeans. In 1915, naturally [due to World War I], German imports came to an end, while English imports amounted to 174,000 tonnes. In 1913, Japan's soybean production was about 5.4 million tonnes; exports [of soybeans] from China were 624,000 tonnes and from Korea 95,000 tonnes.

175. Murray, James. 1918. The farm and farm crops: Soy beans for Quebec. *J. of Agriculture and Horticulture* (*Quebec, Canada*). June 1. p. 3.
• ***Summary:*** "The Soy Bean (Glycine soja) has not been generally recognized as adapted to climates as cool as that of Quebec and as most of the varieties on the market are only suitable for growing in warmer climates this is as it should be... we now have at least one variety which we can confidently recommend as suitable for the climate of Montreal..."

"The Soy Bean is an exceedingly important crop in Manchuria, Japan and Korea and is exported in large quantities from these countries."

"Like the ordinary bean, the soy bean is an annual that cannot be planted until danger of frost is over,–about the first of June [in southern Quebec].

"In the countries where soy beans are grown extensively they are used largely for human food... In this country where the production is likely to be on a small scale for some years their principal use will be for human food either as baked beans or in a ground condition [as flour] for making muffins, biscuits, etc. In using them as baked beans they may be used without pork as the large percentage of fat which they contain makes the use of additional fat unnecessary.

"In preparing them it is important that they be soaked over night *in a large quantity of water,* and this water poured off before they are boiled. The large quantity of water is necessary to dissolve out of them a disagreeable flavor which they possess naturally. Otherwise they are cooked in exactly the same way as ordinary beans." Note: No; they must be cooked much longer than ordinary beans.

© Copyright Soyinfo Center 2021

"In the Cereal Department of Macdonald College considerable work has been done in selecting varieties for earliness and yield, and seed of one variety that will mature here every year is now available in limited quantities. This variety is known as Quebec No. 92. To those who wish to try them the Department is willing to send samples of one pound as long as the available supply lasts."

Photos show: (1) Mature plants of Quebec No. 92 soy beans. (2) A field of soy beans in midsummer.

176. *Board of Trade Journal* (*London*). 1918. Japan (Corea). Bean crop, 1917. 101:262. Aug. 22.
• ***Summary:*** "According to a report received from H.M. Consul-General at Seoul, the bean crop of Corea for 1917 amounted to 19.366,124 bushels. Of this total soya beans accounted for 14,583,159 bushels, being a decrease of 5 per cent. as compared with the previous year.

"The official figures of the bean and pea crop of the island of Hokkaido (Japan) for 1917 have also been announced. The yield of beans was 1,016,666 koku (5,042,663 bushels), valued at yen 22,305,661, and that of peas 612,973 koku (3,040,346 bushels), valued at yen 13,307,662.

"Compared with the preceding year, the output of beans shows an increase of 549.856 koku (2,727,286 bushels), valued at yen 11,983,243, and that of peas 317,075 koku (1,572,692 bushels), valued at yen 4,962,639. (Yen = 2*s.* 0*d.* at par)." Address: British Consul-General at Seoul.

177. *Millard's Review of the Far East* (*Shanghai*). 1918. Chosen and Manchuria are prosperous. 6(1):39. Sept. 7.
• ***Summary:*** S. Minobe, governor of the Bank of Chosen, told an "interesting story of the continued prosperity and increased agricultural development of Chosen and Manchuria."

"Cotton also brought up the total of Chosen's exports [to Japan]... The export of [soy] beans, tobacco, ginseng, cocoons, livestock, and other agricultural products also increased by from 10 to 200 per cent."

"While the export of beans and bean cake [from Manchuria] to Japan was exceedingly active, American orders for bean oil reached such an enormous amount that the whole production of the country appeared hardly sufficient to meet all of them. This export of bean oil to America was carried on briskly throughout the period despite the difficulty attending transportation."

178. Winkler, Gustav. 1918. Die Sojabohne: Aus einem Vortrage... gehalten in der Hauptversammlung der Gartenbau-Gesellschaft Frankfurt a.M. am 17. April 1914. Zweite Auflage [The soybean: From a lecture... presented at the main meeting of the Gardening Society of Frankfurt am Main, on 17 April 1914. 2nd ed.]. Mainkur bei Frankfurt am Main, Germany: Published by the author. ii + 28 p. Illust. 22 cm. [4 ref. Ger]
• ***Summary:*** On the cover: "Die Sojabohne der Mandschurei [The soybean of Manchuria]. Much of this lecture (as stated on the title page) was based the following English-language article, translated into German by Werner Winkler (Gustav's son) in 1913: Shaw, Norman. 1911. "The soya bean of Manchuria." *Shanghai, Statistical Department, Inspectorate General of Customs. China Imperial Maritime Customs. II. Special Series* No. 31. 32 p.

Contents: A 2-page insert at the front. Photos show: (1) The author (with a large white beard and moustache) with a many-branched soybean plant, stripped of its leaves, mounted on a 2 x 3 foot wooden board, from his beanfield (*Winklers Bohnenfeld*) at Mainkur. This one plant grew from May 10 to Oct. 15, 6 months, producing 242 pods containing 503 completely mature soybeans. This line was acclimatized for 6 years and cultivated in the soil for 5 years. (2) The author standing and holding (with the roots facing upward) one soybean plant in each hand. In his right hand is an acclimatized soybean which produced 58 beans in 100 days. In his left hand is a plant grown from Chinese seeds of 1912-13 which produced 224 flowers and no seeds in 100 days. (3) A many-branched soybean plant, stripped of its leaves, from Winkler's beanfield, affixed to a board. Grown from Chinese seeds harvested in 1911/12. It grew from 15 May 1917 until Oct. 1, five months. 105 pods produced about 250 completely mature soybeans. From seeds that were not yet acclimatized grown on cultivated soil. (4) A similar looking plant from Winkler's beanfield. Grown from Chinese seeds harvested in 1911/12. It grew from 15 May 1918 until Oct. 15, five months. 160 pods produced about 350 soybeans. The seeds were not yet completely ripe because of bad, raw weather in 1918.

Foreword to the 2nd edition. Introduction. Diagram in the shape of a rhombus / diamond, showing how the various colored soybeans change from one color into another (adapted from Shaw 1911, p. 2). Description of the diagram: Discusses: (1) Ball, Carleton R. 1907. "Soy bean varieties." *USDA Bureau of Plant Industry, Bulletin* No. 98. 30 p. + 5 plates. May 27. (2) Hosie, Alexander. 1910. *Manchuria: Its People, Resources, and Recent History.* London: Methuen & Co. xii + 293 p. Hosie describes 3 types of soybeans: Yellow, with 3 subvarieties. Green, with 2 subvarieties. Black, with 3 subvarieties.

The rest of the contents is fairly similar to that of the 1st edition (1914), but the details within many sections are greatly expanded. On the back cover is a photo of two soybean plants attached to a board, one month after planting the seed, Summer 1917; 15 May to 15 June. In the Supplement (p. 26-28), the author summarizes the results of his 8 years of soybean cultivation in Frankfurt; he concludes that it can be grown with good results in southern Germany. Frankfurt am Main is about midway between the northern and southern tips of Germany.

179. *Bulletin Economique de l'Indochine* (*Hanoi*). 1918. Les exportations de soja et de coton de Corée [Exports of soybeans and cotton from Korea]. 20(130):477. New series. Extract from Board of Trade. [Fre]

• ***Summary:*** According to the English consul in Seoul, the soybean harvest in 1917 has risen to 14,094,545 bushels (36 liters/bu), down from 14,668,197 in 1916. The drop was due to lack of rain in the spring of 1917.

180. Takenob, Y. 1918. Japan Year Book. Tokyo: Japan Year Book Office. 784 p. See p. 303, 492-93, 514, 530-31, 574, 584-85, 606-07, 611-12, 614, 691, 713, 721, 736, 782. 13th annual issue. [Eng]

• ***Summary:*** This book gives statistics for the Japanese empire: Japan Proper, Korea, and Formosa. The Preface is dated 31 Aug. 1918.

At the front of the book are 34 pages of large ads on pages enumerated with Roman numerals. At the rear of the book are 49 pages of large ads on pages similarly enumerated.

Near the front is a page of "Weights, measures, and moneys." 1 koku = 10 to = 100 sho = 4.65389 gallons (liquid) (U.S.A.) = 180.39 liters.

Page 303 shows how inflation in Japan during the great European war is making it difficult for regular families to make ends meet. The price of common foods such as "Sugar, soy, etc." has increased by 50% from June 1914 to Feb. 1918.

Page 584-85. The section on "Brewing industry" gives information about soy sauce plus production statistics for sake, beer, and soy [sauce] from 1913 to 1916.

Page 493. A table titled "Prices of principal commodities," 1914-1916 shows that the price of soja beans decreased from 11.55 yen per koku in 1914 to 10.28 yen per koku in 1916. The price of red [azuki] beans and miso also decreased. But the price of soy [sauce] increased from 24.91 yen per koku in 1914 to 25.05 yen per koku in 1916.

Page 492. A section titled "Guilds of stable commodities" lists: "The principal production guilds as classified according to the kind of commodities handled were as follows at the end of the year 1913:–Raw silk, 238; Rice, 68; Artificial fertilizers, 30; Paper, 24; Porcelain, 22; Medicines, 23; Weaving, 138; Timber, 32; Soy and miso, 31; Charcoal, 26; Matting, 20; Total, incl. others, 975."

Page 530-31. In the chapter on "Agriculture." A table shows production of soy beans, potatoes, and sweet potatoes, 1912-1916 (in 1,000 koku). Production of soy beans increased from:

3.511 million *koku* in 1912
2.993 million *koku* in 1913
3.664 million *koku* in 1914
3.807 million *koku* in 1915
3.750 million *koku* in 1916

The text immediately after the table (p. 531) states: "Among subsidiary farm crops there is perhaps nothing which plays so important a part in the Japanese kitchen as soy beans..."

Pages 573-74. A table of industrial companies classified by amount of investment states for "Soy and miso." Number of companies: 281. Paid up capital: 6.653 million yen. Reserves: 552,000 yen.

Pages 606-07 show record tax revenues in 1917-18, including 5.28 million yen from soy [sauce].

Pages 611-12. Discuss the history of taxation in Japan, including the tax on soy. The system is said to be irrational, and excises taxes applied to daily necessities, such as soy, place an unfairly heavy burden on the poor.

Page 614 repeats basic information about "6. Tax on Japanese soy [sauce]."

Page 691. The chapter on "Chosen (Korea)" states (p. 691): "Barley and soya bean.–Barley covers 584,664 cho, yielding 4.600,000 koku. Soya and other beans are exported chiefly to Japan for manufacturing soy, the export amounting to about 5,000,0O0 yen annually; the acreage is 553,077 cho and the yield 3,200,000 koku [415,252 metric tons]." Address: Prof. at Waseda Univ. and Late of the *Japan Times,* Tokyo, Japan.

181. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*). 1919. Improved seed beans for cultivation in Manchuria. 22(61):1232. March 14.

• ***Summary:*** Source: Clipping from the *Manchuria Daily News,* 21 Dec. 1918, transmitted by Consul A.A. Williamson, Dairen. The South Manchuria Railway Co. Agricultural Experiment Station "succeeded in improving the seed [soy] beans a few years ago, and has been distributing 30 to 40 koku (154 to 205 bushels) of the improved beans throughout Manchuria, and the new variety is now very favorably received. This year at Szupingkai 400 koku (2,048 bushels) were harvested and shipped to Kobe where they were so well received that advance orders for next year's crop are coming in.

"The improved variety has the advantage of containing more oil and being uniform in shape and size. It possesses a very fine luster. Furthermore, the raising of this variety is known to bring in about 15 to 20 per cent greater crop from the same area of land. At the place of production it fetches 20 sen (10 cents) more per koku than other varieties. Naturally there is now an increasing demand for the seeds of the new bean, which the experimental station is unable to supply. Some newspapers warn that the new variety is a strong rival to the Chosen [Korean] or Hokkaido beans, but the

© Copyright Soyinfo Center 2021

Manchurian beans are produced for the purpose of obtaining oil, and the new variety is specially fitted for that purpose, while the Chosen or Hokkaido beans are used for food." Note: Hokkaido, Japan's northernmost main island, has long been a leader in soybean production in Japan.

182. Holland, J.H. 1919. Food and fodder plants. *Bulletin of Miscellaneous Information* (*Royal Gardens, Kew*) Nos. 1&2. p. 1-84. April 16. See p. 11-12. [5 ref]
• ***Summary:*** Great Britain imported large quantities of soy oil before World War I to make up for the shortage of cottonseed oil needed to manufacture soaps: 875,526 hundredweight from Manchuria, 816,032 hundredweight from China, and 43,209 hundredweight from Manchuria. Note: A hundredweight is 112 pounds weight.

"Considerable interest has been taken in the cultivation in England, but results of experiments made at Cambridge, Midland Agricultural College, South Eastern Agric. College, Wye, &c., go to show that no variety so far has been found that can be relied on to produce seed here.

"In Japan and China they [soy beans] are largely known in the preparation of the sauce known commercially as 'Soy,' and they make there a preparation used as a substitute for milk, and from this a food product call 'Tofu,' which in turn forms the basis of the bean cheeses of Japan. The meal [flour] in this country is used in the manufacture of biscuits and in making a bread for special use in diabetes; but the principal use here is for the extraction of the oil of which the beans contain about 18 per cent., suitable for soap-making and in general as a substitute for cotton seed oil, the residue being a valuable cattle feed.

Also discusses the adzuki bean (*Phaseolus angularis*, Wight). "This bean appears to have been coming into the market recently in quantity. Trade samples have been submitted to Kew for name as 'Dainagon Azuki Beans.'" They are important human food in Japan, Korea, China, and Manchuria, cultivated for the purpose.

• ***Summary:*** The story of the life and work of Frank N. Meyer, USDA agricultural explorer, including descriptions of his four expeditions. He drowned on 2 June 1918 in the muddy waters of the Yangtze River. "His first expedition in the years 1905-1908 was into North China, Manchuria, and northern Korea; his second, in 1909-1911, through the Caucasus, Russian Turkestan, Chinese Turkestan, and Siberia; his third, in 1912-15, through northwestern China into the Kansu Province to the borders of Tibet, and his last expedition in search of plants began in 1916..."

Photos show: (1) A "courtyard filled with jars in which a mixture of soy-beans, wheat, and salt is fermenting to make soy sauce. The mixture is protected from the sun and rain by cleverly woven hoods of split bamboo. Mr. Meyer made a careful study of this great soy-bean sauce industry and introduced a large number of varieties of the bean" (p. 66). (2) Frank N. Meyer with a branch of Taiyuan jujube in his hand (Shansi, Aug. 1914). He first saw orchards of this new fruit in China in 1906 (p. 76). Address: Agricultural Explorer, in Charge of Office of Foreign Seed and Plant Introduction, USDA.

184. Arnold, Julean. 1919. Commercial handbook of China. 2 vols. Washington, DC: Government Printing Office. 629 p. + 472 p. Dep. of Commerce, Bureau of Foreign and Domestic Commerce, Miscellaneous Series No. 84.
• ***Summary:*** In Vol. 1: The "Letter of submittal" from the Department of Commerce, Bureau of Foreign and Domestic Commerce, states that the Bureau "realizes keenly the desirability of an immediate, vigorous, and systematic effort to promote American trade with this great friendly nation in the east of Asia. Such an effort... must be based on the most recent and dependable economic information. To supply that information is the purpose of this handbook.

"This handbook, the most detailed publication of its kind ever issued by the Department of Commerce, will appear in two volumes." The basic organization will be by each of the 17 American consular districts.

Digital searches for "soy" or "soya" or "beans" or "bean curd" or "bean cake" or "bean oil" will result in many hits and a vast amount of information. For example:

Pages 42, 45: A table titled "Commercial statistics for China as a whole," under "Exports, sundries" includes:

"Bean cake" (pounds). For 1913. Quantity: 1,575,792,400 pounds. Value: $18,197,871.

"Bean cake" (pounds). For 1918. Quantity: 2,182,241,744 pounds. Value: $35,650,215.

"Bean curd" (pounds). For 1913. Quantity: 4,846,543 pounds. Value: $144,849.

"Bean curd" (pounds). For 1918. Quantity: 3,765,591 pounds. Value: $265,141.

"Beans" (black, green white, yellow, other kinds) (pounds). For 1913. Quantity: 1,376,795,200 pounds. Value: $16,983,422.

"Beans" (black, green white, yellow, other kinds) (pounds). For 1918. Quantity: Yellow (#1): 849,479,313 pounds. Value: $17,106,454. Values are also given for Other kinds (#2), White (#3), Green (#4), and Black (#5): 13,481,033 pounds. Value: $295,796.

"Oil, Bean" (pounds). For 1913. Quantity: 65,575,600 pounds. Value: $2,720,637.

"Oil, Bean" (pounds). For 1918. Quantity: 393,621,508 pounds. Value: $29,802,630.

"Soy" (pounds). For 1918. Quantity: 820,531 pounds. Value: $45,871.

Page 115: "Canton Consular District." "Other native industries of Canton that give employment to large numbers of people in the aggregate are:... The making of a Chinese

© Copyright Soyinfo Center 2021

sauce called 'soy,' which is made from a certain bean which as been boiled slowly and to which wheat or barley flour is added (soy is exported for the use of Chinese living abroad and also for the making of certain foreign sauces and condiments);" [such as Worcestershire sauce?].

Page 200: "Export trade:... The leading products shipped from Hongkong to all parts of the world are:... beans,...soy, tapioca flour, tea..." Pages 202-03: Trade between Hongkong and the United States during 1918. Hongkong Consular District. Value in 1913: Soy. Shipped to the United States: $51,595. Shipped to the Philippine Islands: $1,430. Shipped to Hawaiian Islands: $1,140.

In the section on "Mukden Consular District" under "Agriculture" we read: (p. 216): "Soya beans furnish material for bean oil, bean curd, and bean sprouts, besides serving as a food when boiled. Bean oil is used locally for cooking and as an illuminant; the bean oil for export is employed in soap and olive-oil manufacture, while in the mixing of paints it serves as a substitute for cotton and linseed oils. Bean cake is used as fertilizer and as food for cattle. About 70 per cent of the output of beans is annually exported, the rest being consumed locally. The annual production of bean cake and bean oil in the Mukden consular district is estimated at 433,992 and 54,279 tons, respectively.

"It is estimated that one-eighth of the beans exported are shipped to Hongkong, the Straits Settlements, and Europe, three-eighths to South China ports, and the remaining four-eighths to Japan. Of bean oil, Europe, China ports, and Japan are buyers in about equal proportions. A somewhat smaller quantity goes to the United States. Bean cake exported from Manchuria is marketed almost exclusively in Japan, Taiwan, and South China."

Page 365-66: "Amoy Consular District." Manufacturing and other industries. The Amoy Tinning Co. (Ltd.) and The China Canning Co. (Ltd.): The output of these two factories includes "soy and soy sauce."

Page 380. The section on Agriculture in Antung states: "Soya beans and their products, bean oil and bean cake, are exported, principally to Japan, Chosen (Korea), and South China ports."

Page 391. The section on Antung, Beans states: "The value of the beans and bean products exported from Antung during the year 1918 constituted 27 per cent of the total value of exports and amounted to $4,941,982. The bean that constitutes the great bulk of this export is known commercially as the soya bean and is grown practically throughout this entire district.

"The bean crop ripens earlier in the southern section of the district than in the northern but is practically all harvested in normal years by the end of September. However, because of the superior transport facilities enjoyed during the winter, when roads and rivers are firmly frozen, it is at this time that the bean harvest is assembled at the various interior towns which serve as collection centers and from which it is forwarded to Antung in the spring.

"The soya bean is exported in three forms–as 'raw beans' (natural condition), as bean oil, and as bean cake.

"The proportion of the export of beans, cake, or oil that goes to any given destination varies from year to year according to several determining factors. However, the following statement, which can only be regarded as approximate and not as exact, gives a general idea (through average percentage) of the destinations of the soya bean products exported from Antung: Beans–Japan, 76 per cent; Shanghai, 6 per cent; Chosen (Korea) 5 percent; other Chinese ports and Dairen, 13 per cent. Bean cake–Japan, 72 per cent; Shanghai, 20 per cent; Chosen, 1.8 per cent; other Chinese ports and Dairen, 6.2 per cent. Bean oil–Japan, 31 per cent; Shanghai, 36 per cent; Chosen, 21 per cent; other Chinese ports and Dairen, 12 per cent. It will be seen that Japan and Chosen (Korea) receive eight-tenths of the beans, almost three-fourths of the bean cake, and slightly more than one- half of the bean oil exported.

"Beans are exported packed in gunny bags which, when filled, weigh about 175 pounds; bean cake in the form of large, round, flat cakes weighing on an average 75 pounds; and bean oil in empty 5-gallon kerosene oil cans, two of which are packed in a wooden case.

"Most of the beans exported are doubtless milled and transformed into cake and oil on reaching their destination. Bean oil is put to many uses, but one that is of common interest is as the base of practically all table sauces. Bean cake is principally used as a fertilizer for rice and in China as a cattle food.

"The trade in beans is a highly speculative one, since the market is contingent on two factors, the bean crop and the price of rice in Japan. When it is anticipated that the price of rice in Japan will be high, brokers will buy 'forward' beans from the large Chinese firms in Antung. This form of speculation is one that has great charm for Chinese merchants, and there are few firms in Antung that do not 'take a flier' occasionally in beans."

Page 394. The section on "Antung–Import trade" states: "Four circumstances have combined to raise the city of Antung to its present importance as a port for the importation of foreign merchandise into Manchuria: (1) The completion of the Chosen Railway, which, through Chosen, connects the Yalu River with Japan; (2) the opening of Antung as a port for foreign trade in 1907; (3) the completion of the standard-gauge railway from Antung to Mukden in 1911; and (4) the erection of the 3,100-foot steel bridge across the Yalu River in the same year, by means of which the Chosen and South Manchuria Railways now furnish a through service from Fusan to Changchun. When this system of railways was completed Antung at once became the natural gateway through which all rail-borne merchandise from Japan enters Manchuria. When the one-third reduction in duty on goods imported into Manchuria from or through Chosen went into

© Copyright Soyinfo Center 2021

effect in 1913 the rail route through Antung became cheaper for the Japanese exporter than the water route through Dairen or Newchwang. This advantage of the Antung route was further enhanced when, in 1914, the South Manchuria Railway granted a special discount, amounting to 30 per cent, on 11 specific through imports from Japan via Chosen when carried over its Antung-Mukden branch."

Note: As of Jan. 2014 Antung (now known as Dandong), is in China, a prefecture-level city in southeastern Liaoning province, and is the largest Chinese border city. It is a port city on the Yalu River, which divides China and North Korea. The population is more than 1 million people.

Page 397. Antung Consular District. Exports include soy.

Page 478: "Shantung Province is the original home of the soya bean and the bean-crushing industry in this part of the world, and until the possibilities of Manchuria were discovered and developed this Province led the industry." "Manufacture of vermicelli: The principal crude native industry is the manufacture of Chinese vermicelli from a small green bean known as the 'lu tou' [mung bean]. This vermicelli is manufactured not only in large factories but also by individual farmers and in the homes of the natives in all parts of the Province."

Page 517-19: Dairen Consular District, Agriculture. The principal crops and their yield per acre: soya bean, 4.5 bushels. "The principal fertilizers are manures and bean cake (the residue after the oil has been pressed from soya beans)." "Soya beans, and the bean oil and bean cakes manufactured therefrom are the principal agricultural products exported from this district... The soya beans raised in this district are of four kinds, the yellow soya, the small green soya, the black soya, and the red mungo. They are not considered as edible beans in their natural states. Some of them are exported raw to Japan, to be manufactured either into 'soy' (a sauce largely used by the Japanese) or into bean oil (used in making soap and for various other purposes) and bean cake (largely used as fertilizer on rice and sugar-cane fields). However, the greatest proportion of the bean products are manufactured in Dairen and other parts of the Leased Territory, and the subject will be considered later under 'Industries' and 'Exports.'" Address: Commercial Attaché, Peking, and various American Consular Officers, China.

185. *Millard's Review of the Far East.* 1919. [Editorial: The soya bean]. 10(7):261-63. Oct. 18.

• ***Summary:*** This editorial, which starts on the front page of this issue, begins: "China sells to America between fifteen and twenty million dollars worth of soya-bean oil annually. Most of this vegetable oil originates in Manchuria and is used in America for various purposes, chief of which is for food purposes and in the manufacture of soaps. The beans from which this oil is derived are produced by the Chinese farmers in Manchuria. The production of the beans is the sole extent of China's interest in this great industry, the rest of the transaction being handled by the Japanese. The Chinese farmer sells his beans to a Japanese dealer and they are collected at the port of Dairen. The oil is extracted either in Dairen or the beans are sent to Japan where the process is handled. The oil is shipped to America to the port of Seattle [Washington], in Japanese boats. The financial transaction is handled through the Japanese banks. The American manufacturer using the oil hands his check for the shipment to a Japanese merchant, and the Japanese merchant in turn pays the Chinese farmer for his beans. The Japanese are to be complimented for their part in the development of this business in Manchuria which is in their 'sphere of influence.' But in complementing them we naturally stop to consider what benefit China obtains from this international trade transaction. The Chinese farmer, of course, obtains his money for the beans, but since the Japanese have a monopoly of the business, the Chinese farmer must accept the price offered by the Japanese. If the Chinese farmer desires to spend his bean money for foreign merchandise, he may purchase American products, but his opportunities for doing so are practically nil, for the simple reason that he lives in a Japanese 'sphere' and very few American firms are able to do business there.

The point to all this is that out of this great business that has grown to such remarkable proportions in the last few years, the Japanese are the real gainers though being in the strategic position of middle-man-monopolist. The great profits derived from the buying and selling of the product go to Japan. In selling his beans the Chinese farmer must deal with one buyer, a Japanese. In buying the oil the American manufacturer must buy from one dealer, a Japanese. Both China and America, the producer and the user of the article are at the mercy of a middle-man who takes his toll both ways. The American dollar does pay for the beans, but it is in the form of a Japanese yen when it is handed to the Chinese farmer. If this international transaction between China and America were normal, the American money for the beans would come back to China in the form of American machinery and other manufactured products. Thus both nations would benefit. As it stands the profit goes to Japan and because of Japan's 'special position' in Manchuria, the Chinese farmer must purchase Japanese manufactured articles or do without. If Manchuria were open territory or if the 'open door' really applied in Manchuria there would be American, British and French buyers of beans in the ports of that territory. The competition would always assure the Chinese farmer a good price for his beans. On the other hand the American manufacturer who needs the vegetable oil, would have the advantage of buying from several dealers and he would not be at the mercy of a middle-man who dictates the price.

"These practical facts should demonstrate to both America and China the importance of keeping the trade route

© Copyright Soyinfo Center 2021

open. There is absolutely no reason or desire to exclude Japan from the transaction, but that country should enjoy no advantage that the ability of her merchants in open competition with other world traders are not able to earn on their merits.

"The trouble with Japan is that she desires to dominate the Orient both economically and politically for her own private advancement and She desires to dominate China in order that the resources of this country may become subject to her and on the other hand she desires to force other nations to come to Japan and submit to her monopoly in order to obtain China's raw products for western mills or to sell these products in China. This is Japan's policy in respect to the Asiatic mainland whether it is in Siberia, Korea, Shantung, Fukien, or all China. Wherever Japan's foothold is established others must get out. She develops the country, but it is in her own sole interest. The Chinese or Korean merchant in a Japanese 'sphere' has no chance. The citizen hasn't even the opportunity of attending a Japanese school established in that territory. They are for Japanese only. The Japanese policy is exactly the opposite of American policy in the Philippines where the Filipino has all the opportunities for education and trade. The Japanese in contending for a Monroe Doctrine for Asia, overlook the fact that all nations, Japan included, enter South and Central America on an even footing with the United States.

"If more evidence is needed of Japan's determination to Koreanize China, it may be found in her post offices all over this country. Wherever the Japanese go in China they take a Japanese postal staff with them."

"One possible explanation of why the Japanese have always tried to have their own post offices in all parts of China is that they want to transfer messages and parcels of a confidential nature from their agents to Tokyo without the knowledge of the Chinese authorities."

186. *Kangyo Mohanjo Kenkyu Hokoku* (*Bulletin/Research Report of the Industry Model Station*). 1919. Gaichu ni kansuru chôsa [Researches on injurious insects]. No. 2. 82 p. + plates. (Suwon, Korea). [Jap]*
• ***Summary:*** An English-language summary states that this report describes the life-histories of, and preventive measures for dealing with various insects in Korea. "*Serica* sp. occurs once a year, the adult beetles occurring from April to June. It hibernates in the larval stage or occasionally as an imago. It attacks barley, tobacco, cotton, hemp, soja bean, cabbage, peach and mulberry."

187. *USDA Bureau of Plant Industry, Inventory.* 1919. Seeds and plants imported by the Office of Foreign Seed and Plant Introduction during the period from January 1 to March 31, 1916. Nos. 41685 to 42383. No. 46. 97 p.
• ***Summary:*** Soy bean introductions: *Soja max* (L.) Piper. Fabaceæ.

"42058-42065. From Keijo, Chosen (Korea). Presented by Miss Katherine Wambold. Received February 28, 1916. Descriptive notes by Miss Wambold.

"42059. *'Kong.* Cooked, pressed, hung all winter to rafters, then soaked in a brown liquid called *chang,* used as a salty sauce on food. It is parched then eaten. A few partly cooked grains are often scattered in the rice, as we use raisins in a rice pudding." Address: Washington, DC.

188. *Market Reporter* (*The*) (*USDA*). 1920. Price of soy beans advances in Japan. 1(2):32. Jan. 10.
• ***Summary:*** The droughts during the summer damaged soy-bean crops in Manchuria and Chosen [Korea]. "Spot cargo is still quoted at 9.4 to 9.5 yen per picul of 133.33 pounds (about $0.036 per pound). Forward quota range up to 9.64 yen per picul ($0.037 per pound).

"Old crops are much preferred by buyers because they are of a better quality, and, although they are quoted at higher figures, their sale is brisker than that of the new crop. The soy-bean oil trade is dull and inactive, as European buyers do not buy and only consignments to the United States are now being made from Dairen." Address: Bureau of Markets, Washington, DC.

189. Parry, Charles A. 1920. Parry, Charles A. 1920 Travel sketches, LXXXIII–Bean that made Manchuria famous: A factory at Shimizu–The bean of many qualities. *Japan Advertiser* (*Tokyo*). *Jan. 25. p. 7.* Jan. 25. p. 7. [Eng]
• ***Summary:*** Contents: Introduction. Sweet and nasty. "Not now." The tea port. History of a bean. Substitutes. Big business. Japanese place names. On 26 Nov. 1919 the author traveled by train from Tokyo to the port city of Shimizu, on Suruga Bay, in Shizuoka prefecture (about 90 miles southwest of Tokyo). "Shimizu is one of the 36 treaty ports, and it was opened along with now fewer than 26 others, in 1899. The name means 'clear water'... My chief object in coming to Shimizu is to visit the Suzuki Company's Bean Oil Factory, for which I have obtained permission by courtesy of the Japan Tourist Bureau. This consists of several large buildings, erected three years ago, including a central office and two mills which being built in a castellated Gothic style, make a picturesque adjunct to the scenery as they rise by the calm waters of Shimizu Bay. The mills deal at present with two only of the many products of the wonderful manchurian [sic] or soy bean, called in Japanese daizu (glycerine [sic, Glycine] hispida) the crushed bean and the oil." The two mills are capable of treating 300 tons of beans per day. The process is secret. "I am informed that factories for the extraction of this oil exist only in Japan and Manchuria; but the Suzuki Co. has a branch office in New York, and the business is rapidly extending."

"The oil is used for frying, for lubricating, for water-proofing clothes, for medicine, as a butter substitute, and in the manufacture of soap, candles, guncotton, and artificial

© Copyright Soyinfo Center 2021

rubber; though it can hardly yet be said to be on the market." For culinary purposes it is not as good as the ordinarily used goma (sesame) oil, being much lighter and requiring the use of a deep saucepan. Yet it costs only about 62% as much as sesame oil; the latter costs ¥1.60 per sho (1.58 quarts).

"At present its chief use is for making soap, for which it is taken at a less refined stage, of a dark brown color while the finished product is light yellow. The oil is at present little used in Japan because little known; its retail sale seems to be limited to the neighborhood of the factories. Of these there are three, the two others being at Yokohama and Kobe, both established only last year.

"One large shed is devoted to storing the crushed beans (*kasu*) after the oil has been extracted, large piles of which lie about... The chief use of this at present is for cattle-food; but it is now to be manufactured into flour, useful for mixing in various proportions with wheat flour."

"The daizu [soy] bean has long been known in Japanese cookery in the form of 'kiriako' [sic, kinako] ('yellow powder') to make which the entire bean is slightly roasted and pulverized; then used for mixing with flour to make light cakes, for giving savor to boiled rice, etc. The prices are not yet determined, the cost of manufacture not being known; but it will be cheaper than flour, as well as more nutritious, and will help to relieve the scarcity of rice.

"Substitutes: Other products of the bean are: tofu, the white bean-curd, used universally in Japan and, until recently, almost absurdly cheap; also used in the forms of age-dofu (fried in cottonseed oil), yake-dofu (baked) [yaki-dofu (grilled)], and the curious gori-dofu [kori-dofu], 'frozen tofu,' also called koya-dofu (from koya-san), tofu sprinkled with hot water, frozen, dried, and cut into small cakes; miso, the cheap condiment made of daizu beans fermented with yeast and barley; and soy, Japan's only sauce. A later addition to the list has been to-nyu, or tofu-milk [sic, "bean milk], a very passable substitute for cow's milk at half the price; and still more recently tofu-butter. The whole bean, parched and boiled, is an excellent coffee-substitute, yielding when parched just to the right degree, much of the aroma of that fascinating drink without any of its deleterious effects."

Note 1. This is the earliest English-language document seen (Aug. 2013) that uses the word "to-nyu" or the term "tofu-milk" to refer to soymilk; the Japanese word is *tônyû*.

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "gori-dofu" or the term "koya-dofu" to refer to dried-frozen tofu.

"The present demand for been cake in Japan is met by the three factories of the Suzuki Co. that at Shimizu supplying central Japan, Yokohama Northern and Kobe Southern.

"There are several varieties of the bean known as white, yellow green and black, the first two being the most used. The plant is as yet little grown in Korea and Japan.

"Big Business: The Shimizu factory, which is the largest of the three, employs about 300 workpeople on day and night shifts. This new bean-industry is, however, only the latest among many activities of the Suzuki Co. which ranks among the great industrial concerns of the world, the third largest in Japan, standing next to the Mitsui and the Mitsubishi, and employing a total of over 3,000 clerks and 100,000 workpeople. It deals also in rice, wheat flour, sugar, sake-brewing, coal, timber, metals, camphor, wool, cloth and manure besides numerous small lines. It has three dockyards, at Harima, Toba and another; a coal-mine in Kyushu; copper mines at Hibi (Okayamaken) Hiroshima (Yamaguchiken) and Dairi (Fukuoka ken) also mines of zinc and iron; while its steel works (*seikojo*) at Kobe are the largest in Japan."

"Shimizu is well situated for growth being midway between the ports of Yokohama and Yokkaichi and serving a prosperous hinterland. Its chief exports are tea and oranges and its imports coal and timber." Address: Japan.

190. Kline, Charles E. 1920. Oil-bearing seeds and nuts in the Shanghai District of China. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 23(98):519-22. April 26.

• ***Summary:*** The chief plants yielding vegetable oils in China are [soy] beans, cotton seed, peanuts, rapeseed, sesamum seed, tea seed, and woodnuts (filberts).

The number of oil mills in China is increasing, and those in northern China treat mainly soya beans, while those in central China produce the other varieties of oil mentioned. The oil mills do not work year round, since there is not sufficient seed available, and also since the high summer temperatures cause the oil to become rancid.

The total capacity of oil mills in Shanghai is 5,400 piculs/day (321 tons/day).

Tables show: (1, p. 520) The quantities of oil, oilseeds, and oil cake exported from the port of Shanghai during the years 1917 and 1918. 1 picul = 133.33 lb. For [soy] bean oil: In 1917–2,351 piculs worth $26,482. In 1918–5,771 piculs worth $71,601. For [soy] bean cake: In 1917–11,213 piculs worth $27,246. In 1918–282 piculs worth $800.

(2, p. 520) The quantities of oil and cake exported from China to the countries of destination; the year (or years) is not given. Both the weight (in piculs; 1 picul = 133.33 lb) and value (in dollars) are given for each destination. In descending order of weight exported:

[Soy] bean oil–United States (incl. Hawaii) 2,136,746 piculs. Japan (incl. Formosa [Taiwan]) 87,673. Korea 23,611, Russia 19,802. Canada 4,001. France 2,132.

Note: This is the earliest document seen (May 2014) that gives statistics for trade (imports or exports) of soybeans, soy oil, or soybean meal with Taiwan.

[Soy] bean cake: Japan (incl. Formosa) 15,150,706 piculs worth $33,383,750. Korea 635,362 piculs worth $1,292,174. Russia 578,960 piculs worth $968,829. Siam

© Copyright Soyinfo Center 2021

1,412 piculs worth $4,625. United States (incl. Hawaii) 27 piculs worth $54. Canada 9 piculs worth $17.

(3, p. 521) Ocean freight rates from Shanghai to various ports. Figures are given for bean oil and bean cake in 1917, 1918, and 1919 shipped to San Francisco [California], London, and Marseille, Naples & Venice (Italy). Present prices (total) are about five times as great as those at the beginning of the war. Address: Vice Consul, Shanghai [China].

191. Kirjassoff, Max D. 1920. Vegetable-oil-bearing materials of Manchuria. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 23(161):180-85. July 10.
• ***Summary:*** Contents: Introduction. Manchurian production of soya beans–exports of soya beans and products. All materials produced by cultivation–local consumption. Marketing raw materials–inspection–shipments. Methods of purchasing raw materials–brokerage. Storage–transportation methods and costs. Prices paid producers–economic conditions of farmers. Crushing of raw materials–prices paid at crushers. Production capacity of oil mills–types of mills and methods of operation. Quality of oil produced–production of bean oil and cake at Dairen. Fuel used in mills–activity of mills. Number of employees–wages. Marketing of products–Dairen exports of bean cake and oil. Prices of bean oil and cake. Ocean freight rates–export charges, insurance, etc. Increased United States demand–market for oil machinery.

"The oil-bearing materials produced in Manchuria are soya beans, perilla seed, peanuts, hempseed, castor beans, sesame seed, flaxseed, sunflower seed, and rapeseed." Estimates indicate that "about 1,500,000 tons of soya beans are produced in South Manchuria and about 800,000 tons in North Manchuria, or a total of 2,300,000 tons for the whole Province."

Tables show: (1) Exports of soya beans, bean cake, and bean oil each year from 1914 to 1919 (p. 180). (2) Exports of bean-cake each month from Oct. 1918 to Sept. 1919 from Dairen (Manchuria) to Japan (by far the largest), United States, Straits Settlements, China, Korea, and total (p. 184). (3) Exports of bean-oil each month during the same time to Japan (by far the largest), Europe, United States, China, Korea, and total. (4) The prices (in silver yen per picul or piece of cake) of beans, cake, and oil during the same period. Mentions the increasing demand for the oil in the United States. Address: Consul, Dairen [Manchuria].

192. Dill-Crosett Inc. 1920. Beans: Importers, exporters, factors in (Ad). *Bean-Bag* (*The*) (*Lansing, Michigan*) 3(2):35. July.
• ***Summary:*** A ¼-page ad. They handle 10 varieties of California beans and 16 varieties of Oriental (Japanese and Korean) beans including Daifuku, Kintoki, and Soya. Also peas. Address: 235 Pine St., San Francisco, California.

193. *Board of Trade Journal* (*London*). 1920. Korea. Estimates of soya bean and millet crops. 105:609. Nov. 18.
• ***Summary:*** "H.M. Consul-General at Seoul, in a recent report to the Department of Overseas Trade, states that according to an official estimate of the soya bean and millet crops in Korea for the current year, the yield [production] is expected to amount to 25,062,230 bushels, and 31,976,295 bushels respectively." Address: British Consul-General at Seoul.

194. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*). 1920. Review of Far Eastern commercial press. 23(292):1124. Dec. 13.
• ***Summary:*** "Soya bean and millet crops in Chosen (Korea): An official estimate of these two crops for the current year, according to the *London and China Telegraph*, places the production of soya beans at 25,062,230 bushels and of millet at 31,076,295 bushels."

195. Choson Unhaeng. comp. 1920. Economic history of Manchuria. Seoul, Chosen: Bank of Choshin. x + 303 p. Illust. Portraits. Folded color map. 20 cm.
• ***Summary:*** A digital version of this book is available on HathiTrust. The word "soya" appears on 19 pages: p. 146 (7 times), 137 (5 times), 138 (4 times), p. x, p. 142, 145 (3 times), p. 72, 138, 140, 148, 216, 303 (2 times), p. vi, 18, 52, 124, 134, 144, 217 (1 times each).

In the chapter on Agriculture (p. 124-60), the long section on "Soya beans" appears on pages 137-148. In this section the terms "bean cake" and "bean oil" appear many times. A large table (p. 147-48) shows the export of soya beans, [soya] bean cake, and [soya] bean oil from Dairen, Newchwang, and Vladivostok from 1908 to 1917.

The term "bean cake" or "bean cakes" appears on 26 pages: p. 144 (4 times), p. 18, 19, 142, 183, 184 (3 times), 20, 28, 140, 143, 186, 187, 215, 216, 218 (2 times), p. vii, 137, 138, 147, 148, 177, 186, 219, 224, 294, 299 (1 time each).

The word "soy," referring to soy sauce (Japanese shoyu) appears only on p. 142, where we read: "(6) Uses of Beans, Bean Cake, and Bean Oil in the Far East: (a) Beans: Perhaps the Japanese are the greatest consumers of beans in the world as an article of diet. Every morning they take soup made of miso which is prepared from beans. For the seasoning of their food they seldom use salt, using instead bean sauce, the chief ingredients of which are beans and salt. Thus the Japanese eat beans in one form or another at least three times a day. An extensive use is also made of beans by the Chinese, who make them into the Chinese paste *chiang* which they habitually eat with fish, meat, and vegetables. But the more

© Copyright Soyinfo Center 2021

expensive Chinese soy, which corresponds to the Japanese shoyu, is only used by wealthy families and restaurant keepers, and is not consumed by the very poor. Another product of beans which is widely used in both Japan and China is tou-fu [tofu, doufu] or bean-curd."

"(b) Bean oil is used extensively in cooking. Although it is inferior to rape and sesamum oils for this purpose, these oils cannot compete with it in point of price; the recent advance in price, due to the foreign demand, may however–if sustained, as seems certain–go far to change the positions of the oils relatively to each other. In spite of its unpleasant characteristic odour and unpalatability, the poorer classes in China consume it in its crude state, but among the rich it is boiled and allowed to stand until it has become clarified.

"As a lubricant bean oil is used for greasing axles and parts of the native machinery in use in the arts and crafts. Other uses in South China are for the making of waterproof cloth, and paper umbrellas and lanterns, and the oil is also mixed with lacquer for the manufacture of varnish and printing ink.

"(c) Bean Cake: Bean cake, which is but the residue after the oil has been expressed from the beans, was of comparatively little value to the Manchurian farmers, who used to feed their stock with it, before the discovery of its great value as a fertilizer. First in the sugar plantains in the provinces of Fukien and Kwangtung [southeast China], and then in the plantations in Java and the South Sea Islands, it was used as a fertilizer, and for centuries it has been an important article of trade with those places. But the great importance it has since attained in Manchuria's foreign trade dates from the conclusion of the Sino-Japanese War, when it began to be exported to, Japan for use in the paddy fields there. Soon it was found that it possessed fertilizing qualities superior to those of the fish manure of past ages which, containing too high a proportion of oil for the purpose for which it was used, was liable to breed insects hurtful to the crops, and so great grew the demand for it in Japan that the relative position of the oil and the cake was changed at one time, the cake becoming the principal product and the oil a by-product, though the tendency now is for the oil to regain its former position, owing to the growing demand for it in the Western markets. The results of the analyses made of bean cake in three different places show the following chemical composition." Analyses were conducted by: (1) Government laboratory, Japan. (2) Agricultural Institute, Scotland. (3) South Manchuria Railway Co. Composition: Water 11.0 to 15.3%. Albuminoids [proteins] 42.1 to 45.2%. Fat 5.2 to 9.6%.

"The Chinese farmer does not yet use bean-cake in his rice field, and in Manchuria it is only used for vegetable-growing. Thus Japan owes much to Manchurian bean-cake for the productiveness of its naturally sterile soil.

"As cattle feed bean cake is used in Manchuria for horses and mules–only, however, when very hard work is being done, and is mixed with bran and *kaoliang* stalk. Its use as cattle feed in Japan still belongs to the experimental stage. Two novel uses of soya beans have been discovered by Mr. Suzuki of the Central Laboratory of the South Manchuria Railway Company. The one is the making from it of a new sort of paint, named Solight, and the other, a chemical composition called Tantalse, which imparts its waterproof characteristic to the cement, mortar, or concrete with which it is mixed, or to paint upon which it is applied. The merits of Solight are enumerated thus: it may be applied as it is; it dries quickly, that is in about half an hour; it has no bad odour like paint; its easy combination with any color; its cheapness.

"Beans are also used in soap-making, and there are already several soap factories in Dairen which use beans as the chief material. The uses of beans are studied by many Japanese institutions and individuals, and many new discoveries have been made; indeed there seems to be no end to their uses."

196. Dep. of Finance (Okurashô). 1920. Financial and Economic Annual of Japan (20th). Tokyo, Japan: Government Printing Office. 199 p.

• ***Summary:*** The section on "Food problem, adjustment of prices, etc." (p. 6) begins: "Amidst this general activity of economic market, the balance of trade for the first time since 1915 was returned against Japan, and it seemed as if a dark, ominous cloud appeared in the horizon. In practice, however, the economic circles, spoiled by continued prosperity, did not take heed of this warning, but persisted in viewing the situation through rose-coloured spectacles. Speculative mania, luxury in living and abnormal rise of new enterprises were [the] order of the day, together with further advance in prices of commodities" [inflation]. The price of rice rose so high there were rice riots last year. "In November an Imperial ordinance was issued to exempt till November 1920 soy beans, raw beef, eggs and cotton fabrics and yarns from import duties, and also to restrict the export of cotton yarns."

Table 1 (p. 8) gives statistics on the tax on soy [sauce]. In 1920-21 it is estimated to be 5.83 million yen, compared with an estimated 5.25 million yen in 1919-20. This is an increase of 79,685 yen.

Table 3 (p. 14-15) gives the Japanese government revenue from the tax on soy sauce each year from 1907-08 (5.47 million yen) to 1920-21 (estimated 5.83 million yen).

In the section "Tax on liquors" we read (p. 20): "VI. Soy [sauce] tax: The tax is levied at the following rates upon persons manufacturing soy (Japanese sauce): -

"Soy yen 1.75 per koku of Moromi.

"Tamari yen 1.65 per koku manufactured.

"In 1900, the tax on soy for household use was created, the rates of which range from sen 50 to yen 4 according to the amount of manufacture. No person whatever is permitted to manufacture for household use more than five koku of soy

© Copyright Soyinfo Center 2021

per annum."

Page 24: "In view of the advance of prices and the consequent unrest as to living, such daily necessaries as soy beans, raw beef, eggs, cotton yarn and cotton fabrics were further placed on free import list, effective till November 30th, 1920."

Table 19 (p. 46) gives annual area (in *chô*) and production (in *koku*) of soy beans (and of "small red beans" [azuki]) from 1909 to 1918. (Note: 1 *koku* = 44.8 gallons = 180 liters. 1 *chô* = 2.45 acres = 0.992 hectares. 1 *kwan* [*kan*] = 8.72 lb). Sample figures were as follows:

1909–479,771 *chô* and 3,766,962 *koku*.

1913–475,284 *chô* and 2,993,095 *koku*.

1918–482,207 *chô* and 3,451,820 *koku*.

Table 33 (p. 62) gives the index number (relative amount) of wages by profession. A "soy-maker" earns 155.6, which is about average among food and drink workers.

A table (p. 67) gives the amount of various manufactured goods made in Japan from 1909 to 1918. The amount of Soy [sauce] increased from 2,197,708 *koku* in 1909 to 2,630,498 *koku* in 1918.

Table 53 (p. 94) gives the value (in yen) of "Chief commodities exported" from 1906 to 1919. For Soy [sauce] the export value increased from 952,840 yen in 1906 to 968,819 yen in 1919.

Table 54 (p. 96-97) gives the "Value of chief commodities imported" (in yen) from 1906 to 1919. For Soja-beans the import value increased from 9,018,173 yen in 1906 to 22,042,824 yen in 1919.

Table 56 (p. 102) gives the "Value of chief commodities imported from various countries" (in yen) from 1913 to 1919. For Soja beans in 1913 the value of imports were: From China: 3,828,508 yen. From Kwantung [Guangdong] province (in southern China): 2,988,212 yen. From Asiatic Russia: 326,874 yen. From other countries: 80 yen. By 1919 Kwantung province was by far Japan's biggest source (14.7 million yen), followed by China. Asiatic Russia, and Other countries.

Table 73 (p. 140) gives the prices of principal commodities from 1912 to 1919. During this period, the price of

Soja beans increased from 10.49 yen per *koku* to 20.81 yen per *koku.*

Red beans [azuki] increased from 14.49 yen per *koku* to 36.60 yen per *koku.*

Soy [sauce] decreased from 88.18 yen per *koku* to 40.61 yen per *koku.*

Miso increased from 0.44 yen per *kwan* to 1.02 yen per *kwan.*

Seed-oil [mainly rapeseed] increased from 46.34 yen per *koku* to 105.24 yen per *koku.*

Oil-cake [mainly rapeseed] increased from 2.72 yen per 10 *kwan* to 5.70 yen per 10 *kwan.*

Table 74 (p. 141) gives the index number of prices of commodities from 1912 to 1919; the index number for each commodity in 1912 is 100. During this period, the price of

Soja beans increased in price by 98%.

Red beans [azuki] increased by 158%.

Soy [sauce] decreased by 68%.

Table 75 (p. 141) gives the prices of principal commodities in Tokyo from 1909 to 1918, including Soja beans, red beans, and soy [sauce].

Table 76 (p. 143) gives the index numbers of prices of commodities in Tokyo from 1909 to 1918.

Miso increased by 182%.

The section on Chôsen [Korea], under "Agricultural products" states (p. 174): "Chosen is a wholly agricultural country, and farming is its most important industry. The fields of Chosen are almost always cultivated on a small scale and are owned by the Yan-pan and richer classes. Rice is the staple agricultural product, followed by barley, Italian millet, soy beans, wheat, and red beans. There are also such special products as cotton, tobacco, hemp, and ginseng. The cultivation of fruit-trees has of late produced very good results; and the area of their cultivation is gradually extending. Silk culture which had hitherto been in a very poor condition, is now, in consequence of official encouragement, being carried on everywhere. Both these are engaged as subsidiary industries by the agricultural class. Live stock is also raised as a by-product of agriculture, and cattle, horses, goats, and pigs are found everywhere in the country; but stock farming is not pursued as an independent enterprise. The cattle are well known for their great size and good quality; and a large number of them are annually exported to Japan Proper and Asiatic Russia."

Note: According to Piper & Morse (1923, p. 13) a table in this document (which we cannot find) gives five-year averages of acreage, production and yield of soybeans in Japan for the following years: 1897-1901, 1902-1906, 1907-1911, 1912-1916, and 1917-1919. The average annual production of soybeans is about 18 million bushels, grown on 1.1 million acres, with a yield of 15-16 bushels per acre. Address: Japan.

197. Hunnicutt, Benjamin Harris. 1920. Instruccoes praticas para a cultura do feijao soja [Practical instructions for the cultivation of soybeans]. Printed in Rio de Janeiro by Papelaria e Typographia Villas-Boas & c. [Por]

• ***Summary:*** This booklet begins: For the production of grain / seed, beans are the most important legume that are adapted to temperate climates. In view of its value for forage or for oil and for human consumption, its cultivation is destined to become very broad in Brazil.

Agricultural history.–Soybeans are very old in Japan, Korea and Manchuria, where there is no more plant in the

© Copyright Soyinfo Center 2021

wild. In these countries it is used as human food and for the extraction of oil Soy beans were introduced in the United States in 1829, but their culture did not attract attention until 1854. The variety Mammoth was introduced in 1882 and, since then, there has been more interest in the planting of that legume. Address: Prof., Director, Escola Agricola de Lavras.

198. Takenob, Y. 1920. Japan Year Book. Tokyo: Japan Year Book Office. 810 p. See p. 528, 545, 604, 635, 711, 744. Tenth annual issue. [Eng]

• ***Summary:*** The full title of this book is: "The Japan Year Book: Complete cyclopedia and general information and statistics on Japan and Japanese territories for the year 1920-21."

This book gives statistics for the Japanese empire: Japan Proper, Korea, and Formosa.

Page 545. In the chapter on "Agriculture." A table shows production of soy beans, potatoes, and sweet potatoes, 1914-1918 (in 1,000 koku). Production of soy beans increased from:

3.664 million *koku* in 1914
3.807 million *koku* in 1915
3.750 million *koku* in 1916
3.695 million *koku* in 1917
3.451 million *koku* in 1918. Address: Prof. at the Waseda Univ. and Late of the *Japan Times*.

199. Meekins, Lynn W. 1921. Favorable outlook for American trade in Manchuria. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 24(41):983-93. Feb. 18. See p. 989-91.

• ***Summary:*** "The South Manchuria Railway Co., the largest purchaser of American products, proposes to spend more than $200,000,000 gold upon improvements and extensions of its enterprises within the next five years... In spite of Japan's special advantages in Manchuria there is an excellent opportunity for the marketing of many lines of American goods,..." Manchuria is made up of three provinces having an area of some 365,000 square miles.

"American trade with Dairen–Dairen versus Vladivostok: The share of the United States in the trade of Dairen is much larger than that shown by the Maritime Customs statistics, owing to the extensive shipments of goods to and from the United States credited to Japan as the country of immediate destination and origin. The direct trade between Dairen and the United States exceeded $38,000,000 in 1919, of which imports [to Dairen] comprised two thirds and exports one third."

"As between Dairen and Vladivostok, at present a greater risk is involved in using the Vladivostok route. Costs of handling cargo at that port are higher than at Dairen; there is no market at Vladivostok itself for produce shipped there, wharves and warehouses are inadequate, and shipping services are irregular. Until these conditions are improved Dairen will probably continue to handle most of the exports of Manchurian products, as well as the imports of American goods for sale in Manchuria.

"If Vladivostok were made a free port and provided with facilities which Dairen now enjoys, full advantage could be taken of it as a real open door to Manchuria. Vladivostok, rather that Dairen, offers the more promising outlook to American firms seeking non-Japanese business in Manchuria and eastern Siberia."

"It is estimated that 2,500,000 tons of soya beans are produced annually in the three Provinces of Manchuria. The wheat and millet crops generally approximate 1,000,000 tons each. The Japanese firm of Suzuki & Co. has sold 100,000 tons of Manchurian wheat to the United Kingdom and 50,000 tons to Italy during the last few months."

"The products of the soya bean include bean curd [tofu], flour, milk, cheese, soy sauce, oil, and cake. The Chinese are concerned chiefly with the food products mentioned and the Japanese use large quantities of the cake for stock feed and fertilizer. The United States is the principal purchaser of the oil, a substitute for cottonseed and linseed oil employed in the manufacture of soap and paint and also as a lubricant."

"How bean trade is conducted: In Tiehling and Sunkiatai (Fengtien) and Kwanchengtze (Kirin) there are about 300 Chinese wholesale bean companies whose capital averages from $100,000 to $200,000 Mukden currency. Four Chinese banks–the Bank of China, the Bank of Communications, the Government Bank of the Three Eastern Provinces, and the Hsing Yeh Bank of Mukden–negotiate loans upon the joint guarantee of two of these companies without security; other Chinese banks require in some cases that the beans be pledged. Such loans are for three months or six months, sometimes one year, and the rate of interest has been less that 10 per cent. The Japanese banks lending money to bean dealers are the Yokohama Specie Bank and the Bank of Chosen [Korea], the former issuing Newchwang notes and the latter gold notes. It is estimated that between 60 and 70 per cent of the loans made by the Japanese banks is to Chinese and between 30 and 40 per cent to Japanese companies.

"The bean business may be said to commence in September, when buyers visit the producing districts and pay from 10 to 20 per cent of the stipulated price in advance. To the towns mentioned above, from 1,000 to 2,000 cartloads of beans are brought daily from November to January. The average price during the past two years has been $2 Mukden currency per 27 catties (36 pounds), exclusive of the production tax and the cost of transportation to Dairen and Newchwang. Mukden currency–that is, small coin dollars–exchanges for Mexican dollars at an average value of $1.40 to $1. At the present rate they are equivalent to about 40 cents in United States currency.

"Owing to the lack of good roads in Manchuria the

© Copyright Soyinfo Center 2021

beans must be carried to the market centers during the winter months, when the fields and streams are frozen. By March the crop has been collected and stored and exports become most active.

"Through the system of mixed storage, the South Manchuria Railway Co. has effected a great improvement in the handling of beans. When brought to the railway stations the beans are examined and graded according to quality and size. A certificate issued to the depositor entitles him to draw from the mixed-storage depot at Dairen or Newchwang an equivalent amount of beans of the same quality and size. The bags used in packing are also examined, and when the grade of bags deposited and that of the bags delivered is different the loss or gain thereon is adjusted by paying to or collecting from the depositor the difference in value. The new system saves the railway the trouble of transporting and storing each consignor's cargo separately. It also saves the shipper from the risks attending delay in transportation and from searching for his goods after they have arrived at their destination.

"Production of oil: The 60 bean mills at Dairen produce daily nearly 400 tons of oil and 3,700 tons of cake. Newchwang and Harbin are next in importance as oil-mill centers. The most widely used method of production is the expression system, by which one picul (133.33 pounds) of beans yields about 12 pounds of oil and 122 pounds of cake (in two equal pieces of 61 pounds each). By the chemical extraction system one picul of beans yields an average of 17 pounds of oil and 116 pounds of meal. The specific gravity of the oil is from .922 to .930.

"Sapan-wood, hemp seed, sesamum, and bean oil are being used by the Manchuria Paint Factory in Dairen, organized in February, 1920, with a capital of 1,000,000 yen, to manufacture paints for the South Manchuria Railway Co. and for various markets. The daily output is about 7,000 pounds, or 250 tins containing 28 pounds each. The colors produced include white, 'iron rust' red, and brown.

"The Japanese initiated the export trade in soya beans from Manchuria and developed the business to its present proportions. These middlemen, conversant with oriental ways, studied occidental needs and learned enough about western business methods to deal successfully with American and European firms. their strong position is due to their control of railways, their banking connections, their oil mills, and, in general, their special organization in South Manchuria for handling the business. Eventually it may be possible by exporting beans and oil through Vladivostok for Chinese sellers and American buyers to deal directly with each other. Meanwhile the most effective methods to be employed involve the development of selling and buying organizations able to cope with the situation now existing."

"About two thirds of the population of Manchuria is in the Province of Fengtien, which composes, in general, South Manchuria." Address: Trade Commissioner, Peking.

200. Suzuki, Keiko. 1921. Daizu no shihan ryû o shôzuru genin ni tsuite [Studies on the cause of "shihan" (purple speck) of soybeans]. *Chosen Nokaiho* (*Chosen* [*Korean*] *Agricultural Association Report*) 16(2):24-28. Feb. [Jap]
• ***Summary:*** Suzuki believed that the cause of the purple speck [stain] disease of soybeans might be due to the mechanical stress exerted by the pod in consequence of unequal growth between pod and seed. Thus, climatic conditions were considered the chief cause of the disease. Note 1. Suzuki was wrong. Kikuchi soon showed that the real cause of the disease was a fungus of the genus *Cercospora.*

Note 2. This is the earliest document seen (Feb. 2006) concerning the purple stain of soybeans.

Note 3. Wikipedia says (Oct. 2014 at Cercospora) that "*Cercospora kikuchii*–causes leaf spot and purple seed stain on soybean." Address: Korea.

201. *Bean-Bag* (*The*) (*Lansing, Michigan*). 1921. Bean trade reports from the Orient. 3(10):34. March.
• ***Summary:*** Source: Commerce Reports. Discusses the effects of World War I on the trade of soya-beans, soya-bean oil, and [soya] bean cake from Manchuria.

There was a decline in shipments of soya bean oil due to "the high rate of exchange in Dairen and the low rate of exchange between the United States and Europe." Much of the oil imported from Manchuria "by the United States was shipped to Europe in the form of sauces, etc. Moreover, when the armistice was declared, large stocks of soya-bean oil were accumulated in the United States.

"Bean oil and bean cake industries: At present there are 20 bean-oil mills in Antung, with an estimated total capital of $1,077,000 and a daily capacity of 22,100 bean cakes (weighing about 62 pounds each) and 160,251 pounds of bean oil. These mills employ 1,100 men, paying to the great mass of laborers an average monthly wage of $8.60 with food and lodging and to some of the expert workmen operating hydraulic presses, etc, as much at $36.40 per month with food and lodging.

"At present there are 20 [soya] bean-oil mills in Antung, with an estimated total capital of $1,077,000 and a daily capacity of 22,100 bean cakes (weighing about 62 pounds each) and 160,251 pounds of bean oil. These mills employ 1,100 men, paying to the great mass of laborers an average monthly wage of $8.00 with food and lodging and to some of the expert workmen operating hydraulic presses, etc. as much at $36.40 per month with food and lodging.

"Of the 20 mills operating in 1919, 2 were equipped with locally-made hydraulic presses and the remainder with native hammer and wedge presses and hand-operated screw presses. All the mills are equipped with steam or oil driven rollers for crushing beans, most of the engines being of Japanese make with a few large engines of English make. The new mills are obtaining equipment in Darien from a

© Copyright Soyinfo Center 2021

Chinese machine shop which specializes in bean-oil presses and allied material. Until the world trade in vegetable oils has settled into its new post-war channels, there is small likelihood of supplanting present equipment in Antung mills by more modern machinery.

"Bean cake as fertilizer: The local bean-oil market was greatly stimulated by the war; and while local trade will probably suffer a setback from post-war readjustments, the trade in bean cake seems more certain, as Chosen (Korea) and Japan are using increasingly large quantities for fertilizing rice fields, the high prices for rice strengthening this demand. In urging its use by farmers, the Japanese Government estimates that Korea's rice output may be increased 40 per cent, thus assisting materially in solving Japan's food problem."

202. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*). 1921. Japanese trade and economic notes. 24(84):252-53. April 12.
• ***Summary:*** "Export of beans and bean products from Dairen during 1920:" A table shows the exports (in piculs) of [soya] beans, bean cake, and bean by destination. The three leading destinations are Japan, England, and Egypt. Others are Hongkong, Dutch East Indies, Sweden, Denmark, Holland, France, Korea, United States.

203. *Bean-Bag* (*The*) (*Lansing, Michigan*). 1921. A line on how China [soya] bean trade is conducted. 3(11):25. April.
• ***Summary:*** "In Tiehling and Sunkiatai (Fengtien) and Kwanchengtze (Kirin) there are about 300 Chinese wholesale bean companies whose capital averages from $100,000 to $200,000 Mukden currency. Four Chinese banks–the Bank of China, the Bank of Communications, the Government Bank of the Three Eastern Provinces, and the Hsing Yeh Bank of Mukden–negotiate loans upon the joint guarantee of two of these companies without security; other Chinese banks require in some cases that the beans be pledged. Such loans are for three months or six months, sometimes one year, and the rate of interest has been less than 10 per cent. The Japanese banks lending money to bean dealers are the Yokohama Specie Bank and the Bank of Chosen [Korea], the former issuing Newchwang notes and the latter gold notes. It is estimated that between 60 and 70 per cent of the loans made by the Japanese banks is to Chinese and between 30 and 40 per cent to Japanese companies.

"The bean business may be said to commence in September, when buyers visit the producing districts and pay from 10 to 20 per cent of the stipulated price in advance. To the towns mentioned above, from 1,000 to 2,000 cartloads of beans are brought daily from November to January. The average price during the past two years has been $2 Mukden currency per 27 catties (36 pounds), exclusive of the production tax and the cost of transportation to Dairen and Newchwang. Mukden currency–that is, small coin dollars–exchanges for Mexican dollars at an average value of $1.40 to $1. At the present rate they are equivalent to about 40 cents in United States currency.

"Owing to the lack of good roads in Manchuria the beans must be carried to the market centers during the winter months, when fields and streams are frozen. By March the crop has been collected and stored and exports become most active.

"Through the system of mixed storage, the South Manchurian Railway Co. has effected a great improvement in the handling of beans. When brought to the railway stations the beans are examined and graded according to quality and size. A certificate issued to the depositor entitles him to draw from the mixed-storage depot at Dairen or Newchwang an equivalent amount of beans of the same quality and size. The bags used in packing are also examined, and when the grade of bags deposited and that of the bags delivered is different the loss or gain is adjusted by paying to or collecting from the depositor the difference in value. The new system saves the railway the trouble of transporting and storing each consignor's cargo separately. It also saves the shipper from the risks attending delay in transportation and from searching for his goods after they have arrived at their destination."

204. *Bean-Bag* (*The*) (*Lansing, Michigan*). 1921. Soy bean makes its way north to colder climes. 3(11):51-52. April.
• ***Summary:*** "The soy bean, an Asiatic importation, popularly associated with the South, is making its way north, and is being well received.

"Most of the varieties first brought to this country were from parts of Asia, whose climate corresponded more nearly to the southern states. Within the last seven or eight years the department [USDA] has obtained about 300 introductions of soy beans from Manchuria, Korea and Japan, some of which grew as far north as the 52d parallel. The most promising northern varieties are the Black Eyebrow, the Mandarin, and the Manchu, all native to a latitude of about 46 degrees, on account of which they are adapted to our most northern states. A large number of samples of Black Eyebrow soy bean were sent to northern farmers last year, and out of 551 reports returned more than 400 were favorable. Reports promise a great increase in acreage in northern states this year. Seedsmen are laying in supplies of these more northern varieties; but many farmers, if unable to obtain northern seed, will plant old varieties, such as Ito San. From 90 to 95 per cent of soy beans are raised for hay, silage and pasture, although they are prolific seed producers."

205. Takimoto, S. 1921. Daizu no saikin-sei hanten-byô [Bacterial spotting disease of soybean]. *Byochu-gai Zasshi* (*J. of Plant Protection, Tokyo*) 8:237-41. May. [Jap]
• ***Summary:*** This preliminary note calls attention to a

spotting bacterial disease of soybean in Japan. The disease is said to be caused by a new bacterium which is not identical to *Bacterium glycineum, B. soyæ,* or *Pseudomonas glycineum* Nakano. The name of the causal bacterium is not given. Address: Chosen Kangyo Mohanjo.

206. Hoshino, T. 1921. Wealth of Manchuria not in beans alone: Yields of various crops being greatly increased as vast areas become cultivated. *Trans-Pacific* 4(6):72-76. June.
• ***Summary:*** "Soy beans and kaoliang are by far the two most important products of Manchuria. Broadly speaking, the latter feeds the people while the former fetches them money, so they may be well compared with silk and rice in Japanese economy. But beans do perhaps more for Manchuria than silk does for Japan, for, without beans, the trade of Manchuria would shrink at once to one-half its actual amount...

"According to one authority a total of no less than 5,126,655 acres or about 19 per cent of all the cultivated land in Manchuria is devoted to the cultivation of beans, and the yield, averaging 21 bushels per acre, amounts to something like 108,000,000 bushels, of which 70 per cent is produced in South Manchuria. Though South Manchuria thus produces far more beans than North Manchuria, they are mostly grown in its northern part, the districts bordering on North Manchuria... Something like 2,000,000 bushels are added to the crop every year...

"The most important food-stuff of the native population, kaoliang, ranks next to beans even as an article of trade, though, last year for once, it was ousted from the position by wheat. It is also the principal grain food of the numerous animals so important in Manchurian agriculture. Out of it is made kaoliang spirit, the most popular drink in the country. The stalk is used for fuel and roofing material, and is also women into Chinese mats, indispensable in native households.

"Before soya beans attained their present importance, half the total area of the cultivated land in Manchuria is said to have been devoted to Kaoliang."

The main livestock animals in Manchuria are pigs (5,298,647), horses (1,769,968), oxen (888,374), sheep (586,128), mules (552,018), and donkeys (508,596).

Photos show: (1) Endless piles of sacks of soybeans at Changchun. A white horse pulling a cart stands in the foreground. (2) New Dairen Wharf Office, opened Nov. 1920. (3) Exterior of Suzuki company's chemical [solvent] extraction bean mill. (4) Junk wharf at Dairen; the junks have very tall rectangular sails. Address: Research Manager, Bank of Chosen, Seoul, Korea.

207. *Boston Daily Globe.* 1921. Beans make Manchuria famous: Soya variety cause of the boom city of Dairen, waste land 30 years ago, now port of 3,000 ships a year. July 24. p. 49.
• ***Summary:*** From New York Times: "The soya bean is making Manchuria famous. There are acres of soya beans in bags in the Dairen warehouses piled several feet high. The traveler sees great stacks of them at Changchun [Chang-chun; W.-G. Ch'ang-ch'un] awaiting shipment by rail, where they are piled 20 feet high and spread out as far as the eye can reach.

"All over Manchuria caravans move slowly across the plains bringing the beans into town. Almost all Manchuria exports are shipped from Dairen, and here steamers are constantly being loaded with the big flat bean cakes for export, imperceptibly decreasing the immense quantities piled in towering columns like giant poker chips on top of a table.

"The soya bean is bringing prosperity as well as fame to Manchuria... The soya bean is rapidly becoming the greatest single of the country Dairen and Yingkou are the big centers of the industry. The native oil and bean-cake factories are called yu-fang. There are no less than 60 yu-fang in Dairen and 21 at Yingkou.

"Manchuria is now considered one of the most promising sections of China. The South Manchuria Railway, which runs through Manchuria and Korea, is the only railway in the Orient boasting an all-American equipment of locomotives, coaches and rails.

"Dairen [Dalian], the southern terminus of the South Manchurian Railway, is on the western [sic, eastern] shore at the extreme southern end of the Liaotung Peninsula. It is less than 38 miles from Port Arthur [Lüshun], on the eastern [sic, southwestern] shore of the peninsula.

"Where the city of Dairen now stands was wasteland barely a generation ago. The harbor is free from ice all the year round... the water is deep enough to allow the largest steamers coming into the inner harbor at all times. Three thousand vessels arrived in Dairen last year. In 1919 the total trade of the port was $360,000,000. Dairen is now third in the order of China's custom ports."

208. *Light of Manchuria.* 1921. Manchuria Enlightening Society. Whose organ the "Light of Manchuria" is. No. 13. p. 54-55. Sept. 1.
• ***Summary:*** "What actuates us in our endeavours to open up Manchuria and Mongolia lies in realizing our ultimate ideal in the enlightenment and development of Manchuria and Mongolia. It will not do only to develop the natural and industrial resources, but the ethical and intellectual culture of the inhabitants must also be carefully husbanded and nourished, so that both mind and matter may be developed in harmony.

"It is urgently important that the truths regarding Manchuria and Mongolia should be made known clearly not only to Japan and China, but also to Europe and America. On this account, the establishment of the Manchuria Enlightening Society is bound to have a serious significance of international character."

© Copyright Soyinfo Center 2021

The Society also helps travelers and observers wishing to visit Manchuria, Mongolia, Siberia, Chosen (Korea), China, etc. All officials of the Society are Japanese.

209. Grinenco, Ivan; Capone, Giorgio. eds. 1921. Produits oléagineux et huiles végétales: Etude statistique sur leur production et leur movement commercial [Oleaginous products and vegetable oils: Statistical study on their production and trade]. Rome, Italy: Institute Internationale d'Agriculture, Service de la Statistique Générale. xxxii + 421 p. See p. XX-XXI, 140-41, 144-47, 442-43, 480-81. Sept. 15. Index in front. [Fre]

• ***Summary:*** In Sept. 1921 the IIA (*Institute Internationale d'Agriculture*) published this monograph in French. Two years later, by popular demand, an updated English-language edition was published. Contents: Introduction. Northern hemisphere: Europe, America, Asia, Africa, Oceania (Hawaii, Guam). Southern hemisphere: America, Asia, Africa, Oceania. Recapitulative tables of commerce, 1910-19. Note 1. All import and export statistics are given in quintals. 1 quintal = 100 kg.

The soybean (introductory information, p. xxii-xxiii, xxxii). Northern hemisphere–Europe. Germany (imports of soybean and soy oil 1910-14, p. 4). Denmark (production of soy oil in 1917, p. 17; imports and exports of soybeans and soy oil 1910-19, p. 18-20). France (imports and exports of soybeans and soy oil 1910-19, p. 28-31). Great Britain and Ireland (treated as one country; imports, exports, and reexports of soybeans and soy oil 1910-19, p. 32-35). Norway (imports of soybeans 1910-19, p. 47). Netherlands (Pays-Bas, imports and exports of soybeans and soy oil 1910-19, p. 49-52). Romania (In 1915 production of soybeans on 3 hectares was 3,600 liters). Russia (in Europe and Asia, imports of soy oil 1909-17, p. 70-71). Sweden (imports and exports of soybeans and soy oil 1910-19, p. 74-76).

Note 2. This is the earliest document seen (April 2020) that gives soybean production or area statistics for Eastern Europe (Romania).

America: Canada (imports of coconut, palm, and soy oil {combined} for the production of soap {in hectoliters} 1915-19, p. 88-89). Cuba (various attempts have been made to introduce the soybean, p. 94).

United States (area and production in 1909 {659 ha}, then from 1917-1920, p. 97-98). An overview of soybeans in the USA (p. 103, 105) states that the soybean, known in the USA since 1804, has become of great economic importance during the past few years. It is becoming popular mainly as a forage plant, but also for its seeds, for extraction of oil, and for making other products. Statistics have been published regularly since 1917. The census for 1909 showed 659 hectares cultivated in soybeans. During the years from 1917 to 1919 the cultivated area surpassed 60,000 ha. The three main states for soybean cultivation are North Carolina, Virginia, and Mississippi, which in 1919 cultivated respectively 33,185, 12,141, and 3,238 hectares; this was almost 75% of the total cultivated to soybeans in the USA. In 1910, the seeds were used for the extraction of oil in the USA, and for the first time the seeds were imported from Manchuria. In 1915, domestically grown soybean were used as a source of oil. This industry is developing rapidly, because the extraction of the oil is easily adapted to existing facilities that press oil from cottonseed and linseed. A table (p. 106) shows production of 16 vegetable oils in the USA from 1912 to 1917. Soybean oil production (in quintals) has increased from 12,537 in 1914, to 44,996 in 1916, to 190,843 in 1917. Figures are also given for peanut oil, sesame oil, etc. Other tables (p. 108-10) show imports, exports, and reexports of soybeans and soy oil from 1910 to 1919.

Asia: China (exports of soybeans and soy oil 1910-19, p. 161-62). French Indo-China (overview, esp. Cambodia and Tonkin, p. 187). Japan (area planted and production of soybeans 1877-1919, p. 190; overview, p. 191; production of soy oil 1909-18, p. 192; imports and exports of soybeans and soy oil 1910-19, p. 192-93). Korea (area planted and production of soybeans 1909-1918, p. 194; imports and exports of soybeans and soy oil 1909-11, p. 195). Formosa [Taiwan] (area planted and production of soybeans 1901-06, p. 196; imports and exports of soybeans and soy oil 1909-17, p. 197. In 1901 10,888 ha produced 8,056,400 liters of soybeans. In 1904 21,960 ha produced 24,401,700 liters of soybeans). Note 3. This is the earliest document seen (Jan. 2005) that gives soybean production or area statistics for Formosa (Taiwan; ceded to Japan in 1895 after Japan won the Sino-Japanese War).

Kwantung [Kwantung Leased Territory in Manchuria] (area planted and production of soybeans 1911-17, p. 198. In 1911 14,627 ha of soybeans produced 102,112 quintals. In 1916 29,902 ha produced 153,995 quintals of soybeans).

Africa: Algeria (in recent years, trials have been made to introduce soybean culture to Algeria, p. 238). Egypt (imports of soy oil 1919, p. 244-47).

Southern hemisphere–America: (Note 4. Soy is not mentioned at Argentina, Brazil, or any other South American country). Asia: Netherlands Indies. (A) In Java and Madura, the area planted to soybeans was 162,800 ha in 1916, 175,696 ha in 1917, and 157,844 ha in 1918. Gives imports of soy oil (1,085 quintals in 1914) and exports of soybeans (46 quintals in 1913) (p. 297-98). (B) In outlying territories, gives imports of soybeans from 1913 to 1919 (p. 299). Africa: Southern Rhodesia (attempts have been made to introduce soybeans and several other oil plants from temperate climates, p. 317). Oceania: Soy is not mentioned at Australia, New Zealand, British New Guinea, former German New Guinea [later Papua New Guinea], or any other country in southern Oceania. (p. 297). Recapitulative tables–Imports and exports from 1910-1919. Soybeans, p. 368-69. Peanuts, p. 370-75. Sesame seeds, p. 376-79. Palm

© Copyright Soyinfo Center 2021

fruits (*Amandes de palme,* from which palm oil is obtained), p. 392-93. Peanut oil, p. 414-17. Corn oil, p. 416-17. Sesame oil, p. 418-19. Soy oil, p. 420-21. Other oils covered in detail by this book are: Cottonseed, hempseed, linseed, rapeseed (*colza* and *navette*), poppy (*pavot* or *oeilette*), castor, olive, coconut, palm, and other–non-specified. Address: 1. Doctor of Agronomics; 2. Doctor of Economics. Both: IIA, Rome, Italy.

210. Satow, Sadakichi. 1921. Researches on oil and proteids extraction from soy-bean. *Tohoku Imperial University, Technology Reports* (*Sendai, Japan*) 2(2):1-124 (41-164). Oct. 28 cm. [Eng]

• ***Summary:*** Contents: 1. General description of the soy-bean: The use of the soy-bean (as a food-stuff [shoyu, miso, tofu, natto], soy bean oil [for the manufacture of soap, hydrogenated oils, paints, varnishes, oil-cloth, and rubber substitutes], and bean cake or waste residue from the manufacture of soy-bean oil [nitrogenous fertilizer, as a cattle food, Solite–a water-based paint]). 2. Classification and analysis of soy beans and their standardization: By color, by protein / proteid content, conclusion of analysis (the best soy-bean varieties are Tsurunoko and Kauro grown in Hokkaido): Standardization of the raw material, content of proteids, color of the raw material, moisture, regularity of the grain, specific gravity of the soy-bean, impurities. 3. Microscopical observations of soy-beans: Colour reactions of cellular substances, distribution of proteids and fatty acids, distribution of fatty oils. 4. Oil extraction (p. 17): Influence of hulls, influence of moisture, influence of oxidation, comparison of the dissolving power of various solvents, to find the best conditions for the extraction of oil by means of benzine, how to extract the oil technically without denaturing the proteids and how to remove the retained solvent, on the apparatus employed in oil extraction, working of the extracting apparatus, recovery of solvent by application of the vacuum system, separation of oil from the solvent and oil refining, reserving the oil-freed soy-bean meal.

5. Isolation of proteids out of oil-freed soy-bean (p. 35): General discussion, necessary and sufficient conditions for the extraction of proteids (on the quality of isolated proteids [plasticity, solubility, coloration], on the purity of isolated proteids, to obtain a maximum yield).

Note 1. This is the earliest English-language document seen (Jan. 2021) that uses the term “isolated proteids” (or “isolated proteid”) to refer to a type of isolated soy protein.

6. The extraction of proteids by means of water (p. 41): General properties of bean meal, on gummy substances and their properties (saccharo-colloids, incl. stachiose [stachyose], araban, galactan; p. 43), quantitative estimation of water-soluble proteids and carbohydrates, determination of the volume of water necessary for the extraction of soluble carbohydrates, relation of the duration of extraction to the quantity of extractable proteid and carbohydrates, effect of the process of water-extraction. 7. On the extraction of proteids by means of alkaline reagents: General properties of glycinin against alkaline reagents, classification of alkaline reagents, comparisons of dissolving power of alkaline reacting compounds, relations of the plasticity and coloration of the proteid to various kinds of extracting agents, standardization of plasticity of isolated proteid, on the relations between plasticity and chemical reagents, comparative experiments relating to the extracting process by means of sodium sulfite and sodium hydroxide.

8. The determination of the concentration, quantity, and other factors of $Na_2SO_3$ [sodium sulfite] in the process of extraction (p. 69): Determination of the concentration of sodium sulfite, the determination of the relation between the plasticity of the protein and the concentration of sodium sulphite, to determine the relation between the yield and the time of extraction, to find out the actual yield of proteid, as well as the volume of sodium sulfite solution provided the bean meal is previously extracted by water, then extracted with sodium sulphite, conclusion of this chapter. 9. Extraction of proteids by means of caustic alkalies [alkalis] (p. 80): To determine the concentration of the caustic soda [sodium hydroxide] solution, determination of the relation between the time of extraction and the yield of proteid, to determine the volume of caustic soda, the systematic extraction of proteids (using water, sodium sulphite, or alkali). 10. Clarification of extracted proteid solution and precipitation thereof (p. 86): Precipitation of proteids, precipitation by means of alkaline earth metals (such as magnesium sulphate), by means of colour base (such as malachite green, methyl violet, brilliant green, auramine, or new fuchin), by means of alcohol, by means of heating, by means of formaldehydes, by means of fermentation, by means of acids (choice of acid, yield of precipitated proteid, quality of proteid). 11. Quantitative investigations on the precipitation of proteids (p. 101, 11 experiments with summary of conclusions). 12. Effect of heating on the yield of proteid (p. 115). 13. Separation of excess water from the proteidal precipitate (p. 118). 13A. Process for drying the proteidal mass and for drying the residue (p. 121). 14. Pulverizing the dried proteid (p. 122). 15. Recovery of carbohydrates from waste liquid (p. 123).

World soybean production (in short tons): Manchuria 1,850,000 (25% is used in Manchuria as food; 75% is exported to all parts of the world in the form of “bean cakes or bean meal”). Japan 450,000. Korea 322,500. Kantoshu 15,400. Total of the above: 2,640,000 tons valued at more than 200 million Japanese yen (p. 2).

The author investigated the use of soy-bean proteins in plastics. There are upwards of 30 varieties of soybeans which may be classified into yellow, blue, and black. The first contain the most protein and oil, the last the least. The protein content varies from 35-40.5% and the oil content from 15.4 to 20.9%. The mean analysis of 16 different

© Copyright Soyinfo Center 2021

varieties was: Water 10.2%, proteins 37.8%, oil 18.9%, carbohydrates 23.5%, fiber 5.2%, and ash 4.4%. The carbohydrates consist mainly of non-reducing sugars with little or no starch. The cell membrane consists of galactan or hemicellulose, with a little free cellulose. The presence of the hulls in the crushed bean reduces the speed of extraction of the oil and the yield, and gives the oil and protein a brown color. Note 2. This is the earliest document seen (Dec. 2015) containing the word "hemicellulose." *Webster's Dictionary* defines hemicellulose, a word first used in 1891, as "any of various plant polysaccharides less complex than cellulose and easily hydrolyzable to simple sugars and other products." The sugar molecules in this polymer each contain 5 carbon atoms.

Oil extraction: Benzene is the most suitable commercial solvent; the solvent must not be recovered by direct steaming of the meal, but by the use of a vacuum.

Protein extraction: The soluble carbohydrates are removed from the meal by washing with very dilute acetic acid. The protein is then extracted in 3 stages, i.e. with water, with 0.2-0.4% sodium sulphite solution, and with 0.2% sodium hydroxide solution. 20-30% of the total available protein is extracted in the first stage, a further 50% in the second, and the total yield is about 95%. The protein is finally dried at the lowest temperature and highest vacuum and in as short a time as possible. The dry protein is very tenacious and can only be ground in high-speed disintegrators; it is then suitable for the manufacture of plastic materials, lacquer, enamel, or imitation leather. The soluble carbohydrates, which amount to 10-12% of the meal treated, can be worked up into syrup or converted into alcohol or lactic acid by fermentation. The bean residue consists of fiber, galactan, and protein and can be used for cattle feed or as an ingredient of linoleum-like products.

211. Satow, Sadakichi. 1921. Researches on oil and proteids extraction from soy-bean: Illustrations and tables (Continued). *Tohoku Imperial University, Technology Reports* (*Sendai, Japan*) 2(2):1-124 (41-164). Oct. 28 cm. [Eng]

• ***Summary:*** Continued: Illustrations show: (1) The cells of the soy-bean (after Winton, p. 55). (2) The effect of various chemicals on soy-bean cells (8 figures, after p. 16). (3) A rotary drum extractor used with solvent and a vacuum system (p. 68). (4) An endless belt system for drying proteid precipitate.

Tables show: (1) Percentage of proteids and fat found in 23 samples of beans. The varieties are: Akakiji bean, Nagaaneko bean, Kintoki bean, Shônembo bean, Biruma ingen bean, Chûnembo bean, Maru uzura bean [speckled], Naga uzura bean, Kumamoto ingen bean, Azuki, Chûnaga uzura bean, Aneko bean, Shiromarufuku bean, Green pea, Dainenbô bean, Daifuku bean, Chûfuku bean, Red pea, Black soy-bean (38.61%), Yellow soy-bean from Manchuria {2 samples, 38.65% and 39.12%}, Yellow soy-bean from Korea (41.00%, and 22.826 fat–the highest fat of any bean tested), Yellow soy-bean from Hokkaido, Japan (41.92%–the highest proteid of any bean tested) (p. 6-7). (2) Previous analyses of the chemical composition of 16 soybean samples from Manchuria, Korea, and Japan. For each, gives the district, variety (mostly yellow but one "Blue variety"), water, proteids, fat, carbohydrate, fiber, ash, name of analyst (an organization) (p. 8). (3) Analyses by Sato of the chemical composition of 14 soybean varieties from Manchuria, Korea, and Hokkaido (Japan). For each, gives the varietal name, growing region, "moisture, total protein, soluble proteose, available protein, non-proteidal nitrogenous matter, fat, nitrogen-free extract, fiber, ash, color and shape (all yellow), producing organization (Korean Central Experimental Station or Sapporo), date of production. Named varieties include: Harupin, Shoshu bean, Utsuzan bean, Ampen bean, Chogei bean, Ryusan bean, Turunoko [Tsurunoko], Kanro, Yoshioka, Otanizi [Otaniji] (41.92% total protein and 37.53% available protein, both the highest of any bean tested) (p. 11). (4) Effect of hulls on solvent extraction of soy-bean oil with 3 varieties: Kanro, Otaniji, Yoshioka (p. 18). (5) Influence of moisture on solvent extraction (ether) of soy-beans (p. 19). (6) Effect of using benzine in place of ether in solvent extraction of soy-bean oil. The best moisture content is 7.5% to 12.5% (p. 20). (7) Substitution of vacuum drying for open air drying in removing moisture. Shows that the smaller the quantity of moisture contained in the bean, the greater the yield of oil, provided that the oil is protected from oxidation (p. 22). (8) Effect of different solvents on oil extraction: Carbon bisulphide (flammable and expensive), ether (flammable and expensive), benzine (boiling point 75ºC), carbon tetra chloride [tetrachloride]. (9) Separation / distillation of benzine from oil solution (p. 34).

(10) Chemical composition of "soy bean meal" from which the hull and oil have been removed (p. 42). (11) Composition of carbohydrates or saccharo-colloids, based on S. Yukawa (p. 43). (12) Composition of para-galacto-araban / gummy substances in 9 varieties (p. 44-45). (13) Percentage of water-extractable substances and reducing sugars in flattened and powdered soy-beans (p. 46-47). (14) Sugars in soy-beans (p. 48). (15) Proteids and soluble carbohydrates in soy-beans (p. 49). (16) Effect of acetic acid in retarding dissolution of the globulins (p. 50). (17-18) Dissolving power of alkaline reagents on proteids in bean meal (p. 54-56). (19) Effect of reagent on plasticity and coloration of proteids (p. 56).

(20-22) Amount of proteid extracted in 3 consecutive extractions, or with pressure (p. 63-65). (23) Effect of 4 consecutive washings in removal of ash (p. 66, 68). (24-26) Percentage of proteid extracted with sodium sulfite after 1 or 2 hours (p. 70-71). (27) Concentration of sodium sulfite, mark of plasticity [rating], and color of precipitate (p.

© Copyright Soyinfo Center 2021

73). (28) Relation between time of extraction and yield of nitrogen and proteid (p. 74). (29-30). Yield of proteid with water or sodium sulfite and 5 or 6 consecutive extractions (p. 76).

(31) Test to maximize yield of proteid using sodium sulphite solvent; the weight of the solution must be 16 times that of the meal, and the yield will be 52.20 (p. 78). (32) Effect of adding acetic acid on yield (p. 79). (32-33). Effect of caustic soda (sodium hydroxide) on percentage of proteid extracted (p. 81) (34-37) Relation between time of extraction and yield of proteid using caustic soda (p. 82-83). (38) Volume of caustic soda consumed by different volumes of bean meal solution (p. 83). (39) Volume of caustic soda solution needed in three extraction processes: water, sodium sulphite, or alkali (p. 85).

(40) Extraction with magnesium sulphate for 1, 2, or 3 hours (p. 90). (41) Percentage of proteids precipitated by different precipitants; "isolated proteid," "glutinizing chemicals" (p. 95) (42). Effects of sulphurous acid, formaldehyde, and formalin (p. 96). (43) Effect of different precipitants on quality of precipitate; "sulphurous acid gives proteid of the whitest and best quality, and most suitable for the manufacture of plastic products" (p. 100). (44) Yields of proteid with different volumes of sulphurous acid; all yields are very unsatisfactory (p. 103). (45-47) Effect of adding sulfur dioxide to sulphurous acid at various concentrations; remarkable increase in yield (p. 104-06). (48-51) Precipitation of water extracted protein using acetic acid (p. 107-10). (52-55) Effect sulphuric acid for precipitation of proteids (p. 111-14). (56-57) Effect heating on yield of proteids (p. 116-17).

Note: Horvath (1937) states: "The extraction of protein from soybean meal, its subsequent precipitation and properties, as well as its industrial applications have been extensively studied by S. Satow, and the results published (in English) in 1921-23 in two voluminous reports [*Technology Reports, Tohoku Imperial University* (Japan): 2(2) and 3(4)]. These reports continue to serve as an unsurpassed source of information on this subject, and a number of discoveries during the last 15 years can be traced to the researches of Satow." Horvath then summarizes many of Satow's key findings. Address: Kôgakuhakushi.

212. *Olien, Vetten en Oliezaden* (*Amsterdam*). 1921. Wereldproductie van Sojaboonen [World production of soybeans]. 6(22):254. Nov. 26. [Dut]

• ***Summary:*** The most recent [1920] annual statistics for world production of soybeans are (in metric tons): China 3,352,400. Japan 430,933. Korea 348,000. United States 58,000. Total 4,189,333 tons.

In 1918, Japan absorbed 77% of the Chinese production, American and Europe 7%, and China itself 16%.

During the last 10 years the amount of soya oil exported from China has risen from 25,000 tons to about 400,000 tons. Before the World War, this oil was sent to England, the United States, Belgium, Japan, and Russia. During this same decade, exports of soya-cake have increased from 400-500 tons to over 1 million tons.

213. *Oil and Colour Trades Journal* (*London*). 1921. The soya bean industry of S. Manchuria: Consular news. 60(1207):2080. Dec. 3.

• ***Summary:*** "The annual production of soya beans in Manchuria is estimated at 2,500,000 tons, of which about three-fourths is exported, 30 per cent. in the form of beans, and the balance in the form of bean cake or bean oil." A table shows the weight (in piculs) of these three products exported in 1919 and 1920. For 1920: Beans 10,224,437. Bean cake 21,479,033. Bean oil 1,805,107. The total value of exports in 1920 was approximately 92,350,000 taels.

Until the Russo-Japanese War of 1904-05 [soya] beans were only exported from South Manchuria in the form of bean cake and bean oil, and the sole market for them was in China, the cake being used as a fertiliser in the sugar-cane fields of the Canton and Fukien [Fujian] Provinces, and the oil chiefly as a food and an illuminant. The valuable properties of bean cake as a fertiliser were then discovered in Japan, to which the market for the product extended, the demand from Japan soon exceeding that from China. In 1908 a trial shipment of beans to England also opened the eyes of British oil-seed manufacturers to the value of the soya bean for the same purposes for which cotton and linseed oil were used, with the result that in that year 400,000 tons of beans were shipped to England. Since then the trade has never looked back. The demand soon extended to the Continent of Europe, and finally to America, which for a time became the chief market for bean oil, though the exports to that country have laterally declined."

A second table shows the destination and amounts of beans, bean cake, and bean oil exported from South Manchuria in 1920. The destinations (listed alphabetically) are: Denmark, Dutch Indies, Egypt, Germany, Great Britain, Hong Kong, Japan and Korea, Netherlands, United States, Chinese ports, other countries. The top four importers (in piculs) of soya beans are Japan and Korea (5,637,882), Chinese ports (2,490,727), Denmark (682,297), and Dutch Indies (546,186). The top four importers (in piculs) of bean cake are Japan and Korea (17,781,698), Chinese ports (3,430,483), United States (182,669), and Denmark (83,285). The top four importers (in piculs) of soya bean oil are Netherlands (616,204), United States (460,379), Japan and Korea (279,823), and Chinese ports (167,598).

This "table includes the exports by steamer from Dairen, Newchwang, and Antung and across the Korean frontier through Antung, Hunchun, and Lungchingtsun, but excludes those by native jung which were also considerable and went almost entirely to South China. All the exports to Europe and America and the bulk of those to Japan were shipped from

© Copyright Soyinfo Center 2021

Dairen, while Newchwang was the chief port of shipment for the exports to Chinese ports. The export of bean oil to the Netherlands is a new trade. It is possible that the ultimate destination of the bulk of the oil was Germany."

214. Bank of Chosen, Seoul, Korea. 1921. Economic history of Manchuria, compiled in commemoration of the decennial of the Bank of Chosen. Seoul, Korea: Bank of Chosen. x + 303 p. See p. 137-48, 183-87. Illust. No index. 20 cm. [Eng]
• ***Summary:*** In Chapter 5, titled "Agriculture," the section on "Population" (p. 140) notes that Manchuria has a population of 20,112,110, which averages about 53 per square over the whole country. A table compares this with population densities of 618 in England and Wales, 589 in Belgium, 374 in Japan (Mainland), and 31 in the USA. However Manchuria's population is growing rapidly; it increased by at least 6 million during the 10 years ending in 1916. A table (p. 135) shows that [soy] beans are typically used in the second year of a four-year rotation on large farms. In 1916 and 1917 an experimental agricultural station of the South Manchuria Railway Company asked some "dozen farmers in the neighbourhood of Szupingchieh and Kungchuling to cultivate native seeds of soya beans according to the purely native method, and the result was in 1916, 4.104 bushels, and in 1917, 3.724 bushels per *tan* (0.245 acres). Now the average bean crop in Korea is about 2.978 bushels, and in Japan 4.02 bushels per *tan...*"–quite similar. In Japan, intensive methods are carried to the extreme, however "in Japan the farmer does not generally devote their best land to bean cultivation" (p. 135).

The section on "Agricultural products" (p. 135) begins: "Of the cereals and pulse which Manchuria produces the principal are [soy] beans, *kaoliang*, and millet, and these are followed by maize, sorghum, buckwheat, wheat, rice, and peas." Other products include sesamum seeds. A table (p. 136) shows the amount (in bushels) of each of these major crops produced in 1915 in Mukden, Kirin, Amur, and total. For soybeans this was 39.2, 17.6, 17.1, and 74.0 million bushels, respectively. Exports of soybeans are 79.11 million bu from South Manchuria, 29.67 million bu from North Manchuria, and 108.78 million bu total. Note: Chinese characters are given with every place name.

The subsection titled "Soya Beans" (p. 137-48) has the following contents: The importance of beans and their products. Cultivation of soya beans. Amount of production. Different species [sic, colors, and varieties]. Composition of different varieties. Uses of the soya bean. Uses of beans, bean cake, and bean oil in the Far East. Uses of beans and their products in Europe and America.

The section titled "Manufacturing products of Manchuria" contains a subsection (p. 183-87) on [soya] "Bean oil and bean cake" which begins: "The industry has a very remote origin and we have it on record that, as early as 1860, Swatow, a port in South China, imported from Manchuria bean cake to the amount of 379,009 piculs, valued at $783,762 (Chinese)."

The oil-mill (*yufang*) is found almost everywhere in Manchuria. The traditional method of making soya bean oil and cake involves steaming the beans then pressing out the oil. The modern method involves using a solvent, benzene. "Then, by heating the compound, the oil is separated from the benzene. By this method nearly all the oil in the beans is extracted, and not only is there no waste of oil, but the residue, in this case not in the form of cake but in bulk, is better fitted for manure, since the small quantity of oil remaining in it makes its absorption underground so much the easier; moreover, the trouble of breaking it up into pieces before using it is spared. The drawbacks to the new method lie in its requiring a greater working capital, and the necessity for packing the residue for shipment, thereby greatly adding to the shipping expenses. The new method is at present employed by only one company in Dairen, Suzuki & Co., which firm by the way operates the largest bean-mill in Manchuria."

A table (p. 185) gives statistics for the following in four locations in Manchuria: No. of soya bean mills. Capital (1,000 yen). No. of workmen. Production of bean cake (1,000 pieces, value in 1,000 yen). Production of bean oil (1,000 pieces, value in 1,000 yen). The four locations are: Dairen, Kwantung Province (Dairen excluded), Railway Zone, Total of the above three. More than half of the 105 mills are in Dairen.

Photos (between p. 138-39) show: (1) A field of soya beans. (2) Piles of soya beans in the open air, Kaiyuan. (3) Soya beans awaiting shipment at Dairen wharves. Tables show: (1) Composition of yellow and green soy beans (p. 141). (2) Composition of bean cake based on analyses by laboratories in Japan, Scotland, and South Manchuria Railway Co. (p. 144). (3) Exports of soya beans, bean cake, and bean oil from 1908 to 1917 from Dairen, Newchwang, Vladivostok, and total (p. 147-48).

Photos (between p. 184-85) show: (1) The Suzuki Bean Oil Factory at Dairen. (2) Casks of bean oil awaiting shipment on Dairen wharves.

Note: This book, like others in this series, was written by Mr. Tokuji Hoshino, manager of the Research Department, Bank of Korea; however his name does not appear on the title page, but only in the Foreword. Also published in 1920. Address: Korea.

215. Rouest, Leon. 1921. Le soja et son lait végétal: Applications agricoles et industrielles [The soybean and its vegetable milk: Agricultural and industrial applications]. Carcassone (Aude), France: Lucie-Grazaille. 157 p. Illust. No index. 25 cm. [42 ref. Fre]
• ***Summary:*** Contents: Preface, by Louis Forest. Introduction–What is soya? 1. History of the dissemination

of soya: In 1712 the naturalist Kaempfer introduced soya, introduction of soya to France and Europe, soya is cultivated in Austria in 1875 by Prof. Haberlandt, soya is the object of many trials in France from 1876 to 1881, the study and acclimatization of soya becomes widespread, the causes of setbacks in the cultivation of soya.

2. Cultivation of soya: Botanical characteristics of soya, the varieties of soya, Chinese varieties and soya in China, Japanese varieties and soya in Japan, American varieties and soya in America (varieties: Mammoth, Hollybrook, Ito San, Guelph, Haberlandt, Medium Yellow, Wilson, Peking, Tokio, Mandchu [Manchu], Black Eyebrow, Barchet), soya in Europe–France and Italy, seven varieties of soya tested in France, soya in the experimental farms for new crops (*les Fermes Expérimentales de Néoculture;* Many varieties from the USA were tested, including Manchu, Wilson Five, Haberlandt, Tokio, Virginia, Hato [Hahto], Early Medium Green), the cultural and geographical appearance of soya, its production worldwide, planting soybeans, heat units (*degré thermique*) and the germination of soya, the importance of spacing between plants, number of seeds per hectare, soya during its vegetative stage, the vegetation of soya compared with that of the haricot at high altitudes, rolling the seeds and types of crop maintenance, growth of the plant, acclimatization, the enemies of soya.

3. Composition of the soybean plant. 4. Soya forage: Green soya forage, soya hay, soya as a plant for soil improvement. 5. Harvesting soybean seeds: Maturity of the seed, harvesting soya, the food value and composition of soya seeds. 6. Soya as an oil plant: Richness in oil, defatted soybean cake, imports and exports of soya cake from 1915 to 1919 (Imports to: Sweden, Canada, Korea, Japan, Formosa. Exports from: England, China, Korea), production of soya cake from 1915 to 1919 (Denmark, Great Britain and Ireland, Netherlands, Sweden, USA, Japan, Formosa, Korea, Java and Madura).

7. Soymilk: Its manufacture (in 1910-1913 Li Yu-ying installed a factory named "La Caséo-Sojaïne" at Vallées {Asnière-Seine} near Paris. Rouest visited this factory and saw them make soymilk, which was filtered using a filter-press resembling those used in sugar refineries), its properties and composition, composition compared to other types of milk, powdered soymilk, soymilk in the nursing and feeding of animals, soymilk related to tuberculosis in animals and in humans, soymilk would allow the milk and butter from animals to be reserved exclusively for human foods and could be used for raising many piglets, manufacture of non-dairy milk in Canada (a factory is now under construction). 8. Soya in Industry: Soymilk and soy casein, Sojalithe (like Galalithe).

9. Soya in human nutrition: Soy flour and its applications (incl. Li Yu-ying's usine de la Caséo-Sojaïne, and bread made of soya and wheat), soya compared to dry legumes (such as lentils, haricots, peas, beans), soya used as a legume (green vegetable soybeans; whole soybeans), the food value of soy sprouts, preserves and confections made from soya, soya chocolate and coffee, the amount of nutrients produced by soya and other crops from a unit of land, a meal of soya served in France (prepared and served some years ago by Li Yu-ying's soyfoods plant La Caséo-Sojaïne for the major print media, the medical press, the National Society for Acclimatization, etc.; it consisted of 2 soups {one with 'soya meat' and one with soymilk}, 2 entrees {an omelet with smoked soya ham, and fritters stuffed with soy meat}, soy [actually mung bean, *lüdou*] sprouts in a salad and sauteed, 3 desserts {soya cake, biscuits, and confection}, and soy coffee; a recipe for each is given; soya meat is smoked tofu).

10. Use of soya in East Asia: Tofu (*fromage végétal*), soy-based condiments (such as natto {Ping ming Natto and Tokio-Natto}, miso, Chinese miso or tao-tjiung [doujiang], and shoyu {Soyou or Schozou}), making soy sauce in Kwantung, China (from Groff).

11. The opinions of several authors concerning soya (from the French medical and hygienic press): Introduction–E. Maurel. Soya and soy bread in diabetic diets–Dr. Dujardin-Beaumetz, Dr. Bloch, Dr. J. Le Goff, L. Beille, M. Gautier. Soya used as a bean–M. Gautier. Soy sauce used in place of meat extracts. The state of cheese. The popularization of soya in Europe–A. Paillieux.

Conclusions: The influence of cultural technology on variation. Appendix: Advice to experimenters on the acclimatization of soya in France. Other methods of obtaining early-maturing soybeans.

The author concludes (p. 140): We must make every effort to acclimatize soya in France. We must develop the will and learn from past mistakes. Most soybean varieties now available in France are too late. We must get varieties from Manchuria, whose climate is similar to that of southeastern France, and from the northeastern USA. It is urgent that, in the near future, we start a Soybean Experiment Station to take responsibility for this work. The setbacks since 1830 can be overcome by present science and genetics. The first step is to introduce better varieties.

On the last page is a full-page advertisement for various seeds sold by Mr. Rouest, including 30 varieties of soybeans (*Soja hispida*)*;* the names of the individual varieties are not given.

Illustrations show: (1) A soy bean plant with many pods (title page). (2) Flowers and pods of the soy bean plant (p. 29). (3) Soy pods and beans (p. 30). (4) A soy bean plant drawn by a Chinese artist (p. 32, from Li Yu-ying). (5) Pods of the Hato [Hahto] variety of soy bean (p. 51). (6) Germinating soy bean seeds (p. 54, from Li Yu-ying). (7) Soy bean roots with nodules (from a photo by Dr. Le Goff; p. 73). (8) Soy bean pods, opened to show 3 beans in each (p. 82).

Tables show: (1) Production of soybeans by color

© Copyright Soyinfo Center 2021

in China in 1916 and 1917 (p. 35, in quintals, from the International Yearbook of Rome, Vol. 1, 1919): In 1917: Yellow 4,069,822. Other 953,012. Green 181,190. White 71,234. Black 40,066. Total: 5,315,324.

(2) Percentage composition of various oilseed cakes (p. 95, from Kellner). (3) Imports and exports of soybean cake, by country, from 1915 to 1919 (in quintals, p. 96). Imports are given for Sweden, Canada, Korea (from 1916), Japan, and Formosa [Taiwan]. Exports are given for England (6 quintals in 1915), China (including Manchuria, by far the biggest exporter, from 1916), and Korea (from 1916).

(4) Production of soybean cakes, by country, from 1915 to 1919 (p. 97, in quintals, based on statistics from the International Bureau of Agriculture, Rome, 1919). In descending order of production in 1915 (in quintals): Japan 5,439,337. Korea 3,209,238. Great Britain and Ireland: 1,513,059. Denmark 921,782. Java and Madura 503,025. Note that China is not listed. Netherlands 144,523. Formosa [Taiwan] 62,131. Sweden 1,733. USA 0, but 501,822 in 1916.

Note 1. When Alsace was occupied by the Germans during World War I, the Rouest family moved from Alsace to Paris. Mr. Rouest brought soybeans from Africa and adapted them to France. He paid for the publication of this book.

Note 2. On the title page of this particular book is the signature "L. Rouest" following the inscription "A M. Meuninier, Hommages de l'auteur." Address: Directeur des Fermes Expérimentales de Néoculture, Carcassonne (Aude), France.

216. Rouest, Leon. 1921. Le soja et son lait végétal: Applications agricoles et industrielles [The soybean and its vegetable milk. Agricultural and industrial applications]. Carcassone (Aude), France: Lucie-Grazaille. 157 p. Illust. No index. 25 cm. [42 ref. Fre]

• ***Summary:*** This is a summary of interesting points throughout this book. The main early use of soy in Europe was more therapeutic than nutritional (p. 3); it was used mainly in diabetic diets.

Nothing remains of the early trials conducted 20 years ago in France and Austria. The reasons for the crop's failure were lack of understanding of the laws of acclimatization and genetics, and the fact that soya (*soja*) was introduced as a new food legume, when actually it can only be utilized as a forage plant and industrially (for oil, cakes, and casein). Later, when the plant has been adapted, when it is understood that soya is not being propagated to competed with other dry legumes, that it is not being cultivated to extract from the seeds a vegetable milk for people, but simply as a forage plant–and the most remarkable one that exists (p. 3).

The English are trying to acclimatize soya to their colonies, especially those in southern Africa. In 1908 some 200,000 tonnes (metric tons) of soybeans were exported from China [including Manchuria] to Europe, followed by 500,000 tonnes in 1909. One can extract from soybean seeds a vegetable milk (*lait végétal*) which has the same value as animal milk for use in raising young animals. Its seeds and forage are also fine for raising farm animals and for industrial products. The author thanks all those who have helped him to acclimatize the soybean to France and to create new varieties of soya in France (p. 4).

Introduction of the soybean to France and to Europe (p. 6-7): A good but brief review of the literature on this subject. In 1739 Buffon was made director of the Jardin des Plants in Paris. Shortly thereafter, Christian missionaries in China sent him specimens of seeds and plants. The soybean must have been among them. The soybean has very probably been cultivated at the Museum since 1779, certainly in 1779 and later from 1834 to 1880. In 1855 Baron de Montigny was charged by the Society for Acclimatization to distribute five varieties of soya sent from China by Mr. Montigny; these were from northern China. The plants first bore seeds in France in 1854; their acclimatization is assured. In 1857 Mr. Lachaume transmitted to the Society for Acclimatization details of the success he obtained at Vitry-sur-Seine with soy culture. The seeds were planted in 1856. In 1858 a report to the Society for Acclimatization indicated that the acclimatization of the soybean was complete. In 1859 Mr. de Vilmorin reported on cultural trials sent from China by Mr. Perny. The varieties matured too late. The same year Dr. Turrel harvested soybeans at Toulon. In 1862 the Society for Acclimatization received seeds from Mr. Guillemin; the yellow soybean was said to be used for making tofu. Following the events of 1870, the cultivation of the soybean in France was apparently discontinued. Note 1. The brief war of 1870 between France and Bismark's Germany ended in France's defeat and the ceding to Germany of Alsace-Lorraine.

In the long section on Prof. Haberlandt's work with soya, starting with his cultivation of it there in 1875, is a quotation from him: "I don't know, in this history of cultivation, any example of a plant which has, in so few years and to such a high degree, excited such general interest" (p. 8).

From 1876 to 1881, the soybean was the object of numerous trials in France by the Society of Horticulture at Etampes (Seine-et-Oise). During this same period, one Dr. H. failed with varieties sent from Japan but succeeded in cultivating a yellow soybean sent from China, and used the latter to make his own tofu (*fromage végétal*) for use at home. In 1880 Messrs. Vilmorin-Andrieux introduced in their catalog a species cultivated in Austria-Hungary (p. 17-18).

In 1878, Japan, China, and the Indies (*les Indes*) presented all the varieties of Soya at the Universal Exposition, and their seeds filled more than 20 boxes. In 1880 the National Society for Acclimatization was able to distribute soy in France and tests were conducted in 24

© Copyright Soyinfo Center 2021

regions; they were largely successful, especially in central and southern France (p. 19-22).

Tests were then abandoned from this time until about 1888, when the soybean started to grow in the southern states of the USA. That same year Messrs. Lecerf and Dujardin-Beaumetz first had the idea of using soy bread in diabetic diets (p. 22).

Causes of setbacks in soybean culture (p. 24-27): First, the varieties used matured too late and were not acclimatized in a progressive manner. We must choose varieties from northern China and adapt them to the south of France (*le Midi*) [which is on the same latitude as Toronto, central Wisconsin, or southern Minnesota]. From these, we must develop hybrids, and gradually move them northward.

The soybean has been ostracized in France. Major commercial, financial, and social interests have viewed with terror the production of an inexpensive food and have retreated into the egotistical "Malthusian agriculture." This is the truth! (p. 26).

Soy cheese is even feared by the cheese industry in France. They ask if they should abandon their excellent cheeses in order to adopt a vegetal cheese (*fromage végétal*).

A long quotation from the *Chinese Imperial Encyclopedia of Agriculture* (p. 34) gives the various colors of soybeans, including black, white, grey, and even some speckled / mottled with blue. The black ones can be used for medicine. And they are used as an ingredient in the condiment called fermented black soybeans (*Chi* [*douchi*]), made of soybeans, ginger, and salt.

In 1910-1913 a factory named "La Caséo-Sojaïne" was installed near Paris. I (Rouest) visited this factory in which were installed all the modern conveniences (*tout le confort moderne*), and presented the best guarantees of hygiene. The milk was filtered using a filter press similar to those used in sugar factories (p. 99).

Note 2. Rouest has borrowed a great deal of material from earlier publications by Li Yu-ying, usually without acknowledgment and often arriving at very different conclusions, especially on the question of using soya to make human foods (Li) vs. foods and milk for animals (Rouest).

Rouest strongly recommends the use of soymilk to feed young domesticated animals. For us, soy will not replace green beans, milk or cheese. During World War I, the Germans were actively involved with the study of soymilk. A translation of an article from the *Schweizerische Milchzeitung* (Nov. 1918) tells how to make soymilk and tofu (p. 102). By using soymilk, there is no fear of transmitting tuberculosis. Address: Directeur des Fermes Expérimentales de Néoculture, Carcassonne (Aude), France.

217. Vlachos, William N.; Vlachos, Conrad A. 1921. The fire and explosion hazards of commercial oils. Philadelphia, Pennsylvania: Press of Otto Jones Co. 292 p. See p. 39-40, 270. Index.

• ***Summary:*** Soy bean oil is discussed in Chapter II, on drying oils. A table shows it has a flash point of 556ºF (the highest listed on p. 270). "Soy bean oil, also known as Soya Bean Oil, Soja Bean Oil, Chinese Bean Oil and Bean Oil, is imported into this country from Manchuria, Japan, China and Korea. In 1917 we imported 265,000,000 pounds, at a cost of about $27,000,000. More soy bean oil is imported by us than any other vegetable or animal oil. It is largely shipped from the Orient in metal cans packed in wooden cases. With us, its production is a comparatively undeveloped industry, but it will doubtless grow very rapidly. In fact, in 1914, we produced 2,764,000 pounds, and in 1917, 42,074,000 pounds, which certainly indicates a healthy growth.

"Soy beans, from which the Soy Bean Oil is expressed, have been cultivated in China since 2800 B.C., and are the world's most important oleaginous seeds. The beans (there are over 500 varieties) contain 18% to 20% of oil, but by pressing, only 10% to 13% is expelled. Extracting with solvents to obtain the remainder of the oil is done quite extensively, but it spoils the presscake, which is a very valuable cattle food.

"In recent years quite a large quantity of soy beans have been imported and soy beans have been planted to a considerable extent in the South. As the beans keep quite well, they can be pressed *after* the cottonseed oil season is over, which is an economic factor of considerable importance. Ordinary cottonseed oil machinery is excellently adapted for soy bean pressing, and the refining process is also quite similar.

"Chemically speaking, Soy Bean Oil lies midway between Linseed Oil and Cottonseed Oil. Its iodine value varies from 137 to 143, which is rather close to that of Linseed Oil, 173 to 201. It is classed by Lewkowitsch as a *drying* oil, that is, a film will dry in four days, but even then it is still tacky. It is mixed with tungstates and cobalt driers to accelerate the drying process.

"In this country it is mainly used as an adulterant of, or substitute for linseed oil, and, like linseed oil, it is boiled and blown. Soy bean oil is also used extensively in soap and candle making.

"It is also an excellent edible oil, but it has to be deodorized, as its beany flavor is objectionable. Soy bean oil is now hardened for use in butter substitutes."

218. *Bean-Bag* (*The*) (*Lansing, Michigan*). 1922. Growth of soya bean industry. 4(9):16. Feb.

• ***Summary:*** "Ten years ago the exports of bean cakes from Manchuria totaled 400,000 to 500,000 tons, but the latest reports show that these figures have been increased to over 1,000,000 tons.

"Bean oil exports totaled 20,000 to 30,000 tons a decade ago, but of late they have been increased to 400,000. Prior to the outbreak of the war Great Britain, America, Belgium, Japan and Russia divided the exports, but now America and

© Copyright Soyinfo Center 2021

Japan are the only two foreign buyers.

"The following table of the last annual production of soya beans in the world is given by the *Bankers' Weekly* (Chinese): 1918 (in piculs)–China 50,286,000. Japan 6,464,000. Korea 5,220,000. United States of America 870,000. Total 62,640,000.

"According to the 1918 figures, Japan absorbed 77 per cent of the Chinese soya beans available for export, American and European markets took 7 per cent and the remaining 16 per cent were distributed throughout the various provinces of China."

219. *Times of India* (*The*) (*Bombay*). 1922. Korean progress: Agriculture and farming. March 24. p. A7.
• ***Summary:*** "It is in southern Korea and especially in the South-Western district that agriculture has prospered, the climate being comparatively mild. The cultivated area is only 10,640,000 acres, being about one-tenth of the total area. About 36 per cent. of this is rice paddy and the remainder farm-land. There is enormous scope for extending cultivation if the difficulty of irrigation, which is the greatest obstacle, is surmounted. Since 1907 [Korea is now a Japanese protectorate], Government have adopted a policy of encouraging the exploitation of state-owned uncultivated lands, by renting them from the state to anyone regardless of nationality for a term of not more than ten years, for tillage, stock-raising, afforestation [planting seeds or trees to make a forest on land which has not been a forest recently, or which never has been a forest; different from reforestation], etc. Rice is the main food of the Korean and is the staple product,... the annual produce being about 60 million bushels. Wheat is another crop. But that of Soya beans is important." In 1918, about 30 million bushels were produced, twice as much as in 1910. Soya oil and soap are made from these soybeans "in Japan to which they are chiefly exported."

220. *Bean-Bag* (*The*) (*Lansing, Michigan*). 1922. Build soy bean oil extraction plant at Peru, Indiana. 4(10):21. March.
• ***Summary:*** (Special to the Bean Bag). "Peru is to have a new industry, the first of its kind in the United States. This is a soy bean oil [solvent] extracting plant. Although this method is used to a small extent in Japan and Korea for the extraction of oil from soy beans, it is comparatively new. No such operation has ever been carried on commercially in this country.

"The men back of this movement are men who have helped to make the city of Peru. With such men in control it certainly augurs well for the new plant. The corporation is to be known as 'The Indiana Products Company,' and is composed of John Unger, John Kramer, Ernest Theobald and Henry Lutes. The plant is to be situated in a part of the building now occupied by the Unger-Kramer Box Factory at the west end of Second street. This building is ideally situated to house such a factory as there are both railroad facilities and wagon road direct to the door. This will allow for the shipping in of beans and also direct delivery from the farmer.

"For the last 18 months the soils and crops department of Purdue University has been attempting to get such a plant started in the state of Indiana. The farmers have been increasing their bean acreage faster than the seed demand will absorb and this has thrown a great many beans on the open market. This plant is largely a result of the work of Prof. Ward A. Ostrander, head of the extension service in the soils and crops department, of Purdue, and county agent L.E. Thome.

"Various educational meetings have been held and the proposition thoroughly discussed. As a result of these meetings the above men became interested in the scheme and as a result we have 'The Indiana Products Co.' This company will take the soy bean as it comes from the threshing machine, extract the oil with a Garrigue Rotary Solvent Extractor, thus leaving the residue to feed in the place of linseed oil meal, cotton seed oil meal, or tankage. If the farmer can thus raise his own supplement for the corn which he produces, the cost of the cattle, hogs or milk which he produces will necessarily be lowered.

"Many farmers fear that the establishment of such a factory will run in competition with the pork industry, as the oil extracted from the bean may be used as a lard substitute. This is hardly possible as last year over 200 millions of pounds of oil were imported into this country. If the American farmer can produce a small amount of this he will be building up his own soil and be using an American product besides.

"The Wm. Garrigue Company which is furnishing the plant, is a firm with a national reputation. Thus the local concern is assured machinery of the highest type."

221. Ockel, Reinhold. 1922. Die Oelindustrie Japans und der Mandschurei [The oil industry of Japan and Manchuria]. *Chemische Umschau* 29(26):201-02. June 28. (Chem. Abst. 16:3005). [Ger]
• ***Summary:*** "(Footnote: Lecture given in the Study Group for Fat Chemistry at the General Meeting of the Association of German Chemists (*Fachgruppe für Fettchemie auf der Hauptversammlung der Verein Deutscher Chemiker*), 1922.)

The oil industry in Japan is relatively small and insignificant. That of Japanese-occupied Manchuria is much more significant. It has an area of 1,456,000 English square miles and is therefore 2½ times as large as Germany. The export of soybeans (*Sojabohnen*), press cakes, and oil with a value of 21,754,000 Haikuan bushels [sic, probably Haikwan taels, a unit of value equal to the equivalent of 584.85 grains of pure silver, which in 1904 was worth 2 shillings 10 pence] in 1912 grew to 74,000,000 in 1918, and during the same period it grew from 11% of the total trade

© Copyright Soyinfo Center 2021

to 27% and from 25% of the export trade to 56%. According to the book published in 1921 by the director of the Bank of Chosen, which is the former Korea [translator's note: Korea under Japanese rule], *Oekonomische Geschichte der Mandschurei* [The Economic History of Manchuria], in 1915 the following were produced: 108,783,216 bushels, which equals approximately 3,000,000 [metric] tons of [soy] beans with a value of 306,765,843 yen, of which roughly 3/4 was exported and specifically 30% of the exports in the form of beans, and the remainder as cakes and oil. The beans went for the most part to China and Japan, the cakes to Japan, and the bean oil for the most part to Europe and America. According to a report about "Die Sojabohne Mandschuriens" ["The Soybean of Manchuria"] that was published in August 1920 by the South Manchuria Railway Company (*Südmandschurische Bahngesellschaft*) that was working with government support and 1½ billion yen, in the city of Dairen [today's Dalian, China], the former Dalay [sic, Dalny], 4,057 [metric] tons of beans were pressed daily in 60 pressing mills and from them, 386 [metric] tons of oil and 3,717 [metric] tons of cakes were obtained. In August of last year, the corresponding numbers were provided to me from the same company as 6,000 [metric] tons of beans and 600 [metric] tons of oil. The same report indicates that from every 60.4 kg (that is, 1 picul) of beans, 5.44 kg of oil and 2 pieces of cake of 27.78 kg each were obtained. Through extraction from 1 picul of beans, 7.7 to 7.93 kg of oil and 48.3 kg of bean meal were obtained. -

"The soybean introduced Manchuria into the trade community of the world," it says in the aforementioned book! I visited three oil mills in Dairen. The method of work is the same in all of them: the prewarmed beans, which look like little peas, are rolled by a pair of rollers into flat disks the size of a penny that are 2 mm thick. They are weighed out into lots of 29.6 kg each and spread out on a burlap cloth in a layer that is 6 cm thick. This rests on a flat iron grid under which a steam nozzle blows steam as long as is necessary for the steam to abundantly penetrate the seeds, such that even with cooler weather (24ºC), such a tropical heat prevails in the room that the Chinese laborers work completely naked in this room and take turns cooling off in a cold water bath that has been set in the floor and also wipe their faces with a cloth that is hung on a beam! The steamed beans are then thrown into a wooden ring that rests on two iron rings that sit on a sheet of metal. In these, a bundle of a species of reed that is as thick as a straw which is bound together at one end has previously been placed. These were purchased from Southern China at a high price. The hot beans are then stamped down with the bare feet while, at the same time, the two iron rings are raised up such that they encircle the cake with a space of around 3 cm. Then the man stamps down, removes the now empty wooden ring, brings the ends of the reeds together centrally over the cake, and pushes it with the bottom plate into the prepress, from which, after having been pressed together, two men then carry it to the finishing press in which one is placed on top of another until it is full, whereupon first 75 atmospheres and then 150 atmospheres of pressure are applied, under which they supposedly remain for 5 to 6 hours. When finished, they are approx. 9 cm thick and weigh 27.78 kg. Approximately 9% oil has run off, tainted by a protein solution and by 3% water that has been picked up from the cake. The protein in the oil at first caused difficulties for me with the refining. But with additional experiments in the laboratory in Oimachi near Tokyo, I overcame this and attained a good edible oil.

In order to remove the protein content if possible and to produce a consistent product, the railway company in Dairen built a large "mixed storage container". In this container, not only the oil that was pressed in Dairen, but that which had been pressed in all of Manchuria can be emptied out of the barrels. And then, after a lengthy sextuple zigzag path with two electrically driven pumps or two steam pumps, the oil is pumped through an eight foot tube that is somewhat flexible with a speed of 250 [metric] tons per hour into tanker ships. Some filter presses are also used there. At first, a concrete container was used, but then the oil contained water. Now an iron one is used. A part of the oil is filled into metal canisters with an automatic device with a large number of them filling simultaneously, and after having been soldered shut, these canisters are packed two to a crate.

Aside from the three oil mills, I also saw an extraction plant in Dairen which supposedly extracts 170 [metric] tons of beans per day and obtains 15% oil from them, of which 1% is as an emulsion for which only half price is attained. Some 2% of the oil remains as a residue which, however, according to [in English] Manschurian Soy Bean [sic], out of every 60.4 kg amounts to 7.7 [kg] of oil, and thus 1.4 kg or 7% is lost. In any case, the very easily soluble protein [is removed] with the condensation water with the steaming. Some 1% of the weight of the beans is lost to the benzene. The extracted product contains 22% water and is dried in a lower drier to 17% and an upper drier to 14-15%. Filling and emptying takes a half an hour, the extraction, 4 hours. The removal of the benzene by distillation takes 2 hours, the steaming 1 hour, so everything all together 7½ hours. A total of 16 extractors of 3 [metric] tons each is available from which of course 153½ [metric] tons could be extracted and not 170 [metric] tons, as had been indicated. One of the three oil mills of Dairen that were visited hydrogenated (*härtete*) its entire product of 10 [metric] tons. It produced the hydrogen according to the filter pressing process: 1,000 cubic meters with 275 kilowatt hours of municipal electricity, adulterated with 1% oxygen. The steam cauldron of the hydrogenation plant had a heating surface of 40 sq. m., that of the pressing works that could produce 4,000 cakes, 85 sq. m. The former employed 25 men, the latter 100.

In Kobe in Japan, there is also a hydrogenation plant. What is for the most part hydrogenated there in Japan is fish

© Copyright Soyinfo Center 2021

oil. Nowhere is anything refined there in advance.

Furthermore, in Wakamatsu, Japan, I visited a bean extraction plant which extracts 400 metric tons of oil and gets a yield of 16% from the beans. (American presses for cottonseed had just been set up.) Some 1½% of oil supposedly remains in the residue. A mixture was used of ½ naphtha and ½ benzene, from which 1%, calculated on the weight of the beans, is lost. Some 30% of the weight of the beans is consumed as charcoal [or carbon] (*Kohle*). The plant, the building, and the land, half of which is developed, cost 1,500,000 yen. Serving as a seed warmer were four gigantic, steam-heated screw conveyors. Then, as takes place everywhere, the beans are once again pressed flat to a thickness of 2 mm by means of a pair of rollers. In the refined oil, there is still ½% fatty acids. Some 2% of the oil is lost through neutralization, and the "deodorizing" that is carried out before this consists only of drawing off the benzene with a vacuum. The oil tastes horrible! The steam cauldron had a heating surface of 540 sq. m. There were 12 extractors with a load of 2.3 metric tons each. The duration of the extraction amounted to 2 hours; the steaming, 1 hour; the filling, 6 minutes; the emptying, 54 minutes; the entire batch, 4 hours. They indicated to me 40 to 50 batches in 24 hours (instead of the 72 that had been calculated) and 100 metric tons of beans as the daily capacity (Continued). Address: Dipl.-Ing.

222. Guillaumin, A. 1922. Les variétés de soya d'Extrème-Orient: Origine probable du soya [The varieties of soybeans in East Asia: The probable origin of the soybean]. *Revue de Botanique Appliquee & d'Agriculture Coloniale* 2(10):254-58. June 30. [10 ref. Fre]

• ***Summary:*** "The soybean (*Le Soya; Glycine Soja* Sieb. et Zucc., *Dolichos Soja* L, *Soja hispida* Moench, *S. angustifolio* Miq.) has been cultivated in the Far East since antiquity. Shen-Nung (*le Shénon*), written up by Houandi in about 3,000 to 3,500 years before Jesus-Christ, already mentioned the soybean. Since then, its culture has expanded to Indochina, India, Malaysia, Europe, America, and Africa.

"Long ago, in Austria and in France, varieties such as *Soja d'Etampes*, were selected for their high yield. In America, efforts have long been made to obtain, for the diverse climates, both forage varieties and seed varieties. And the U.S. Department of Agriculture has assembled in its test fields more than 500 varieties, of which about 20 are currently in commerce. Among the forage varieties are (Ball 1907): Early Brown, Black Eye Brown, Peking, Wilson Five, Virginia, Barchet, Biloxi, Laredo, Atoo San [sic, Ito San?], Tarheel Black, and Wisconsin Early Black. Among those grown for their seeds are: Ito San, Manchu, Elton, Medium Yellow, Mikado, Hollybrook, Haberlandt, Mammoth, Tokyo, Guelph, Austin, Easy Cook, Morse, Hahto, Early Medium Green, Mandarin, and Chiquita.

Note 1. This is the earliest document seen (March 2021) that mentions the soybean variety Black Eye Brown. However, it does not appear in Ball (1907) as stated, nor does any name even vaguely resembling it appear. The Black Eye Brown variety is mentioned in only 3 known documents, all published in France in 1922.

"Note that the forage varieties all have black- or dark-colored seeds, whereas the seed varieties have yellow or greenish seeds.

"In Turkestan it seems that the only varieties are ovoid (5.7 x 3.7 mm), brilliant yellow, with brown hilum and traversed longitudinally by a bright line." Note 2. Turkistan or Turkestan is an historical region of Central Asia, usually thought to comprise Turkmenistan, Uzbekistan, Kyrgyzstan, Tajikistan, southern Kazakhstan, western China, and northeast Afghanistan.

Note 3. This is the earliest document seen (March 2021) concerning soybeans in Turkestan, or the cultivation of soybeans in Turkestan (not including Chinese Turkestan). This document contains the earliest date seen for soybeans in Turkestan, or the cultivation of soybeans in Turkestan (not including Chinese Turkestan) (1922). The source of these soybeans is unknown. Unfortunately, it is not clear in which part of Turkestan the soybeans were grown.

"In India, soybeans are cultivated in the United Provinces and at the foot of the Hamalayas from Kashmir to Darjeeling." David Hooper (1912) distinguished five different soybean races in India.

"In Cambodia, the only known variety is ovoid (6.3 x 4.2 cm), dull yellow, brown hilum, with a long, clear white line, known as *Sandek sieng* in Cambodian and *dau nanh in Annamite*. It is cultivated along the steep banks of the Mekong River.

"In Cochin China, the soybean is cultivated only on the red soils of the provinces of Chau-doc, Baria, and Bien-Hoa; in the western provinces, cultivation is insignificant and the seeds come from Cambodia. It seems that there is only one variety, closely related to that of Cambodia, called *dau nanh* or *dau-xa*, but it is not well established / widely grown, for it bears black or brown seeds.

"In the province of Baria one can obtain two harvests in a wet year–one in September, the other in December-January. In the province of Bien-Hoa, there is only harvest.

"In Annam, there is one variety similar to that cultivated in the lower parts of the provinces of Bin-dinh, Thua-hien, Dong-hoï, and Tanh-hoa.

In Tonkin, the soybean is known as *dau tuong;* in the [Mekong] delta, one can distinguish a small, ovoid variety (5.1 x 3 mm), with a yellow seed coat and a hilum surrounded by a brownish black aura that sometimes overflows the sides. In the region of Lang-son, on the plateaus 100-500 meters in height, it is replaced by a larger variety, ovoid (7.1 x 5 mm), dull yellow, and a hilum that is uncolored [pale] or brownish; one variety is also cultivated at Lao-kay.

© Copyright Soyinfo Center 2021

"In Laos, the soybean is known as *Mok toua kon* and *Ta tone,* according to Dr. Spire, but precise information is lacking.

In the territory of Kwang-cho-wan (French: *Kouang-tchéou-wan,* in southeast China) the soybean is cultivated in the region of Taï ping, at an altitude of 30 meters. It is planted in the spring and harvested in the summer. One can distinguish two varieties here. One is very elongated (8 mm x 4.6 mm), dull yellow with a very clear brown hilum, called *Wong tao* or *Wong tao tsaï* in Cantonese. The other is small, flat (6.4 mm x 3.7 mm), dull black, with a large hilum, called *Hat tao* in Cantonese; it is absolutely the same as the variety Nigra cultivated at the botanical gardens of Cluz (Romania), and in Trieste (Italy), but different from that which is cultivated under this name at the botanical gardens of Cracow / Krakow (French: *Cracovie*) (Poland), Tabor (Czechoslovakia), and Delft (Netherlands), which is fatter, more round (7 mm x 4.8 mm) and of a velvety black color.

Note 4. This is the earliest document seen (March 2021) concerning the cultivation of soybeans in Czechoslovakia (which became a country in 1918). This document contains the earliest date seen for the cultivation of soybeans in Czechoslovakia (June 1922). The source of these soybeans is unknown.

"In China, in Szechwan, only the yellow and green varieties are known. In the region of Shanghai, R.P. Courtois, of the Museum of Zi-ka-wei, has assembled an important collection of soybean varieties. Descriptions are given of varieties with the following colors and names: (1) Yellow: *Ta hoang téou* (large, yellow, almost round), *Kiu hoang téou* (ovoid, brilliant yellow). (2) Green: *Tsing pi téou* (roundish, 7.1 x 5.5 mm, clear green with clear hilum). (3) Brown: Large, ovoid (9.1 x 6.4 mm), reddish brown, with a slightly clearer hilum; no name given. (4) Black: Many varieties. (4A) Large ovoid seeds (9 x 4.3 mm), with large hilum; indigenous name unknown; (4B) A little smaller and bulging (8.3 x 5.4 mm), with ornate hilum and a longitudinal white line, named *Ta hé téou;* (4C) Ovoid (8.1 x 4.7 mm) with a wide hilum traversed by a white line, called *Hé téou;* (4D) Small (6.7 x 3.1 mm) and brownish black named *Siao hé téou;* (4E) And finally a very small, flat (6 x 2.7 mm), brownish black named *Ni téou.* By their shape, form, and color, the seeds of these last appear very similar to the American variety Laredo."

"In Europe, soya has its apostles, but it will never amount to anything more here than a small-time vegetable. Despite the Caséosojaïne at Vallées near Paris, France (Li Yu-ying, 1911) and the Soyama Werke at Bockenheim, Germany (1914), the milk, cream, butter, and cheese [tofu] made from soya will never be more than ersatz. The "soy bread" is only good for diabetics and the "soy ham" (*jambon de Soja*) in nothing but a weak imitation of pork. Soybeans themselves are indigestible and require a very long time to cook–even the yellow or white varieties. Soy sprouts (*germes de Soja*), which enjoyed some popularity before the war and deserved it, for they are a nice hors d'oeuvre, are actually nothing but mung bean sprouts."

Based on other sources (most of which are cited), the writer also discusses the soybean varieties of Manchuria (Hosie 1901), and Japan (Lemarié 1910), and discusses soybeans briefly in Korea, Philippines, Netherlands Indies.

In Europe, the soybean has its apostles: Caséosojaïne at Vallé near Paris (1911), and Soyama werke at Bockenheim (Germany) (1914). The latter makes milk, cream, butter and cheese (*le fromage de Soja* [tofu]), which are nothing but imitations. Soy bread has a good taste, especially for diabetics. Soy ham (*jambon de Soja*) is but a vague imitation of the pork product. The seeds, themselves, are hard to digest and take a very long time to cook, even the yellow or white varieties. As for the soy sprouts (*germes de Soja*), which enjoyed some popularity before the war, which they deserved as an agreeable hors d'oeuvre, they are nothing but young mung bean sprouts (*de jeunes germinations du Haricot Mungo*).

Also mentions foods such as soy sauce, fermented tofu, and tofu, made from soybeans in India, Indo-China, China, and Japan. Tofu is known as *dau phu* in Annamite, *tao fou* in, Cantonese, *téou fou* in Chinese, and *to fou* in Japanese. A significant amount was being exported from China before the war. In Manchuria soybeans occupy 1/5 of the cultivated land. Speculates on the origin of the soybean. Address: Asst. to the Crop Service, Museum of Natural History (Assistant du Service de culture au Muséum d'histoire naturelle).

223. *Christian Science Monitor.* 1922. Japanese finance conquers rich province of Manchuria: Practical monopoly of soya bean oil secured, while Bank of Chosen [Korea] issues most of paper money. Oct. 4. p. 4.

• ***Summary:*** "Harbin, Manchuria, Sept. 1–What Japan has accomplished in the peaceful pursuit of conquering Manchuria is eloquently shown in the statement of the companies operating and their aggregate capital. At the end of July, according to official figures, there were 458 companies with a subscribed capital of 634,230,000 yen, of which 408,480,000 was paid up.

"With the practical suzerainty that has been obtained over the Chinese Eastern railroad by the rate agreement now in effect, there will doubtless be a decided impetus given to the investment of capital in North Manchuria. The stock in the Russian steamship companies that ply the Amur has been bought by the Japanese, and they are being operated under the names of dummies..."

"Soya bean monopoly: Should diplomatic pressure cause the withdrawal of the rate that has caused so much concern, Japan will still have much of the best of the business and financial situation in the best province in all of China. The oil that comes from soya beans is almost exclusively in Japanese hands, for the reason that they control the cake, which is 90

© Copyright Soyinfo Center 2021

per cent of the total output. They have some competition in the raw beans, as the Danes are heavy purchasers, shipping them to Copenhagen [via the East Asiatic Company] to be milled. The Chinese oil mill owners are unprogressive and the use of obsolete machinery gives them a kind of cake that can only be used in Japan, the oil remaining therein causing sourness [rancidity] in long shipments.

"Many of the best buildings in Harbin are falling into Japanese hands through mortgage foreclosures." "Most of the business of Manchuria is done with Bank of Chosen paper money,..."

224. Scanlon, Jerry. ed. 1922. Chanler [Candler] preparing to have transport Logan sent to Baltimore to be transformed into training schools for boys. *San Francisco Chronicle*. Nov. 21. p. 10.
• ***Summary:*** This a collection of articles about shipping. The section titled "S.F.-Korea service" begins: "Within a short time San Francisco and Korea will be connected by a direct steamship service..."

"Yee said his associates are interested in buying flour, agricultural machinery, shoes, hardware, cotton textiles and kerosene. They want to sell San Francisco buyers mattings, bristles, soya beans, castor beans, linseed, bamboo furniture and hides."

Cargoes now destined for Korea are "handled four times in trans-shipment before reaching their destination, which sometimes results in complete loss of the commodities."

225. **Product Name:** Soy Sauce.
**Manufacturer's Name:** La Choy Food Products (Importer). Made in China.
**Manufacturer's Address:** Detroit, Michigan.
**Date of Introduction:** 1922.
**Wt/Vol., Packaging, Price:** Bottle.
**New Product–Documentation:** Ad in *Soybean Digest*. 1944. Sept. p. 12. "Genuine soy sauce." Soybean Blue Book. 1947. p. 72-73. The 2¼ by 3½ inch display ad is titled: "Genuine Soy Sauce" from "LaChoy Food Products, Archbold, Ohio. Division of Beatrice Foods Company."

Shurtleff & Aoyagi. 1982. History of Soy Sauce. p. 105. "One of the earliest importers and marketers of soy sauce in America was La Choy Food Products. The company was founded to produce mung bean sprouts in Detroit, Michigan, by Mr. Ilhan New (a Korean) and Wally Smith. Soon they were doing a booming business and by 1922 they were importing fermented soy sauce from China in wooden barrels to use as a seasoning in their Asian food products. In the early 1930s they began buying HVP soy sauce from Huron Milling Co. (now Hercules) and A.E. Staley, and selling it in small bottles as La Choy Soy Sauce."

Note 1. See also the history of Oriental Show-You Company, which was started in 1918 in Detroit, Michigan, by Shinzo Ohki, a Japanese man, who began by importing shoyu and tea from Japan. In late 1922 he moved his business to Columbia City, Indiana, and began making his own shoyu there in 1924.

Joe Staudt. 1985. Horizons (Beatrice Grocery Group). Summer. p. 1-7. In 1920 Wally Smith and Ilhan New, two friends from the University of Michigan, founded La Choy Foods in Detroit. Their first product was bean sprouts. In 1922 the business was incorporated as La Choy Food Products. The first La Choy-owned plant was built in Detroit in 1937. The Archbold, Ohio plant was built on its present site in 1942. The Company's long association with Beatrice started in 1943, when La Choy was bought by the Chicago-based company and became Beatrice's first non-dairy operation.

Note 2. This is the earliest record seen (May 2021) concerning La Choy. Note 3. This is the earliest document seen (May 2021) concerning Koreans working with soyfoods outside of Korea.

226. Mori, Tamezô. 1922. An enumeration of plants hitherto known from Corea. Seoul, Corea: Government General of Chosen. 372 p. + 174 p. 23 cm. [Eng; Jap; Lat]*
• ***Summary:*** In the chapter on "Leguminosae" are entries (p. 215) for: (1) Glycine Soja, Bentham. Called *Daizu* or *Mame* in Japanese, and *Kong* in Korean. (2) Glycine ussuriensis, Regel et Maack, is called *Tsuru-mame* in Japanese, and *Tolkong* in Korean; it grows wild in Korea. The author was born in 1884.

227. Ri-Koheki. 1922. Chôsen shôyu miso oyobi tôfu no seihô ni tsuite [The processes for manufacturing shoyu, miso, and tofu in Korea]. *Nippon Jozo Kyokai Zasshi* (*J. of the Society of Brewing, Japan*) 17(11):45-46. [Jap]
Address: Chosen Sotokufu Iin Yakuzai-shi.

228. Mori, Tamezô. 1922. An enumeration of plants hitherto known from Corea. Seoul, Corea: Government of Chosen. xiv + 372 p. + 174 p. See p. 215. Index. 23 cm. 5 plates. [Eng; Jap; Kor; Chi]
• ***Summary:*** The section titled Leguminosae mentions two species of Glycine. Glycine Soja, Bentham, is called daizu or mame in Japanese, and Kong in Korean. It is cultivated.

Glycine ussuriensis, Regel et Maack, is called tsuru-mame in Japanese and Tolkong in Korean. It grows wild in Korea. The names of 4 places that it grows are listed in Chinese characters: Jizhoudao, Jinzhou, Shuiyuan, Jiangjie. The author was born in 1884.

229. Piper, Charles V.; Morse, William J. 1923. The soybean. New York, NY: McGraw-Hill Book Company, Inc. xv + 329 p. Feb. Illust. Index. 24 cm. Reprinted unrevised in 1943 by Peter Smith Publishers, New York. [563 ref]
• ***Summary:*** This classic is the first comprehensive book about the soybean written in English, and the most important

© Copyright Soyinfo Center 2021

book on soybeans and soyfoods written in its time. Contains an excellent review of the world literature on soybeans and soyfoods with a 22-page bibliography on soy that is larger than any published prior to that time (563 references), a good description of the present status of the soybean worldwide based on the authors' extensive contacts, and a great deal of original information. It quickly became a key source for people and organizations working with soybeans and soyfoods in all countries, and a major factor in the expansion of the soybean in the western world. Because of its scope and influence, Soyfoods Center considers the year of its publication to mark the end of the "Early Years" of the soybean worldwide. It remained in print until about 1986.

Facing the title page is a list of "McGraw-Hill Agricultural and Biological Publications. Dr. Charles V. Piper, Consulting Editor." The authors and titles of twelve books already published in this series are listed.

Contents: Preface. 1. Introduction: Name of the plant, origin, literature, use by the Chinese and Japanese, present importance, future prospects in the U.S., recognition of the possibilities. 2. The commercial status of the soybean: Manchuria and China, Japan, Europe, U.S., other countries, summary of imports and exports of soybeans and soybean oil. 3. Botanical history of the soybean: History prior to Linnaeus' "Species Plantarum" 1753, Linnaeus' misunderstandings of the soybean, Prain's elucidation, other and the correct botanical name.

4. Agricultural history of the soybean: Vernacular names of the soybean, China, Korea, and Japan, India and neighboring regions, Cochin China, Malayan region, early introduction into the United States, later U.S. introductions, the early introduced varieties (grown in the USA by 1898–Ito San, Mammoth, Buckshot, Guelph or Medium Green, Butterball, Kingston, Samarow, Eda, Ogemaw or Ogema), soybean in Europe, varieties grown in Europe and identification, Hawaiian Islands, Australia, Africa, Argentina (p. 50), Canada ("Soybeans are grown in very small quantities in Canada and then usually as a forage crop"), Philippines, Egypt, Cuba (p. 52), British Guiana, Mauritius (p. 53), present culture distribution. 5. Culture of the soybean: Climatic adaptations, soil preferences, water requirement, preparation of seed bed, time of planting, methods and rate of seeding, seeding for pasturage, depth of seeding, inoculation, fertilizer reactions, cultivation, soybeans in mixtures (with cowpeas, sorghums, Sudan grass, Johnson grass, millet, corn, or sunflowers and corn).

6. Harvesting and storage of soybeans: harvesting soybeans for hay, silage, for the seed, seed yields, proportion of straw to seed, storing seed, separation of cracked from whole soybean seed, viability of soybean seed, pedigreed, inspected, registered, and certified seed. 7. Composition of the soybean: Proportions of stems, leaves and pods, composition of plant and seed, nutritive and mineral constituents, forms of nitrogen in soybean nodules, factors affecting oil content of seed. 8. Utilization of the soybean: Diversity of uses (a chart, p. 129, shows 59 products that can be made from soybean seeds, and 6 more that can be made from soybean plants), soybeans for green manure, pasturage, soiling, ensilage, hay, straw.

9. Varieties: Japanese classification of varieties, classification of varieties in Manchuria (3 yellow, 2 green, 3 black), botanical classifications, vital characteristics, descriptions of important varieties (43 varieties and 7 synonyms), key for identification, breeding and improvement, genetic behavior, oil content.

10. Structure of soybean seeds. 11. Soybean oil: Methods of extraction [Manchurian, and solvent], American oil mills, methods of shipping and marketing, prices, utilization in soap manufacture, food, paint manufacture, miscellaneous. 12. Soybean cake or meal: Feeding value, composition, use for feeding for dairy cows, cattle, swine, sheep, poultry, digestibility, injurious effects, fertilizer.

13. Soybean products for human food: Food value of the soybean, digestibility of the soybean and its products, mature or dry soybeans, immature or green soybeans (a "nutritious green vegetable"), soybean flour, digestibility of soybean flour, soybean bran (p. 225-26), soybean sprouts, soybean coffee, soybean or vegetable milk [soymilk] (preparation, composition, residue from the manufacture of vegetable milk [okara], utilization of soybean milk, condensed vegetable milk, vegetable milk powder, fermented vegetable milk), vegetable casein, tofu or soybean curd (names and brief history, method of manufacture, coagulating agents, manufacturing yields, digestibility, utilization of bean curd and manufactured products, bean curd brains or *tofu nao*, dry bean curd or *tofu khan*, thousand folds {*chien chang tofu*}, fried bean curd {*tza tofu*}, Fragrant dry bean curd {*hsiang khan*}, frozen tofu {*kori tofu*}, Chinese preparation, various dishes), natto, hamananatto [hamanatto], yuba, miso, shoyu [soy sauce], confections. 14. Table dishes of soybeans and soybean products: mature or dry beans, flour, tofu, sprouts (86 recipes). 15. Enemies of the soybean: bacterial, mosaic, fungous [fungus], and nematode diseases, insects, rodents. This last chapter is a comprehensive review of the literature on soybean diseases and insects published before 1922.

The Preface begins: "The soybean, also known as soya or soja bean, has assumed great importance in recent years and offers far-reaching possibilities of the future, particularly in the United States. It is, therefore, desirable to bring together in a single volume the accumulated information concerning this crop...

"The aim has been to present the information so as to make it useful from both agricultural and commercial standpoints, not omitting, however, much that is mainly of historical or botanical interest..."

The introduction begins: "There is a wide and growing belief that the soybean is destined to become one of the leading farm crops in the United States."

• ***Summary:*** Photos show: (Fig. 1) Typical soybean plant (p. 1). (2) Plant of wild soybean (p. 2). (3) A fleet of junks engaged in carrying soybeans to Newchwang, Manchuria, from different points in the interior, taking away bean oil and bean cake to other places * (p. 6). (4) Soybeans in sacks brought to a bean center by horses in winter in Manchuria (p. 8). (5) Chinese bean cart loaded with beans in wicker containers in Manchuria (p. 8).

(6) Type of cart and method of hauling soybeans with a horse in Manchuria (p. 10). (7) Manchurian farmers hauling the bean crop to market in winter on sleds (p. 10). (8) Plants of a soybean variety from India (p. 38). (9) Plants of the wild soybean from Soochow, China, grown at the Arlington Experimental Farm, 1908 (p. 38). (Fig. 15) Soybeans grown on the edges of a rice field in southern China * (p. 58).

(16) A man in a field of the Peking variety of soybean grown in rows and cultivated (p. 61). (17) A broadcast field of soybeans showing how weeds have overrun the field (p. 61). (18) The ordinary grain drill furnishes a most convenient method of seeding in rows or broadcast (p. 63). (19) Soybeans and corn grown in alternate rows for pasturage; a man in a hat stands between the rows (p. 65). (20) The roots of a soybean plant, showing abundant development of nodules (p. 66).

(21) A man standing in a plat of soybeans without inoculation (in the foreground) and an adjacent plat which had been inoculated, in the background (p. 67). (22) A man seated on a cultivator pulled by two horses doing the last cultivation on a field of soybeans (p. 79). (23) Soybeans and sorghums grown in mixture for forage purposes (p. 80). (24) A field of soybean and Sudan grass grown in mixture for hay (p. 81). (25) A field of soybeans and corn grown in the same row for ensilage (p. 82).

(26) Soybean hay on frames. Under favorable weather conditions, hay can be successfully cured in this manner (p. 86). (27) A field of mature soybeans ready to cut for seed (p. 90). (28) Harvesting soybeans for seed with a bunching attachment on the mower (p. 90). (29) Self-rake reaper used in cutting soybeans for seed (p. 91). (30) Soybeans cut for seed with binder and soybeans placed in shocks for curing (p. 92).

(31) The ordinary gasoline threshing outfit which may be used in threshing soybeans (p. 92). (32) A special bean harvester used in gathering the soybean seed from the standing mature plants and also cleaning it (p. 94). (33) A special bean harvester by which the plants are cut, thrashed, and cleaned (p. 94). (34) A special soybean harvester used to gather soybean seeds from the standing mature plants, and which can be adjusted to level or ridged cultivation. On one side is written "The Little Giant Bean Harvester," manufactured by Hardy & Newsom, La Grange, North Carolina (p. 95). (35) Method of storing soybean seed awaiting shipment in Manchuria. The beans in sacks are stacked under Chinese mats (p. 98).

(37) Pasturing a corn and soybean mixture with sheep (p. 133). (38) Thrashing soybeans from the field and baling the straw (p. 141). (39) The larger plant is the Guelph or Medium Green which is very pubescent, while the smaller plant is a nearly smooth variety from Japan (p. 149). (40) Pods of soybeans showing the range in size and shape (natural size; p. 151).

(41) Seeds of the most important varieties of soybeans now grown in the United States showing the wide range in size and shape of seed. The name of each of the 20 varieties is given. A side view and a ventral view of each pair of seeds is given (p. 152). (42) Seeds of a black and white variety (Widower) from Korea. The white is due to the splitting of the outer later of the testa. A side view of six varieties is shown (p. 155). (43) A field of the Biloxi soybean, which requires a long season to mature (p. 163). (44) A man standing in a field of the Virginia variety of soybeans (p. 170). (45) Seeds of a natural soybean hybrid showing peculiar types of coloration (p. 175). (46) Pods of soybeans, hairy and smooth (p. 176). (47) A sterile soybean plant obtained from a natural hybrid (p. 176). (49) Seeds of an artificial soybean hybrid, showing peculiar types of coloration (p. 181). (56) An old style Chinese oil bean press, Manchuria (p. 195). (57) Coolies at Newchwang, Manchuria, carrying loads of soybeans from the junks to big stacks, where they are kept until the factory needs them for oil manufacture * (p. 196). (58) "Seeds and pods of the Hahto variety of soybeans, the seeds being especially valuable as a green vegetable" (p. 222). (59) Baskets of sprouted, small

yellow soybeans and sprouted mung beans * (p. 226). (60) Men making soymilk, working with machinery with which the soybeans are ground and the milk strained. Note the 2 grinding stones and the cloth strainers suspended from the ceiling over the tub. The cabinet with rack for bottles is noted in the background (p. 228). (61) Motor stone mill for grinding soybeans in preparing tofu with brass water tank (A), funnel reservoir (B), stones (C), and brass guard (D) (p. 229). (62) Delivery coolies holding baskets full of bottles showing the way soybean milk is delivered by the factory in Changsha, China (p. 231). (76) A courtyard filled with large earthenware containers with cone-shaped wicker tops for ripening soy sauce mash [in Ichang (I-ch'ang or Yichang), Hupe / Hupeh / Hubei province, China]; a small, strong basket is placed into each, with its rim just above the surface of the mash. The soy sauce collects or accumulates in each basket and is then dipped out, ready for consumption * (p. 251). (77) A man standing next to an iron cauldron in which soybeans are boiled for the manufacture of soy sauce (p. 252). (79) Fermenting room for yeast and soybeans in preparation of soy sauce (p. 253). (80) Rows of pots with cone-shaped wicker lids filled with soybean and wheat mixture for soy sauce * (p. 254). (81) A box press in which sacks of fermented soybeans are placed for pressing out the liquid forming soy sauce * (p. 254). (82) A man next to a kettle for boiling the soy sauce. After it is boiled, the sauce is ready to be placed in kegs at left side (p. 255). (83) Rows of soybean sauce in jars ready for shipment (p. 255). (84) Root of a soybean plant showing rootknot caused by the nematode (*Heterodera radicicola*) (p. 285).

Note: * means photo by Frank N. Meyer in China or Manchuria.

Illustrations (line drawings) show: (Fig. 48) Flower of the soybean enlarged. Front view. Side view. Parts of the corolla, standard, wing, one of the keel petals. Stamens. Pistil (p. 177). Figures 50-55, from Kondo (1913) are described at Kondo.

Maps show where the soybean is extensively and successfully grown in: (Fig. 10) The Orient (p. 51). (11) North and South America (p. 52). (12) Europe and Africa (p. 53). (13) A map of Manchuria shows the soybean districts and seed production of different localities (p. 56). (14) An outline map of the United States shows the areas with shading to which the soybean is especially adapted as to varieties and purposes (p. 57).

A diagram (Fig. 36, p. 129) shows the various ways in which the plants and seeds of soybeans are utilized. Level 2: The first two categories are seeds and plants.

Level 3: Under seeds: Food products, oil, and meal. Under plants: Hay, ensilage, soiling.

Level 4: Under food products: green beans and dry beans. Under oil: Glycerin, explosives, enamels, varnish, food products, waterproof goods, linoleum, paints, soap stock, celluloid, rubber substitute, printing inks, lighting [illumination], lubricating. Under meal: Human food, stock feed, fertilizer. Under forage: Hay, ensilage, soiling.

Level 5: Under green beans: Green vegetables, canned, salads. Under dried beans: Soy sauce, boiled beans [from whole dry soybeans], baked beans [whole], soups, coffee substitute, roasted beans, vegetable milk, breakfast foods. Under soap stock: Soft soaps, hard soaps. Under oil–food products: Butter substitute, lard substitutes, edible oils. salad oils. Under meal–human food: Breakfast foods, diabetic foods, flour, infant foods, macaroni, crackers, [soy] milk.

Level 6: Under dried beans–vegetable milk: Cheese, condensed milk, fresh milk, confections, casein. Under meal–human food–flour: Bread, cakes, muffins, biscuit.

Level 7: Under cheese: Fresh, dried, smoked, fermented.

231. Piper, Charles V.; Morse, William J. 1923. Soybean varieties: Size and weight of seeds. Color of seeds (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 152-55. [14 ref]

• ***Summary:*** A full-page black-and-white photo (fig. 41, p. 152) shows the "Seeds of the most important varieties of soybeans now grown in the United States showing wide range in size and shape of seed." The varieties are: Mammoth, Hollybrook, Haberlandt, Manchu, Medium Yellow, Mikado, Ito San, Chiquita, Lexington, Hahto, Tokio, Guelph, Biloxi, Early Brown, Virginia, Barchet, Black Eyebrow, Wilson-Five, Peking, Ebony.

"None is truly globose, but this shape is closely approximated by some varieties. Others are much compressed. The great majority, however, are elliptic in outline, the thickness less than the breadth.

"The size and weight of the seeds vary considerably, the lowest weight per hundred seeds being 4.3 grams and the highest 21.2 grams. Soybean seeds weigh about 60 lb. to the bushel and this weight is recognized as standard throughout the United States. In Manchuria the weight per bushel is usually 40 lb."

Table 69 (p. 154) show the "Number of seeds per bushel and weight in grams of 100 seeds of the most important varieties." Mammoth 132,480 / 21.2. Hollybrook 175,680 / 17.3. Haberlandt 141,120 / 20.4. Manchu 140,160 / 20.0. Ito San 171,840 / 15.7. Midwest 261,120 / 10.6. Chiquita 274,560 / 10.4. Tokio 142,080 / 19.3. Guelph 148,000 / 19.0. Biloxi 112,000 / -. Hahto 75,000 / -. Early Brown 170,000 / -. Virginia 249,600 / 11.6. Jet 340,000 / -. Barchet 644,160 / 4.3. Black Eyebrow 147,840 / 19.1. Tarheel 164,000 / -. Arlington 306,240 / 9.0. Peking 348,480 / 7.8. Wilson-Five 327,360 / 9.8. Ebony 345,000 / -. Lexington 215,000 / -.

"Color of seeds: Most varieties of soybeans have unicolored seeds in the following colors: Straw yellow, olive yellow, green, olive, brown, and black, the last really a dark violet. Straw-yellow seeds are in some varieties very pale, especially when old, and are sometimes erroneously called white, but no truly white seeds are known in soybeans...

© Copyright Soyinfo Center 2021

Bi-colored seed occurs in but few varieties... Some varieties have their seeds brindled brown and black, the two colors somewhat concentrically arranged... The hilum or seed scar may be of the same color as the seed coat... In a few varieties, as in Ito San, there is a minute brown spot on the micropyle which is diagnostic."

A quarter-page photo (fig. 42, p. 155) shows the "Seeds of a back and white variety (Widower) from Korea." The white is due to the splitting of the outer layer of the testa.

232. Piper, Charles V.; Morse, William J. 1923. Agricultural history of the soybean: China, Korea and Japan (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 36-37.

• ***Summary:*** "The soybean is a plant of very early cultivation in China. According to Li-Yu-Ying and Grandvoinnet (1911-1912) the soybean is described in the book of Materia Medica 'She-non' written over 5,000 years ago. Note 1. This is probably the *Shennong Bencao Jing* (abbreviated *Benjing*) [Classical Pharmacopoeia of Shennong, the Heavenly Husbandman], which appeared in about AD 100.

"The celebrated dictionary of Sui Sham describes the plant under the name of *'tchouan.'* Note 2. This is the earliest document seen (July 2007) that mentions the name "Sui Sham." We have been unable to find any dictionary compiled by a man who name sounds even vaguely like his.

In another ancient dictionary, the 'Kouang-ia' [sic, *Guangya,* by Zhang Yi, AD 230] dating from the time of the Christian era, the soybean is called *ta-teou* or grand pea and also *sou.* It seems very probable that the names soi, soy, soya and soja are all derived from the ancient Chinese name sou.

"In Manchuria the soybean is grown to a greater extent than in any other country, and its culture there is doubtless ancient. From Korea there have been sent to the United States Department of Agriculture many distinct varieties, the large number indicating long cultivation in that country. The culture of the soybean in Japan is likewise very old and many species peculiar to that country are in cultivation.

"No comprehensive account of the agricultural history of the soybean in any of these countries has yet been attempted, but doubtless much information is contained in ancient Chinese and Japanese literature.

"Several varieties different from any secured elsewhere have been introduced into the United States from Formosa, and the plant has probably been cultivated there for a considerable period."

Korea (p. 14): "The beans produced in Japan are believed to be superior in quality to those of Manchuria or Chosen (Korea) and are used exclusively in the manufacture of food products."

Korea (p. 154-55). Color of seeds. "Among recent introductions from Chosen (Korea) were several black and a few brown varieties with the outer layer of the testa (seed coat / hull) broken by numerous cracks so as to expose the inner white layer (Fig. 42). In the case of the black sorts this splitting has a net-like appearance, giving the beans a black and white color." Fig. 42 shows six soybeans. The caption: "Seeds of a black and white variety (Widower) from Korea. The white is due to the splitting of the outer layer of the testa."

233. Piper, Charles V.; Morse, William J. 1923. The commercial status of the soybean: Japan (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 13-16.

• ***Summary:*** In production and utilization, the soybean occupies a most important position among the various legumes grown for seed in Japan. It is extensively cultivated from Hokkaido province in the north, to Formosa in the south. The data relative to the production and commerce of the soybean and soybean products in Japan are more extensive than for China and Manchuria, and furnish rather valuable information concerning the importance of this crop.

"Acreage and Production: The soybean is grown by the Japanese farmers mainly for grain and not to any considerable extent as a green manure crop. The average annual production of seed is about 18,000,000 bu. The following table shows the acreage and production in Japan during the decade [sic] 1897 to 1919. The principal bean-producing provinces are Hokkaido, Ibaraki, Saitama, Iwate, Niigata, Nagasaki and Kumamoto, but there is no province where the annual production does not exceed 50,000 bu. The province of Hokkaido has the largest acreage and produces the highest quantity and best quality of beans.

Utilization: The soybean forms one of the most important articles of food in Japan. It is one of the principal ingredients of soy sauce, miso, tofu and natto. The beans are eaten boiled or baked or in powder form for soups. Sometimes they are picked green, boiled and served cold with soy sauce, and sometimes as a salad. A vegetable milk is also produced from the bean forming the basis for the manufacture of vegetable cheese. The milk is not only used in the fresh state, but a form of condensed milk is also manufactured from it. All these foodstuffs are used daily in the Japanese homes. For the poorer classes they are the principal source of protein and considered indispensable as articles of food in the diet. Owing to their large utilization as human food, the domestic soybeans are used only to a limited extent in the feeding of live stock. To supply the protein ration for animals deficient in that nutrient, the beans are sometimes boiled and fed mixed with straw, barley and bran. The beans, especially those imported from China and Manchuria, are used extensively in the production of oil and cake. The oil is used as an article of diet and for various technical uses, while the residue or bean cake is used extensively as a fertilizer and as a cattle feed.

"Cost of production and market prices: Accurate data as to cost of production are not available, but estimates made

© Copyright Soyinfo Center 2021

by Japanese agricultural experts, place it about $10.00 per acre, exclusive of taxes, or about 65 cents per bushel. The beans produced in Japan are considered to be superior in quality to those of Manchuria and Chosen (Korea) and are used exclusively in the manufacture of food products. Prior to 1914 the prevailing wholesale price of domestic beans in Japan was about $1.00 per bushel while for imported beans it was about 70 cents per bushel.

"Imports: Japan has always been a large consumer of soybeans from China and Manchuria, the greater part of the beans being used in the manufacture of oil and bean cake. In amount and value the importation of soybeans is second only to rice. The amounts and values of soybeans imported are shown in table VII for the years 1903 to 1907 inclusive, and 1911 to 1914 inclusive.

The bean cake manufactured in Japan forms only a small proportion of the total used by Japanese farmers. Large amounts of bean cake are annually imported as shown in the following table. Previous to 1903, bean cake was the largest in amount among imported fertilizers.

Exports: In addition to supplying domestic demands, Japan has exported beans, bean oil, miso (bean cheese) and soy sauce in large quantities to American and European countries as shown in the following tables. The exports of beans and bean oil have only become of importance since the development of the American and European trade. Prior to 1914, soybeans were not listed separately.

234. *USDA Bureau of Plant Industry, Inventory.* 1923. Seeds and plants imported by the Office of Foreign Seed and Plant Introduction during the period from April 1 to May 31, 1920. Nos. 49797 to 50647. No. 63. 99 p. March.

• ***Summary:*** Soy bean introductions: *Soja max* (L.) Piper. Fabaceæ. (*Glycine hispida* Maxim.)

49828-49833. "From Yokohama, Japan. Beans presented by Robert Fulton & Co. Received April 2, 1920. Quoted notes by Mr. Fulton:

"49828. '*Kuro mame* (black soy bean).'

"49829. '*Kuro Teppo mame* (round, middle-late, black soy bean).'

"49830. '*Nakate mame* (middle-late, white soy bean), seed larger than *Wase mame.'*

"49831. '*Okute mame* (late white soy bean).'

"49832. '*Shiro daizu* (white soy bean).'

"49833. '*Wase mame* (summer bean), small seeded early white.'

"49834. From Aizu Wakamatsu, Japan. Beans presented by Rev. Christopher Noss. Received April 2, 1920. '*Ogon daizu* (golden soy bean).' (*Noss.*)

"The oil of the bean is used for frying, as a butter substitute, for lubricating, for water-proofing clothes, for medicine, and in the manufacture of soap, candles, guncotton, and artificial rubber. The residue after the oil has been extracted has been used for cattle feed, but is now mixed with wheat flour for food purposes. The entire bean is slightly roasted, pulverized [to make kinako], and mixed with flour to make light cakes and to give flavor to boiled rice; it is cheaper and more nutritious than flour. (Adapted from *Parry, Travel Sketches, Japan Advertiser, January 25, 1920.*)'

"49911/49921. From Techow, Shantung, China. Seeds presented by Miss Alice Reed through Prof. Henry Conrad, Grinnel College, Grinnel, Iowa. Received April 21, 1920. Quoted notes by Miss Reed.

"49918-49920.

"49918. 'Black bean.'

"49919. 'Yellow bean.'

"49920. 'Large green bean.'

"50382/50387. From Foochow, Fukien [Fujian], China. Seeds collected by C.R. Kellogg. Received May 27, 1920. Quoted notes by Mr. Kellogg.

"50385. 'Yellow bean from Hokchiang (Futsing).'

"50440-50441.

"50440. '*Deu tz* (bean). The only yellow soy bean known here and the one referred to when beans are spoken of unless some other variety is definitely mentioned. A field crop; clay preferred. Usually planted right after rice is reaped, making a rotation of rice in the spring and beans in the fall.'

"50441. '*U deu* (black bean). The only other type of soy bean grown here. Rather heavier yielder and more vine than the yellow, but not grown very much. A field crop preferring medium-heavy clay soil. Collected at the farm of Lee U. Ken.'

"50522-50524. From Mukden, China. Seeds presented by Albert W. Pontius, American consul general. Received June 7, 1920. Market beans requested for the Office of Forage-Crop Investigations.

"50522. '*Hei tou* (black).' 'A small flat shining black bean used when boiled, salted, and fermented as the main ingredient in a sauce; also fed, when boiled, to water buffaloes.' (*Frank N. Meyer.*) For previous introduction, see S.P.I. No. 45294.

"50523. '*Hsiao chin huang tou* (small golden yellow bean).'

"50524. '*Pai mei tou* (white-crested bean).' A late maturing bean, yellow with a 'white eyebrow.' For previous introductions, see S.P.I. No. 30745.

"50531/50539. From Keijo, Chosen (Korea). Seed presented by Miss Katherine Wambold. Received June 21, 1920.

"50535-50536.

"50535. '*Kong* Bean.' For previous introductions, see S.P.I. No. 42059.

"50536. '*Kong* bean; this is used for making sauce.'" Address: Washington, DC.

*Scientific Monthly* 17:283-85. Sept.
• ***Summary:*** The soy bean "was first introduced to America in 1804, but it was a hundred years before we could be induced to take it seriously... But in the last ten years it has rapidly come to the front as one of our major crops and is likely in the next ten years to go ahead of oats in acreage in some of our states... The latest bulletin of the Department of Agriculture lists fifty different uses for soy products, and doubtless Yankee ingenuity can and will add more when we get our minds to working on it.

"Even the Japanese have not exhausted their ingenuity in this field, long as they have been at it. A Japanese scientist named Sato has invented a new plastic which he has called, according to American precedent, 'Satolite.' It is made by precipitating the protein with sulphite, hardening it with formaldehyde, and molding it under heat and pressure into combs, buttons and whatever we make from hard rubber or celluloid or the casein of milk.

"The soy bean is rich in protein and fat, and lacking in starch; in that more like animal than like vegetable food. You can make a milk out of it by simply soaking the dried beans till soft, then crushing fine in a meat grinder, boiling in three times the volume of water for half an hour and straining through cloth. If you do not like the flavor you can add vanillin or something else. This vegetable milk sometimes agrees with children when cow's milk does not. It can also be used for cakes and custards.

"The soy milk may be made into curds and cheeses of various sorts which form a large part of the diet of orientals, but for which we have not yet acquired a taste. Soy meal has come into common use in America, not only as a cattle food, but also for bread and pastry mixed with three parts wheat flour.

"Soy sauce has long been familiar but quite unknown to us. We did not recognize it under its aristocratic English name and its added flavors. But when the high cost of living drove us to the chop sueys, we became acquainted with the cruet of brown salty sauce called 'shoyu,' and we found, as the Chinese had found thousands of years before, that a sprinkling of it would make tasty a large lot of rice and serve as substitute for meat, both in taste and nutriment. Soy sauce is of several sorts. If you want it strong take the Korean. If you want it sweet take the Japanese. It is made by fermentation and the flavor depends upon the way it is brewed and the length of time it is left to ripen. To suit the palate of a Korean connoisseur the jars must be exposed to the sunshine by day and covered by night for a period of thirty years. We Americans, when we get to making it, will undoubtedly speed up the process.

"So far the oil is the most in demand of the soy products. The beans contain from 18 to 20 percent. of a fine palatable oil, which we have imported at the rate of a hundred thousand tons in a year, but which we are now growing for ourselves. It can take the place of cottonseed oil in vegetable substitutes for lard and butter, and of linseed oil in paints. Formerly the oil went mostly to Germany and England, but the war made a shift in the currents of Pacific trade, and we learned to appreciate its value. But we have a lot to learn yet before we catch up with the orientals in the utilization of this multifarious bean."

Torino & Genova, Italy: S. Lattes & Co. 243 p. Preface by Prof. Oreste Mattriolo (R. Università di Torino). With 34 illust. 22 cm. [25 ref. Ita]
• ***Summary:*** This is the first major book in Italian about the soybean.

Contents: Preface. Reason for the work; its scope and limits. Part I: The origin and history of the soybean. Reason for this history, the origin of the soybean and its early dissemination, soya (including production statistics) in Oriental countries (China, Manchuria, Japan, Formosa, Korea, French Indochina), how the soybean was introduced to Europe, the cultivation of soya in France, Soya in England, Austria, Germany, Denmark, Holland, Russia, Sweden, Alsace-Lorraine (now in northeast France), Spain, Italy, America, Conclusion.

Part II: Cultivation of soya.

Part III: Soya in the feeding and nutrition of humans and animals. 1. The analysis and physiology of metabolism as an element in the study of nutrition. 2. Soybean forage in the feeding of animals. 3. Soybeans (*il grano di soja*) and soy products in the feeding of humans and animals: Commercial and nutritional value and digestibility of the soybean, how to prepare and cook whole soybeans, soy broth, thick soups, salads, and meat dishes, soy purée (*puré di soja*), soybean cakes (*torté di soja*), soybean sprouts (*germi di soja*), roasted soybeans (*grano di soja come frutta secca*), soy coffee (*caffé di soja*), soy chocolate (*cioccolata di soja*), soy confections (*confetture di soja*), special soy sweets and chocolates for diabetics and tuberculosis patients, the soybean as a feed for animals.

Note 1. This is the earliest Italian-language document seen (Nov. 2012) that mentions soy coffee, which it calls

© Copyright Soyinfo Center 2021

*caffé di soja.*

4. Flour, pasta, and bread in feeding. 5. Soymilk (*il latte di soja*) and its use in the feeding of animals and humans. 6. Tofu (*il formaggio di soja;* p. 209). 7. Soy oil and oil-cakes (*L'olio ed i panelli di soja;* p. 212). 8. Condiments and sauces: Natto, miso, soy sauce (*le salse,* called *Schogon* [sic] in Japan, *Tsinag-Yeou* [sic] or *Tao-yu* in China, *Ketjap* in Java, and *Tuong* in Annam). 9. Enzymes (I fermenti, incl. urease). 10. Conclusions.

Part IV: Industrial applications of soya. 1. Various industrial applications of soya and its derivatives. 2. Chemical composition of vegetable casein compared with animal casein. 3. The industrial applications of animal casein. 4. If it is possible, it is convenient, necessary and appropriate to replace vegetable casein for the animal casein in industrial applications. 5. Vegetable casein factories. 6. Process for extracting casein from soy. 7. How to manufacture galalith / galalite.

Part V: General conclusions.

The first test of the lactation of calves with soymilk was conducted in the winter of 1916-17 by the Bonafous Institute in Turin. The results were splendid, and have encouraged eminent pediatricians such as Dr. Casalini, Prof. Dr. Alberto Muggia (teacher of clinical pediatrics at the University of Turin), and Dr. Enrico Gasca (vice director general of infants at Turin) to extend their experiments (p. 6).

A table (p. 31) shows soybean and cotton hectarage and production in Korea from 1909 to 1917. Soybean hectarage increased from 277,776 ha to a record 487,134 ha. Soybean production grew from 1,991,126 quintals (1 quintal = 100 kg or 0.1 metric tons) to a record 3,816,498 quintals.

Page 35: "Prof. Rouest of Luxey (Landes) in France wrote us on 30 Nov. 1921. 'I have finished only the period of acclimatization of the soybean. It remains for me to propagate it a little everywhere. The experiments of 1921 were extended in all the Departments, being viewed from an industrial and commercial point of view. I must now study which variety adapts among those I am cultivating. Soy flour will not be able to be made until we have many thousands of hectares under cultivation, and then we will be able to think of other applications as well... Actually the firm Hendebert de Lion sells its flour, originating in China, at 10 French francs per kg, a prohibitive price.'"

Page 206: At the pediatric congress held in Milan in Sept. 1922, the question of lactation (feeding children) with vegetable milk was discussed in a favorable way, proposed by Prof. Muggia and sustained by the illustrious Prof. Berghius, Director of the Pediatric Clinic of the University of Padua, and by Prof. Francioni of Bologna. We can also add that experiments on lactation are proceeding in Italy at the pediatric clinics of Turin, Bologna, Padua, Genoa, and Florence, and also at the Infant's Dispensary in Turin.

Photos and tables are discussed in a separate record.

A diagram (p. 227) compares the chemical composition of animal casein and vegetable casein.

Note 2. Quite a bit of the historical and non-Italian information in this book comes from Léon Rouest's 1921 book *Le soja et son lait végétal: Applications agricoles et industrielles.*

Note 3. This is the earliest Italian-language document seen (Jan. 2012) that mentions natto, of which it says: "il *Natto* in Giappone che corrisponde al *Tao-Teche* della Cina."

Note 4. This is the earliest Italian-language document seen (Jan. 2013) that mentions soy sprouts, which it calls *germi di soja.*

Note 5. This is the earliest Italian-language document seen (Sept. 2016) that mentions soybean cake (a co-product of soybean oil), which it calls *panelli di soja.* Address: Dr. of Economic and Commercial Science, Turin [Torino], Italy.

238. Bottari, Fulvio. 1923. La soja nella storia, nell'agricoltura e nelle applicazioni alimentari ed industriali [The soybean in history, in agriculture, and in food and industrial applications (Photos and tables–Document part)]. Torino & Genova, Italy: S. Lattes & Co. 243 p. Preface by Prof. Oreste Mattriolo (R. Università di Torino). With 34 illust. 22 cm. [25 ref. Ita]

• ***Summary:*** Photos show: (0) An infant fed soymilk in Turin in 1921, together with a table showing its weight gain from 18 July 1921 until 14 Jan. 1922 (p. 7). (Figs. 1-3) Three different varieties of soybean plants (p. 70-71). (4) The leaves of 3 different varieties of soybean plants (p. 72). (5) Close-up of the stem and pods of a soybean plant (p. 73). (6) Beans and pods of soybeans (p. 74).

(7-8) Different stages of germinating soybean seeds (p. 75). (9) Close-up of soybean roots and nodules (p. 76).

(10-12) Fields of soybeans at the "Istituto Bonafous" (p. 106, 108, 113). (13-14) Field of soybeans grown with corn (p. 122, 123). (15-18) Cellular transverse section through a soybean (facing p. 152).

(20-21) Soy flour and wheat flour, each in a sack and loose (p. 177). (22) Pasta made from soy (p. 181). (23-28) Bread and baguettes / breadsticks made with various percentages of soy (*Pane di soja*) (p. 183-89).

(29-30) Soy bran and wheat bran, each in a sack and loose (p. 191). (31) Two bottles of soymilk (p. 194). (32) Two bottles of soy oil (p. 214).

Tables show: (1) Imports and exports of soybean seeds from 1910 to 1919 by various countries, Imports into Europe (Denmark, France, Great Britain and Ireland, Norway, the Low Countries {Netherlands, Belgium, Luxembourg}, Sweden), into Asia (Netherlands Indies {today's Indonesia}, Java & Madura, External Possessions, Japan, Formosa). Exports from Europe (France, Great Britain and Ireland, the Low Countries), from Asia (China, Japan, Formosa) (p. 3).

(2) Imports and exports of soybean oil from 1910 to 1919 by various countries, Imports into Europe (Denmark, Germany, Denmark, France, Great Britain and Ireland,

© Copyright Soyinfo Center 2021

the Low Countries {Netherlands, Belgium, Luxembourg}, Russia {both European and Asiatic} Sweden), into North America (Canada, United States), into Asia (Netherlands Indies {today's Indonesia}, Java & Madura, Japan, Formosa), into Africa (Egypt). Exports from Europe (Denmark, France, Great Britain and Ireland {re-export}, the Low Countries, Sweden), from North America (United states, re-export), from Asia (China, Japan) (p. 4).

(3) The weight gained by a baby fed soymilk at the dispensary of Lattanti at Torino. The trial ran from 18 July 1921 to 14 Jan. 1922. The baby's weight increased from 3,000 gm to 6,140 gm (p. 7).

(4) Production of soybeans in China in 1916 and 1917 by color. And production of soybean cakes and soy oil in China in 1916 and 1917 (p. 21).

(5) Exports of soybeans and soybean cakes from Manchuria yearly from 1905 to 1908 (data from Rouest) (p. 23).

(6) Area and production of oilseed plants (cotton, linseed, colza/canola, peanut, and soya) in Japan from 1877 to 1920. Soy is by far the greatest, and both the area and production of soybeans increase during this time (p. 26).

(7) Production of the principal vegetable oils (colza/canola, sesame, cotton, linseed, soya, peanut, coconut) in Japan from 1886 to 1918.

(8) Area and production of major oilseeds (cotton, soja) in Korea from 1909 to 1917 (p. 31). Soybean hectarage increased from 277,776 ha to a record 487,134 ha. Soybean production grew from 1,991,126 quintals (1 quintal = 100 kg or 0.1 metric tons) to a record 3,816,498 quintals.

(9) Imports of soybean oil to England from 1910 to 1919 (p. 38). (10) Imports of soybean oil to Denmark from 1910 to 1919 (p. 46). (11) Imports of oilseeds (copra, soya, peanut, sesame, linseed, colza / canola & mustard seed) to Denmark in 1917 (p. 46).

(12) Exports of soybean oil from Denmark from 1910 to 1919 (p. 47). (13) Imports of soybean oil to the Low Countries from 1911 to 1919 (p. 47). (14) Imports of soybean oil to Russia from 1909 to 1915 (p. 48). (15) Imports of soybean oil and cottonseed oil to Sweden from 1912 to 1919 (p. 48). (16) Imports of soybean oil to Alsace Lorraine from 1913 to 1919 (p. 49). (17) Area of oilseeds and production of oil in Italy from 1909-1920 (p. 50). The area was about constant and the production of oil increased. (18) Median annual production of oil in Italy from 1870-1874 to 1920 (p. 50). Production decreased. (19) Trial comparing the nutritional value of cow's milk and vegetal milk (soymilk). The name of each of the 8 calves is given (p. 56-57). (20) Area and production of soybeans in the United States from 1909, and 1917-1919.

(21) Imports of various vegetable oils (olive, palm, coconut, soya) to the United States from 1910 to 1919 (p. 63).

(22) Cultivation of soybeans in Spain as described by Coll. D. Santiago Felice Valderrama of Montilla. The five columns are: (a) Classification, from 0 to 10. (b) Provenance / Source (China). (c) Seed color. (d) Development (large, medium, small). (e) Maturity date (Late, semi-late, early, etc.) (p. 85).

(23) Fertilizer tests with Soja hispida, The five columns are: (a) Parcel number, 1-9. (b) Fertilizers used and dosage. (c) Stems, kg per 50 square meters. (d) Production of pods, kg per 50 square meters. (e) Grain, kg per 50 square meters (p. 95).

(24) Chemical composition of soybeans grown in Vienna, yellow from Mongolia, Yellow from China, reddish brown from China. Composition is given for both the original seed and for its progeny (p. 98).

(25) Weight of soybean stems, pods, and seeds of soybeans grown by Prof. Manvilli of the Bonafous Institute (p. 98).

(26-28) Effect of planting distance and pattern on the weight of soybean stems, pods, and seeds (p. 102, 105).

(29) Effect of place of origin and variety on the time to germination, time of flowering and formation of the pods. The soybeans came from Tunisia, China, Ceylon, New South Wales, Podolia [in today's Ukraine], and Lithuania, France, Northwestern Italy (*Piemonte*, [Piedmont]), United States, Indochina [Cambodia, Laos, Vietnam, Burma, Siam, Peninsular Malaysia, Singapore], and India (p. 109).

(30-31) The effect of applying electrical voltage to soybean plants on the yield of stems, pods, and seed (p. 110-111).

(32) Ito San Soybean production per ha in Connecticut from 1877 to 1918 (p. 120).

(33) The yield of protein and oil from common beans, peas and soybeans (p. 121).

(34) The yield of various minerals from the stem, leaves, pods, seeds and entire plant (p. 121).

(35) Chemical analysis of the soybean plant, on both an "as is" and a dry basis, in the stem, foliage, pods, and entire plant (p. 141).

(36) Composition of the soybean–various parts from various places. entire plant, forage after the plant blooms and sets pods, hay from Japan, hay from Massachusetts, straw from Massachusetts (p. 142).

(37) Nutritive elements in hay from different types of plants, both green and dry, for crude substance and digestible portion (p. 143).

(38) Distribution of the various nutritive components in the various parts of the soybean seed. The parts are entire seed, cotyledons, embryo, seedcoat (*scorza*) (p. 145).

(39) Complex analysis of the seed of the soybean (in parts per 100) (p. 146).

(40) Analysis of the seed of various colors of soybean by various researchers, incl. Dr. Emil Pott, Meissl & Böcker, & Pellet.

(41) Nutritional composition, both crude substance and

© Copyright Soyinfo Center 2021

digestible portion, of various protein sources: beef, common beans, lentils, peas, broad/fava beans, soybeans (p. 149).

(42) Protein content of various basic protein sources, incl. meat, peas, broad beans and soya (p. 155). (43) Bar graph. The soybean as a source of nutrients, compared with other legumes, wheat flour, soy flour, wheat pasta, soy pasta, 75% wheat + 25% soy pasta, wheat bread, soy bread, 75% wheat + 25% soy bread, cow's milk, soymilk, mother's milk (p. 159).

(44) Chemical composition of soybean hay according to Oscar Kellner 1885, p. 82 (p. 162).

(45)

(45) Chemical composition of soybean hay according to Emil Pott 1907 (Vol. 2, p. 3) (p. 163).

(46) Composition of soybean straw, according to Emil Pott (p. 165).

(47) Chemical composition of soybean pods according to Emil Pott (p. 165).

(48) Nutritional composition of soy coffee from Tyrol and Dalmatia (p. 171).

(49) Nutritional composition of soy jams (*confetture di soja*).

(50) Nutritional composition of soy flour compared with the flour of various cereals (p. 176).

(51) Nutritional composition of various types of soy pasta: 100% soy, 25% soy, pasta from Naples (p. 182).

(52) Nutritional composition of soy bread, four analyses, compared with two analyses of wheat bread (p. 185).

(53) Nutritional composition of soymilk made from whole soybeans or soy flour (p. 195).

(54-55) Nutritional composition of soymilk, 7 analyses, compared with mother's milk, cow's milk and goat's milk (p. 200-201).

(56) Nutritional composition of okara (the residue from making soymilk), various analyses (p. 207).

(57-58) Nutritional composition of soybean oil vs. cottonseed oil, and according to five different analysts (p. 213).

(59) Nutritional composition of soybean cake according to five different analysts (p. 215).

(60) A diagram compares the chemical composition of animal casein and vegetable casein (p. 227).

(61) A table compares the chemical composition of animal casein and vegetable casein (p. 228). Address: Dr. of Economic and Commercial Science, Turin [Torino], Italy.

239. Capone, Giorgio; Grinenco, Ivan; Costa, Mario. eds. 1923. Oleaginous products and vegetable oils: Production and trade. Rome, Italy: International Institute of Agriculture, Bureau of Statistics. 545 p. See p. XX-XXI, 140-41, 144-47, 442-43, 480-81. No index. 24 cm. [Eng]

• ***Summary:*** In Sept. 1921 the IIA published a monograph on this subject in French. By popular demand, this English edition was published 2 years later. Contents: Introduction (p. VII-XXXII): General scope, general survey of the 9 principal crops (including soya beans) plus others, final points of consideration. Part I (p. 1-402) is an analysis by region, and within each region by country, countries of vegetable oil production and trade. Regions are Europe, North and Central America, South America, Asia, Africa, and Oceania.

Major countries: Denmark (p. 20-23; oil production 1916-1921, oil imports 1910-1922). France (p. 26-34). Germany (p. 35-40). Great Britain and Ireland (p. 41-43). Netherlands (p. 65-68). Norway (p. 69-70). Russia–European and Asiatic (p. 84-93). Sweden (p. 100-03). Canada (p. 111-15). United States (p. 131-47). Argentina (p. 179-85; no soy). Brazil (p. 187-90; no soy). Ceylon (p. 218-21; no soy). China (p. 222-26). Dutch East Indies (Java & Madura, Other islands; p. 229-33). Formosa (p. 238-39; gives soybean production and acreage from 1900 to 1921). Japan (p. 259-64; gives Japanese soybean production and acreage from 1877 to 1921, and production of soya oil from 1909 to 1920. Japan's leading oil produced domestically from 1895 was rapeseed oil). Korea (Chosen, p. 265-67). Kwantung Leased Territory (p. 268). Hawaii (p. 388; Hawaii produced 17 long tons of soybeans on 20 acres in 1909, and 10 tons on 15 acres in 1919).

Part II (p. 403-506) is recapitulatory tables for both soya beans and soya bean oil: Area and production by crop (1909-1922), Trade by crop (1909-1921). Cottonseed (p. 410-11). Linseed (p. 414-15). Soya beans (p. 442-43, 480-81).

Pages XX-XXI state: "In the absence of data from China, the chief grower of soya beans, it is impossible to make even the roughest estimate of the world's yield of this product. Among the few countries of any moment as producers of soya beans, we may mention: Japan, where this crop increased rapidly between 1877 and 1887 and then became nearly stationary at about 500,000 long tons [2,240 lb per long ton] per annum, although in the last few years some further increase has been noticeable; Korea, with a continuous increase in area and yield, from 1910 onwards, (the crop of 1920 was about 600,000 long tons); and United States, where from 1909 to 1921, the area under soya beans increased from about 1,600 to 186,000 acres with a production of about 70 thousand long tons. It may be observed that the increase of this crop during the last twenty years is supplemented by attempts already made and in progress for its introduction into countries with a favourable climate, especially into Africa."

"Exports are exclusively from China and Korea. The Chinese exports have increased very greatly during the last thirty years. Before 1890 they were insignificant, in 1901 they had reached a total of more than 100 thousand tons, and during the decade from 1909 to 1918 they averaged about 600 thousand tons and reached their maximum in 1919 with about 1 million, declining in the two following years to 600 thousand long tons.

© Copyright Soyinfo Center 2021

"With regard to Korea although we have not a complete series of data for the period 1909-1918, the ever-increasing importance of its exports of soya beans may be emphasized; during the last few years these have been double the average of the years 1909-1911, and in 1921 they already equalled one third of the Chinese exports."

"The chief importers, in Europe are Great Britain, Denmark, and Holland, and, in Asia, Japan, and the Dutch East Indies. To these must also be added Russia-in-Asia as the Chinese Customs register large exports destined for the Russian Pacific ports."

"England, which at one time constituted the greatest market for the soya bean, has continually reduced its imports: these were 420 thousand long tons in 1910, 76 thousand in 1913, and about 60 thousand in the two years 1921-1922... In the Asiatic market, represented in this case by Japan and the Dutch East Indies, imports have continuously increased especially in the last few years of the period under consideration.

"The trade figures of *soya oil* (see tables on pages 480 and 481) indicate that China is the principal exporter, having quadrupled its shipment during the period from 1914 to 1919, attaining in the latter year a total of over 140 thousand long tons."

Other countries unrelated to soy (some no longer in existence): Europe: Esthonia [Estonia], Luxemburg [Luxembourg], Serb-Croat-Slovene State. North and Central America: British Honduras [named Belize after about 1975]. South America: Curaçao [Curacao; no soy], Falkland Islands, British Guiana, French Guiana. Asia: Aden [became part of independent Yemen in 1967], Andaman and Nicobar Islands, Bahrein Islands [Bahrain], Borneo (British Protectorates), Dutch East Indies, Federated Malay States, Formosa, French Settlements in India, Indo-China, Persia, Portuguese India [annexed in 1962 by India; became Union territory of Goa, Daman, and Diu], Protected Malay States, Russia, Japanese Saghalin (Karafuto), Siam [later Thailand], Straits Settlements [later Singapore], Timor and Cambing, Wei-Hai-Wei [Weihai, Wei-hai, or Weihaiwei; seaport in northeast Shandong province, northeast China]. Oceania: Australia, Fiji Islands, French Settlements in Oceania, Gilbert and Ellice Islands, Hawaii, Island of Guam, New Caledonia, New Hebrides, Papua, Samoan Islands (American Samoa), Solomon Islands, Territory of New Guinea (*Later German New Guinea*), Tonga, Western Samoa (*Formerly German Samoa*).

Note 1. This document gives a clear definition of the geographical region named "Oceania."

Note 2. A "quintal" is probably 100 kg. Address: 1. Doctor of Economics; 2. Doctor of Agronomics. Both: IIA, Rome, Italy.

240. Capone, Giorgio; Grinenco, Ivan. 1923. Korea (Chosen) (Document part). In: G. Capone & I. Grinenco, eds. 1923. Oleaginous Products and Vegetable Oils: Production and Trade. Rome, Italy: International Institute of Agriculture, Bureau of Statistics. 545 p. See p. 265-67. [Eng]

• ***Summary:*** Area and production: Table 1 (p. 265) shows Japanese statistics for area and production of oil-yielding crops in Korea (Chosen) from 1909 to 1922. Soya was the leader by far in both categories throughout this period. Soya area increased from 686,409 acres in 1909 to 1,858,971 acres in 1919. The crop with the next largest area was cotton followed by hemp (which had 40,407 acres in 1909, increasing to 69,731 acres in 1921), then sesamum.

Soybean production grew from 195,967 long tons in 1909 (Note: 1 long ton = 2,240 lb) to 612,459 tons in 1920. The crop with the second largest tonnage was cottonseed (44,807 tons in 1920), followed by sesamum (4,000 tons in 1920). *Perilla ocymoides* is cultivated in almost all the provinces of Korea, where it is used for the manufacture of oil. In 1920 about 35,000 acres were devoted to this crop. About half of the seed produced is exported to Japan.

Imports of oleaginous products and vegetable oils: Small amounts of sesamum seed (2,772 tons in 1922) and groundnuts (1,063 tons in 1922) are imported. Smaller amounts of vegetable oils are imported. Imports in 1922 were: Soya bean oil 500 tons, rapeseed oil 391 tons, and linseed oil 155 tons.

Exports of oleaginous products: The main product exported by far is soya beans. In 1909 some 90,108 tons of soya beans were exported. Exports of this crop apparently ceased from 1912 to 1917 (during World War I), then rose from 122,471 tons in 1918 to a peak of 225,417 tons in 1921. The second largest export was cottonseed (2,602 tons in 1922), followed by very small amounts of sesamum. Address: 1. Doctor of Economics; 2. Doctor of Agronomics. Both: IIA, Rome, Italy.

241. Kellogg, John Harvey. 1923. The natural diet of man. Battle Creek, Michigan: The Modern Medicine Publishing Co. 386 p. Illust. Index. 20 cm. [50+* ref]

• ***Summary:*** This classic of vegetarian literature contends that a vegetarian diet is the natural diet of man. Contents: 1. Man not naturally a flesh-eater: Modern civilized life unnatural and unbiologic, animal dietaries, lessons from the monkey, porcine wisdom in diet, animals classified by diet, the ancient family of primates, all mammals originally vegetable feeders, when germ diseases were unknown, kinship of higher apes and men, flesh-eating never a universal human custom.

2. Twenty popular delusions about flesh foods: D-1. That meat is superior as a blood-making food, and, hence, is needed in anemia. D-2. That meat is essential as a flesh-building food. D-3. That a flesh diet is essential to support severe or prolonged activity; that is, promotes endurance. D-4. That flesh-eating is necessary to produce physical courage. D-5. That vegetarian races are inferior physically

© Copyright Soyinfo Center 2021

and mentally to races using a mixed diet. D-6. That flesh foods are more refined and more easily digested and, hence, more nutritious than are foods of vegetable origin. D-7. That man is naturally omnivorous. D-8. That flesh foods are stimulating and thus supply an element needed especially by brain workers. D-9. That beef tea is a useful nutrient. D-10. That a meat diet is required to prevent or cure gastric acidity. D-11. That a meat diet is desirable in tuberculosis. D-12. That a meat diet is necessary in diabetes. D-13. That a flesh diet is essential in the treatment of obesity. D-14. That meat is required in beri-beri. D-15. That meat is essential as a "building-up" or restorative food. D-16. That meat is needed by growing children. D-17. That meats are needed as a stimulus to appetite. D-18. That the beef industry is a necessary part of our national economic system. D-19. That a meat diet is necessary to insure reproductive activity. The law of diminishing returns versus flesh-eating. D-20. That meat is a harmless luxury.

3. Scientific objections to the use of meat: Human liver not adapted to meat diet; important differences between meat and milk; meat deficient in vitamins and food lime; Eskimos eagerly seek vegetable food; ill effects of meat diet on Arctic explorers; meat saturated with tissue poisons; meat readily putrefies, natural foods do not; the poisons of meat; meat extracts; why viscera are especially objectionable; bacteriology condemns meat as food; vast numbers of bacteria in meat; putrefactive products of meat; why physicians forbid meat in cases of kidney disease and high blood pressure; how flesh-eating causes constipation ("partly because the flesh diet is lacking in the roughage or indigestible material required to stimulate the intestine to action").

4. Diseases due to flesh eating: Tuberculosis in animals, cancer from meat eating, cancer rare and appendicitis unknown among flesh abstainers, meat-eating causes disorders of nutrition, acidosis from a flesh diet, a meat diet and scurvy, meat eating and arteriosclerosis, pernicious effects of a meat diet experimentally proven, recognized meat contraindications, the peregrinations of a deadly parasite, typhoid germs in meat products, flesh poisoning, no protection for meat-eaters, oyster poisoning, converting sewage into food.

5. Experimental evidence against flesh eating: McCollum's experiments, Dr. S. Weir Mitchell endorses the meatless regimen, an eminent scientist on meat diet, Fauvel's observations, greater endurance of flesh-abstainers, the death rate reduced by meatless diet, flesh-eating does not develop intelligence, meat-eating and race degeneracy, meat-eating a city habit, non-meat diet best even for carnivorous animals, the Scotchman's dog, the effects of a meat diet on rats, the effects of a flesh diet on rabbits, flesh-eating animals short lived. 6. The ethical argument.

7. Historical facts and authoritative opinions: Biblical teaching about flesh eating, apostles who were flesh abstainers, the Essenes were flesh-abstainers, the diet of the ancient Greeks, King Cyrus a flesh-abstainer, Julius Caesar's army ration, diet of Peruvian soldiers, diet of athletes of ancient Greece, ancient philosophers were flesh-abstainers, Plutarch's essay on flesh-eating, fleshless diet of a Roman emperor, meatless diet endorsed by Gautier, views of Seneca, diet of the ancient Sumerians [today's Iraq], eminent modern flesh abstainers, vegetarian monks, Thoreau on the fleshless diet, a Chinese statesman's experience, the views of two great naturalists, the poet Shelley a food reformer, a child's natural repugnance to meat, Liebig on the advantages of a non-flesh diet, Sylvester Graham's diet reform movement.

8. Interesting facts concerning the dietary habits of various peoples. 9. The marvelous adaptation of the natural diet to human needs. 10. How to discard meats comfortably and safely.

11. Is the disuse of meat advisable from a practical standpoint? The U.S. Department of Agriculture shows the use of less meat to be safe and economic, the importance of planting nut trees, avoidance of meat is necessary to change the intestinal flora, vegetable substitutes for meat, the recent low protein movement in the United States, the half century experience of the Battle Creek Sanitarium with a fleshless diet.

12. Newspaper and magazine misinformation: An "eat-more-meat" campaign, Professor Fisher of Yale University [Connecticut] refuses to support the "eat-more-meat" campaign of the [Chicago, meat] packers, pernicious piffle.

Soy is mentioned in many places. The section titled "Flesh-eating never a universal custom" states (p. 33-34): "According to Mori, the Japanese peasant of the interior is almost an exclusive vegetarian. He eats fish once or twice a month and meat once or twice a year... The soy bean is held in high esteem and used largely in the form of *miso*, a purée prepared from the bean and fermented; also *to-fu*, a sort of cheese; and *cho-yu* [shoyu, soy sauce], which is prepared by mixing the pulverized beans with wheat flour, salt, and water and fermenting from one and a half to five years. The Chinese peasant lives on essentially the same diet, as do also the Siamese, the Koreans, and most other Oriental peoples. Three-fourths of the world's population eat so little meat that it cannot be regarded as anything more than an incidental factor in their bill of fare."

Page 45: Complete "proteins are found in milk and eggs as well as in most nuts, peanuts, and the soy bean..."

Page 73: "The protein of milk, of the soy bean, and of nuts is known to be superior to meat as a source of body nitrogen." Address: M.D., LL.D., F.A.C.S. [Fellow of the American College of Surgeons], Superintendent of the Battle Creek Sanitarium, Battle Creek, Michigan.

242. Kempski, Karl E. 1923. Die Sojabohne: Geschichte, Kultur und Verwendung unter besonderer Beruecksichtigung der Verhaeltnisse in Niederlaendisch-Indien [The soybean:

© Copyright Soyinfo Center 2021

History, culture and use, with special attention to the situation in the Netherlands-Indies]. Berlin: Paul Parey. 88 p. Illust. Index. 22 cm. [101 ref. Ger]

• ***Summary:*** Contents: Introduction. Some remarks on the soybean's early history (p. 8). Overproduction of soybeans in Manchuria after the Russo-Japanese War–English oil mills make their first trials (p. 9). Soybean production in Manchuria (p. 10-11). Soybean production in Korea (p. 11-12). Soybean production in Japan (p. 13-15). Soybean production in America–Soybean meal and soybean milk are introduced (p. 16-22). Soybean production has also expanded in Africa, British India, and the Philippines (p. 22-23). The introduction of soybean cultivation to Europe (p. 23-25). The many uses of the soybean in Europe (p. 25-26). The many uses of soy oil (p. 26-27). Old and new methods of obtaining soy oil (p. 27-31). Soybean production and use of soybeans in the Netherlands-Indies (*Niederländisch-Indien*) (p. 31-61). A table gives the production of soybeans on Java in bouws (1 bouw = 1.7537 acres = 7096.49 square meters). In 1921 the production was 226,186 bouws. Of this: West Java 12,980 bouws. Central Java 162,124 bouws. East Java 61,082 bouws. Thus, Central Java produced about 71.7% of Java's soybeans.

Appendix: Descriptions of how the most important soybean products are manufactured: In Java (tao-hoe [tofu]), tempeh, ketjap [soy sauce], tao-tjiong [or tao-jiung, a term, and perhaps a product, between *doujiang* and *tao-tjo,* Indonesian-style miso] (p. 62-65), in China and Japan (soy sauce, miso, tofu, frozen tofu, natto, soymilk) (p. 65-68). Supplements: I: Soybeans in Manchuria (p. 69-75). II; Hansamuehle [Hansa Muehle] in Hamburg, Germany (p. 75). III: *The Soybean* by Piper and Morse (p. 75).

Note the extensive, early bibliography. Unfortunately, it contains many errors.

This book is largely a review of the literature, but with some original information, especially on Indonesia and Germany. In 1923 Java imported 150,000 to 200,000 tons of soybeans and had a population of 35 million. The area of soybeans planted in Java (including Madura) increased from 157,600 ha in 1918 to 164,700 ha in 1922 (p. 32). In 1921, 67.3% of Java's soybean acreage was in Central Java, 20.7% was in East Java, and only 5.7% was in West Java. (p. 35). Large quantities of soybeans are imported to the Netherlands-Indies from Manchuria: 35,105 metric tons (tonnes) in 1920, rising to 95,742 tonnes in 1922. From these and local soybeans are made tempeh [spelled like this!], tofu (*tahoe; Bohnenkäse*), soy sauce (*Ketjap, Sojasauce*), etc. In Java, mostly black soybeans are grown. To make tofu yellow, it is cooked in an extract of the *Curcuma* root / rhizome. Sometimes it is also sun-dried or fried/roasted (*gebraten*). Tempeh is inoculated with a piece of tempeh from a previous fermentation, and often fried in coconut oil. Detailed descriptions are given of the production of soy sauce (*ketjap;* which is made from black soybeans) and Indonesian miso (*taucho; tao-tjiong*). The author (p. 64) states that ketjap and tao-tjiung are both inoculated using *Hibiscus tiliaceus* (hibiscus) leaves, called *waroe* in Java. Today Germany, like America, produces fresh and dried soymilk, fresh and dried soya cream, meat analogs, and soy sauce (p. 25).

This book contains 17 interesting, old photos. Descriptions of those reproduced from other periodicals are omitted. (1) A soybean field on the farm Kikai Nojo near Sempo-Station, Korea, owned and run by Mr. Moegling (p. 12). (2) A combine used for harvesting regular beans in California in 1918 (p. 19). (3) Many hydraulic presses in a modern American oil factory (p. 29). (4) The equipment used in steaming the soybeans before they are crushed in an American "steam mill" type oil mill (p. 31). (5) The interior of a British oil mill (p. 33). (6) The electrical generators in a modern oil mill (p. 34). (7) Soybeans being harvested manually at Madioen [Madiun, in East Java], Java (p. 48). (8) Harvested soybeans being dried on racks in a field in Java, and carried away by one worker (p. 48). (9) Workers dividing up the harvest in Java (p. 50). (10) Threshing soybeans with bamboo flails in the courtyard of a small farmer in Java (p. 51). (11) Selling soybeans in a small market in Central Java (p. 51).

Tables show: (1) Imports of soybeans to Germany from 1910 (43,500 tonnes) to 1912 (more than 125,200 tonnes) (p. 24). (2) Soybean acreage in Java (including Madoera) from 1918 (157,600 ha) to 1922 (164,700 ha) (p. 32). (3) A breakdown of soybean area in Java in 1921 (of 226,186 bouws) into West Java (12,980 bouws), Central Java (152,154 bouws), and East Java (61,082 bouws) (p. 35). Note: 1 bouw = 1.754 acres (Johnstone 1975). (4) Imports of Manchurian soybeans to Java (including Madoera) and other parts of the Dutch East Indies (mainly Sumatra) from 1920 to 1922 (p. 36). (5) Yields (average or range) of soybeans in various countries: Germany, Italy, British Indies, Manchuria (incl. China and Korea), Japan, America (up to 2,700 kg/ha), Java (p. 52). (6) Comparison of the nutritional composition of soybeans, peas, and regular beans (Phaseolus varieties) (p. 53). (7) Comparison of the nutritional composition of soya cheese (*Sojakäse,* tofu), beef, and lean pork (p. 53). (8) The prices of white and of black soybeans in Java during January and December 1922 and the same two months of 1923 (in Gulden) (p. 56). (9) Comparison of yields, price, costs, and profit for peanuts (*Katjang tanah*) and soybeans in Java (p. 57-58). (10) Nutritional composition of canned frozen tofu (based on E. Senft) (p. 68). (11) Exports of soybeans from five Manchurian ports (Dairen, Antung, Newchwang, Suifenho [Suifenhe], and Sansing) in 1919, 1920, and 1921 (p. 70). (12) Exports and value of soybeans from all of China to four countries (Netherlands, Russia, Japan, Dutch East Indies) in 1919, 1920, and 1921 (p. 72). (13) Exports of soybean oil from five Manchurian ports (Dairen, Antung, Newchwang, Suifenho [Suifenhe], and Harbin) in 1919, 1920, and 1921 (p. 72). (14) Exports and value of soybean

© Copyright Soyinfo Center 2021

oil from all of China to five countries (England, Netherlands, Belgium, Japan, USA) in 1919, 1920, and 1921 (p. 72). (15) Exports of soybean meal from four Manchurian ports (Dairen, Antung, Newchwang, Suifenho [Suifenhe]) in 1919, 1920, and 1921 (p. 73). (16) Exports and value of soybean meal from all of China to three countries (Japan, Russia, USA) in 1919, 1920, and 1921 (p. 73). (17) Names of the five major railway lines in Manchuria (South Manchuria Railway, Chinese Eastern Railway, Peking Mukden Line, Kirin-Changchun Line, Saupingkai-Taonan Line) (p. 74). (18) Amounts (in tons) of soybeans, soybean cake, and soy oil (*Sojaöl*) shipped over the South Manchuria Railway, and the Chinese Eastern Railway in one year (p. 74). (19) Railway transport and production amounts of the mills (in tons) in Dairen and Newchwang of soybeans, soybean cake, and soy oil (*Sojaöl*) during the year 1921 (p. 74). Address: Agricultural Expert in Poerbasari te Pengalengan, Java.

244. *Ministerio de Agricultura de la Nacion* (*Buenos Aires, Argentina*), *Circular.* 1924. La soja: Conferencia con ilustraciones [The soybean: Illustrated lecture with 50 lantern slides]. No. 307. 16 p. Aug. 16. Reissued in Feb. 1932. [Spa]
• ***Summary:*** This is a Spanish translation of USDA Syllabus No. 35–Illustrated lecture on soy beans by W.J. Morse and H.B. Hendrick (1919). The slides and their captions are identical. The opening sentence, a mistranslation, reads: "The soy bean originated in the southeast of Africa [the original says "Asia"], and has been cultivated in China, Korea, and Japan since ancient times." Address: Seccion Propaganda e Informes, Buenos Aires, Argentina.

245. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1924. Soy beans and millet in Chosen [Korea]. 9(22):569. Nov. 26.
• ***Summary:*** "Soy beans and millet in Chosen are expected to proved poor crops this year owing to a prolonged drought, according to R. S. Miller, the United States Consul of that district. The soy bean crop for 1924 is estimated at 18,147,000 bushels compared with 23,760,000 in 1923, or a decrease of 23.6%."

246. Muramatsu, Syunsuke [Shunsuke]. 1924. On the composition of the soy bean. *Bulletin of the Imperial College of Agriculture and Forestry, Morioka* No. 7. 52 p. Nov. [15 ref. Eng]
• ***Summary:*** Contents: I. Chemical studies on the soy bean proteins (p. 1-23; 15 ref).

II. On the starch of soy bean (p. 25-30; 0 ref). Illustrations show (after p. 26): (1) Section of a green seed stained with iodine solution. (2) Section of a ripened seed stained with iodine solution. (3) Section of an imperfectly ripened seed stained with iodine solution. (4) Ditto. (5) Spermoderm of a green seed stained with iodine solution, showing that its palisade cells contain starch granules. (6) Spermoderm of a ripened seed stained with iodine solution. ps = Palisade cell. ed = Endosperm. (7) Section of a cotyledon of a green seed stained with iodine solution, showing the starch granules in it. (8). Ditto, a ripened seed. (9) Section of a cotyledon of a green seed showing the mode of aggregation of starch granules in the cell. (10). Starch granules X 1000 magnification.

III. On the natural soap occurring in soy bean (p. 31-41; 0 ref). Illustration (p. 38): Crystals of hispidic acid X 450 magnification.

IV. On the preparation of tofu (p. 43-52; 0 ref). Contents of part IV, "On the preparation of tofu." Introduction." Introduction. Raw materials: Soy bean, nigari (the composition of each is given). The method of preparation of tofu. An improvement for the preparation of tofu (using calcium chloride as a coagulant to increase the calcium content and quality). Conclusion.

It is said the method for preparing tofu was developed in China during the Han dynasty, and was brought to Japan during the rule of Toyotomi Hideyoshi (1585) from Korea. The author analyzed the composition of 7 varieties of soybeans used to make tofu. They contained on average 12.29% moisture, 43.18% crude protein, and 18.72% crude fat. The smaller beans contained more protein and gave higher yields of tofu. Address: Morioka Koto Norin Gakko, Nogei Kagaku Jikken-shitsu, Morioka, Japan.

247. Dorsett, P.H.; Dorsett, Jim H. 1924-1927. Agricultural explorations–Japan, Korea, Manchuria and Northeastern China, 1924-26.
• ***Summary:*** This set of microfilms, located in the National Archives, is part of a larger collection titled "Expedition Reports of the Office of Foreign Seed and Plant Introduction of the [U.S.] Department of Agriculture 1900-1938." The records reproduced in the microfilm publication are from *Records of the Bureau of Plant Industry, Soils and Agricultural Engineering, Record Group 54*–also known as Microfilm M840.

The set is occasionally cited incorrectly as "Plant hunting in northeastern China." However, so far as we know, no book or PhD thesis, other than the report in the National Archives Record Group 54, has ever been published. Note: We highly recommend this important USDA expedition to East Asia as the subject of a PhD thesis or book. Many new soybean varieties were introduced by this expedition.

Dorsett kept a daily log of his activities during the years 1924 to 1927; the logs are in the custody of the National Archives and microfilm copies may be found on Microfilm M840.

An index to Microfilm M840, found in the National

Archives & Records Administration (US) (NARA) microfilm catalog is available in PDF format.

The microfilms concerning the 1924-26 Dorsett expedition are found in RG-54 on Rolls 11-15, Volumes 40-54, and Roll 20, Volume 73.

Another part of this expedition is: "Clips from Motion Pictures Made by P. Howard Dorsett and Jim Dorsett, compiled 1925-1926.

"ARC Identifier 516517 / Local Identifier 54-FSD.

"Series from Record Group 54: Records of the Bureau of Plant Industry, Soils, and Agricultural Engineering, 1853–1977.

"Scope and Content: These surveys, conducted over several years by P. Howard Dorsett and W.J. Morse, respectively, resulted in the collection of some 3,000 new varieties of soybeans from China, Manchuria, Korea, and Sakhalin Island, U.S.S.R. The images in this series are a reference file, apparently produced by the Motion Picture Laboratory of the Department of Agriculture, from motion pictures produced during the surveys of P. Howard Dorsett. His son, Jim, accompanied his father on these surveys and shot the motion picture footage. After the 1926 survey, Jim Dorsett joined the staff of the National Geographic Society as a photographer; he died in 1927. The series consists of 1 to 4–frame opening segments from each film, with accompanying caption for the subject contents of each film. Covering the years 1925 and 1926, the films documented the Dorsetts' journeys to Manchuria, China, Ceylon, Java, and Sumatra. In addition to footage of different varieties of soybeans found during the surveys, these film clips also show examples of indigenous flowers, plants, and trees, including wild peony (500), sorghum (313), Dutchman's Pipe (331), the King Coconut (405), and the Cannon Ball Tree (480).

"The camera used 35mm film wound onto special cartridges, and produced 18 x 24mm images. Duplicate positives, negatives, and contact prints have been made from these film clips. The cellulose nitrate and cellulose acetate film (probably made in the 1950's as a copy) are unstable and should not be used. The whereabouts of the motion pictures, from which these clips were taken, are unknown."

scenes of soybean transportation, storage, and processing in Manchuria, as follows: (1) Mule drivers whipping mules trying to pull carts loaded with large sacks of soybeans over muddy roads. (2) Cylindrical osier storage bins for soybeans. (3) Row upon row of sacks of soybeans piled high in storage near docks. (4) Soy sauce being made in a courtyard; each earthenware jar is covered with a woven conical lid. (5) The inside of a huge and modern soy sauce plant. (6) Wooden kegs and glass bottles of Yamasa shoyu. (7) Soy sprouts (*daizu moyashi*) growing in round woven baskets. (8-11) Soy oil being pressed using vertical screw presses [as an alternative to hydraulic presses]–four views. (12) Boilers used in a soybean mill. (13) A wooden barrel of soybean oil being sealed. (14) Soy oil packaged in many small containers, each surrounded by a wicker basket. (15) Round soybean cakes stacked high on railway flatcars. (16) The inside of a modern soy oil factory.

Note 1. This is the earliest Japanese-language document seen (Jan. 2013) that uses the term *daizu moyashi* to refer to soy sprouts.

Contents: 1. Current status of soybean production and consumption: A. Production: Overview (p. 2), Japan (p. 4), Korea (p. 12), Manchuria (p. 16), China (except 3 eastern provinces, but including Eastern Inner Mongolia, p. 31), USA (p. 34), British colonies (p. 37), European countries (p. 40). B. Consumption: Japan (p. 41), Korea (p. 52), Manchuria (p. 57), China (p. 59), Dutch East Indies (Indonesia, p. 60), USA (p. 61), European countries (p. 63).

2. Characteristics of soybeans: A. From a physical sciences viewpoint (p. 67): Structure (overview, cotyledons, hypocotyl, seed coat), contents of each system (p. 70), appearance (p. 73; color, gloss, shape, size, hilum (*fusuma*) color, young plumule leaf color, ratio of seed to seed coat). B. From chemical viewpoint (p. 82): General composition, structure of each component (p. 109; protein, oil, carbohydrate, ash/minerals, vitamins). C. Appearance and relationship between oil and protein content (p. 126): Oil and protein color related to color, glossiness, shape, size, hilum color, young plumule leaf color. D. Evaluating soybean quality (p. 140): Overview, key points (sizes, shapes, colors, glossiness, hilum color, young plumule leaf color, ratio of seed coat to seed, dryness of seed, volume, weight, smell, mixing of different varieties, ratio of imperfect seeds, amount of other types of seeds), collection of materials for testing, testing and evaluating commercial soybeans.

3. Soybean usage and processing (p. 175). A. One view of main usage of soybeans. B. Nutritional value of soybeans as food (p. 183): Nutritional value of soy protein. C. Processed soyfoods (p. 208): Soy sprouts (p. 208), natto (*itohiki nattô*, p. 212, Hamanatto, p. 224), types of tofu (regular tofu [*nama-dôfu*, p. 226], *kori-dofu* or *koya-dofu*, p. 240, aburaage, p. 245, tofu curds [*tofu nô*, p. 247], hard tofu [*tofu-kan*, p. 247], fragrant hard tofu [*kô-kan*, p. 248], *senchô tofu*, p. 249, fermented tofu [*nyûfu or funyû*, p. 249]), *tofu-p'i* or yuba (p. 256), soymilk and artificial cow's milk, p. 259, soybean flour raw, or roasted (kinako, p. 263), shoyu (p. 266; overview of miso and shoyu, Japanese traditional regular shoyu, p. 267, Japanese traditional special shoyu and tamari, p. 269, Chinese soy sauce, p. 272, recent shoyu research and development, p. 274), miso (p. 280; Japanese traditional regular miso, Japanese traditional special and processed miso, p. 282, Chinese miso, recent miso research and development, p, 285). D. Soybeans as feed or fodder (p. 287; green soybeans as feed, p. 290): Fresh forage, dried forage or hay. E. Soybeans as manure or fertilizer (*hiryô*, p. 297; in the Kaijô area of Manchuria, have been roasted and steamed, and mixed with compost, and used for green manure (*ryokuhi*) or soybean cake (*daizu kasu*). This method has also been used in the northeastern provinces (*Tohoku Chiho*) of Japan in rice fields). F. Soybeans as oilseeds (p. 302). G. Use of soybean protein in industrial products (p. 304).

4. The soy oil extraction industry (p. 305): A. Methods of removing the oil (origins, traditional methods, hydraulic pressing, extraction method, p. 340). B. Advantages and disadvantages of each method (p. 348). C. The soy oil industry in Manchuria (p. 357): History of development, important places for soy oil on the Manchurian Railway, economic condition of the Manchurian oil industry (p. 420), oil extraction in Japan (history, p. 437, commercial factories, p. 442, development of these factories, p. 451).

5. Soybean meal or cake and its composition (p. 464). A. The varieties of soybean meal or cake and the composition of each. B. Evaluation of quality (p. 473). C. Soybean meal or cake as a fodder (p. 478): Feeding value and digestibility, incorrectness of the theory that there are bad effects from feeding soybean meal or cake (p. 479). D. Soybean meal or cake as a fertilizer (p. 490). E. Soybean meal or cake as food (p. 504): Use as a raw material for shoyu production (p. 506), use to make soy flour (p. 509). F. Soybean meal or cake as a source of protein in industrial products.

6. Soy oil and its processing (p. 526). A. Characteristics of soy oil: Composition, physical characteristics (p. 535), chemical characteristics, testing and evaluating soy oil (p. 564), the quality of commercial soy oil products (p. 577). B. Refining soy oil (p. 587). C. The use and processing of soy oil (p. 631): Overview, refined soy oil as a food, substitute for salad oil, or for deep-frying oil, as an illuminant, as a cutting oil, lard substitute, margarine, in paints, soap, hardened oil, for waterproofing, substitute for petroleum oil, glycerin, fatty acids, stearine.

7. Exports and imports of soybeans, soybean meal or cake, and soy oil (p. 708). A. Manchuria. B. Manchurian exports. C. China. D. Japan. E. Korea. Appendix: Bibliography of soybeans (Japanese-, German, and English-language works; p. 748). List of photos.

Note 2. This is the earliest Japanese-language document seen (Oct. 2011) that mentions fermented tofu, which it calls *nyûfu* or *funyû*.

© Copyright Soyinfo Center 2021

Note 3. This is the earliest Japanese-language document seen (Feb. 2012) that uses the term *itohiki nattô* to refer to natto. Address: Dairen, Manchuria.

251. *Crops and Markets* (*USDA*). 1925. Foreign crops and markets: Production of oil materials. 3(15):240. April 11.
• ***Summary:*** "Manchuria is by far the most important soybean producing region for which an estimate is available. An unofficial estimate for that part of China places the 1924 crop about equal to or slightly greater than the 1923 harvest of 2,500,000 tons. The Chosen [Korean] crop, according to a commercial estimate, is much smaller this year than last, while the United States crop is slightly larger. No recent estimates are available for Japan."

Large producers of olives for oil include Spain, Italy and Greece.

"The hempseed, rapeseed and sesamum crops were probably slightly smaller in 1924 than in 1923... In both rapeseed and sesamum the crop of British India is the dominating factor." Address: Washington, DC.

252. Kaku, T. 1925. [Analysis of miso of Korea]. *Chosen Ikai* 55:317-; 56:495-. [Jap]*

253. Adachi, Kinnosuke. 1925. Manchuria: a survey (Continued–Document part IV). New York, NY: R.M. McBride & Co. xvii + 401 p. Plus 62 plates on unnumbered leaves. Illust. Maps (many, 1 folded, p. 10). 24 cm.
• ***Summary:*** Continued: Chapter 13, "Trade and trade tendencies" states (p. 258-59): "There are also eight articles on the list of her exports which put all the rest in the shade. They are in their order of importance:

"Bean cake 58,072,138 Haikwan taels
"Soya beans 36,164,538 Hk. taels
"Kaoliang 23,664,024 Hk. taels
"Bean oil 14,367,410 Hk. taels
"Coal and coke 13,462,752 Hk. taels
"Raw silk, wild (tussah) 11,242,321 Hk. taels
"Millet 6,591,058 Hk. taels
"Timber and bamboo 5,462,017 Hk. taels

"All of these belong to the raw-material class except bean oil; and the Manchurian bean oil is not at all refined in the sense America or Europe understands the term. In short, the character of Manchurian trade is essentially of colonial type. The list of her exports paints her as a great agricultural state, as we have already seen; and the story of her export trade is largely the epic of her humble bean. No prophet or historian can correctly read the meaning of this simple statement, however, unless he can vision clearly to what extent [soya] beans enter into the food articles in the Far East in general and in Nippon and Chosen [Korea] in particular. This is the aspect which we have already treated at length in other chapters. From all of which it is not difficult to see why it is that Nippon places so much emphasis on the possibilities of Manchuria–on the economic development of that country. American and British writers who cannot see Manchuria except from a political angle miss the point entirely as far as the real meaning of Nippon's activities in the Eastern Three Provinces is concerned."

Full-page photos show: (1) "Beans and bean-cakes in the open storage ground at the Wharf compound at Dairen" (facing p. 258). (2) "Soya bean crowding into Kaiyuan from surrounding districts for shipment" (facing p. 270).

Also in Chapter 13. "Trade and trade tendencies" is a section titled "Soya beans and the Manchurian trade" (p. 270-72): "The prizes and honors the soya bean has won in the profitable arena of commerce are countless and old–achieved long before the opening of the Port of Newchwang to foreign commerce. Like champions in any other field, it rarely took a backward step on its way to triumph. For the period of thirty years from 1872 to 1901, when the port of Yingkou, known to all the outside world as Newchwang, was the only outlet for Manchurian goods, the annual average shipments of soya beans out of Manchuria amounted to 2,592,869 piculs (1 picul is 133.3 pounds) valued at 10,222,471 Hk. taels. In the same thirty years the average annual export of bean cake amounted to 6,096,920 piculs worth 2,061,117 Hk. taels, and that of bean oil to 54,147 piculs of the value of 255,221 Hk. taels. From that time on the progress has been marked: in the ten-year period from 1913 to 1922, when Dairen and Antung and other points of outlet in Manchuria were opened and operating, the average annual exportation of soya beans amounted to 7,370,505 piculs valued at 21,050,937 Hk. taels; the average annual figures for the bean cake for the same period were 18,672,447 piculs valued at 38,053,762 Hk. taels; and for the bean oil 1,688,163 piculs valued at 14,477,610.

"One gets a hint of the giant step the soya bean has taken as the leader of international trade commodities in Manchuria by looking at the following two figures and noting the distance between them: The total value of bean, bean-cake, and bean-oil exports for 1907 through the Big Three of Manchurian ports amounted to 17,015,365 Hk. taels. In 1922 they were valued at 115,438,224. After the first trial shipment of 100 tons to England in November, 1908, which proved an instantaneous success, the first regular shipment of 5,200 tons was landed in Hull in March, 1909. That was the beginning. In the season of 1909-1910 no less than 400,000 tons were shipped to England. Fifty steamers were chartered for the sole purpose of carrying beans from Dairen and Vladivostok to Europe. In the month of December, 1909, alone, 300,000 tons of new beans worth two million pounds sterling were contracted.

"These figures are colorless, however, to any one who knows intimately to what extent the soya bean has leavened the life and activities of trade in Manchuria. More than a thousand mule- and donkey-power *yufang* [traditional Manchurian bean-oil mills] all over South and Central

© Copyright Soyinfo Center 2021

Manchuria would be without a job, as would be hundreds of banks which finance them, if tomorrow the bean were to disappear from the face of the country. More than 26,000,000 yen of capital funds in 337 larger modern oil mills would be instantly idle. In 1922 more than 252,620,000 catties of bean oil and more than fifty million pieces of bean cake came from the oil mills. Without them the market places would have been as lonely as lower Broadway at midnight.

"Coal of course gave, in 1922 and in other years, the great South Manchuria Railway its heaviest freight tonnage; but the second ranking commodity in terms of railway tonnage was soya bean. Out of the 12,043,790 tons, the total tonnage of principal commodities carried over the South Manchuria line, the bean and bean oil accounted for more than 2,077,000 tons. Kaoliang, the biggest freight tonnage producer among Manchurian grains, could not provide half of the bean tonnage; it was less than 912,200 tons. All other grains combined could give the railway no more than 688,975 tons. When one comes to the export tonnage out of Dairen, respect for the humble bean increases mightily: out of the total of 4,081,431 tons exported, bean, bean cake, and oil made up pretty nearly half–to be exact, 1,927,803 tons.

"And the most eloquent part of the story of the soya bean is that not half–not one hundredth–has ever yet been told." Address: Author.

254. Adachi, Kinnosuke. 1925. Manchuria: a survey. Map of Dairen (Dalny) with legend (Continued–Document part IV). New York, NY: R.M. McBride & Co. xvii + 401 p. Plus 62 plates on unnumbered leaves. Illust. Maps (many, 1 folded, p. 10). 24 cm.

• ***Summary:*** This detailed map of Dairen (2-page spread after p. 268) in about 1922 has a legend in the upper left corner which gives a reference number for each of 46 importance places on the map.

Numbers 1-11 run vertically down both sides of the map. Letters A-N run horizontally along the top and bottom of the map. The Reference Numbers are as follows.

255. Kephart, L.W. 1926. Charles Vancouver Piper. 7 p. Unpublished manuscript.

• ***Summary:*** "Charles Vancouver Piper, ex-president and recently elected Fellow of the American Society of Agronomy, and for twenty-three years Agrostologist in Charge of the Office of Forage Crop Investigations of the United States Department of Agriculture, died at Washington, D.C., February 11, 1926. He was in his 59th year. He had been in poor health for nearly two years and had been forced to curtail the extraordinarily active interests in which he was engaged, but he had been attending his office regularly until a few days before his death.

"In the passing of Prof. Piper, the science of agronomy loses one of its most distinguished exponents and staunchest friends. In a day when the study of field crops consisted mostly of simple plot tests and its proponents were looked upon merely as glorified farm hands, he insisted on the maintenance of the highest scientific standards in agronomic

© Copyright Soyinfo Center 2021

research and, by the example of his own individual contributions, did much to convince the classical sciences that agronomy was worthy of a place among them. In that conception he never faltered and his many writings, while clear, lucid and practical, are accepted as the authoritative treatises on these subjects throughout the world.

"Professor Piper belonged to that fast disappearing class of truly versatile naturalists who are competent in all branches of biology. He was primarily a taxonomic botanist and, in that difficult field, had gained distinction long before the science of agronomy, as such, was conceived. He was almost equally proficient in entomology, while in the hundred or more technical papers from his pen are found treatises on pathology, histology, soil chemistry, historical geology and plant and animal physiology. In addition, he was a master of etymology and of languages and understood the derivation and use of words as perhaps no other man in the agricultural professions. Exactness and precision of phraseology were his hobby and he coined many words or called attention to the incorrect use of words in both technical and popular speech.

"Perhaps the reason for his broad interest in the natural sciences can be found in the background of his boyhood days. He was born in Vancouver, British Columbia and his early years were spent amid the teeming life of the northwest Pacific Coast. Probably there was an inborn spirit of the naturalist, or it may have been merely the urge of his rugged physique that took him out into the woods and fields and early gave him an interest in the living world about him. At all events, while still in his teens, he began the systematic study of the fauna and flora of his native region. To such good effect did he apply himself that before he was eighteen he had graduated as Bachelor of Science from Washington State College [sic, Univ. of Washington]. Before he was twenty-six he had acquired his Master's degree and had been appointed Professor and Head of the department of Zoology and Biology of the same institution. To the upbuilding of that department he devoted the next ten years of his life, setting an example of interest and enthusiasm that inspired those about him to a degree not common in those branches of study. Somewhere he found time during the summers to go East and study at Harvard, where he obtained an M.S. in 1900. Years later the doctorate was conferred upon him by the Kansas Agricultural College. Most of his vacations at Pullman, however, were spent exploring the little known mountains, forests and plains of Washington, in the course of which he built up an extensive collection of plants, which culminated in 1915 in the publication of the *Flora of the Northwest Coast,* the first and foremost manual of the plants of that region.

"In 1903, Prof. Piper came to the Department of Agriculture to take charge of the agrostology or grass investigations of the old Office of Farm Management. Two years later Forage Crop Investigations became a separate office and Prof. Piper was placed in charge. Immediately his attention turned to the possibility of applying his botanical knowledge to the solution of forage difficulties. The most promising avenue of approach appeared to be the introduction and testing of forage plants from other parts of the world. Arrangements were therefore made with the Office of Foreign Seed and Plant Introduction for explorers to be sent to the remote corners of the earth in search of unknown plants and a systematic combing of the earth began, which has continued to the present time. This search was by no means a blind hit-and-miss peregrination. Each journey was definitely for the purpose of uncovering some type or species of plant whose existence seemed probable because of the botanical relation to other plants, but whose like had never actually been seen. Such a program on the part of a botanist can be compared only to the efforts of the chemist, who, having at hand the composition and behavior of the known substances, constructs a Periodic Table of the elements, predicting that the gaps in the table will be filled at some time in the future by the discovery of other elements corresponding exactly in chemical composition to the hypothetical figures in the table. Or it may be likened to the effort of the astronomer, who, carefully arranging the known celestial bodies in orderly fashion, predicts that at some precise moment, perhaps years in the future, two bodies will come into juxtaposition. Botanical exploration, based on such a premise, had not, so far as known, heretofore been made, and it required courage of the convictions of a rare order to risk the funds and reputation of the government in such pursuits.

"That these endeavors were richly rewarded is well known. Probably the most spectacular success was Sudan grass. This plant, now so important a part of the agriculture of the great plains, would today be utterly unknown in America had not Prof. Piper, by pure deductive reasoning, decided that in a certain part of Africa there was almost certain to be found the missing link between Johnson grass, a perennial, and its evolutionary forms, the annual sorghums. Seed of the sorghums was accordingly assembled from all northern Africa, and in a small packet received from the director of agriculture at Khartum [Khartoum], in the Sudan, and labeled simply *Sorghum Halepense,* was contained the precious seeds so earnestly sought. After careful trials, the plant was released to the public and, since 1915, the crop has been estimated to be worth $10,000,000 a year to the people of the United States.

"Next in importance to Sudan grass and apparently destined to exceed it in value are the improved varieties of soybeans which have made possible the culture of this crop north of the Mason and Dixon Line. So gradually and systematically have the seeds of these new varieties been diffused through the northern states that their origin is sometimes obscured. But it is a fact that soybeans would still be an unprofitable curiosity outside of the cotton belt had not

Prof. Piper brought together and segregated and cross-bred at various places the hundreds of varieties found in Mongolia, Korea and the Far East" (Continued). Address: [Asst. Agronomist, Office of Forage-Crop Investigations, Bureau of Plant Industry [USDA, Washington, DC].

256. Wolf, Frederick A.; Lehman, S.G. 1926. Diseases of soy beans which occur both in North Carolina and the Orient. *J. of Agricultural Research* 33(4):391-96. Aug. 15. [19 ref]
• ***Summary:*** "Introduction: A number of the more important diseases of soy bean, *Soja max* (L.) Piper have been investigated in the last 10 years at the North Carolina Experiment Station" (nine papers are cited).

"The most significant result of this work, which has arisen both from the laboratory studies and the field survey, has been the establishment of the fact that certain of these diseases are seed-borne. This fact accounts for the distribution of the diseases throughout the States in which soy beans are grown, serves as a basis for control, and suggests that some of the diseases probably were introduced into the United States with the seed. It is the primary purpose of this report to present such evidence as bears on the last phase of this problem and to give a brief account of the diseases which are common to the Orient and to North Carolina.

"As is well known, the soy bean is native to eastern Asia and is a crop of great importance in Japan, Manchuria, Chosen (Korea), and Mongolia. It has been a major crop of the Orient since ancient times, but was of no importance as a farm crop in the United States until about 1880.

"In the last 10 years there has been a progressive increase in soy-bean acreage in this country, especially in North Carolina and in several States of the Corn Belt. To-day soy beans are a major crop in the United States.

"Apparently the fact that soy beans have only recently become of commercial importance in this country is responsible for the lack of knowledge of soy-bean diseases as found in the United States. A survey of available literature on soy-bean diseases in eastern [Asia] shows that a similar condition exists there, and that such information as has been recorded on soy-bean diseases in Asia has been contributed largely by Miura (13), Hemmi (6, 7, 8), Takimoto (16), and Nakata. The present writers' knowledge of soy-bean diseases in the Orient is limited by the fact that a considerable part of the work done there has been published in Japanese. Collections of diseased plants and unpublished manuscripts and additional notes sent by Miura, Hemmi, and Nakata have been of invaluable service to the present writers in their work."

The following diseases occur in both North Carolina and eastern Asia: Wilt (*Fusarium tracheiphilum*). Mildew (*Peronospora manshurica*). Brown-spot disease (*Septoria glycines*). Pod-and-stem blight (*Diaporthe sojae*) [=*D. phaseolorum* var. *sojae*]. Cercospora leaf spot (*Cercospora diazu*) [=*C. sojina*, Frog-eye leaf spot]. Anthracnose (*Colletotrichum glycines*) [=*C. dematium f. truncata*], and *Glomerella glycines.* Bacterial blight.

*Xanthomonas phaseoli* var. *sojense* and *Sclerotium rolfsii* are found in North Carolina but not in Asia. *Sclerotinia libertiana* (=*Whetzelinia sclerotiotum*), *Hypochnus centrifugus, Uromyces sojae* (=*Phakopsora pachyrhizi*), and *Phyllosticta sojaecola* occur in eastern Asia but not in North Carolina. Address: 1. Plant Pathologist, Office of Fruit Diseases, Bureau of Plant Industry, USDA; 2. Plant Pathologist, North Carolina Agric. Exp. Station.

257. South Manchuria Railway Co. 1926. Soya beans in Manchuria. Dairen: SMRC Agricultural Office. 40 p. Nov. 26 cm. [Eng]
• ***Summary:*** Contents: 1. How Manchurian beans are produced: Soybean production in the world (Japan, Chosen {Korea}, Manchuria, China proper, United States), bean cultivation in Manchuria (how production has been increased, Manchuria suited for bean production {meteorological peculiarities, Manchurian soil and bean cultivation, local adaptability}). 2. World-wide demand for Manchurian beans: Supply and demand in Manchuria, bean demand in destination countries (demands in Japan, in China proper, in Java {Dutch East Indies}, in European countries).

3. Uses of beans: Introduction (gives uses as food, cattle feed, and fertilizer, and uses for the oil), general uses of beans (beans, bean oil, bean cake, food), value of beans as food (from general constituents, food value of beans from new dietetic point of view, conclusion), uses of bean oil (properties of bean oil, miscellaneous uses of bean oil {direct uses (native), refined bean oil for table use, substitute for lard, substitute for butter, paint solvent, soap, glycerine and fatty acid, candles, water proof, substitute for petroleum, substitute for India Rubber, etc.}), uses of bean cake (as fertilizer, bean cake as cattle feed, bean powder [probably defatted soybean flour] made from bean cake & its uses, "soy" made from bean residuum, "Aji-no-moto" made from bean residuum, water-paint made {Solite, invented by Mr. T. Suzuki and manufactured and sold by the Dairen Solite & Co. until several years ago}, protein products made from bean residuum {such as paper sizing, celluloid substitutes, and Satolite [soybean plastic]}). 4. Bean milling in Manchuria: History of development, oil milling processes (expressing process, by process of operation, by kinds of expressing devices, by chemical / benzine extraction at Honen Bean Mill, Dairen), advantages & disadvantages of different processes (wedge, screw, & hydraulic systems compared; round cake, plate cake, & extraction system compared {advantages & disadvantages of extraction system, advantages & disadvantages of bean plate, advantages & disadvantages of hydraulic pressure system}), bean mills in Manchuria.

5. Accumulation & distribution of beans, bean cake

© Copyright Soyinfo Center 2021

& oil: Produce movements in South Manchuria, produce movements in North Manchuria. 6. Business in Manchurian produce: Business on the Exchange (Japanese Exchanges, Chinese Exchanges), business outside the Exchanges (spot deals in beans {river beans, market beans, osier bin beans, train beans}, by forward contract {by future contract, business in the green field, by speculation}, business in bean cake & oil).

7. Export staple produce: Staple produce in Manchurian trade, exports of staple produce in South & North Manchuria compared, position of custom houses in Manchuria concerning export of staple produce.

In Chapter 4, "Bean milling in Manchuria," section 1 titled "History of development" states: The [soya] Bean milling industry was established in China a few hundred years ago. In Manchuria, hemp oil mills used to be practically all that existed up until about 60 years ago [i.e., until about 1866]. Around Tiehling and Changchun, which were important [soya] bean markets, the process for expressing oil from hempseed was applied to Beans with excellent results; this was the origin of the bean milling industry in Manchuria. As the demand for bean oil kept rising, hempseed oil found its uses gradually reduced, and in time the term "oil mill" came to refer to a bean oil factory. At that time, the object of the mills lay chiefly in producing Bean Oil; Bean Cake was regarded as a by-product, good only for cattle feed. Most of the demand was local and the milling process was primitive and on a small scale, often conducted by hand or by means of a donkey.

Phase II: The Sino-Japanese War (1894-1895) marked the start of Bean Cake exports to Japan. As its fertilizing value came to be recognized, demand for to Japan expanded rapidly. Starting at this time, Bean Cake came to be seen as the main product and Bean Oil as the by-product.

Phase III: In recent years, with the worldwide shortage of oils and fats, Manchurian Bean Oil has come to be exported worldwide; exports to the West have begun and increased dramatically. Demand reached its zenith during the Great War [World War I].

Photos show: Seed-bean field (Agricultural Experiment Station, Kungchuling). Soya beans in pods. Sowing of seed beans. Bean plant in harvesting season. Weeding in bean field. Beans being threshed in farm-yard. Beans harvested & carted away. Beans stored in Osier Bins in the yard of the local merchant. Bean carts wending their way the Market in the Interior. Old screw patterned presses in Manchuria. Hills of bags of beans in Changchun Station Yard. Train loads of bean cake to be shunted to quay of shipment. Hydraulic pressure system in Manchuria.

The section titled "'Aji-no-moto' made from bean residuum" (p. 17) states: "In the amino acid that constitutes [soy] bean protein is contained much glutamic acid that serves as the chief source of 'ajinomoto,' a very popular flavor at Japanese table. Thus, by decomposing the constituents of bean residuum [defatted soybean meal], the manufacture of glutamic acid soda will be easily accomplished." Note: This is the earliest document seen (Jan. 2014) concerning "aji-no-moto" / "ajinomoto" (mono-sodium-glutamate) made from soybeans.

258. Takagi, M. 1926. On the frequency of the spontaneous hybridization in soybean. *Annals of the Agricultural Experiment Station of the Governor General of Chosen* 4:323-24. Abstract in Japanese Journal of Botany 3:68 for 1927. *

259. International Institute of Agriculture. Bureau of Statistics. 1926. Production et commerce des produits oleagineux de huiles vegetales [Oleaginous products and vegetable oils–Production and trade]. Rome, Italy: Institut International d'Agriculture. Service de la Statistique Generale. 192 p. Index 24 cm. [30+ ref. Fre; Eng]
• ***Summary:*** The Introduction begins: "This volume is a continuation of a the monograph on oleaginous products (*produits oléagineux*) and vegetable oils, published in 1921 in French, then in 1923, with numerous amplifications and modifications, in English.

Soya is discussed in detail in English on pages 70-73. Tables show: (1) World production of soybeans in 1909-13, 1921, 1922, 1923, and 1924 in the following countries (in thousands of quintals): China (incl. Manchuria), Korea, Japan, United States, Java & Madura, and Kwangtung (French: Koung-Toung; today's Guangdong province in southern China). In 1923, China was by far the leading country (22,680), followed by Korea (6,466), Japan (4,378), USA (2,434), and Java and Madura (973). (2) Exports of soybeans worldwide (during the same 5 years as (1) above). (3) Exports of soy oil worldwide (during the same 5 years as (1) above). Note: This same basic information is given in French on pages 24-27.

Pages 60-63 give a worldwide overview in English. Tables show: (4) World production of primary oleaginous products (during the same 5 years as (1) above). The eight products are: Groundnuts, rapeseed, linseed, hempseed, cottonseed, sesamum, soya and copra. For sesamum, soya, and copra, values are given only for the year 1924. (5) World production of primary oleaginous products (expressed in terms of oil, in thousands of quintals). (6) World exports of primary oleaginous products (in thousands of quintals). (7) Excess of imports (+) or of exports (-) of primary oleaginous products terms of oil (in thousands of quintals). For the eight products for the years 1909-1913 and 1924 for: Europe, North and Central America, South America, Asia, Africa, Oceania. (8) World exports of vegetable oils (in thousands of quintals during the same 5 years as (1) above).

There are also detailed sections in English on groundnuts (p. 64-68), and sesamum (p. 68-71). Address: Rome, Italy.

• ***Summary:*** Pages 171-72, under "Soja," list 19 diseases attacking *Soja* spp. which are new to or not widely distributed in the U.S.: "*Aecidium glycines* P. Henn. Leaf rust on *S. max* in Tanganyika and Uganda." Note: This is the earliest document seen (March 2021) concerning soybeans in Uganda, or the cultivation of soybeans in Uganda.

"*Ascochyta* sp. On *S. max* in Japan.

"*Bacterium* sp. A leaf-spotting disease of *S. max*, said to be due to a bacterium distinct from other species on this host, is reported from Japan.

"*Cercospora daizii* Miura. Leaf spot on *S. max* in Manchuria.

"*Cercospora glycines* Cke. Definite dark-brown leaf spots on *Glycine clandestina* in Australia.

"*Colletotrichum glycines* Hori. Anthracnose on stems and pods of *S. max* in Japan and Chosen.

"*Fusarium* sp. Causes ring spot disease of *S. max* in Manchuria.

"*Hypochnus centrifugus* Tul. Causes cankers on stems, blighting infected plants of *S. max* in Manchuria.

"*Hypochnus cucumeris* Frank. See Cucumis.

"*Mosaic.* Mosaic disease of *S. max* reported from Japan is probably the same as the mosaic and crinkling reported from the United States.

"*Mycosphaerella phaseotarum* Siem. See Phaseolus.

"*Peronospora manshurica* (Naoum) Syd. (*P. trifoliorum* De B. var. *manshurica* Naoum.) Downy mildew on leaves of *S. max* in Siberia, India, Formosa, and Manchuria, causing premature leaf fall.

"*Phyllosticta sojaecola* Massal. (*Phaeosphaerulina sojaecola* Miura.) Subcircular, dull-brown leaf spots on *S. max* in Japan, Russia, Manchuria, and Italy.

"*Pseudomonas glycines* Nak. Circular yellow leaf spots, becoming brown to dark-brown with yellow margins on *S. max* in Japan. The spots may be as numerous as 70 to 80 per square centimeter, causing death of infected leaves.

"*Septoria glycines* T. Hem. Brown leaf spots on *S. max* in Japan and Manchuria.

"*Septoria sojina* v. Thuem. Irregular yellowish leaf spots on *S. max* in Italy, Japan, and Austria.

"*Trotteria venturioides* Sacc. Black mildew on leaves of *S. max* in the Philippines.

"*Uredo vignae* Bres. See Vigna.

"*Uromyces sojae* (P. Henn.) Syd. Brown rust pustules on leaves of *S. max* in Japan, Java, China, India, Formosa, Manchuria, and the Philippines." Address: Chief Pathological Inspector, Federal Horticultural Board.

261. Takenobu, Y. 1926. Japan Year Book. Tokyo: Japan Year Book Office. 626 + 162 p. See p. 447, 449, 514. 22nd annual issue.

• ***Summary:*** The total area of Japan proper is 147,652 square miles (382,861 square kilometers). Japan's population (as of Oct. 1925) was 59,736,704. A large area of Japan is very mountainous, and it is estimated that the cultivated area is about 6 million hectares. According to Prof. Shimizu of Keio University the population density per square kilometer of cultivated area in Japan is much larger than various European countries. Japan 969. Belgium 394. Italy 305. Netherlands 273. England 226. Germany 195. Switzerland 168. France 108. Spain 90.

In chapter 29, Agriculture, the section titled "Beans, potatoes and sweet potatoes" (p. 449) begins with a table showing the production (in koku; 1 koku = 180 liters) of these crops from 1921 to 1923, inclusive. Soybean production decreased from:

4.261 million *koku* in 1921
3.628 million *koku* in 1922
3.434 million *koku* in 1923.

The text continues: "Among subsidiary farm crops there is perhaps nothing that plays so important a part in the Japanese kitchen as soy beans..."

In the section on "Breweries" (p. 512+) the subsection titled "Soy" [meaning shoyu or soy sauce] (p. 514) states: "For soy the prefecture of Chiba, which is contiguous to Tokyo municipality, heads all other places on the list as to output. Parched wheat mixed with salt and beans is a principal ingredient. The process is still far from scientific, requiring about 12 months before the liquid is ready for sale. It is also costly, as it does not much admit labor-saving appliances. To obviate these disadvantages have been tried several patented processes, but most of them have failed. In 1917 the leading soy manufactures of Chiba-ken combined and formed the Noda Soy Co., capital ¥7,000,000 p.u. with capacity of about 250,000 'koku' i.e. about 60 per cent. of the total output of the Prefecture."

A table (p. 514) shows production of sake, beer, and soy from 1919 to 1922 (year ending in March). Production of soy (in 1,000 koku) grew from 2,940 in 1919 to 3,268 in 1922. Address: Prof. at the Waseda Univ. and late of the "Japan Times".

262. United States Tariff Commission. 1926. Certain vegetable oils. I. Costs of production. II. Economic study of the trade in and the prices and interchangeability of oils and fats. Washington, DC: U.S. Government Printing Office. 174 p. See Part I, p. 55-71, 77; Part II, p. 114-17, 138-40, 159-61. Tables. Diagrams. 31 cm. [6 ref]

• ***Summary:*** This document gives the best picture of the soy oil industry and market in the U.S. and worldwide up to this time. Part 1. Costs of production, Section 4, titled "Soya-bean oil" (p. 55) has the following contents:

© Copyright Soyinfo Center 2021

Rates of duty. Uses. Raw material and its sources: Foreign production, domestic production. Joint products. Domestic production and consumption: History, production statistics, geographic distribution of mills, domestic consumption. Imports. Principal competing country (Manchuria). Exports of domestic and foreign oil. Foreign production and consumption: Production (China [Manchuria], Japan, Europe), consumption. Costs of production: United States (proportion of the industry covered, cost data by companies, shipping charges), China (Manchuria; Introduction, verification of cost data, Dairen, shipping charges from Dairen to the U.S., Harbin, Newchwang, Antung), Japan, Great Britain, comparison of these cost data.

The Act of 1921, an emergency tariff that went into effect on 28 May 1921, placed the first tariff on soya-bean oil, at the rate of 20 cents per gallon (2.67 cents per pound). The Act of 1922 (which went into effect on 22 Sept. 1922) reduced this slightly to 18.75 cents per gallon (2.5 cents per pound). "For a number of years prior to 1921 soya-bean oil was used in the United States chiefly in the manufacture of soaps, and to a lesser extent in paint, varnish, and lard compounds... Since 1921 the domestic consumption of soya-bean oil has been chiefly in the manufacture of paints and varnishes and in foundry core oils. In lesser quantities it finds use in the manufacture of linoleum and of printing inks" (p. 55)

"Foreign production.–Chinese official statistics estimate that the area under soya beans in the whole of China in recent years has been 12 million acres (*Chinese Economic Monthly*, June 1924). Generally accepted show that China produces about 80 per cent of the world's production of [soya] beans, or from 3 to 4 short tons annually, of which Manchuria produces from 2 to 3 million tons. Japan and Chosen [Korea] grow the beans in about equal quantities, each producing approximately 600,000 tons per year or about 15 per cent of China's production. Some soya beans are grown in Central European countries, but there, as in the United States, they are used mainly for forage. Japan, Chosen, and the interior of China consume practically all of the beans they produce, but Manchuria, which is less densely populated, exports in the raw state or as manufactured products about 60 percent of its production. It is from Manchuria that the other nations of the world obtain their supply for crushing.

"Domestic production [USA].–The domestic soya bean crop is grown primarily for forage. The chief States harvesting soya beans in 1923 and 1924 were North Carolina, with 2,675,000 and 2,560,000 bushels, Illinois, with 1,722,000 and 1,548,000 bushels, and Indiana, with 790,000 and 650,000 bushels, respectively. Sixteen other States, of which Ohio and Missouri were the most important, produced soya beans in much smaller quantities... The total harvest in the United States was 8,944,000 bushels (268,320 short tons) in 1923 and 9,567,000 bushels (287,010 short tons) in 1924. Only about 20 per cent of the acreage planted is harvested, and of the quantity harvested less than 2 per cent is crushed for oil. This is because the seed necessary for the next crop of beans requires nearly all the beans that are harvested" (p. 55).

Note: This is the earliest document seen (Jan. 2005) that gives total soybean production or area statistics worldwide. However the information lacks detail, except for the USA.

Table 82 (p. 56) shows that the amount of soya beans crushed in the U.S. increased from 2,978 tons in 1922 (1.70% of the total soya beans harvested), to 3,724 tons in 1924 (1.3% of the total). Imported soya beans were first crushed in about 1910 on the Pacific Coast.

Table 83 (p. 57) shows that production of crude soya-bean oil in the U.S. rose from 751,108 lb in 1922, to to 1,404,035 lb in 1923, to 950,437 lb in 1924, to 1,406,112 lb in 1925. "Domestic production has at all times been small compared with imports. In 1923 the domestic output was 4 per cent of imports; in 1924 and 1925 about 8.5 per cent."

The soy oil tariff of 1921 led to a rapid increase in soybean crushing in the U.S. "The commission's investigators interviewed the managers of eight domestic oil mills–all that had produced soya-bean oil since 1921. Four of these mills were located in Illinois, three in Indiana, and one in North Carolina. Of these, two had used the benzine extraction process and after extracting a few tons of beans had closed down because of mechanical difficulties, high cost of operation, and high cost of beans. Nearly all the other mills used Anderson expellers, although a few of them used hydraulic presses."

Table 86 (p. 58) shows imports of soya-bean oil into the U.S. by countries, 1918-1925. In 1918, the peak year for imports (335,984,143 lb), 68.7% came from the Kwantung Leased Territory (principally from Dairen on the southern tip of the Liaotung Peninsula in South Manchuria), 27.2% came from Japan, and 4.0% came from other parts of China. In Japan 19 mills are known to be crushing soya beans. Their production of soya-bean oil in 1922 was 44,714,000 pounds.

Table 88 shows imports of soya beans into Germany, United Kingdom, Denmark, and Holland 1919-1925. In 1925 Germany was by far the largest importer (370,585 short tons), followed by the UK (181,420), Denmark (121,389), and Holland (39,301).

Part I, Section 5, titled "Interest on capital invested in crushing vegetable oils," has a passage on soya-bean oil which gives that information for 1924.

Part 2. Economic Study of the Trade in and Prices and Interchangeability of Oils and Fats, includes references to the domestic production of soybean oil, net imports of oils, including soybean oil, into the United States 1910-1924; and 1916-1924; international supply and consumption of soybeans and soybean oil; price changes of soybean oil and beans; statistics of these price changes. The Interchangeability of Oils and Fats in Consuming Industries has scattered references to soybean oil, and a special section

© Copyright Soyinfo Center 2021

on soybean oil giving data received from questionnaires on the interchangeability of oils and fats.

This is the earliest document stating that soy oil, itself, is used in printing inks. Address: Washington, DC.

263. Horvath, A.A. 1927. The soybean as human food. *Chinese Economic Journal* 1(4):415-25. April. [34 footnotes. Eng]

• ***Summary:*** Contents: Soybean curd (tofu) for food: Preparation and types ("The Chinese classical name for *tofu* is *li chi*, probably meaning 'the morning prayer'"), historical, present state (of tofu in China), chemical composition, digestibility, utilization (incl. frozen tofu and fried tofu).

Fermented soybean products for food. Soy sauce: Kibiki and sobiki tamari, composition of various soy sauces. Natto. Miso. Conclusion. Bibliography.

Tofu–Historical (p. 416): "The manufacture of soybean curd (*tofu*) was started in China in 164 B.C., during the reign of the Emperor Han Wen, by a man named Liu An, the duke of Hwai Nan. Liu An was a great friend of the Buddhist monks, and it seems quite probable that he made this bean curd to provide a change or delicacy to break the monotony of the monastic ration (Adolph). *Tofu* was introduced into Japan from Korea for the first time during the Toyotomi government, and Buddhist priests and some other people used it for their daily food among others before it was generally used in Japan.

Tofu–Utilization (p. 418-19): "Both the composition and the digestibility of *tofu*, therefore, prove it to be a very nutritious food material. In the Orient *tofu* forms a very popular and almost indispensable dietary article for the Buddhist priests, as well as the strict adherents to Buddhism, who eat no animal food [i.e., are vegans]. A common saying in some parts of China terms 'bean milk the poor man's milk, and bean curd the poor man's meat.' *Tofu* is also called 'the meat without the bones.'

Note: This is the earliest English-language document seen (Aug. 2016) that contains the phrase "the meat without the bones" (or a similar phrase containing the words "meat" and "bones"); the phrase is used to refer to tofu, not to soybeans.

In Indo-China the daily consumption of *tofu* by an adult is about 3/4 of a pound. *Tofu* in its various forms is also used very extensively by all classes of Japanese. In the interior of the country where fish cannot be easily obtained, it is a most important source of protein.

"In the Orient *tofu* is eaten in a fresh condition simply with a little *shoyu*, though it is also frequently cooked in soup. Fried *tofu* is also a very popular article of food. Rape-seed oil, sesame oil or soybean oil are generally used in frying.

"*Tofu* may also be prepared for preservation and transportation. For this purpose fresh *tofu* is cut into smaller pieces and exposed to severe cold weather, to remove the water by freezing, and is then dried in an oven. As thus prepared it can be preserved for several years. When the *tofu* is frozen the water collects in fine needles of ice distributed throughout the mass. When the ice melts and the water runs out, it leaves the *tofu* porous and it may be easily dried. If it is not frozen, it is difficult to dry and the resulting material is dense and horn-like. The *tofu* also cooks very well if cooked in diluted soy sauce and smoked in the same manner as meat. The resulting product forms in the Orient the basis for the manufacture of various 'artificial meat' preparations.*" Footnote: * "In Germany, the Soyama factory prepared during the Great War [World War I] a meat supplement from soybeans. It was cheaper than beef, contained less carbohydrates and had a nutritive value of about 1500 Calories in 1 kilo."

"In Peking, at the Kai Cheng Bean Products Company, various preparations manufactured from tofu may be purchased, such as different kinds of soybean meat, soybean sausages, etc. The company has established a restaurant in Peking (at 86 Morrison Street, the name is written in Chinese characters) where one can get a Chinese dinner of numerous dishes prepared mostly from soybean products (chicken meat, pork, ham and beef, manufactured from *tofu*).

Also discusses: "Dr. Yamei Kin, a Chinese dietitian, has become particularly well-known as an exponent of bean curd on her visits to the United States" (p. 419).

A note at the end of this April issue states: "A reprint of Dr. Horvath's paper in booklet form may be obtained from the Bureau of Economic Information. Price $1, Peking Currency.–Ed." Thus, these six articles were reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China). Address: M.D., Peking Union Medical College, China.

264. Morse, W.J. 1927. Soy beans: Culture and varieties. *Farmers' Bulletin* (*USDA*) No. 1520. 34 p. April. Revised 1939 and 1949. Supersedes Morse 1918b. The Soy Bean. USDA Farmers' Bulletin No. 973. [36 ref]

• ***Summary:*** Contents: History of the soy bean. Climatic adaptations. Soil preferences. Varieties: Descriptions of varieties (59 varieties and 44 synonyms). Varieties recommended for different areas. Preparation of seed bed. Fertilizers. Inoculation. Time of seeding. Methods of seeding. Rate of seeding. Depth of seeding. Cultivation. Soy beans in rotations. Soy beans in mixtures: Soy beans and corn, cowpeas, Sudan grass, millet. Insect enemies of soy beans: Grasshoppers, blister beetles, Mexican bean beetle, other beetle enemies, leaf hoppers, army worms and other caterpillars, the green clover worm, chinch bugs. Diseases of the soy bean: Bacterial blight, bacterial pustule, mosaic, fusarium blight or wilt disease, stem rot, pod and stem blight, sunburn, downy mildew, anthracnose, root knot (caused by a tiny eelworm or nematode, *Heterodera radicicola*). Other enemies of soy beans (rabbits, woodchucks).

© Copyright Soyinfo Center 2021

The soy bean is "also called the soja bean, the soya bean, and in North Carolina the stock pea." "Previous to 1908 the trade in soy beans was largely confined to oriental countries, particularly China, Manchuria, and Japan. Since that time the value of the soy bean and its products has gradually been realized in other countries, and during the last decade they have attained considerable importance in the world's commerce. At the present time the soy bean is cultivated principally in China, Manchuria, Japan, Chosen (Korea), and the United States, but it is also of more or less importance in northern India, Indo China, and the Malayan Islands. Soy beans are grown also in Italy, France, southern Russia, Hungary, Hawaii, Egypt, South Africa, and in a few countries of South America, but the acreage in these countries is very limited.

"The soy bean was introduced into the United States as early as 1804 and for several decades was regarded more as a botanical curiosity than as a plant of economic importance. Since 1890 nearly all of the State Agricultural Experiments have experimented with soy beans and many bulletins have been published dealing wholly or partly with the crop."

"The soy bean has been used mainly for forage purposes in the United States, but as a forage crop alone it would not likely become one of the major field crops. The acreage in soy beans has increased very rapidly during the last decade. Previous to 1917 considerably less than 500,000 acres were grown. In 1924 there were more than 2,500,000 acres, of which 1,000,000 were grown for hay, 932,000 for pasture and silage, and 613,000 for the production of seed. More than 10,000,000 bushels of soy-bean seed and about 1,360,000 tons of soybean hay were produced in 1924."

The 103 soy bean varieties and synonyms described on pages 5-11 are as follows (in alphabetical order): A.K., Aksarben, Arlington, Austin, Banner–same as Midwest, Barchet, Biloxi, Black Beauty–same as Ebony, Black Eyebrow, Black Sable–same as Peking, Bopp–same as Chernie, Brown–same as Mammoth Brown, Chernie, Chestnut, Chiquita, Columbia (from China), Columbian–same as Columbia, Dixie, Dunfield, Early Brown, Early Green–same as Medium Green, Early Virginia Brown–same as Virginia, Early Wilson–same as Wilson, Early Wisconsin Black–same as Wisconsin Black, Early Yellow–same as Ito San, Easycook (from Shantung province, China in 1894), Ebony, Elton, Essex–same as Peking, Extra Early Black Eyebrow–same as Black Eyebrow, Extra Select Sable–same as Peking, Giant Brown–same as Mammoth Brown, Goshen Prolific, Green–same as Medium Green, Guelph–same as Medium Green, Habaro, Haberlandt, Hahto ("Introduced under S.P.I. No. 40118 from Wakamatsu, Japan, in 1915. It is commonly known in Japan as 'dove killer,' and is said to be used boiled in the green stage... Especially valuable as a green vegetable bean when three-fourths to full grown"), Hamilton, Herman, Hollybrook, Hongkong, Hoosier, Illini, Ilsoy, Indiana Hollybrook–same as Midwest, Ito San, Jet, Laredo, Large Brown–same as Mammoth Brown, Large Yellow–same as Mammoth Yellow, Late Yellow–same as Mammoth Yellow, Lexington, Mammoth–same as Mammoth Yellow, Mammoth Black–same as Tarheel Black, Mammoth Brown, Mammoth Yellow, Manchu, Manchuria–same as Pinpu, Mandarin, Medium Early Green–same as Medium Green, Medium Early Yellow–same as Ito San, Medium Green, Medium Yellow–same as Midwest, Merko, Midwest, Mikado, Minsoy, Mongol–same as Midwest, Morse, Ogemaw, Ohio 9035–same as Hamilton, Old Dominion, Otootan, Peking, Perley's Mongol–same as Midwest, Pinpu, Red Sable–same as Peking, Roosevelt–same as Midwest, Roosevelt Medium Early Yellow–same as Midwest, Royal–same as Wilson Five, Sable–same as Peking, Shanghai–same as Tarheel Black, Sooty, Southern–same as Mammoth Yellow, Southern Prolific, Soysota, Tarheel–same as Tarheel Black, Tarheel Black, Tarheel Brown–same as Mammoth Brown, Tokyo, Virginia, Virginia Early Brown–same as Virginia, Wea, White Eyebrow, Wilson, Wilson-Five, Wisconsin Black, Wisconsin Early Black–same as Wisconsin Black, Wisconsin Pedigreed Black–same as Wisconsin Black, Yoko–same as Yokoten, Yokoten, Yellow–same as Mammoth Yellow.

Note 1. This is the earliest document seen (Nov. 2020) that mentions the soybean varieties Black Sable, Early Virginia Brown, Extra Early Black Eyebrow, Giant Brown, Large Brown, Tarheel Brown, Virginia Early Brown, or Wisconsin Pedigreed Black.

Note 2. This is the earliest document seen (Nov. 2020) which states that Black Sable is the same as Peking, or that Brown, Giant Brown, Large Brown, and Tarheel Brown are the same as Mammoth Brown, or that Early Green is the same as Medium Green, or that Early Virginia Brown and Virginia Early Brown are the same as Virginia, or that Early Wisconsin Black and Wisconsin Early Black and Wisconsin Pedigreed Black are the same as Wisconsin Black, or that Extra Early Black Eyebrow is the same as Black Eyebrow, or that Mammoth Black is the same as Tarheel Black, or that Yellow is the same as Mammoth Yellow.

Photos show (unless otherwise stated): (1) A typical soy-bean plant growing alone. (2) "Outline map of the United States showing by numerals the areas to which the soy bean is especially adapted. The varieties suited to the various areas for different purposes are discussed on page 11. Outside the unnumbered areas the soy bean either can not be grown profitably or it is in the experimental stage." A vertical line shows that the soybean grows east of the 99th meridian. The area east of this line is divided into 5 zones by 4 lines parallel to the latitudes. Soybeans can also be grown in small parts of Arizona, New Mexico, and California, where extremely hot weather prevails during the period when the seed is forming. (3) Roots of a soy-bean plant showing abundant development of nodules.

(4) Soy beans and corn planted in alternate rows; two

266. Morse, W.J. 1927. The present outlook of the soybean industry in the United States. *Proceedings of the American Soybean Association* 1:167-71. Eighth annual field meeting. Held 9-12 Aug. in North Carolina.
• ***Summary:*** "In 1907, the soybean was considered but a minor crop in America, less than 50,000 acres being devoted to its culture. North Carolina had the largest acreage at that time, and produced at least 90 per cent of the seed, possibly more."

Note: This is the earliest document seen (May 2008) that gives statistics for soybean production in the USA before 1909. It is also the earliest document seen (May 2008) that mentions the number "50,000 acres" in connection with the year 1907–statistics that were repeated by many subsequent publications. Yet we have been unable to find Morse's source for these earliest baseline statistics. He may have somehow derived the figures from those in: U.S. Department of Commerce, Bureau of the Census. 1913. Thirteenth census of the United States taken in the year 1910. Volume V. Agriculture, 1909 and 1910.

"Not more than six varieties were being grown [in America]. The most important of these were the Mammoth Yellow, Ito San, Ogemaw, and Medium Green, varieties limited as to soil and climatic conditions, and also as to purpose. At this time, it seemed unlikely, to all except a few soybean enthusiasts or 'soybean cranks' as they were then called, that the soybean would ever amount to much more than a minor or emergency crop. Several experiment stations had conducted tests with the crop as pasture, hay and silage, and with the seed as a concentrated feed... One soybean enthusiast, the late Dr. C.V. Piper, then Chief of the Office of Forage Crops, United States Department of Agriculture, had a remarkably clear vision of the great potential value of the soybean as a major crop in American agriculture. After studying the soybean in the Orient, it seemed to Dr. Piper that more and better varieties were essential to meet the widely diverse conditions found in the United States... Through the Office of Foreign Plants, therefore, numerous introductions were made from the soybean regions of China, Manchuria, Korea, and Japan. Additional introductions and numerous tests indicated the wisdom of Dr. Piper's conclusions. The introductions were found to be adapted to wider ranges of soil and climatic conditions. The new and varied uses of the crop stimulated new and greater interest in possibilities, and the soybean's march of progress was on.

"Moving forward slowly through the years with new varieties, increased acreage, wider interest, greater utilization of crop and by-products, its safety and dependability under adverse conditions, more efficient methods of planting, cultivating and harvesting, its availability as a relief crop (as in the recent Mississippi flood area in the South and in the corn-borer infested territory in the North), *the lowly soybean of 1907 has risen to the rank of a major crop in 1927.*

"In 1926, the acreage of soybeans for all purposes was estimated at more than 3,000,000 acres and the seed production at about 148,000,000 bushels. At present (1927), all states east of the Mississippi River are growing soybeans and with yearly increasing acreages. Moreover, the states bordering the west bank of the Mississippi are greatly increasing their soybean acreage. For 1927, the average increase of soybean acreage over that of 1926, is estimated at about 20 percent.

"Let us consider the forage outlook in the United States. The soybean undoubtedly will be utilized primarily for forage purposes, and by forage purposes is meant as hay, pasture, ensilage, and soilage. In 1924 (we have no later statistics), more than 1,500,000 tons of soybean hay were produced, nearly doubling the production of 1922. No figures are available as to acreage devoted to pasturage and ensilage; but, you of the states producing soybeans know that a very considerable part of the soybean acreage of your state was devoted in 1924 to these two purposes. For instance, Illinois, with a total soybean acreage in 1924 of 747,000 acres, had only 90,000 acres for seed production. North Carolina had a total acreage in 1924 of 255,000 acres of which 120,000 were for seed. For forage purposes, soybeans are increasing in favor on the farms of the North, South, East and West. Without a doubt, as hay, pasturage, and ensilage, soybeans will be used more and more in the farming systems of America.

"Seed production has become a very important and profitable industry in many sections. During the past few

© Copyright Soyinfo Center 2021

years, the growers in certain sections have been confronted in the fall with the surplus-seed problem. Before the passing of the next planting season, however, first-class seed for planting has been at a premium, and during the past two years (1926 and 1927), there has been an acute shortage in some sections of seed of desirable varieties. Commercial possibilities today offer a potential outlet for a supply above seeding requirements, many times the size of the present surplus. Several oil mills are now crushing domestic-grown soybeans for oil and oil meal in the Southern and Western States, and many others are being equipped for this purpose. Complaint is often made that oil mills pay too little for seed, making seed production for this purpose unprofitable. We must take into account, however, that the soybean is a legume. We must consider the fertilizing value, the feeding value of the straw, and not expect too much in comparison with other standard crops. Let us be fair with this oil-mill industry, and forget the high prices for seed which have prevailed with the introduction of new varieties and the large increase in acreage. To me, the production of soybean seed for oil and oil meal appears to be one of the bright spots in the future of the soybean which will firmly establish it as a major crop.

"Increasing imports of soybeans, soybean oil, and soybean cake from China and Japan, in spite of a tariff on the beans and oil, indicate a ready market for these products in the United States. Soybean oil is a strong competitor of other vegetable oils and is used extensively in the manufacture of butter and lard substitutes, paints, enamels, waterproof goods, rubber substitutes, linoleum, and edible oils; and constantly new uses are being found for this valuable oil. Soybean oil meal is a valuable concentrate for all kinds of livestock. Oil meal is also valuable as a flour, and is extensively used in the manufacture of glue, of buttons, etc. The following table shows the increasing demands for soybean products through imports for the past five years.

This table, "Soybeans, soybean oil, and soybean cake imported into the United States, 1922-1926 inclusive," shows that imports of soybean oil ranged from 9.1 million lb in 1924 to a high of 41.7 million lb in 1923. Soybean cake ranged from 4.2 million lb in 1922 to a high 47.1 million lb in 1924. Imports of soybeans ranged from 3.5 million lb in 1922 to a high 4.2 million lb in 1924.

"Soybean seed is employed for various other purposes and its uses, no doubt, will further increase. There are established in the United States several factories for the manufacture of soy sauce, which in previous years was imported in large quantities from China and Japan. There are, also, a large number of food factories using soybean seed in the manufacture of special foods. And we must not overlook the value of soybean seed as a highly valuable stock feed, relished by all kinds of farm stock. Practical experience and extensive tests by experiment stations have indicated the value of soybean seed as a home-grown concentrate.

"No doubt, most of you will recall that soybean bulletins of a few years ago told you that the ordinary farm equipment was all that was necessary to produce a crop of soybeans. Today, however, after extensive experiments, we have more efficient and economical methods of planting, cultivating, harvesting and marketing the crop. In the matter of machinery, we have soybean seed drills, soybean cultivators, and soybean harvesters. Just a word concerning harvesters, of which we have several types adapted to various conditions. There is the beater type for rows and for broadcast beans, and these have gradually brought about the combine harvester, now used successfully in the Western States.

"Further brightening the path of the soybean is the extensive work of experiment stations. Nearly all state experiment stations (and the United States Department of Agriculture) are engaged in various tests with regard to variety testing, breeding work, feeding experiments, inoculating, fertilizing, methods of culture and harvesting, and in greater utilization of the soybean and its products. From this review of experimental and other work during a score of years, I think you will quite agree that the outlook is decidedly bright for the soybean, and that, through the efforts of the American Soybean Association, we must keep this work going, and place the soybean where it belongs–in the 'King' row with King Corn and King Cotton." Address: USDA, Washington, DC.

270. Morse, W.J. 1927. Soy-bean varieties newly developed for U.S. farms. *Yearbook of Agriculture* (*USDA*) p. 676-79. For the year 1926.

• ***Summary:*** "The acreage of soy beans in the United States increased from about 500,000 acres in 1917 to over 2,500,000 acres in 1924. This enormous increase in the use made of soy beans in this country has been largely due to the development of better-adapted varieties. The number of real or supposed varieties has increased very rapidly in the United States during the past few years, resulting in much confusion concerning varietal names and characters. In many instances disapointment and loss have been caused to the grower by the lack of reliable information, and the soy bean brought into disfavor in some localities. At the present time about 60 varieties of soy beans are handled by growers and seedsmen in the United States. Varietal names greatly exceed the number of true varieties, for different varieties are often sold under the same name and different names are often applied to the same variety. It is therefore essential not only to know the name of a desired kind, but also its varietal characteristics in order to prevent substitution in purchasing seed. Varieties of soy beans are differentiated largely by the color and size of seed, though they also differ in time of maturity, habit of growth, disposition to shatter their seed, disease resistance, oil and protein content, and in yield of forage and seed. They vary also in their adaptation to climate and soil. Some varieties are especially suitable for fertile land, others for less productive land; some for early planting, others for late planting; some for a seed crop, others for forage; some for planting with corn, others for planting with Sudan grass and sorghum. One may find a few varieties or even a single variety adapted to the climate of a certain section which will fill all the local requirements of the crop. No single factor has greater influence upon the success of the crop than the selection of the right variety to meet the needs and the conditions of the section where it is to be grown.

"Only Eight Varieties Grown in 1898: Previous to the numerous introductions made by the United States Department of Agriculture, beginning in 1898, there were not more than 8 varieties of soy beans grown in the United States, namely, Mammoth Yellow, Ito San, Butterball, Guelph or Medium Green, Eda, Ogemaw, Buckshot, and Kingston. All of these varieties were rather limited in adaptation, and at present the Ito San and Mammoth Yellow are the only ones grown to any appreciable extent. In 1907, 23 varieties of soy beans were being grown, and of these 15 were introductions made by the department prior to 1905. Vigorous efforts were inaugurated about 1907 to obtain additional varieties through consuls, agricultural explorers, foreign seedsmen, and extensive correspondence with missionaries and others until in 1909 the department had in its trials about 200 distinct varieties; by 1913, 400 varieties; by 1919, 600 varieties, and by 1925, about 1,200 varieties.

"The records of introduction indicate that every Chinese village has its own distinct varieties. There is no seed trade in China, consequently local varieties are never widely disseminated. Undoubtedly numerous varieties are yet obtainable from the agriculturally unexplored villages of China, Manchuria, Korea, Japan, and India.

"When new introductions are received they are thoroughly tested at Arlington Experiment Farm the first year, and if mixed, single plant selections are made for the second year's test. After three years' work with these selected strains, those giving the best results in comparison with standard varieties are disseminated among the State experiment stations, where they are grown again under careful observation and test conditions. Finally seed is distributed among farmer cooperators who assist the department in its practical field investigations. Varieties that appear promising in these field trials ultimately are assigned suitable varietal names and made available for general use and distribution in the localities to which they are adapted.

"One thousand varieties introduced: During the past 20 years more than 1,000 varieties have been introduced into the United States from China, Japan, Manchuria, India, Korea, Siberia, and the East Indies. Several of these have become established in American agriculture, either as direct introductions or as selections from introductions. Others, introduced in the past year have proven so valuable in trials that they are deemed important acquisitions and doubtless will become widely grown. It is universally appreciated and acknowledged by all soy-bean authorities that the annual introductions of soy beans into the United States have been of fundamental importance in the rapid rise of the crop in public favor.

"The soy bean lends itself readily to improvement. Considerable breeding work is being carried on by the department, several State experiment stations, and a few soy-bean growers. Although the Orient abounds with varieties, it is evident that they are the result of natural crossing and selection, as very little breeding work has been done. Introductions, for the most part, are admixtures, containing two or more varieties. The progeny of individual plants has shown decided differences in yield of forage and seed, in tendency to shatter, in maturity, and in oil and protein content. Many new varieties have been introduced into the seed trade of the United States as a result of selection work. Some of these varieties originated from natural hybridization and a few are almost certainly mutations or sports. The most important of such varieties are Chestnut, Dixie, Goshen

© Copyright Soyinfo Center 2021

Prolific, Hamilton, Herman, Illini, Ilsoy, Lexington, Mikado, Minsoy, Peking, Sooty, Soysota, Virginia, Wilson-Five, and Wisconsin Black. Introductions without selection have given us the following important varieties: Biloxi, Black Eyebrow, Chiquita, Columbia, Haberlandt, Hahto, Hoosier, Laredo, Manchu, Mandarin, Morse, Old Dominion, Otootan, Southern Prolific, Tarheel Black, Tokio, Wea, and Yokoten.

"Work justified by results: The results that have been obtained by this wholesale search have justified the work and expense many times over. When the department work began, the soy bean was a very minor crop, and of importance only in limited areas, owing primarily to the lack of suitable varieties. To-day, its culture, due to a wide range of excellent varieties, is widespread and lends substance to the belief that the soy bean will become one of our major crops.

"Table 24 shows the total value of soy-bean seed and hay produced in 1924 by varieties introduced and developed by the department. These data, which do not include the value of the soy beans pastured or fed as silage, indicate that over half (52 per cent) of the total soy-bean hay and seed produced in the United States was obtained from these new varieties. The wide use that is being made of these varieties shows most conclusively the effect this introduction and breeding work has exerted on the development of the soy-bean industry in the United States."

Photos show: (1) Field trials of varieties of soy beans at Clemson College, South Carolina. (2) Two men standing in a "field of Otootan soy beans, one of the newer introductions by the United States Department of Agriculture."

Table 24 has six columns: 1. Variety (18 varieties). 2. Year introduced. 3. Estimated value as seed. 4. Estimated value as hay. 5. Estimated value, total. 6. Percent of value of all soybean hay and seed. Those with the highest percent of value are: Midwest 11.4%. Manchu 6.8%. Virginia 6.7%. Wilson 6.2%.

The 18 varieties, listed alphabetically, are: Biloxi, Black Eyebrow, Ebony, Hamilton, Haberlandt, Laredo, Lexington, Manchu, Midwest, Minsoy, Mandarin, Morse, Peking, Tarheel Black, Tokio, Virginia, Wisconsin Black, Wilson. Address: USDA, Washington, DC.

271. Dorsett, P.H.; Morse, W.J. 1928. Agricultural explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon (Log–unpublished). Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished typescript log. Illust. Partially indexed. 28 cm.

• ***Summary:*** Also called the "Log of the Dorsett Morse Expedition to East Asia" and (by the National Archives) "Dorsett-Morse Expedition to the Far East, 1929-31," this is one of the most important documents ever produced on soybeans and soyfoods. Covering the period from late 1928 until 1932, it consists of 17 volumes of typewritten unpublished manuscript plus handwritten notebooks.

The two explorers, who were gone on the expedition for a little more than two years, initially planned to be gone for about three years. They took 3,369 photos of which 95% appear in the report; the original prints are pasted on the pages, each with a number and a caption. The first negative number is #43196 (p. 238) and the last is #46514. The last numbered page of the report is #8818, but most of the index pages are not numbered and some special reports at the end of the main report each start with page 1.

The first quarter of the pages (to about page 2,500) are indexed, using 4 separate indexes. The only original and 2 microfilm copies were at the American Soybean Assoc. (St. Louis, Missouri), however as of Feb. 2014 they are on permanent loan to Rare and Special Collections at the National Agricultural Library (Beltsville, Maryland)–which also has 7 photograph albums that accompany the 7 log books. A list of the missing pages has been compiled. One photocopy of a microfilm copy is at the Soyinfo Center (Lafayette, California). One microfilm copy is at the National Archives in Washington, DC, in Records of the Bureau of Plant Industry, Soils, and Agricultural Engineering, Record Group 54. See: "National Archives Microfilm Publication No. M840. Expedition Reports of the Office of Foreign Seed and Plant Introduction of the Department of Agriculture, 1900–1938." Rolls 16-20, volumes 56-73. These microfilm rolls may also be available for viewing or duplication at one of the various regional branches of the National Archives (e.g. San Bruno, California).

A brief itinerary of the trip is as follows: 1929 Feb. 18–The party of 5 people leaves Washington, DC, for Los Angeles by train. It consists of Morse, his wife Edna, their daughter Margaret (age 7), Dorsett, and his daughter-in-law Ruth (Bobbie; the widow of Dorsett's son, she served as Dorsett's secretary and general helper).

March 1–They sail from San Francisco to Yokohama on the S.S. *President Grant* of the Dollar Steamship Lines.

March 29–Arrive in Yokohama, proceed directly to Tokyo, establish headquarters with rooms at the Imperial Hotel, and hire an interpreter, Mr. Suyetake, who works with them for the next 2 years.

May 21–The Morses go to Hokkaido, the Dorsetts to Kyoto, by sleeper train. Morse returns to Tokyo.

Aug. 17–The entire party arrives in Hokkaido and establishes headquarters in Sapporo to study soybeans.

Oct. 8–Leave Hokkaido for the Northeast Provinces, then arrive in Tokyo on Oct. 15.

1929 Oct. 23–Arrive in Keijo (Seoul), Korea, then take many side trips. Note: 1929 Oct. 29–Great Depression begins in USA with stock market crash.

Dec. 8–Return to Japan via Kyushu, then to Tokyo to study soyfoods. They buy and photograph many!

1930 April 1–Travel by steamer to Dairen, Manchuria, where they set up headquarters. Dorsett very sick from

© Copyright Soyinfo Center 2021

April 11 to June 11; taken to a Japanese hospital in Dairen, with Japanese doctors and nurses, he almost dies of double pneumonia. Morse does the work of both men and does not inform USDA of Dorsett's critical condition.

June 24–Morse takes a quick trip to northern Korea, via Mukden and Antung (Tan-Tung), to look for Zoysia grass.

July 1–Returns to Manchuria via Mukden.

July 21. Dorsetts leave for Peking by train; Morses and Mr. Suyetake stay in Dairen.

Aug. 21–Morse party travels to northern Korea, staying in Heijo (Pyongyang / P'yongyang); takes a 4-day side trip to Seoul.

Sept. 28–Morse returns to Dairen, Manchuria.

Oct. 19–Morse party leaves Dairen, arriving in Peking the next day.

Nov. 9–Morse party returns to Dairen.

Nov. 30–Morse arrives in Harbin, north Manchuria, then passing through Mukden, returns to Dairen.

Dec. 18–Morses leave Dairen for Japan, passing through Kobe on Dec. 21 and arrive in Tokyo on Dec. 23.

1931 Jan. 12–Travel to Kyoto, Himeiji, and Tatsuno Shoyu.

Jan. 16–Visit Okazaki and Hatcho miso. Jan. 17–Return to Tokyo.

Feb. 17–Morse party leaves Tokyo by boat for the USA, arriving in San Francisco on March 4.

March 15–Dorsett party leaves Peking for Tientsin, Shanghai, and Hankow.

March 27–Dorsetts sail from Shanghai to San Francisco.

Note 1. The title of this report is puzzling since the expedition never went to Taiwan, Singapore, Java, Sumatra, or Ceylon. It was proposed several times that they visit these places, but the plans did not work out.

Note 2. This is the earliest log (unpublished) seen (Oct. 2016) that mentions soy.

Note 3. The best biography of P.H. Dorsett seen to date was written by Theodore Hymowitz and published in 1984 in "Dorsett-Morse Soybean Collection Trip to East Asia: 50 Year Retrospective" (*Economic Botany*, 1984, 38(4):378-88). He wrote: "Palemon Howard Dorsett, veteran plant explorer and senior member of the team, had collected plants previously in Brazil, northeast China, Sri Lanka (Ceylon), and Indonesia. After the plant exploration trip with Morse, he collected plants in the Caribbean area and on the north coast of South America. His interests included photography, carpentry, gardening and tinkering with equipment.

"Howard Dorsett was born in Carlinville, Illinois, on April 21, 1862 and thus was 67 yr old at the time of the journey to east Asia. He married Mary V. Payne on September 12, 1892 and received a B.S. degree from the University of Missouri in 1894. The Dorsetts had 3 children, 2 daughters and a son. Dorsett's wife and 2 daughters died in the early 1900s. His son, Jim, accompanied him on a plant exploration trip to Asia in 1924 to 1927. Personal tragedy struck Howard Dorsett again when his son died of tuberculosis on October 8, 1927. His daughter-in-law, Ruth B. Dorsett, accompanied him on the Dorsett-Morse exploration trip.

"Dorsett joined the USDA in 1891 and was employed by the Section of Plant Pathology. He was involved with the early experiments on the use of Bordeaux mixture for the treatment of leaf diseases of nursery stock. From 1904-1907, he was in charge of the Chico, California, plant introduction garden. Altogether, Dorsett developed 6 plant introduction gardens for the USDA. From 1909 until he retired in 1932, Dorsett was either in the field as a plant explorer or working as an administrator dealing with plant introductions. In 1936, he was awarded the Meyer Medal in recognition of distinguished service in the field of plant introduction. According to David Fairchild, Howard Dorsett was involved with the first propagation in the United States of the tung oil tree, date palms, Japanese flowering cherry trees, oriental bamboos, east Indian mangos, Chinese cabbage, and many other plants. He collected about 1,000 soybean accessions from northeast China and also introduced guinea grass from Brazil. On April 1, 1943, Howard Dorsett died in a nursing home in Washington, DC (Cattell and Cattell, 1938a; Marquis, 1928; Fairchild, 1936, 1938; *Washington Post*, 1943; Who Was Who in America, 1968)."

Two detailed biographies of Morse have been written by Wm. Shurtleff: (1) In *Soyfoods* magazine (Summer 1981, p. 56-60). (2) "William J. Morse–History of his work with soybeans and soyfoods (1884-1959)." Sept. 2011. 482 p. 866 references. 126 photos. A digital book published by Soyinfo Center on Google Books. Address: Agricultural Explorers, USDA, Washington, DC.

272. Dorsett, P.H.; Morse, W.J. 1928. Foreign agricultural explorations: Introduction (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 5. No author, date or place are given. "It is primarily through plant introduction in the form of new species or those related to the ones already established [new varieties] in the United States, and their fullest utilization which, not only promise most for the further extension, development and success of agriculture, but also tend to make the United States more nearly self supporting.

"The world is a 'Gold Mine' of plant wealth accessible, alike to all nations, however the development of country's interest in this vast and practically inexhaustible storehouse of potential agricultural possibilities is not dependent upon the united efforts of the nations but is directly in proportion to the efforts exerted by each country independently in its

© Copyright Soyinfo Center 2021

search for plant nuggets [?] adaptable to its needs.

"The United States has perhaps accomplished more in this important field of agricultural research than any of our sister countries, and yet she has but yet touched the fringe of its possibilities, both as to plant introduction and adaptation.

"It has been stated on good authority that more than 90% of the cultivated plants now being grown in the United States, are directly or indirectly the result of plant introduction. Under these conditions it is self evident that Foreign Plant Introduction is one of the most important lines of research investigations now being pushed by the United States Department of Agriculture."

Page 8. "Through plant introduction, selection and breeding, soybean culture in the United States is being rapidly extended throughout both the cotton belt of the South and the corn belt of the North. The acreage devoted to the growing of this plant alien in the United States has increased from 500,000 acres in 1917 to approximately 4,000,000 acres for the year 1928. The Virginia, Manchu and Laredo soybean selections made from introductions made by the late Mr. Frank N. Meyer, Agricultural Explorer of the Office of Foreign Plant Introduction, in 1906, 1911 and 1914 respectively, returned in the aggregate in money value, to their adopted country in 1924, for hay and grain alone upwards of $7,700,000.00" [$7.7 million].

Note: The soybean was probably the most import and best known of the many plants introduced to the United States.

Pages 9-10. "While the work as a whole is general agricultural explorations and every thing possible will be done to accomplish results in this connection, there are two principal objectives which it is hoped the expedition can accomplish. They are First to round up, in so far as possible, the work of observation, investigation and seed collection of desirable varieties, strains, etc. of the Soyabeans in the Orient, and also to secure data and photographs not alone of field operations but also of practices and methods of the utilization of the soybean for food and all other byproducts, especially those industrial. Second, to study the persimmon industry of the Orient..."

Pages 11-12.

"Ninety-five percent or more of the agricultural crops of America today are either directly or indirectly the result of plant introductions. The United States heads the nations of the world in its activities in agricultural exploration and plant introduction, As a result of this work this nation's diversification of important and valuable crop production and agricultural research investigations are not surpassed by any other country of the world.

"The work of agricultural exploration in northeastern China during the period from August 1924 to December 1926 [by P.H. Dorsett] resulted in the introduction of valuable types of soybeans, mung beans, wheat, rice, barley, chestnuts, pears, jujubes, persimmons, and other deciduous fruits, vegetables, forest trees, and ornamental shrubs and vines. All were adapted for trial in the temperate regions of the United States and many of them suitable for trial in the semi-arid Great Plain region of America, where the need for such material is so very great.

"The observations made, data, and still and motion pictures secured, concerning the Chinese practices of growing, harvesting, handling, and storing soybeans in a country which leads the world in its production has materially stimulated the interest in N.E. China, Japan, Korea & Formosa of farmers and research investigators, who have put America's acreage of this extremely valuable plant immigrant ahead of all other countries and next to Manchuria."

Note: The next paragraph (p. 12) is similar to the one above it, discussing the importance of agricultural exploration in 1924-1926 on the Chinese persimmon, and has helped to make the persimmon an important crop in California.

"Regions to be covered [by this expedition]: Japan, Chosen (Korea), Taiwan (Formosa), and Northeastern China..."

Page 13. "Objectives: It is proposed to conduct extensive agricultural investigations in the previously mentioned regions, primarily on the following crops:

"1. Soybeans: No one factor has contributed more to the increase of the soybean in America than the development of new varieties through introductions from the Orient. The soybean is a crop of local adaptation, as shown by the numerous varieties in Asiatic countries and the results of extensive tests in the United States. Although grown primarily for forage in the United States, many sections are looking forward to the production of soybeans as a cash crop for oil and oil meal, and for human food and industrial uses. It is quite generally predicted that the soybean will become one of our major crops, particularly in the South of the boll weevil sections and in the Corn Belt states through the menace of the corn borer. To attain this importance in American agriculture high yielding varieties for different uses and adapted to a wide range of soil and climatic conditions are essential. Also, extensive investigations are necessary as to the best methods of planting, culture, storage, marketing, and the extensive utilization of the seed for human food and industrial purposes as practiced in these Oriental countries where the soybean has been the most important food crop for many centuries."

Pages 14-15. 2. Mung bean: 3. Kudzu: 4. Persimmon. 5. Forage, green manure, and cereal crops; fruits, vegetables, trees, and other crops and plants of potential value to American agriculture.

Personnel: The Office of Foreign Plant Introduction plans to send on the proposed Agricultural Explorations to Japan, Chosen, Northeastern China and Formosa in 1929, Mr. W.J. Morse, Agronomist in the Office of Forage Crop

© Copyright Soyinfo Center 2021

Investigations–in charge of Soybean, Mung Bean, Kudzu and other Oriental leguminous crops, and Mr. P.H. Dorsett, Horticulturist in the Office of Foreign Plant Introduction. leader of the Agricultural Exploration work in N.E. China in 1924 to 1927.

Pages 26-28: "Regions to be explored: The countries included in the proposed exploration are Manchuria, Northeastern China, Chosen (Korea) and Japan including Formosa. On completion of the work in the above countries, provided conditions are favorable, a short time will be spent in the Dutch East Indies, especially Java and Sumatra [Note: This never happened].

Next come descriptions (location, latitude and longitude, etc.) of each of the countries they intend to visit: Manchuria: Chosen (Korea): Japan: Formosa (Taiwan): Dutch East Indies:"

Pages 28-29: "Prospective crops: Soybeans: The rapid expansion of soybean culture has been one of the outstanding developments in the recent history of American agriculture. From an area of less than 50,000 acres in 1907 it has expanded in 1927 to approximately 11,500,000 acres, with a production of over 8,000,000 bushels of seed valued at nearly $14,000,000. The value for hay, forage, silage and pasture is estimated to be equal to a similar amount. The present industry is based primarily on the more than 1,500 varieties of soybeans already introduced by the Department [USDA]. The present area in which soybeans are now being grown is indicated on the inclosed map. Over ½ of the area of the United States is involved. While the soybean is primarily grown for hay and forage its use for oil is also increasing and oil mills are being erected (see map 2). In Manchuria and Japan the soybean oil meal ranks first in importance as a soybean product, being especially valuable for animal feed and fertilizer. Soybean oil, now imported, is being used in lard and butter substitutes, paints and varnishes, glue, linoleum, rubber substitutes and also is refined as an edible oil.

"Varieties for expanding present area: The area in which soybeans are grown in this country can be greatly expanded provided drought resistant types can be found for the southwest and early maturing types for the northern and northwestern regions. The prevalence of the soybean throughout the widely varying districts of Manchuria and Japan gives ample promise of supplying these types.

"Soybeans are being extensively cultivated throughout Java for food and green manure. It is a highly important article in the products of the country. It is believed that types can be found here that will be successful in the milder, moist-summered southern states.

"In the present area where soybeans are grown, swine feeders demand [?] varieties of low oil content while the demand for oil mills is for varieties of high oil content. The range in both directions can be extended it is believed by introduction of new varieties.

"Leaf, stem, and root diseases are gradually increasing in some of our older soybean production regions. In the event these diseases [become] prevalent, a special study and selection of resistant strains is highly desirably." Address: Agricultural Explorers, USDA, Washington, DC.

273. Ryerson, Knowles A. 1928. Re: Memorandum for W.A. Taylor (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Dec. 19. Unpublished log.
• ***Summary:*** Pages 61-64. This letter, dated Dec. 19, begins: "Dear Dr. Taylor:

"In accordance with tentative plans discussed at various times during the past month, I wish at this time to ask formal approval for the proposed expedition of Mr. Dorsett and Mr. Morse to Manchuria, China, Chosen, Japan and also the Dutch East Indies."

"Of the plant material to be sought, new soybean varieties are the most important. The extension of the area where they can be grown in this country, both in the northwest and southeast, depends upon securing drought resistant strains."

According to reports of workers in Japanese Experiment Stations and to Consular reports, there are at least 500 varieties of soybean in Japan. Not more than 50 of these have been introduced into this country. Breeding work has been under way at the Japanese Experiment Stations for the past decade. Few of the new types developed have been obtained. On the North of the Island of Hokkaido, 250,000 acres of early maturing varieties are grown. Experience of a cooperator in Canada indicated that these varieties are better suited to the northern conditions than any of the varieties grown in the United States.

"Manchurian varieties vary from 90 to 130 days in the time required for maturity. In China, exclusive of Manchuria, the time to maturity ranges from 125 to 175 days. Many introductions have been made from Northern Manchuria but better varieties with a longer maturing period are needed in the southern part of the corn belt and the northern part of the northern part of the cotton belt. Japanese Experiment Stations in Korea have carried on extensive breeding work. At least 300 varieties are known in that country, many of which appear promising for the southern corn belt and adjacent cotton belt. Late maturing varieties are also grown extensively in the Island for Formosa."

Page 62. "According to various Dutch reports, soybeans are extensively grown in Sumatra and Java, principally for green manure purposes. There are many varieties of the late, yellow-seeded type which are of low oil content and are grown for forage, pasture, and soil improvement."

Page 63. "Personnel: It is proposed to head the

© Copyright Soyinfo Center 2021

expedition by Mr. P.H. Dorsett, Office of Foreign Plant Introduction, who led the expedition to Northeastern China and Manchuria in 1924 to 1927. He would be accompanied by Mr. W.J. Morse, a Bureau specialist in soybean and other Oriental legumes. In addition it is desired to send Mr. C.C. Thomas, of the Office of Foreign Plant Introduction who as specialized in the study of Oriental persimmon varieties, culture and storage problems, to spend six months, either in the fall of 1929 or 1930, to cooperate with Dorsett in the study of Korean varieties and the root stock problem in both Japanese and Chinese persimmon districts."

"Mr. Morse has planned to have Mrs. Morse accompany him and Mr. Dorsett has tentatively planned for his daughter-in-law also to go on the trip. This is a matter, however, which I wish to talk over with you.

"If approved, it is hoped to have the expedition sail from San Francisco, March 1, 1929, to be gone for two to three years."

"Expenses: The salaries of the men will be carried by the Offices concerned. Field expenses for the remainder of the fiscal year, 1928 and 1929, are estimated at $4,025 for the two men. Of this sum, the Office of Forage Crops will contribute $1,000 and the Office of Foreign Plant Introduction the balance."

"Concurred in (Signed) A.J. Pieters, Acting in Charge of Forage Crops." Address: Senior Horticulturist in Charge [Div. of Foreign Plant Introduction, USDA].

274. International Institute of Agriculture. 1928. International yearbook of agricultural statistics, 1927-28. Rome, Italy. See p. 370-77. Index. 23 cm.
• ***Summary:*** Statistics for soya (imports and exports) are on pages 370-71. In Europe, soya statistics are given for Germany, Denmark, France, Great Britain and northern Ireland, Italy, Norway, Netherlands, and Sweden. In Asia, for China, Korea, Formosa [Taiwan], Dutch East Indies, and Japan. For peanuts on pages 372-75, and for sesame on pages 376-77.

Note: This earliest issue of this book is 1909-21, but soybeans are not mentioned (under any name) anywhere in this book. Address: Italy.

275. New, Ilhan. 1928. When I was a boy in Korea. Boston, Massachusetts: Lothrop, Lee & Shepard. 190 p. Frontispiece (2 portraits). Illust. 19 cm. Series: Children of other lands books. *
• ***Summary:*** New was born in 1894, the first born son of New Kee Yun, a silk manufacturer and a successful business man. A patriot and a leader among the converts to Christianity, New lived part of his life in Manchurian villages. With 35 black and white photos.

276. Diaz, Juan B. 1929. Re: Soybeans in Cuba. Potential for soymilk. Letter to Director of the Station, Santiago de las Vegas, Cuba, Jan. 17. 1 p. [Spa]*
• ***Summary:*** "With respect to this bean (*judea* = soybean), a short time ago I read in the *Havana Post* an article which said that these soybeans contain a large quantity of a substance from which it is possible to make a very good and rich milk. In Korea there are said to be many dairies (*lecherias*) that are devoted exclusively to selling soymilk (*leche de soya beans*) and this milk is very rich and nutritious.

This letter is located in file #565 in the archives, INIFAT, Santiago de las Vegas, Cuba. Another letter in the same file, dated 5 Feb. 1929, describes the use of soybeans for green manure (*abono verde*) in tobacco cultivation. Address: J.B. Diaz & Co. (tobacco store), Habana, Cuba.

277. Dorsett, P.H. 1929. Re: Letter notifying Mr. Matsumoto of forthcoming trip to East Asia (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Jan. 25. Unpublished log.
• ***Summary:*** Page 113. This letter dated 25 Jan. 1929 is to Mr. H. Matsumoto, Central Laboratory, South Manchuria Railway Co., Dairen, Manchuria.

"Dear Mr. Matsumoto. I greatly appreciate the receipt of your kind favor of December 1928, and was delighted to learn of your safe arrival back in Dairen after your visit to the United States..."

"Mr. Morse and I plan on sailing from San Francisco on March 1 for Yokohama, Japan. After a year spent there and in Chosen (Korea), we expect to get over into Manchuria and will probably, at least for a time, make our headquarters at Mukden, and later get down to Dairen. We are looking forward with pleasure to meeting you then.

"If in the meantime, you, for any reason, desire to get in touch with us, address your communications in care of the American Embassy, Tokyo, Japan. We plan, while in Japan, to receive our mail through that source.

"With kindest personal regards, I remain very truly yours,..." PHD/p. Address: Agricultural Explorer, USDA, Washington, DC.

278. Jardine, William M. 1929. Re: Letter of introduction for William Morse, Agricultural Explorer, Bureau of Plant Industry, USDA–to be used on trip to East Asia. Letter to whom it may concern, Jan. 26. 1 p. Typed, with signature on letterhead.
• ***Summary:*** "Be it known that Mr. William J. Morse, Agricultural Explorer, in the Bureau of Plant Industry, of the United States Department of Agriculture, whose signature appears on the margin hereof, will, in the immediate future, visit Japan, Ceylon, Formosa, Manchuria, China, Chosen, the

© Copyright Soyinfo Center 2021

Dutch East Indies, and other foreign countries, in connection with the work of this Department.

"He is hereby introduced and cordially commended to all persons with whom he may come in contact, whose good offices on his behalf are earnestly requested."

Morse's signature does indeed appear in the margin, and document is signed and sealed by Mr. Jardine.

Note: William M. Jardine of Kansas was secretary of agriculture (1925-29) under President Calvin Coolidge. William Marion Jardine (seventh president of Kansas State University) served as U.S. Secretary of Agriculture (1925-1929) under President Calvin Coolidge.

This digital image was sent to Soyfoods Center by Joyce Garrison (William Morse's granddaughter) of West Hartford, Connecticut (July 2004). Address: Secretary of Agriculture.

279. U.S. Department of Agriculture, Office of Information, Press Service. 1929. Plant explorers of the United States Department of Agriculture start for the Orient. Release immediately (News release) (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Feb. 18. Unpublished log.

• ***Summary:*** Page 223. P.H. Dorsett veteran agricultural explorer of the United States Department of Agriculture, and W.J. Morse, soybean specialist of the department, left Washington [DC] February 18 on a two year expedition to the Orient. They will sail from San Francisco March 1, going direct to Tokyo, Japan.

"The soybean culture of Japan, Chosen [Korea], Manchuria and Java will be one of the main features of the exploration program. New varieties will be sought for expanding the present acreage of the United States, methods of handling and preparation of a wide variety of by-products will be investigated.

"The varieties of the Oriental persimmon of Chosen will be sought."

280. Dorsett, P.H.; Morse, W.J. 1929. Re: Letter notifying Mr. Peter Liu in China of trip to East Asia including China (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. March 12. Unpublished log.

• ***Summary:*** Pages 343-45. Neither the address, title or affiliation of Mr. Liu are given. However, Peter Liu was Mr. Dorsett's Chinese interpreter on his 1924-25 trip in China.

"Dear Liu: Well here we are on the way back to the Orient. We left Washington [DC] February 18th, and came by way of Los Angeles, California to San Francisco, California and left there March 1st. We are now about half way between Honolulu and Yokohama, Japan where we are scheduled to arrive on the morning of the 18th. As soon as practicable after landing we will go to Tokyo and arrange for making headquarters there at least until we can get acquainted officially and learn what part of the country we should first get to work in.

"Our present plans contemplate a stay of a full year in Japan and Chosen (Korea) and in the spring or early summer of 1930 we will get into Northeastern China and make headquarters there in Mukden, at least for a while. Later in the season we will likely move headquarters to Dairen and remain there until fall and then hope to get over to Peking and be there during the winter of 1930-31. From there we will likely work south to Nanking, Shanghai, Han Kow (Hankow; pinyin Hankou, as of March 2014 part of Wuhan), Hong Kong and then to Taiwan (Formosa) where we may spend the winter of 1931-32. From there we will likely go to Singapore, Penang, Java, Sumatra, and Ceylon then back to America by England.

"We are wondering if you and the other two boys, Yey and Gow, would like to be with us while we are in China at least until we are ready to start South from Peking. Please let us know.

Page 345. "I copy the following from a letter from Mr. Julian Arnold under date of January 16, 1929, which I consider a high compliment and feel sure that you will appreciate.

"'I wish to commend the expeditious and thorough manner in which Mr. Liu handles this whole matter. His work and attitude were most commendable.'

"We are wish that you could speak Japanese for if you could we would have arranged to have had you meet us in Yokohama and helped us with our work in Japan and Korea.

"All of the party joins me in kindest regards. Very truly yours, Dorsett and Morse." Address: Agricultural Explorers, USDA, Washington, DC.

281. Dorsett, P.H.; Morse, W.J. 1929. Soy sauce (shoyu) in Japan, China, and Manchuria (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 655 (16 April 1929). "A representative of a Shoyu Sauce Company called on us and wished to give us a demonstration of a new process of soy sauce manufacture. This company had developed a chemical compound which when added to the regular soy sauce doubles the amount and makes an excellent soy sauce." However, in exchange, the company wanted the Americans' endorsement to use in

© Copyright Soyinfo Center 2021

advertising. He was politely refused.

Page 847 (May 2). Visited the soy sauce and rice wine experiment station [*Jozo Shikensho*] at Nishigahara. Met Prof. Dr. K. Kurono, who was said to be in charge. His young assistant took them through the soy sauce factory and rice winery. "We were able to get considerable data about the making of soy sauce as all the various steps involved were in operation and we were able to obtain seed of the soybeans and wheat used especially in making soy sauce.

Page 1222 (May 27). Dr. Ito made arrangements for Morse to visit a large soy sauce factory on the outskirts of Sapporo, Hokkaido. The Tomoe Shoyu Factory consisted of several large buildings covering several acres. Morse was shown through the entire plant. The wheat and soybeans are grown in Hokkaido, but each consists of a mixture of varieties; samples were sent to the USA. This factory uses the most modern machinery and methods. "In one of the large vat rooms more than 120 vats were counted in which the wheat and bean mash [moromi] is cured for about 18 months. The mash from which the soy sauce was pressed out is sold as cattle and hog feeds around Sapporo. The manager was interested in the possibility of selling soy sauce in the United States." A photo shows the outside of the factory's headquarters in Sapporo.

Note 1. This is the earliest English-language document seen (July 2011) that contains the term "bean mash" or the term "wheat and bean mash." The latter almost certainly refers to *moromi.*

Page 3341 (24 Dec. 1929). "Today [in Tokyo] Morse and Suyetake went to call upon soy sauce and natto manufacturers for the purpose of getting acquainted and also if possible to arrange for getting still and motion pictures of their places, equipment, and operations."

Page 3499 (9 Jan. 1930). They got six good photos of steps in the making of soy sauce at the Noda Shoyu Co. It is probably "the first time that such a picture has been made." "Detailed notes and descriptions of these soybean products will be found in the special report on soybean and soybean products which is a part of this report."

Page 4341 (March 11, 1930). A photo (neg. #45026) shows numbered specimens of various ingredients (in bottles) used in the manufacture of soy sauce, including soybeans, wheat, soy mash [moromi], malt from curing tub, soy sauce, soy sauce oil, and a small wooden cask. Purchased in Tokyo.

Page 4356. Photo (neg. #45033) of "a small quantity of mash left after the sauce has been pressed out. It is known locally as 'shoyu kasu.' It is used for feeding hogs and cattle and also for a fertilizer."

Page 4357 (March 17, 1930). "About 11 a.m. we went to the Yamasa Shoyu Factory at 576 Nakano-machi, Tokyo, Japan. There we met Mr. S. Yamaguchi, the manager, who allowed us to make pictures in the factory culture room and storage and curing sheds."

Pages 4358-4366. Photos (negatives #45034-42) of Yamasa Shoyu Sauce Factory in Tokyo. 1. Hydraulic press with thin bags for pressing out the sauce. 2. Factory interior, incl. cookers, pump, large casks. 3. Interior of wheat roasting and preparation room, with roaster, pile of small [koji] trays, huge wooden rafters. 4. Interior of "Shoyu sauce bacterial [sic, koji mold] culture room," with lines of small boxes [koji trays] on both sides. 5. Large iron double-boilers in which soy sauce is cooked [pasteurized?]. 6. Storing and aging room containing 4 rows of 16 casks each, taken at level of rim of casks. Each cask is about 8 feet across and 8-10 feet deep. The company has 8 such rooms and all are kept at full capacity. 7. Storage and curing shed (same room), taken from ground level. 8. Pile of "roasted wheat mixed with bacterial germs for shoyu sauce." Note 2. Actually, this contains soybeans and koji mold spores, about to be put into trays to make koji. Morse failed to understand these two basic facts. 9. Small wooden casks "ready for filling with shoyu sauce."

Page 5649-5650 (28 Aug. 1930). Heijo, Chosen [Pyongyang, North Korea]. Morse visited the branch office of the Grain Inspection Office of the Neian Nando Prefecture to learn about soybeans. Last season (1 Nov. 1928 to 1 Nov. 1929) some 263,090 bags of soybeans (of 2 bushels each) were inspected and shipped out from various points in the prefecture. "The Noda Soy Sauce Co. obtains most of its soybeans from here. The beans are shipped entirely to the Main Island [Honshu, Japan] for miso, soy sauce, and natto. Note 3. Chosen has been a Japanese colony since 1910.

Pages 6339, 6340, 6341, 6342 (3 Nov. 1930). In Peiping [Beijing], China. After tiffin they visited the Lan Hsin Chai "soy sauce, soy jam [chiang / jiang], and pickle" factory of Mr. Wang in the outer city to the southwest–not far from Hsuan Wumen Street. It is about 300 years old and many of the large earthen glazed jars are the same age as the establishment.

Note: This is the 2nd earliest English-language document seen (Nov. 2011) that uses the word "jam" to refer to *chiang / jiang.*

Pages 6341, 6342. 6343, 6344, 6345 (negatives #46157-61) show photos of this factory. 1. Side view "of one of a number of old Chinese lever soy sauce presses." 2-3. Other views of a soy sauce press, with jar in foreground. 4-5. Many large earthen jars, some covered with reed grass matting, in outdoors compound / courtyard.

Page 6802 (16 Dec. 1930). At Dairen, Manchuria, Morse met Dr. Kato at the Central Laboratory of the South Manchuria Railway Co. Concerning Japan, Dr. Kato said Ajimoto [a type of HVP] was made from wheat proteins, not soybean proteins. However, in and around Kyoto a product named Soyamint was very similar to Ajimoto but was made from soybeans.

Pages 7008-09 (21 Jan. 1931). In Tokyo, Morse visited the Institute of Physical and Chemical Research, where he met Dr. U. Suzuki, Prof. of Biological Chemistry at Tokyo

© Copyright Soyinfo Center 2021

Univ. "With reference to Soyamint, Dr. Suzuki advised that it is a soy sauce substitute–one half chemical and one-half fermentation" [i.e., a mixture of equal parts HVP and fermented shoyu].

Pages 7035-36 (24 Jan. 1931). In Tokyo, Morse "learned that soy sauce is prepared in nearly 12,000 establishments throughout the Japanese Empire and in addition it is made in private homes, especially farm homes. When 5 koku [1 koku = 47.6 gallons or 180 liters] (liquid measure) of soy sauce are made, a permit must be obtained from local authorities. Various sections in Japan are noted for brands of soy sauce such as Noda, Chiba Prefecture, for its "Kikkoman' and 'Higeta' soy sauces. In the Kwansei [Kansai, Osaka-Kyoto] district the 'Marukin' soy sauce is made while in the Tatsuno district [in western Japan's Hyogo Prefecture] the light colored [*usukuchi*] soy is made. The various brands are made in slightly different ways regarded as trade secrets by the various companies. Many experiments by chemical laboratories are being conducted to make artificial soy sauce and also to shorten the period of fermentation.

"Considerable quantities of Japanese soy sauce are exported, China being the chief market. Recently America and Europe have made increasing demands. In shipping to some countries, especially America, condensed soy sauce is exported, then water added and bottled."

Pages 7066-67 (30 Jan. 1931). In Tokyo, Morse has been trying for some time to locate the company that makes Soyamint. Finally, Mr. Suyetake found that it was made by the Japan Fertilizer Co. Morse visited the main office and met one of the directors, Mr. Koshiro Horie, who said that "his company supplies 65% of the commercial fertilizers used in Japan. One of the principal by-products of the manufacture of fertilizers is used with soybean oil meal in producing an artificial soy sauce. The process of manufacture is more or less secret so that it is not possible to visit the factory. As yet 'Soyament' is not on the market in large quantities as it is of only recent manufacture. It is said that soy sauce can be made in slightly over one month with this process, allowing one month for curing. It has quite a different flavor from that of soy sauce and it may take some time to establish it on the market. It can be produced much more cheaply than the ordinary soy and being cheaper may help it to take more quickly with the poorer classes." Mr. Horie gave Morse some literature about Soyament and promised to send samples of two grades of commercial products which differ principally in specific gravity. Address: Agricultural Explorers, USDA, Washington, DC.

282. Dorsett, P.H.; Morse, W.J. 1929. Green vegetable soybeans and Edamame varieties in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Pages 802, 803 (24 April 1929). While in Tokyo, Dorsett purchases from T. Sakata & Co. in [Yokohama] Japan eleven varieties of soybeans (8 oz each), one variety of Dainagon Azuki, and 2 varieties of swordbeans. Vegetable soybean varieties are: Edamame Wase Aosakigake, Edamame Wase Kurome Oxaya, Otsubu Wase Aojiro Edamame, Daikoku Edamame, Edamame Wase Higanmame, Tsurunoko Daizu, Edamame Wase Kurosakigake, Edamame Wase Chamame.

Page 892 (7 May 1929). A photo shows two commercial retail bunches of soybean vines and pods, bound at the bottom with rice straw. The soybeans are "used as a green vegetable."

Pages 1201-02 (26 May 1929). While visiting the Hokkaido Agricultural Experiment Station at Kotoni, Sapporo, Mr. Morse notes: "The soybeans grown in Hokkaido are used entirely for food purposes, such as natto, bean curd, green vegetable bean, soy sauce, miso, bean paste and roasted beans."

Page 1270 (30 May 1929). In Hakodate, Hokkaido, in northern Japan, the authors visited a store where pickles were sold. There they saw "a tub of pickled soybean pods, the seeds of which were about full grown. These pods were pickled in the same manner as we pickle cucumbers and sauerkraut, that is by salting down. This is the first time we have ever heard of or seen this kind of soybean product. According to Mr. Suyetake [their guide], this form of soybean product is eaten along with refreshments, the kind we no longer have at home [alcoholic beverages]. It seems rather ironical that we should come to study soybean products for the United States and find so many that, to enjoy them most, they should be eaten along with the refreshments of the pre-prohibition era of our country, but such is fate."

Page 1837 (11 July 1929). "The country around Nishiarai raises soybeans to a very considerable extent for edible green beans. Not only are early and late varieties planted but the beans are planted at intervals so that there will be a continuous supply for the Tokyo market. A number of farms were visited and soybeans were found on all in various stages of growth."

Pages 1869, 1871, 1878-1879 (15 July 1929). "Left the hotel about 7:45 for a day's agricultural exploration in one of the trucking areas in the vicinity of Tokyo, where the growing of soybeans as a vegetable is an important industry." From Nishiarai they set out across country on foot. "Saw many plantings of soybeans from just coming up to ready to pull for market. It is extremely interesting to note how they are planted for succession. We saw many plantings of beans ready for pulling for market with rows interplanted as seedlings or transplants just coming into bloom. One photo shows "Vegetable soybeans only recently transplanted. The light color between the rows is caused by fertilizing with

liquid night soil." Two other photos show soybeans "quite probably planted for use as a vegetable."

Pages 1897, 1898 (17 July 1929). "Secured interesting data and motion pictures of varieties of vegetable soybeans in the Tokyo market and outlying farming and trucking districts.

"Changed herbarium dryers on a large collection of plants and worked on estimates and tentative itinerary for the fiscal year 1929 and 1930. Also on official correspondence.

"In the morning we left early for the market to secure soybean pictures as soybeans in bundles of 30 to 50 plants each were very abundant. After securing two scenes we left for Kitasenju station where an agricultural association is located. It was learned from officers in charge that around Takenotsuka [near Tokyo] soybeans were grown extensively for green vegetable beans and that a village agricultural fair was being held. Arriving at Takenobu we found that the fair was being held in a school building about a mile from the station."

"Soybeans: Forty bundles of plants, 30-50 plants to the bundle representing several varieties used only for green vegetable beans. The two most common varieties use for green vegetable beans were the Sodefuri and the Chamame. The bundles were judged by color, size and shape of pod, and size and yield of each plant. Pods should be bright green and plump, that is the seed full grown. The size of the bundle for market purposes depends on the desire of the individual farmer. Three crops of vegetable soybeans are grown during the season–early, medium and late season.

"Perilla spikes: Small bundles of flower spikes which are much used for garnishing.

Page 1899. "Ginger flower buds (Mioga variety) 2 pans."

"Perilla plants (purple variety). 10 bundles of plants representing two purple foliage varieties. These are used for dying pickled plums [umeboshi], ginger, etc."

"Perilla plants (white). Bundles of a white variety used for pickling and as greens."

Page 1901. Still at the fair: "The prize awarding ceremony took place about 2:30 p.m. The fair only lasted two days. The prize winning bundles of soybeans were taken to the play ground outside the building and motion pictures were taken of the farmer winning the special soybean prize and the one winning the 1st prize.

"We were then taken to a farm house where soybean plants were being bundled for market. This was being done inside a shed and was too dark for taking motion pictures. The farmer very kindly brought out the bean plants and bundling box in the sunshine, and motion pictures were taken of the operation."

Pages 1925-1926 (19 July 1929). Negatives #44087, #44088, #44089. Three views of: "A native Japanese woman pulling soybeans to be bunched and sold as a fresh green vegetable."

Page 1927 (19 July 1929). Neg. #44090 and #44091. Two photos from the village of Hanabata: (1) "Children with their hands and aprons full of soybeans which have been boiled in the pod; they are eating them like we eat peanuts." (2) Details of how a farmer, sitting on the ground in his yard, bundles vegetable soybean plants for market and ties them with a grass string using a frame for support.

Page 1928. Neg. #44092. "The Japanese farmer shown in picture #44091 fixing a string of rice straw to tie about the top of the bundle of soybeans he has just fixed."

Neg. #44093. "A pile of soybeans awaiting bunching for the market."

Page 2065. Black and white movie film, DeVry camera, spool 23. Description of 8 shots of vegetable soybeans taken in Japan; undated. Page 2071 (3 Aug. 1920). "Visited the wholesale vegetable and fruit market and as usual found it full... and most interesting." "Soybeans: Bunches of soybeans are to be found in abundance on every turn, they are to be found in large and small piles at almost every stand. See picture #44162.

Page 2080. Neg. #44162. "Piled bundles of soybeans, one of the commonest vegetables in the market. They are to be found at every turn."

Pages 3501-3502 (10 Jan. 1930). The authors leave Tokyo for Urawa, the capital of Saitama prefecture in Japan, where they visit the Saitama Prefecture Experiment Station. The horticulturist explains that they have "three varieties of vegetable soybeans. These are grown especially as green vegetables. Plant seed in hot in hot beds about the middle of April and transplant to the field when danger of frost is over."

Page 3683 (24 Jan. 1930) states that at the Shizuoka Agricultural Experiment Station the authors "secured considerable information about vegetable and green manure soybeans for the Shizuoka prefecture."

Page 6911 (3 Jan. 1931). Morse writes from Tokyo: "At one of the department stores, in the vegetable market section, we found small bundles of soybean sprouts and also some bundles of green vegetable soybean plants. There were only 6 plants to a bundle, about 8 inches long and with 6 to 8 pods per plant. The seed in rather large pods seemed only about one half developed.

Pages 6931-6932 (7 Jan. 1931). Morse went to the Imperial Department of Agriculture in Tokyo and met the director, Mr. A. Manabe, who provided information, statistics, and recent publications on soybean acreage, production, utilization, and industries in Japan, Chosen [Korea], and Taiwan. The beans from Japan proper and Chosen are utilized primarily for food, such as bean curd (Tofu), confections, flour and green vegetable beans [edamamé]. A table shows that less than 1% (0.8%) of the soybeans used in Japan are consumed in the form of "Green vegetable beans."

Pages 7102-7103 (2 Feb. 1931). Morse is in Urawa,

© Copyright Soyinfo Center 2021

capital of Saitama prefecture. "The green vegetable soybean work, so much of which has been done at Urawa, has been transferred to the branch station at Koshigawa. A very extensive acreage of green vegetable soybeans is grown in the Saitama Prefecture. The beans are started in hot beds about March 1 and when warm weather sets in the plants are transplanted in the fields.

"Soybeans are not used extensively for green manure in the Saitama Prefecture. The station, however, is doing work with varieties best adapted to green manure purposes. Genge clover (*Astragalus sinensis*) is used most extensively by the farmers as a green manure crop in the rice paddy sections. We were given publications of results of the station's work for several years."

Note 1. This is the earliest English-language document seen (June 2009) that uses the term "Vegetable soybeans" (entry of 15 July 1929), or "green vegetable soybean" (3 Jan. 1931) or "green vegetable soybeans" (Feb. 1931).

Note 2. No mention is made of "edamame" (except in variety names; Apparently Dorsett and Morse don't yet understand the meaning of this word) nor of "vegetable-type soybeans" or "edible soybeans" as a larger category of soybeans. Address: Agricultural Explorers, USDA, Washington, DC.

283. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1929. The world situation in oils and oilseeds. 18(20):697-735. May 20.

• ***Summary:*** Pages 701-02: "Manchuria is reported to have produced another record soy bean crop in 1928, or approximately 3,500,000 short tons, against 2,952,000 short tons in 1927. Production also increased in the United States, but decreased in Chosen [Korea]. Manchuria provides about 70 per cent of the world's production of soy beans and is the only important source of supply for importing countries. Trade with the United States, however, appears to be diminishing, largely as a result of the increasing interest displayed by European countries in importing seeds for crushing. See table, page 708.

"The 1928 returns of imports into the chief consuming countries show a larger volume of business in soy beans and a corresponding reduction the quantities of soy-bean oil moving from China to Europe. Outstanding increases appear in the imports into the United Kingdom and Germany, while larger quantities also were taken by Japan. In the latter country, the amount of soy-bean cake required for fertilizer was an important influence upon the market for soy beans, while in Europe the chief use of the by-product is as a livestock feed. In the United States the bulk of the requirements are met from domestic production. The crop of 1928 is placed at 261,000 short tons. Only 18,102 short tons are reported having been crushed for oil, however, against 11,364 in 1927 when the domestic crop was placed at 224,000 short tons: Most of the American crop is used as feed or as a green manure. Since June 1928, the price of crude soy-bean oil in barrels at New York has stood at 12.3 cents pound, a figure slightly higher than that of the corresponding period of 1927-28."

There follow similar but shorter sections on olive oil, sesame oil, rapeseed oil, sunflower seed oil, and flaxseed oil.

Tables showing production of soybean oil or its equivalent, from 1924 to 1928, appear on the following pages: Page 704: Vegetable oil: Production of more important materials in terms of oil in important producing countries, 1924-1928.

Page 708: Exports (in short tons) of soybeans and [soy] bean oil in terms of beans, 1919-1928, from Manchuria, Chosen [Korea], Dutch East Indies, Japan, United States.

Page 720: Vegetable oils: Raw materials used in production in the United States, annual 1919-1928, and three-month periods 1926-1928. The raw materials are cottonseed (by far the biggest), copra, peanuts (kernels), olives, soy beans, flaxseed (#2 largest).

Page 721: Vegetable oils, estimated total disappearance in the United States, 1924-1928 (in 1,000 pounds). The oils are cottonseed oil (bigger than all others combined), peanut oil, soybean oil, olive oil (edible), coconut oil, corn oil.

Page 723: Animal and vegetable fats and oils: Factory production in the United States, fiscal year 1912-13, calendar years 1924-1928 (in 1,000 pounds). In 1927 the top 5 were cottonseed crude, lard (other edible), lard compounds and other lard substitutes, cottonseed refined, and oleomargarine. In 1927, crude soybean oil was 3.088 million lb whereas refined soybean oil was 5.681 million lb–both miniscule compared with 1,806.7 million lb of crude cottonseed oil.

Page 724: Animal and vegetable fats and oils: Factory consumption in the United States, 1924-1928 (in 1,000 lb).

Page 725: Animal and vegetable fats and oils: Stocks in the United States, December 31, 1924-1928.

Page 726: Oleomargarine: Materials used in its manufacture in the United States for the years ended June 30, 1924-1928. In 1927 the leading materials (in million lb) were coconut oil (107.6), milk (73.7), oleo oil [made from rendered animal fats] (48.7), neutral lard (24.87), cottonseed oil (23.72). Soybean oil was a mere 0.032 (=32,620 lb).

Pages 728-29: Fats and oils: Wholesale prices of some of the principal fats and oils in cents per pound, annual 1915-1926, monthly Jan. 1925 to March 1929. In March 1929, the 5 least expensive were: Coconut oil (crude) 9.2. Peanut oil (crude) 10.3. Cottonseed oil (crude) 10.6. Oleo oil (crude) 11.2. Soybean oil (crude) 13.3. The two most expensive were butter (49.2) and olive oil (30.0).

Page 732-33: Vegetable oils and oil materials: Imports into the United States by countries, 1913, 1924-28. Soybean oil imports were 12.3 million lb in 1913, 9.1 million lb in 1924, 19.4 million lb in 1925, 30.7 million lb in 1926, 14.9 million lb in 1927, and (prelim.) 13.1 million lb in 1928. In 1913 most of the oil came from Japan, but from 1924-1928

© Copyright Soyinfo Center 2021

most came from the Kwantung leased territory (in northeast China, controlled by Japan).

Page 735: Vegetable oils and oil materials: Exports from the United States by countries, 1913, 1924-28. In 1928 the USA exported an estimated 7.14 million lb of soybean oil, with the most going to Cuba (2.732 million lb) and Dominican Republic (1.638 million lb).

284. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1929. The world situation in oils and oilseeds. 18(21):761-89. May 27.

• ***Summary:*** Page 762: Germany: "The increase in the potential output of [vegetable] oil in 1928 was to a large extent the result of the augmented imports and milling [crushing] of soy beans, peanuts, and flaxseed.

Page 763: Great Britain: "Imports of vegetable oils as such during 1928, however, declined more than 4 per cent below the 1927 figure. The decline is accounted for largely by the smaller imports of soy-bean oil, peanut oil, palm oil, and vegetable oleo-margarine.

Page 764: The Netherlands had increased imports of flaxseed, soybeans, rapeseed, and sesame seed.

Page 768: A full-page table shows imports into Germany, 1924-1928, of seeds, vegetable oils and fats, and animal fats and oil (short tons).

The top 4 seeds imported in 1928 were: soy-beans (934,446), peanuts (655,760), linseed (488,273), palm kernels (327,788).

The top 4 vegetable oils imported in 1928 were: palm oil and butter (22,341), linseed oil (14,594), castor oil (9,141), coconut oil and butter (6,895). Soy-bean oil was only (1,233),

The top 4 animal fats imported in 1928 were: butter (139,500), fish oils (109,686), lard (96,478), oleomargarine (12,702).

Page 770: A full-page table shows imports into France, 1924-1928, of seeds, vegetable oils and fats, and animal fats and oil (short tons).

The top 4 seeds imported were: peanuts shelled (40% oil) (363,433), peanuts unshelled (318,797), linseed (231,590), copra (202,587). Soy-beans were only 8,782.

The top 4 vegetable oils imported in 1928 were: olive oil (21,901), palm oil (17,579), soy-bean oil (9,995), peanut oil (7,216).

The top 4 animal fats imported in 1928 were: fish oils (16,356), lard (14,768), margarine, oleogarine [oleomargarine], etc. (13,545), tallow (8,850).

Page 771: A full-page table shows exports from France, 1926-1928, of seeds, vegetable oils and fats, and animal fats and oil (short tons). The main exports were peanuts unshelled and peanut oil.

Page 775: A half-page table shows "Soy-bean oil: Monthly average price of Manchurian, crushed, in bulk, C.I.F., London, 1925-1929 (in cents): In 1925 the price ranged from a high of 9.15 cents in Jan. to a low of 7.78 in Dec. In 1928 the price ranged from a high of 7.09 cents in April and May to a low of 6.73 in Sept.

Page 776: A full-page table shows imports into the United Kingdom, 1925-1928, of seeds, vegetable oils and fats, and animal fats and oil (short tons).

The top 4 seeds imported in 1928 were: cottonseed (18% oil) (643,479), flaxseed (30% oil) (390,395), soy beans (13% oil) (215,531), palm kernels (45% oil) (179,805).

The top 4 vegetable oils imported in 1928 were: coconut oil (70,941), margarine (61,756), palm oil (59,039), soy-bean oil (27,627).

The top 4 animal fats imported in 1928 were: butter (342,766), lard (137,049), fish oils (81,902), and oleomargarine, oleo oil, premier jus and refined tallow oil (30,421). Note the UK's large imports of animal fats.

Page 777: Exports and reexports from the United Kingdom, 1925-1928 of seeds, vegetable oils and fats, and animal fats and oil (short tons). All quantities are relatively small.

Page 778: A full-page table shows imports into the Netherlands 1924-1928, of seeds, vegetable oils and fats, and animal fats and oil (short tons). The two main imports in 1928 are linseed (460,299) and copra (151,101).

Page 779: A full-page table shows exports from the Netherlands 1924-1928, of seeds, vegetable oils and fats, and animal fats and oil (short tons). The main exports in 1928 are margarine and other butter substitutes (97,878), linseed oil (77,962), coconut oil (62,239), butter (51,743).

Page 780: A full-page table shows exports from China 1925-1927, of seeds, vegetable oils and fats, and animal fats and oil (short tons). The top two seeds exported in 1927 are soy beans (1,940,728) and peanuts shelled (102,731). The top 3 vegetable fats exported in 1927 are soy-bean oil (164,649), wood oil (60,028), and peanut oil (39,448). Animal fats exported are small: lard in bulk (4,329), animal tallow (2,312).

Page 786: A half-page table shows: Soy beans: international trade, years 1926-1928 (pounds). Principal exporting countries: only China (3,376,789). Principal importing countries in 1928: Germany (1,868,891), Japan, incl. Chosen [Korea] (1,031,713), Denmark (474,218), UK (430,866).

Page 786: A half-page table shows: Soy bean oil: international trade, years 1926-1928 (pounds). Principal exporting countries in 1927: China (329,298), Denmark (33,837), Japan incl. Chosen (11,167). Principal importing countries in 1927: Netherlands (166,388), UK (118,075).

Note: This is the earliest document seen (May 2020) that contains the term "vegetable oleo-margarine."

285. Morrison, Ben. 1929. Re: Glad to hear of return of Dorsett's good health. Letters from Ryerson and Fairchild (Document part). In: P.H. Dorsett and W.J. Morse. 1928-

© Copyright Soyinfo Center 2021

1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. March 12. Unpublished log.
• ***Summary:*** Pages 5785-5786. Letter to Mr. P.H. Dorsett, c/o United States Embassy, Peiping, China.

Dear Dorsett: I have your letter of July 16 and, of course, have since had your cable saying that you have gone on to Peiping and are feeling fine. This is certainly good news and we are all very much relieved to know that you are getting on your feet again. However it seems to be my role this summer to always rush out with more shouts of precaution. Do see to it that after you get to Peiping you take care of yourself there, and if you find that it is getting too hot, too dry, or too anything else four your continued progress, find out where the other Europeans and Americans go and give yourself a short vacation to pick up."

"We have been having interesting letters from Ryerson who had to change his plans radically in order to meet the situation with Professor Biolotti [?], but everything seems to have taken a turn for the better there and I suppose by this time Ryerson is headed north for the congresses in London as his next important stop.

"Our last letter from Dr. Fairchild, written on board the yacht off Sicily, would indicate that he is thinking of coming back to this country after a long, interesting but somewhat tiring trip. He said he had written you two letters and I hope these have reached you safely as he is, of course, as interested as we all are in your recovery."

"When you get back at Christmas you will be as much interested as anyone to see all the things that have happened– new roadway, new reservoir, and endless miles of copper screen, as well as one additional pit house and a rebuilt lath structure.

"With kindest personal regards, I am

"Very sincerely yours,..." Address: Senior Horticulturist Acting in Charge, USDA, Washington, DC.

286. Dorsett, P.H.; Morse, W.J. 1929. Plans for further exploration (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Pages 2273, 2274, 2275 (30 Aug. 1929) "In view of the number of soybeans we have already collected and the large number which we have been promised by Japanese Experiment Stations this fall, as well as the very rapid increase of the soybean industry in the United States, Morse does not feel that it will be advisable or possible for him to remain in the field away from his work at Washington [DC] for more than two years. Dorsett does not have any special work which needs his attention at Washington and can remain in the Orient for another year or two if that appears necessary or desirable by those in authority at Washington.

"We are considering the following two plans of operation for the remainder of the time Morse feels that he can spend in the foreign field.

"1. Complete the work in Hokkaido which will possible require a month or six weeks longer then return to Tokyo and as soon thereafter as practicable make a trip into Chosen (Korea), and do what we can there within a week or ten days. Return to Tokyo and complete operations there by not later than December 15th or January first, 1930. Then leave for Formosa (Taiwan) and spend the remainder of the winter there. In early spring, April or not later than May 15th, proceed to Dairen and our headquarters there for the remainder of the time Morse can remain in the Orient. From Dairen work southern Manchuria and as far north as Mukden [now Shenyang], even making a short trip up to Harbin and vicinity. Also go from Dairen into Chosen during the spring or summer season and in the fall or early winter of 1930 get over to Peking to clean up the work of soybean milk production and other soybean products, in time for Morse and Dorsett too, if it is deemed advisable, to leave for America so that they will reach there in time for Morse to take up his spring work with soybeans.

#2. Complete our work here within the next six weeks or two months if possible. At any rate return to Tokyo as soon this fall as the work here is completed. Then at the earliest possible opportunity get over to Chosen (Korea) and do what we can there this fall, Return to Tokyo and complete our work there with soybean products, making when practicable excursions of a week or so into other parts of Japan for the purpose of picking up information and seed and pictures where possible of persimmons, green manure and cover crops as well as other features of Japanese horticulture.

"In early spring move headquarters to Dairen and work South Manchuria and the central portion as far north as Mukden and Chen Chung [Changchun], the region which was not worked by the Dorsetts in 1925-26. Chosen (Korea) might also be given additional attention throughout the summer and fall as opportunity permits. Dairen is perhaps the best place in the Orient to data if all kinds on soybean storage, handling, and by-products. Complete this work then get over into Peking to work up soybean products, especially soybean milk production. In the early winter go to Taiwan and work that region until Morse feels its time for him to leave for the states. If it is deemed advisable, Dorsett can return then or he could remain and finish up the work in Taiwan (Formosa) in case that was not done before Morse left. He could get in touch with McClure at Canton, which is nearby Canton, and together they might handle the *Placanea cornea*, edible Chinese acorn, and Tonkin cane proposition. Dorsett could then go to Java and look after the soybean and

© Copyright Soyinfo Center 2021

green manure and cover crop work...” Address: Agricultural Explorers, USDA, Washington, DC.

287. Nouelle, Georges. 1929. Le soja: Les produits coloniales [The soybean: Colonial products]. *Annales Coloniales* (*Les*) 30(137):1. Sept. 17. [2 ref. Fre]
• ***Summary:*** This is basically a good review of the literature, with no new information. It discusses the history, cultivation, and utilization of soybeans as human food, animal feed and in industry, with some emphasis on utilization.

For a long time, it has been considered in Europe as an object for botanical studies.

The milestone dates in its history are:

1779–The first cultural trials at the Museum of Natural History [Paris].

1868–Experiments are undertaken by the Society of Horticulture of the Côte-d’Or.

1880–Soybean seeds are sold by the house of Vilmorin [a seed company].

1888 [sic]–Introduction of soybeans into the United States, where it is adopted for the feeding of animals.

1906–Use of soybean in English oil mills, to make up for the shortage of cottonseed oil.

1908–Creation at Paris by Mr. Li-Yu-Ying of a research laboratory, later expanded into a factory named the *Caséo-Sojaïne* [soy casein factory = tofu factory].

The soybean is adapted to various climates and can be cultivated as far north as the haricot bean. It resists the cold better than the latter and is very tolerant of drought.

It is said that it grows from the Equator to 60º latitude. It is cultivated in China and from Manchuria large amounts are exported to China, Japan, Formosa, Korea, Indo-China and Siam.

In the Americas, it is cultivated in the United States. In Europe. it is cultivated in France in the area around Etampes, in several provinces of Italy, and in Russia.

In Oceania, it is grown in Philippines, Java, and Borneo.

In Africa, trials have been conducted in Algeria and Tunisia, as well as in the British colonies of southern Africa.

In 1908 about 100,000 metric tons were exported from China to Europe, of which 69,200 went to Great Britain and 21,390 to France. In 1909 England purchased 400,000 metric tons for its oil mills.

The soybean can be used profitably in crop rotations to add nitrogen to the soil for subsequent crops.

It is also widely used as a feed for animals.

For human food, it can be used in various forms, especially in the form of milk and of flour.

Soymilk (*Le lait de soja*), known in China before the Christian era, is obtained as follows: a brief description is given, including the process used at *Caséo-Sojaïne.*

Soymilk bears some resemblance to animal milk and it has analogous properties. It can be coagulated to make soy cheese (*fromage de soja* [tofu]). This is done in China and Japan using the water from salt marshes [nigari], or calcium sulfate (*plâtre*) or sour soymilk (*lait aigri*). At *Caséo-Sojaïne* it is made using a mechanized process, which ensures complete hygiene and uses pure coagulant solutions which leave no taste of bitterness.

They have also been able to make cheeses that resemble European cheeses, fermented or not.

Soymilk, like animal milk, can be concentrated, dried and reduced to a powder. Or it can be fermented to make kefir or yogurt (*Kéfir ou Yoghourt*). The cost of making it renders its use very economical.

Soy flour is obtained in the same way as wheat flour, by grind the seed–preferably dehulled. It is a very rich food which contains 4 times as much protein and 20 times as much oil as typical wheat flour. From it one can make bread (notably a diabetic bread using the formula of Dr. Menudier, 1890). By mixing it with wheat flour one can make biscuits that are easy to digest and have a long shelf life, or cakes, pâtes, etc.

From the seeds one can extract an oil which the Chinese presently use in their cuisine, and the English use to make margarine or soap. The cake remaining after oil extraction makes an excellent animal feed.

The soybean can also be consumed as a vegetable [green vegetable soybeans]. Its digestibility varies with the means of preparation. It is recommended to boil it (after soaking) in water to which had been added a pinch of sodium bicarbonate [baking soda]. Soy sprouts give salads a very agreeable taste. The Chinese make a bouillon base which can replace the bouillon from meat. And fresh soybeans can be prepared like peas. The Japanese and Chinese make soy sauce, using a complicated process, of which certain types are appreciated in England.

Finally, it can be used in confectionery in the form of a confection similar to *crème de marron*, or in the form of chocolate (with sugar and cocoa butter added). Grilled soybeans are served in certain European countries in place of coffee.

In addition to its alimentary uses, the soybean is used to make candles, paints, and *sojalithe* as an insulator for electrical devices.

The soybean is thus suited for numerous and diverse uses. It would be desirable to develop its culture in our colonies and even in France itself in places where it can be acclimatized. Address: Député de Saône-et-Loire, vice président de la Commission des Colonies, membre de la Commission des Mines.

We went direct to the Chosen Hotel which will be our headquarters for the time we are working in Chosen." "We spent the afternoon at the Chosen Expedition where we saw many interesting products, among them quite a number of soybeans..."

Page 2773 (25 Oct. 1929). "We left Keijo [Seoul] at 7:30 this morning with Professor Dr. N.I. Vavilov, Member of the Academy of Sciences, Director of the Institute of Applied Botany, Leningrad, Herzen Street, 44, Russia, whom we met by chance at the hotel last night, to visit the Agricultural Experiment Station, Government-General of Chosen." "The experimental work of the station embraces breeding, selection and cultivation of rice, soybeans and other legumes,..." "They have a collection of about 625 samples of soybeans and are actually growing something like 200. Of these we hope to get samples for trial at home."

Page 2774. "We saw two varieties of fasciated soybeans which were developed at the Station which is [sic, are] very interesting, see Neg. #44443, 44444, and 44445. The stem is broad and flattened and the pods are borne in a cluster at the top of the broad flat stem. However, we understand that it is the intention of the Experiment Station to distribute this variety as a green vegetable bean."

Page 2775. Negative #44436 shows a "View (but a poor one) of... the Suigen Agricultural Experiment Station.

Page 2779. Neg. #44443. View of a variety of soybeans with fasciated stems. The beans are borne in clusters. Suigen Experimental Station, Suigen [today's Suwôn, South Korea], Chosen.

Neg. #44444. A nearby view of fasciated stems of soybeans; the pods are in clusters near the top. Suigen..."

Page 2787 (30 Oct. 1929). Left Keijo [Seoul] at 8:30 this morning for the soybean section at and in the vicinity of Chotan, where we arrived at 9:45 a.m." "In a number of instances the land from which soybeans was harvested is in winter barley or wheat, and in numerous instances the wheat is up and making a good showing.

"As soon as we arrived at Chotan we called at the office of the Village Cooperative Society. The Director or manager sent a man with us to show us the soybean area and to assist us in any possible way."

Page 2780 (Neg. #44445). An excellent, clear photo. "Prof. Dr. N.I. Vavilov holding two stems of the variety of fasciated soybeans. This shows well the fasciation and the clustering of the pods. Suigen Agricultural Experiment Station, Suigen, Chosen.

Page 2788. "We saw soybeans in sacks, two bushels to the sack, weight about 126 pounds. The rice straw bags cost this farmer 25 to 33 sen each, depending upon the quality and grade.

"We secured quite a number of samples of soybeans, got a lot of information concerning soybeans and also quite a number of still and motion pictures.

Ginseng: There are two commercial kinds, red and white. The 'red' ginseng, which we understand brings the highest price, is different from the white only in processing, which gives it its red color. The ginseng raised in the vicinity of Heijo [Pyongyang], the former capital, for 470 years, is considered the best ginseng in the world. It is recorded that the medicinal ginseng is obtained from the roots of plants six years old.

"The principal demand for ginseng is from China, especially South China."

Page 2789. Having missed a train and with a long wait for the next: "We secured quite a number samples of soybeans, and a number of still and motion pictures."

Page 2803 (31 Oct. 1929). "At 10:00 a.m. we visited the three Keijo markets: Nandaimon, Central, and Todaimon, where we rounded up the following seed: 28 numbers of soybeans, three of adzuki beans, 2 of cow peas, 2 of mung beans, 2 of rice, 2 of beans and 3 of barley.

"We also visited a mung bean vermicelli factory and saw them making bean vermicelli. The beans are soaked for about 12 hours then ground in dripping water. From the ground product the hulls and foreign matter is floated out and the resultant product is then put into a cloth and pressed into a more or less square form. When needed it is melted in hot water and after mixing, depending upon condition, in the following proportions: 3 parts bean paste to 2 parts of kaoliang flour, it is worked into a dough, then put through a perforated strainer or former into boiling water, from this it

is transferred to cold water and then hung up in a sheltered place and later out in the air to dry.

Page 2807. Forecast of crops for 1929. "From American Consul General Ransford S. Miller. Seoul, Chosen. Date of completion: Sept. 17, 1929. Source of information: Official Gazette of the Government General of Chosen, Sept. 16, 1929."

"2. Forecast:... "Soya beans were forecasted at 4,077,028 *koku* (20,874,383 bushels) from 800,602.6 *cho* (1,962,037 acres) of land under cultivation, the former showing an increase of seven percent or 266,367 koku (1,363,901 bushels) but the latter decreased by 20.7 cho (51 acres), as compared with the previous year."

Page 2808. I. Comparison by years. (1 cho = 2.4507 acres. 1 koku = 5.12 U.S. bushels).

Soya beans: Area of land (cho); amounts of production (koku).

1924–690,858.7 cho; 3,657,623 koku
1925–803,495.1 cho; 4,612,033 koku
1926–791,636.9 cho; 4,351,527 koku
1927–793,628.8 cho; 4,747,062 koku
1928–800,623.3 cho; 3,010,641 koku
1929–800,602.6 cho; 4,077,028 koku

Page 2809. A large table shows land area under cultivation for soya beans by province, for 1928 and 1928, for the following provinces: Keiki, North Chusei, South Chusei, North Zenra, South Zenra, North Keisho, South Keisho, Kokai, South Heian, South Heian, Kogen [Kegen?], South Kankyo, North Kankyo.

Page 2810. A large table shows soya bean production by province, for 1928 and 1928, for the same provinces shown above.

Page 2849 (1 Nov. 1929). "In the forenoon we visited the Capitol... [then we visited] the Prefectorate Seed and Plant Nursery of Keijo... Here we met Mr. S. Yamaguchi, Director of the Institution. He explains that this organization tests for, and supplies tested seed... to farmers throughout the prefectorate. This organization, we understood, is really under the direction of the agricultural experiment station at Suigen... The Director showed us the two standard soybeans recommended by the Station, and the ones most generally grown by the farmers.

Page 2850. They are known as 'White eye,' best adapted for good ground in valley conditions, and the 'Black eye' most suitable for poor valley and upland soils. The former is the best yielder and most desired by the market, but on account of prevailing land conditions throughout the region, the 'Black eye' variety is most generally grown.

"Nematodes are present in a good many sections and this is frequently the cause or more or less small yields of grain. The average yield of soybeans is given at 8 bushels per acre, which is really quite low. Soybeans in the district are planted from about the middle of April to the last of May, and usually harvested in October.

"Soybeans are usually, in this region, planted by making a hole in the ground with the heel, dropping two or three beans in it and covering the seed with the foot. Sometimes soybeans, one or two rows about a foot apart, are planted between barley which normally is planted in rows three feet apart." "Green manure is seldom used by local farmers."

Page 2905 (8 Nov. 1929). "Today we met with a serious disappointment. As previously noted, we arranged, or thought that we had arranged, to secure samples of soybeans, mung beans, adsuki beans, millet, sorghum and buckwheat from the extensive display which we found at the Exposition when we first arrived in Keijo.

"This morning we sent Mr. N. Suyetake (our interpreter) to learn how things were progressing and if we could be of any assistance in getting and bagging the material. He returned about 2:00 p.m. with 8 samples of seed, two each of soybeans, mung beans, adsuki beans and two kinds of garden beans." He was told there had been a misunderstanding.

Page 2918 (9 Nov. 1929). "We saw a good many small green planted soybeans alone and with corn and millet which was being harvested by cutting, or is yet to be harvested."

"Morse advised this morning that last night he met Mr. Oda, Secretary to the Governor-General, who inquired how we were getting along. (He had special reference to our getting grain samples from the collection at the Exposition which we had requested). Morse replied that we were not getting along at all, for we only got two samples of soybeans. Mr. Oda expressed surprise and arranged with Mr. Morse and Mr. Suyetake to call at his office about 10:30 this morning and he would go with them to see one of the principal officials about the matter of taking up with the 13 prefectorates the problem of getting samples for us."

Page 2919. "They attended to that this morning and reported that Mr. Oda had started things moving to get a collection of local as well as commercial varieties of soybeans, also samples of mung beans, adsuki beans, wheat, barley and buckwheat. We will supply the small bags to be sent to the proper authority in each prefectorate."

Page 2934. Neg. #44530. "Large bales of soybeans in a farmer's yard near the village of Koka, Koka Island [today's Ganghwa Island], Chosen.

Chosen. "Winnowing soybeans by means of a piece of matting."

Neg. #44552. Soja max. Soybean. Shariin, Chosen. "Balls of soybeans [*meju*] each prepared to grow the culture and make miso."

Page 2965 (14 Nov. 1929). "We called at the Experiment Station this morning and found Dr. Takahashi ready to demonstrate for us the common Korean practice of planting soybeans in this section, so that we could try to get still and motion pictures of the several practices.

"The first method he showed us was the planting in 4-foot hills on ridges among other crops. Opening the hill with a short handled hoe and dropping the beans (three or four) in a hill and covering with the hand hoe.

"Planting thickly, 6 inches to 8 inches apart in the row for grain or other purposes. Opening the hole with the heel, dropping the beans and covering with the feet.

"The Doctor also demonstrated for us the Korean double and single oxen plow in preparing land for seeding. From what we could see in a trial of this kind, the Korean plow does excellent work and perhaps for the Korean method of farming is superior to the Western plow."

"In the afternoon we visited a nearby village and tried photographing scenes and operations in the making of soybean mash balls [*meju*] for the home manufacture of miso and soy sauce.

Page 2966. Neg. #44558. "Planting soybeans on the side of ridges by means of a small short handled hoe. Shariin Agricultural Experiment Station. Shariin, Chosen."

Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 2978 (15 Nov. 1929). "At 1:45 p.m. we all boarded the train for Kokaikoshu, a half an hour or so's ride from Shariin [today's Sariwôn, North Korea] to the north. We arrived at Kokaikoshu at 2:30 p.m., where we went to visit one of the large soybean sections. There we visited three concerns where they were receiving, grading, sacking and storing away in storage houses soybeans. We secured samples of their special varieties and still and motion pictures of some of their equipment and supplies, as well as of several of their operations.

"At the last commercial place visited they have 3,000 *cho* of land, about 7,350 acres, devoted to soybean culture. 15,000 *koku* of seed is required for the annual seeding. The yield for the 3,000 *cho* is 53,400 *koku* or 267,000 bushels (we question this yield as it gives over 36 bushels per acre, far beyond the yields in Japan or Manchuria)."

"The present price of beans is as follows:

"Extra (mostly Oiyakukon A1 variety, large beans), Yen 18.00 per *koku* (5 bushels). 1st grade, Yen 17.00 per *koku.* 2nd grade, Yen 16.00 per koku; and 3rd grade, Yen 15.50 per *koku.*

• ***Summary:*** Chotan soybeans are a variety of soybeans that come from Chotan prefecture in Korea. Address: Kyonggi-do, Seoul, Korea.

293. Morse, W.J. 1929. Re: Impressions of Korea. Agricultural exhibition. Suigen experiment station and Dr. Nagai. Letter to R.A. Oakley, Office of Forage Crops, USDA, Washington, DC, Nov. 3. 3 p. Typed, with signature on USDA letterhead.
• ***Summary:*** "Just a few words to let you know that I am still in the land of this living but this is sure a strenuous life." Morse arrived in Keijo (Seoul), Chosen, the morning of Oct. 23. "The conditions in Korea, or Chosen, as they now call it, are quite different from those we have observed in other parts of Japan. This is surely one poor country, not only from the point of view of soils but also the people... at first it was very interesting to us to see the men in their funny 'happy Hooligan' hats and both the men and women dressed all in white.

"The Korean Agricultural Exhibition was still on when we reached here so we spent two days studying the agricultural products of the different prefectures of Chosen as well as some of the products from other parts of Japan... We also found a very large exhibit of soybean varieties from all over Chosen. It was the largest and nicest collection that I have ever seen. There were between four and five hundred samples and as many more of adsuki beans, mung beans, sorghums and millets." Through the American Consul–"We went to see the Japanese in charge of the agriculture exhibits and we were promised the seed desired. Mighty busy times ahead for several folks.

"We have been down to see the Suigen experiment station which is about an hour's run on the train from Keijo. This is the main station of Korea and surely is a fine one. We found that they are doing a very large amount of work with soybeans and have in the past few years tested out about one thousand varieties."

"We do not know just how long we will be in the 'Hermit Kingdom' but it is getting rather cold..."

"We are stopping at the Chosen Hotel which is a government railway place. When coming in the lobby the other night a man rushed up to me and called me by name. It was Dr. [Nikolai] Vavilov, Director of Applied Botany, Leningrad, Russia and whom I had met two or three times in Washington. He was touring Japan and had spent time in China and Turkestan... We went out to the Suigen [agricultural experiment] station with him and had quite a visit."

Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** * = Best photos. Page 2965 (14 Nov. 1929). Again visited the Shariin Agricultural Experiment Station near Shariin [today's Sariwon in North Korea] and met Dr. Takahashi, the director, who demonstrated the common Korean practice of planting soybeans in 4' hills on ridges among the other crops. "In the afternoon we visited a nearby village and tried photographing scenes and operations in the making of soybean mash balls for the home manufacture of soybean miso and soy-sauce.

Note: This is the earliest English-language document seen (April 2021) that uses the term "soybean mash balls" to refer to what in Korean are called *meju* and in Japanese are called *misodama.*

Photos (p. 2966-67) show women planting soybeans on the side of ridges using a small, short-handled hoe.

Photos (p. 2968-69) show close-up views of "Tenjan [doen jang = Korean soybean jang], soy sauce, and Kanjan [Kanjang = Korean soy sauce]; back row, left to right, two balls of freshly made bean mash, on the right, two made three weeks or more ago, these are pretty will cracked and covered with mould."

Note 1. Each ball is wrapped in straw which is joined and twisted at the top.

Note 2. This is the earliest document seen (April 2021) that uses a Korean name for Korean-style soybean jang (miso), or that uses the word "Tenjan" to refer to Korean-style soybean jang.

Note 3. This is the earliest English-language document seen (April 2021) that uses the word "Kanjan to refer to Korean-style soy sauce.

Same photo but with a crock of miso in the back. Photo of Korean planting soybeans using a large plow and oxen.

Page 2972 (14 Nov. 1929). Shariin, Chosen [Korea]. *

"Pouring boiled soybeans into a wooden mortar for crushing" (neg. #44570).

Page 2973. "Crushing the boiled soybeans in a wooden mortar for use in making Miso balls for the growing of curing bacteria" [sic, koji mold] (neg. #44572).

Page 2974. "A Korean farmer's wife working the mashed soybeans into balls similar to the ones in the background, which are already more than two weeks

© Copyright Soyinfo Center 2021

old and are full of molds and bacteria, which apparently are necessary for the making of miso" (neg. #44575).

Page 2975. "A nearby view of the new and the old. From left to right, the first two are the newly made miso bean balls and the two with the [rice straw] strings tied about them are more than two weeks old. They are cracked and already pretty well covered with moulds of various kinds and also, presumably, bacteria of various kinds" (neg. #44576).

Note: The various types of traditional Korean miso and soy sauce are made from a dried soybean koji called *meju,* which is prepared in much the same way as Japan's *miso-dama.* The word *jang* is closely related to the Chinese word *chiang* [pinyin: *jiang*]. Traditional Korean miso and soy sauce contain no wheat, rice, barley, or other grain. For details, see *The Book of Miso,* 2nd ed., by Shurtleff & Aoyagi (1983, p. 245-47). Address: Agricultural Explorers, USDA, Washington, DC.

Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 3015 (20 Nov. 1929). In Keijo [Seoul], Chosen. After sending off four parcel post packages, the authors "went to The Natto Co., 55 Nichome, Yoshino Cho, Keijo, and arranged for making snap and motion pictures of the various operations incident to the manufacture of this interesting food product."

The building is a rather low one-story structure with the cooker and fermenting room or chamber built inside the one-room building. There are shelves 18 inches or 2 feet below the ceiling and upon these the prepared rice straw packages of boiled beans are placed to cure or for the development of the bacterial germs.

"The beans are first soaked for about half a day and then boiled slowly for 7 to 9 hours. After the proper amount of cooking the beans (in a small amount, about a double handful) are placed in rice straw containers. They are then put into the culture chamber where they remain for 20 to 24 hours at a temperature of 40º to 45º F.

© Copyright Soyinfo Center 2021

"This curing or culture room is heated and the above noted temperature maintained by means of charcoal fire pots.

Page 3016 shows a floor plan of the factory with ten areas labeled in detail.

Page 3017. "We learned that there is a liquid residue from the cooking which is rich in soluble proteins and other valuable food constituents of the soybean. The owners have been trying to find a practical use for this by-product. They have utilized it in the sizing of dough in place of water or milk with fairly good results. They also tried to make a bean candy by adding sugar, but rather a poor product was obtained. A table compares the composition and food value of 75 gm of natto compared with beef. Natto contains 19.3% protein, 8.2% fat, 6.1% carbohydrates, 180 calories, and a cost of 0.03 sen (vs. 0.12 sen for beef). See next page.

Page 3018-3021. Photos show: (1-2) "Filling natto into the rice straw containers" (two views). (3-4) "Selecting rice straw for making into rice straw containers." (5) "Making natto containers of rice straw." (6) "From left to right are as follows (in a row on a table): 1. Selected rice straw; 2. holder before trimming; 3. holder after trimming; 4. holder open ready for filling. 5. filled. 6. trimmed, ready to use. (7) Trimming natto containers of rice straw. (negatives #44603-09).

Page 3043 and 3044 (21 Nov. 1929). "About 9:30 this morning we took our cameras and went to a Natto factory, Shuji Kamiga, at 72 Kantetsudo, Keijo, Chosen, to get information about the making of this soybean product. and also to try and get still and motion pictures of at least some of the operations as well as supplies utilized in connection with the handling and marketing of this product." They "secured a lot of information and made several motion picture shots and tried a lot of still pictures, both of which we trust will turn out to be good." Later that day they "visited several markets and picked up some samples of seed of soybeans and other crops.

"Today we got our Field Trip Report for the quarter September 1 to October 31 packed up for shipment via parcel post to Washington, D.C." A photo (p. 3045) shows a metal pan piled high with round white "Balls of the refuse after making Tofu" [okara] (neg. #44610).

Pages 3046 to 3049. Photos show: (1) (1) Bundles of natto containers at the Shuji Kamiga Natto Factory. (2) Trimming natto containers and preparing the packages for

products. Dr. Burlison. Korea. Soybean variety collections. Letter to Dr. E.A. Hollowell, Office of Forage Crops, USDA, Washington, DC, Nov. 21. 2 p. Typed, with signature on USDA letterhead.

• ***Summary:*** "Dear Holly: I have your letter of October 23 with reference to your visit to the Middle West and the discussion with Dr. Burlison concerning soybean products. I note that you say we are willing to loan him the products which we have at the office. Holly, I have had quite a bit of experience in the loaning of products and also enlarged pictures for special exhibits and I must say that most of such experiences have not been very pleasing, in spite of the many promises made. Many of the products and even the pictures were never returned, and more were broken or spoiled through lack of proper care. I have taken quite a little trouble to collect the various products we have on hand and it would be extremely difficult to duplicate many of them. Therefore, I think it the best plan not to loan out our products, for I have in mind to have in our office one of, if not the best, collection of soybean products in the world..."

"With regard to the products that I have sent in so far from the Oriental trip, I have written Oakley that he have Mrs. Donavan [Verna; Morse's secretary] and Miss Cruickshanks place them in the case in their room as the products are received. I am sending them in tins as much as I am able to or in other sealed boxes. I have asked that they be set aside thus so that they will not be opened until my return. After my return I want to have uniform containers to place the various products in and properly labeled... I wish, therefore, that you would also keep a kindly eye on these various products coming in from time to time to see that they are taken care of as I wish until my return. when I can fix them up for a permanent exhibit. I am sending duplicates of all, for if I sent only one there would be sure [sic] something happen to it. I wish the duplicates taken care of the same as the other."

"If Dr. Burlison, we can send him numerous products from Japan for Tokio seems to be quite a center for the manufacture of soybean products."

"We are finding Korea one big soybean country and we are getting so loaded up with the native varieties that I do not know 'where I am at.' The station at Suigen will already have for us on the 25th inst. samples of one thousand numbers. The station at Shariin is going to send us more than two hundred numbers. Various stations in Japan are sending in their best varieties this winter so I do not know where this variety business will end."

"In Korea one sees very few horses, for bulls are used almost entirely as beasts of burden. My point is that boiled soybeans are used as feed for these animals. The boiled beans are mixed with chopped rice or millet straw or sometimes kaoliang stalks. In fact the whole mixture is boiled. In Japan soybeans are rarely used for cattle feed. In the northern prefecture [sic] the boiled beans are quite extensively used for horse feed, especially the stallions. I do not know how many note books I have full of soy notes and only hope that I can find time to get them in ship-shape. We also have a great collection of movie film and still pictures from the planting to harvesting, threshing, marketing, and shipping, and also on to the manufacture of many products."

Location: National Archives, College Park, Maryland. Record group 54–Bureau of Plant Industry, Soils and Agricultural Engineering. Subgroup–Div. of Forage Crops and Diseases. Series–General Correspondence, 1905-29. Box 93–Morse-Napier. Folder–Morse, W.J.-#4 F.C.I.

Sent to Soyfoods Center by Jacob Jones of Purdue Univ., Aug. 1998. Address: Agricultural Explorer, Keijo (Seoul), Chosen / Korea; c/o American Consulate, Tokio, Japan.

302. Dorsett, P.H.; Morse, W.J. 1929. Year's end in Tokyo, Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 3341 (24 Dec. 1929). "Today Morse and Suyetake went to call upon soy sauce and natto manufacturers for the purpose of getting acquainted and also if possible arrange for getting still and motion pictures of their plants, equipment and operations.

"Dorsett worked at the office packing seed and making packages to go in the next outgoing diplomatic pouch..."

"The streets of Tokyo are a-blaze with colored banners, price lists, decorations and gaily dressed women and children." All this in preparation for the New Year. "The streets and stores are packed from early morning until late at night.

"At the Matsuya Department store on the Ginza, they have a spruce Christmas tree in the stairway well which looks to be fully... 50 feet or more in height. It is really very attractive and beautiful."

Page 3369 (31 Dec. 1929). "Introduction cards were finished on the 1,003 samples of soybeans secured from the Suigen Agricultural Experiment Station, Suigen, Chosen [Korea]. These samples showed a wide range in size, color and shape of seed, and also in the color of the hilum. Some most excellent and interesting varieties are included in this collection.

"One of the most interesting is a very small seeded yellow sort, the seed being about the size of a mung bean. This is the smallest seeded variety of soybean we have ever seen and it should prove valuable as a bean for sprouting. We are in hopes that in this collection will be found the high oil strains for our oil mills and low oil strains for our hog and cattle feeders in the United States. All in all we consider the collection the most interesting and valuable in our

exploration work thus far." Address: Agricultural Explorers, USDA, Washington, DC.

303. N.I. Vavilov's collection of soybeans in 1927 and 1929. 1929.
• ***Summary:*** From 1927 to 1929 N.I. Vavilov collected soybeans in four countries; these soybeans are now at the VIR (N.I. Vavilov Research Institute of Plant Industry, St. Petersburg, Russia). Information about these trips and soybean collecting was sent to Soyinfo Center Irina Seferova, Soybean Collection Curator at the VIR.

(1) Trip to Italy on business. Vavilov obtained 1 accession from Japan (number k-602).

In early June 1929 Vavilov left on a trip for East Asia. "In a whirlwind tour of western China, Japan, Formosa (now Taiwan) and Korea, he collected 3,500 kilograms of seed and Herbarium samples and also several thousand photographs of the farming and geography. He did not return until December. He concluded boldly that the crop diversity in these countries was 'wholly unique, that the cultivated plants were absolutely atypical, that the cultivation techniques were unmatched and that the ancient cultural center of East Asia was completely independent with its uncommon plants species and genera..." (Pringle 2008, p. 150)

(2) On his trip to Chinese Turkestan (western China), Vavilov, who was head of the expedition, collected 15 soybean seeds (numbers k-2944–2946; 3017-3028). The table also states: "Coll. Popov M.G."–meaning that M.G. Popov (Mihail Grigor'evich Popov) was a member of the expedition and also collected soybean seeds.

(3) On his trip to Korea, Vavilov collected 41 soybean seeds (numbers k-2949–2989).

(4) On his trip to Japan, Vavilov collected 30 soybean seeds (numbers k-2990–3016).

In total, on these four trips, he collected 87 soybean accession from East Asia.

The sequence of these trips was as follows (Irina Seferoa, Dec. 2010, personal communication): "Vavilov visited Japan in October 1929. Then he visited Korea and Taiwan (China). In November he returned to Japan, then left for the USSR. It was a business trip or expedition." Address: St. Petersburg, USSR.

304. Sasaki, S. 1929. [Mummy disease of black spot of soybean]. *Annals of the Agricultural Experiment Station, Government-General of Chosen* 4:1-28. [Jap]*
• ***Summary:*** The disease is due to a *Phomopsis*, the imperfect stage of *Diaporthe sojae* (=D. paseolorum var. sojae). Symptoms and morphology of the fungus are fully described.

305. Savich, I.N. 1929. [On classification of soya beans]. *Vestnik Manchzhurii* (*Manchuria Monitor*) (*Chinese Eastern Railway*) No. 11. p. 20-34. 4 plates, 7 tables. Russian edition. [56 ref. Rus; eng]
• ***Summary:*** In this botanical classification, Mrs. Savich verifies and criticizes the previous classification of the "Harbin explorer, B.V. Skvortzow, who gave a botanic description of the existing varieties and species of soya beans in his work 'Wild and Cultivated Soya Beans in Eastern Asia' (*Manchuria Monitor,* Nos. 9-10, 1927). At the same time the work of Mrs. Savich may be considered a verification and criticism of the classification that was proposed by the Harbin explorer Skvortzow.

"Taking for investigation several hundreds of specimens of soya beans, not only growing in the Maritime Province of Siberia, but also in Korea, Japan and North Manchuria, Mrs. Savich accepts the classification of B.V. Skvortzow, but extensively applies to it the law of homologous series in hereditary variation of the academician N.I. Vavilow [Vavilov]. Owing to this, the classification of B.V. Skvortzow, which is founded upon morphological symptoms, is placed upon a more sound basis.

"Mrs. Savich has come to the conclusion that only three hereditary botanical characters, are to be noted in our soya bean–*Glycine hispidae* [*hispida*] Max. which are ordinarily cultivated. They are:

"(1) Form of the stem a=erect; A=twining.

"(2) Form of the leaves index b=2; B=2

"(3) Colour of the flowers c=white; C=lilac

"These three characters in their combination give eight races or subspecies of soya beans and in each race we have homologous series according to the colour of the seeds (Law of prof. Vavilow).

abc 'Lutea' yellow green brown black bi-colored
abC 'Vulgaris'–ditto
aBc 'Lubrics'–ditto
aBC 'Nobilis'–ditto
Abc 'Nictans'–ditto
abC 'Rara'–ditto
aBc -
ABC 'Varians'

"'Lutea,' with white flowers and large leaves, is the most cultivated race of the south of Manchuria. 'Vulgaris' and 'Nobilis' with lilac flowers are the common races of the north. 'Rara' and 'Varians' are good as vegetable food.

"The highest yield' and the greatest percentage of oil is found in the heterogeneous and mixed varieties. We suppose that natural crossing is a very common fact in the Far East and that increased yield may be obtained by the use of mixed varieties, a method used to advantage with maize." Address: Harbin, Manchuria.

308. Pieters, A.J. 1930. Re: Zoyzia / zoysia and soybeans. Letter to Mr. W.J. Morse, c/o American Consulate, Tokyo, Japan, Jan. 3. 2 p. Typed, without signature (carbon copy).
• ***Summary:*** Zoysia, a grass of the genus *Zoisia*, is also known as Korean lawn grass, or Manila grass.

"In regard to the soybean products, Mrs. Donovan advises me that these show no sign of having been opened. They have all been turned over to her, and she is holding them. I may say in this connection that I have been appointed a member of a committee to recommend an exhibit for the Chicago Fair [in Illinois] for 1933. This is to be a very big event, I understand, and the program for the Office of Cereals and the Office of Forage Crops and Diseases has been united into one. One of the things that I have strongly urged is a comprehensive exhibit of the soybean and things made from the soybean. If this idea is adopted, we may want you to send from Japan enough extra material so that the exhibit can include some Japan soybean products."

Location: National Archives, College Park, Maryland. Record group 54–Bureau of Plant Industry, Soils and Agricultural Engineering. Subgroup–Div. of Forage Crops and Diseases. Series–General Correspondence, 1905-29. Box 93–Morse-Napier. Folder–Morse, W.J.-#4 F.C.I.

Sent to Soyfoods Center by Jacob Jones of Purdue Univ., Aug. 1998. Address: Senior Agronomist, USDA, Washington, DC.

309. Dorsett, P.H.; Morse, W.J. 1930. Work in Tokyo, Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 3553 (14 Jan. 1930, Tokyo). "Worked at the office today preparing, packing and sewing up five parcel post packages of soybean and other plant products to go to Washington [DC].

"We will have a good sized shipment for the diplomatic pouch about two weeks hence.

"Got the five backs for our picture albums finished up tonight. By tomorrow night we think we can use them to cover the leaves on which we have already mounted our pictures.

"Today Ruth [Dorsett's daughter-in-law; the widow of Dorsett's son] completed our field trip report for October and expects to page it tomorrow.

"We got behind in our trip report for October, November and December on account of not developing the pictures made in Chosen [Korea] until after our return to Tokyo. However we hope to get this work pretty well up to date before we transfer over to Dairen, Manchuria, this coming March." Address: Agricultural Explorers, USDA, Washington, DC.

310. Dorsett, P.H.; Morse, W.J. 1930. Soybean sprouts in Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Pages 3801 to 3802 (5 Feb. 1930). "We had some difficulty in finding the soybean sprout man, but finally succeeded in locating him in the village of Zoshiki. He has transformed one of the rooms in his house into a forcing chamber, and is sprouting soybeans in flats. This method we haven't seen before.

"The bottom of a flat, about 12 by 18 inches, is covered to a depth of about half an inch with [soy] beans, which have been soaked until plump, about 10 or 12 hours. These trays are then placed on shelves and covered with burlap. The room is kept at a temperature of about 70º [F.]. The beans sprout and are ready to market in 10 or 12 days. They are ready to dispose of when they get about even with, or a little above, the sides of the two flats, which are about three of four inches high. Photo: "Soja max. Soybean sprouts. A fairly nearby view of two flats of soybeans, the one in the foreground containing soaked soybeans, the one in the background sprouted soybeans, but past the marketing stage–they are too far advanced. On the edges of the two flats at the center are three small bunches of sprouted soybeans. This is the way Mr. Katakura puts them up for the market (Negative #44892).

Page 3802. "A nearby view of the same two flats... The picture really shows how the sprouts should *not* be treated. Mr. Katakura sprouts his mung beans in tubs, and he occasionally handles his soybeans in this way. He told us that it required more attention to grow bean sprouts in tubs than in flats" (Neg. #44893). Page 3824 (5 Feb. 1930) Tokyo. "A nearby (about life size) picture of a commercial bunch of long stem soybean sprouts. This bunch is over all about 4 inches wide and 11 inches long. Purchased at a vegetable

stand in Komato, Japan, Feb. 7th, 1930. D. & M. #3786 (Neg. #44900).

Page 3825, "About a three-quarter life size picture of a commercial bunch of rather short stemmed soybean sprouts. Purchased at a vegetable stand in Komato, Japan, Feb. 7, 1930. D. & M. #3785 (Neg. #44901).

Page 3865. (12 Feb. 1930). "Morse and Suyetake were all smiles when they reached the office this morning, for they had great success yesterday. They corralled nine different soybean products."

"After lunch we called on Dr. T. Nakai, Botanist at the Tokyo Botanical Garden. We talked with him about soybeans of Quelpaert Island [*Jeju-do* in Korean. As of Aug. 2011 it is part of Korea; it lies in the Korea trait between South Korea and Kyushu, the southernmost of Japan's four main islands]. He told us that there they grow small soybeans only about the size of mung beans. He thinks it is a case of stepping down (degeneration) in place of up.

Page 6911 (3 Jan. 1931). Morse writes from Tokyo: "At one of the department stores, in the vegetable market section, we found small bundles of soybean sprouts..."

Page 7071 (31 Jan. 1931). Morse writes from Tokyo: "After our visit to the Botanic Gardens, we visited some market sections. At some we found soybean sprouts (6 inches long) in small bundles." Address: Agricultural Explorers, USDA, Washington, DC.

311. Dorsett, P.H.; Morse, W.J. 1930. Re: There is just too much to do and see concerning soybeans in Japan. Letter to Mr. Knowles A. Ryerson, Principal Horticulturist in Charge, USDA, March 5. 3 p. Typed, without signature (carbon copy).

• ***Summary:*** "I have been kept rather busy writing up and packing the material that has been coming in from many sources in Japan, Hokkaido and Chosen (Korea) in spite of the opinion that the Japanese are better receivers than givers. We think... that exactly the opposite is true. If you do not think that we have been busy, please note the number of packages that have been sent in since the first of the year. These are merely a start, for in winding up our work in Japan, we expect to send in quite a few packages.

In regard to plans for the coming year,... So many new things keep coming up during the work in Tokyo and adjacent districts that our plans change almost daily in trying to get the most out of our work for the soybean industry in the United States... We simply can not do it all and to do the most important that is of the most value to the new soybean industry in our country, we must change our plans from time to time to meet the new conditions constantly arising."

"We think it would be well worth our time to return by way of the Trans-Siberian to Germany, France and England as a sort of clean-up of our Manchurian investigations."

"Mr. Lee, who is bearing the brunt of testing the new introductions, writes us to keep up the good work."

Location: National Archives, College Park, Maryland. Record group 54–Bureau of Plant Industry, Soils and Agricultural Engineering. Subgroup–Div. of Forage Crops and Diseases. Series–General Correspondence, 1905-29. Box 93–Morse-Napier. Folder–Morse, W.J.-#4 F.C.I.

Sent to Soyfoods Center by Jacob Jones of Purdue Univ., Aug. 1998. Address: Tokyo, Japan.

312. Dorsett, P.H.; Morse, W.J. 1930. In Dairen, Manchuria (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 4499 (2 April 1930). Dairen, Manchuria. "This morning we called at the South Manchurian Railway Company and met Mr. Kan Matsushima, one of the high officials in charge of the agricultural activities of the company.

"Mr. Matsushima was in the United States a few years ago and visited the Department. During this visit he met Mr. Morse and a number of other officials.

"We went over the plan for this season's work with Mr. Matsushima, and got from him a number of interesting and valuable suggestions. He also presented us with a number of pamphlets of the South Manchurian Railway relative to soybeans and other Manchurian crops. He outlined for us the important soybean, fruit and vegetable sections which he thought we should visit.

"With the exception of 30 meters on each side of the S.M. Ry. in the Japanese leased territory, practically all farmers are Chinese.

"We had lunch with Mr. Matsushima and then went with him to the Museum building, where we saw a relief map of Manchuria and got a very good impression of the important agricultural producing regions.

"We also saw a rather extensive and interesting exhibit of soybeans, soybean cake and other soybean products. They had a very good collection of millets, sorghums, rice, barley, mung beans, adsuki beans;..."

Pages 4525, 4526, 4527 (10 April 1930, Dairen, Manchuria). "This morning we called at the office of Mr. K. Matsushima and a little later, in company with Mr. Yoshitane Sato of the Bureau of Agriculture of the South Manchuria Ry. [Railway Co.; S.M.R.] we visited the soybean exchange.

"Here, as in all other grain exchanges, of which we have had an opportunity to see everything, pandemonium raged on the floor of the chamber.

"The room looked to be 40 feet or more in width and 75 feet or so in length, with a gallery extending around the entire room." Of the 100 members, 60 are Chinese, 30 Japanese and 10 are of other nationalities–Russian, Danes, British, etc.

© Copyright Soyinfo Center 2021

"From the exchange, we went to one of the research laboratories of the Agricultural Branch of the S.M.R., where we met Mr. Takamori, also the assistant director of the Bureau of Economic Research, Mr. Igarashi. These gentlemen offered to assist in any way possible; both speak good English and understand a good deal. We next visited Dr. Y. Nakanishi, Secretary of the Soybean Oil Association."

"After lunch we visited a good sized shoyu sauce factory and looked over the plant, including culture chambers and ageing mash vat rooms. They demonstrated for us their method of vat mash stirring by compressed air. It is a simple method. The air passes through a one-inch pipe to the bottom of the tank, as the pipe is moved about over the bottom the air expelled from the pipe forces its way up through the mash, which gives the impression of boiling. The practice appears to be much more effective and easier than the hand or paddle method of stirring the mash which is pretty generally followed.

"The refuse left after pressing out the soy sauce is sold for cattle feed (we understand primarily for hog feeding). It is also resoaked and used for making a much inferior and cheaper grade of soy sauce, for which this concern has quite a demand."

"We received several official letters from the office today, the contents of which especially regarding our work for the year, are more or less disconcerting. They are at variance with our understanding of much of the work outlined and arranged for at Washington [DC] before our departure and by no means in accord with the policy concerning the work in Japan outlined quite differently to us in correspondence received shortly after we took up our work in Japan in the spring of 1929.

"The letters to which we refer are under date of March 10 and 13, these, together with our reply, where a reply is deemed advisable, will be found under a later date in this field trip report."

Page 4539 (14 April 1930). Dairen, Manchuria. "Went to the American Consulate in the morning and discussed with Mr. Langdon, the Consul, the soybean industry in South Manchuria. He has collected statistics on the exports of [soy] beans, bean cake and bean oil and gave us a summary of much data for 1929, which is as follows:"

The 1st table titled "Exports–Manchuria–1929" shows exports (in short tons) of the three commodities by country of destination.

Soybeans: To Japan 604,753 tons. To Europe 1,403,589 tons.

Bean cake: To Japan 652,687 tons. To Europe 62,775 tons.

Bean oil: To Japan 1,443 tons. To Europe 59,849 tons.

The 2nd table titled "Percentage of Manchurian area sown" gives figures for 1929 and 1928.

Soybeans 29.2% and 29.0%
Other beans 2.7% and 3.2.0%
Kaoliang 22.5% and 22.5%
Millet 17.2% and 16.9%
Corn 6.9% and 7.8%
Wheat 7.7% and 10.2%
Paddy rice 0.6% and 0.7%
Upland rice 0.9% and 0.8%
Miscellaneous grains 10.5% and 9.2%.

Page 4541 (15 April 1930). Dairen, Manchuria. In the morning visited Mr. Satoh of the S.M.R. with reference to soybean oil mills and soap factories using soybean oil in Dairen. Arrangements were made to visit the oil mill of the Mitsubishi Trading Co."

"This Oil Company crushes about 300,000 tons of soybeans yearly, producing about 270,000 tons of bean cake and about 30,000 tons of bean oil."

Page 4542. "For Japanese trade, where bean cake is used chiefly for fertilizer, and to a slight extent for poultry feed, the cakes are ground into a very coarse meal. Permission was given to take any pictures we might wish within the mills or mill yard."

Page 4543 (16 April 1930, Dairen). "In the morning visited the Mangylku Soap Mfg. Co. where crude soybean oil and hydrogenated soybean oil are used in the manufacture of soap."

"Mr. Satoh suggested that we get in touch with Dr. Satoh, botanist and author of the bulletin [on wild legumes which shows 28 genera and 102 species] as he might be of assistance to us in our collections of wild legumes in Manchuria, North China, and Chosen" [Korea].

Page 4546. "The wild soybean is very abundant throughout this vicinity..." No soybean work is being carried on by the station. Most of the work is placed on cotton and apples. "Mr. Nakatomi assured us of his hearty cooperation in our studies of Manchurian agriculture."

Page 4547 (12 [?] April 1930). Dairen. "In the morning we went to the South Manchurian Ry. Central Laboratory to see Dr. Kato concerning the various soybean products of which he had promised us samples. The products were not ready and I was promised to send them to our office in the Gohin [?] Building shortly.

"Mr. Kato is much interested in the utilization of soybean flour in bread making and is conducting extensive experiments along this line. He was very much interested in the work which Dr. J.A. Le Clerc of the U.S. Bureau of Chemistry is doing with various kinds of soybean flour and intends taking up correspondence with Dr. Le Clerc.

"At 5:00 p.m. Messrs. Morse and Suyetake went to the Auditorium of the South Manchurian Ry. Club and gave a talk on the soybean industry in the United States before Members of the Dairen Oil Mills Association, Dairen Soybean Trading Corporation, and the Agricultural Division of the South Manchurian Railway."

Pages 4553-4554 (21 April 1930, Dairen). "In the morning we went to the office of Mr. Satoh of the S.M.Ry.

© Copyright Soyinfo Center 2021

and found a package of fifteen varieties of soybeans that had been sent to us from the S.M.R. Experiment Station at Kungchuling. This station is the principal soybean breeding station and the varieties sent us represent selected varieties from their 1929 variety test of over five hundred varieties. The following list gives the varieties sent. An unnamed table gives the D.&M. number (from 5649 to 5663), varietal name, and use of each of the 15; the three uses are grain, forage, and pasture. The varietal names are:

Hakube (Mukden White)
Changchung #220
Kingen
Kungchuling #319
Kohonshu [?]
Kungchuling #543
Kungchuling #483
Kaiyuan #191
Mochoto
Kungchuling #480
Kungchuling #235
Chanchu #391
Kungchuling #262
Kungchuling #420
Kungchuling #224

"In the afternoon samples of different forms of soy bean oil cake and oil cake meal were received from Mr. Yoshida, manager of the Mitsubishi Soybean oil Mills." They are: (1) "Coarse flakes. Made for export to Japan for cattle feed and fertilizer. Moisture 11%. Protein 44%. Fat 7.5%." (2) Finely cracked like cracked corn. Made for export to Japan for cattle feed; 10%, 44.5%, 7%. (3) Coarse meal for export to the United States for cattle feed. 9.11%, 45.6%, 7%. (4) Finely ground meal for export to the United States. 9.10%, 45.6%, 7%. (5) Medium coarse flakes for export to Japan for poultry feed. 10%, 44.5%, 7%. (6) Coarse flakes for export to Japan for fertilizer. 11%, 44%, 7.5%.

Pages 4565-4566 (25 April 1930, Port Arthur, Manchuria). "We then visited the museum and looked over the agricultural exhibits of the Kwantung Province. The Nisshin Oil Mills of Dairen has rather an extensive exhibit of various forms of soybean oil and oil cake. The Manchuria Paint Co. has a very good exhibit of many kinds of paints, enamels, varnishes and plastic paints in the manufacture of which soybean oil was used" (Continued). Address: Agricultural Explorers, USDA, Washington, DC.

313. Dorsett, P.H.; Morse, W.J. 1930. In Kungchuling, Manchuria (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** (Continued): (6 May 1930). Page 4615. Negative #45103. "Soja max. Soybean. Kungchuling (today's Gongzhuling, Jilin province), Manchuria. View showing the [round] Osier storage bin in which soybeans are stored. This bin is made of straw matting. Taken in yard of Chinese Soybean oil Mill. This bin holds 3 carloads of beans. Each carload has 150 sacks of 160 pounds each.

Neg. #45104. "Soja max. Soybean. Kungchuling, Manchuria. View showing storage of soybean seed in Osier bins in the yard of a soybean oil mill.

Page 4651, 4652, 4653 (9 May 1930). Kungchuling, Manchuria. "Although may is the dry month of the year, it was anything but that during the night. A very heavy rain fell..."

"About 9:00 a.m. we went to the Experiment Station where we had a talk with Dr. Kanda on soybeans in this section. Although there are many insects and diseases affecting the soybeans in Manchuria, none of them, with the exception of the pod borer, affects the crop very seriously. The only way to combat these pests and diseases is by breeding resistant strains as it is impossible to get the Manchurian farmer to take up spraying for the soybeans are grown too extensively and the farmer is too poor.

"We were advised by Dr. Kanda, that Mr. Nakamoto, the soybean expert, had returned to his office this morning for the first time since his illness, and wished to talk with us on soybeans. After arriving at Mr. Nakamoto's office, we found that we had met in Washington [DC] a few years ago when he came to study the soybeans in the United States. Mr. Nakamoto took us to his laboratory room and showed us samples of his selections and native varieties. He is doing much work with the 'Moshito' variety, the seed of which appears identical with our U.S. Virginia variety. Complete chemical analyses have been made of all collections and varieties. On a moisture basis, the varieties ranged from about 14 to 21% fat.

Mr. Nakamoto said that he had tried out many Japanese and Korean varieties but they were not suited to the dry conditions of Manchuria. The small-seeded varieties from Siberia [in the eastern Russian SSR] make good growth and are considered the best forage sorts."

"Soybeans were being planted in a field of the station so we were taken to see the method of planting which is the same that the Dorsetts took motion pictures of at Harbin in 1926. A few snap shots were taken of the planting but under rather adverse conditions as a fine mist was falling. After the planting we visited Dr. Kanda to thank him and say good bye.

"We left on the 5:35 p.m. train, arriving at Ssu-ping-kai [today's Siping, Jilin province] at 6:39 p.m. and went at once to the Japanese Inn. Shortly after we had settled down in our rooms, Mr. Yukutaro Yamazaki, in charge of the local commercial office of the S.M.Ry., and his assistant, Mr. Yutaka Shimizu, called to make arrangements with us for tomorrow. Although there are six large Chinese soybean

© Copyright Soyinfo Center 2021

oil mills in this place, they have been idle for these years. In a Chinese village about five miles from here there are some of the old native wedge soybean oil mills which Mr. Yamazaki thought we might be interested in seeing. He said he would make arrangements with the Chinese governor for some soldiers as an escort as the country about Ssu-ping-kai is rather badly infested with bandits and only the previous day a Chinese policeman had been killed by bandits a short distance from the town." Arrangements were made to take a taxi with soldiers the next day.

Page 4654. Neg. #45109. "Soja max. Soybeans. Kungchuling, Manchuria. Tramping ploughed ridge for planting soybeans."

Page 4657-4658 (10 May 1930). Ssu-ping-kai, Manchuria. Mr. Hideji Miura, director of the local office of the territory controlled by the S.M.Ry. "stated that soybeans are extensively planted in this region and in 1927 about 427,000 tons of beans were shipped from the station. Ssu-ping-kai is the terminal point of a Chinese railroad extending for a considerable way in Mongolia and large amounts of Mongolian crops, especially kaoliang, come to this place."

After a delay and suspecting trickery, the taxi trip to the native wedge soybean oil mill was cancelled.

"At 3:20 p.m. we left for Kaiyuan [Liaoning province] where a soybean seed farm of the South Manchurian Railway is located. As we passed along we noticed that the farmers were busy planting soybeans. Only occasionally did we see kaoliang or millet being planted... We arrived at Kaiyuan at 5:31 p.m. and were met at the station by Mr. Sazuo [?] Kofuku, director of the local office of the S.M.Ry. and also director of the soybean seed farm located on the outskirts of Kaiyuan. After a short talk with Mr. Kofuku, during which he said he would make arrangements to see the farm and soybean planting about Kaiyuan, we went to the Japanese Inn 'Futaba'"

Page 4659. Neg. #45113. "Soja max. Soybean. Ssu-ping-kai, Manchuria. View showing the floor or bottom of an Osier bin used in the storage of soybean seed. The floor is made of kaoliang stalks Osier bins of soybean seed are noted in the picture. In a Chinese merchant's storage yard."

Page 4673 (13 May 1930). Dairen, Manchuria. "After lunch Mr. Tamakura of the S.M.Ry. Agricultural Bureau called at the office with reference to information on the various kinds of machinery used in soybean culture and harvest in the United States. We referred him to the International Harvester Company, Chicago [Illinois], as this concern manufactures many implements used in the planting, cultivation, harvesting and threshing of soybeans and other grain crops.

"Mr. Tamakura gave us more information on the transportation of soybeans through the port of Yingkou (Newchwang). Before the days of railroad transportation, Yingkou was the largest soybean port in the export of soybeans and soybean products. At the present time, little foreign trade is handled at Yingkou but it still remains the largest Chinese junk port in Manchuria. The junks and river boats bring down large quantities of soybeans and other grains from sections along the Liao River.

"We received today four samples of soybean seed from the Island Master of Saishu-to [today's Cheju-do, South Korea] Island, Chosen. This is the island on which we were told grow very small seeded varieties of soybeans." It was "stated that they were very small seeded and had been grown for many years with no export of seed. The seed received

© Copyright Soyinfo Center 2021

was by no means the small seeded varieties." Address: Agricultural Explorers, USDA, Washington, DC.

• ***Summary:*** Pages 4671 and 4672 (11 May 1930). Mukden, Manchuria. "We found the officials very nice at the Consulate and within twenty minutes our passports were fixed for one year without reservation so that we can enter and visit Dairen, Chosen [Korea], Formosa, in fact, any part of the Japanese Empire for another year.

Then they visited the Mukden market. "Only one place had sprouted beans and these were mung beans."

"We spent some time looking around Chinese and Japanese stores for soybean products but found nothing but what we already have. In the window of a Chinese lunch room we saw soybean sprouts, the sprouts being about one-half to one inch long, and had been fried in oil. There was also a dish of mung beans..."

Pages 4733 and 4734 (30 May 1930). Yingkou, Manchuria. "Nearly all of the stores had large quantities and bundles of mung bean noodles and vermicelli. Many stores or outside shops had both mung bean and soybean sprouts. The latter were quite short and apparently had been allowed to germinate for not more than two days. These are said to be used alone fried in oil or mixed with chopped vegetables and fried in oil." Address: Agricultural Explorers, USDA, Washington, DC.

315. Dorsett, P.H.; Morse, W.J. 1930. Green vegetable soybeans in Manchuria, China, and Korea (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Pages 4911-4912 (19 June 1930) find the authors in Dairen, Manchuria. Morse writes: "A short visit was made to the Dairen market but about the only new thing noted was bundles of soybean plants with green pods for use as a green vegetable bean. These were notes at several stands and we learned that they had come from the Shimonoseki district (Japan)."

Pages 5431 and 5434 (13 Aug. 1930) find the authors in Peiping [Beijing], China. They visited an open street market in the northwestern part of the city on Chienmen Street. A list of fruits and vegetables observed include: "Soybeans in the pod, quite abundant." A photo shows these soybeans at Hsi Tan Pai Lou in Peiping.

Page 5587 (22 Aug. 1930) finds the authors in Heijo, Chosen (today's Pyongyang / P'yongyang, the capital of North Korea). They visited several Korean vegetable markets and among the farm products noted were "Soybeans (bundles of plants with pods)."

(7) Vol. 9 P. 5950

(14) Vol. 9 P. 5949

Pages 5811, 5812, 5813 (11 Sept. 1930). Morse, still in Heijo (today's Pyongyang, North Korea) noted: "On our way through the city in the morning we saw shelled green soybeans in the baskets of several Korean vegetable stands." Negative #45793 and #45794. Two photos show these "green vegetable soybeans" and "shelled green soybeans."

Page 5845 (16 Sept. 1930). Fa Hua Ssu Temple, Chihli, China. P.H. Dorsett's notes. "We left Tang Shan about 8:30

© Copyright Soyinfo Center 2021

this morning with two mules, four donkeys and ten pieces of official baggage, en route to Fa Hua Ssu.

"It has been a lovely day and we had a very pleasant ride. Through the valley we saw the farmers harvesting and getting their crops of millet, kaoliang, corn, peanuts and in a few instances, soybeans.

"Going through the valley we made three single plant selections of soybeans, two yellow, #7190 and 7191, and one black variety #7192, and on the way up the canyon we made another one-plant selection of black soybeans #7193 which was growing on decomposed granitic soil. We also collected seed of a Deutzia sp. #7189, what we call the thin-leaved type."

"The mountain sides are covered with several species or varieties of Lespedeza. There may be as many as a half dozen or more. They are full of flowers and for the most part very attractive."

Pages 5888-5889 (19 Sept. 1930). Morse is now in Keijo [today's Seoul, South Korea], Chosen. A long list of vegetables he observed at the large central Korean market included "Soybean sprouts" and "Green vegetable soybeans." In the grain section he found: "Millet, adsuki beans, susu (sorghum), mung beans, and soybeans."

"After the visit to the Central Market, we visited the East and West Markets and found about the same products. Two photos (Neg. 45859; Neg. #45860) show these.

Page 5890. Neg. #45861. "*Soja max.* Soybean. Keijo, Chosen. Korean Grain Market showing different varieties of soybeans in front of a grain merchant's store.

Neg. #45862. "*Soja max.* Soybean. Suigen, Chosen. Korean farmer with bundles of green vegetable soybeans on pack [tied to his backpack] at Keijo Korean market."

Pages 5911-5912 (23 Sept. 1930). Morse is now in Ritsuri, Korea. (Note: As of 1994 Ritsuri was named Yul-li and located in North Korea, about 25 miles east of Pyongyang, the capital.) In a farming section he noticed some farmers roasting soybean plants over a fire and "making their lunch of the green roasted soybeans." Each cart the farmers drove to market in the morning "had a bundle of green soybean plants. The green soybean plants are used extensively for food at this season of the year."

Page 5913. Neg. #45874. "Soja max. Soybean. Ritsuri, Chosen. Korean farmer bundling harvested soybean plants for hauling to the farm yard. The plants were cut yesterday when fully mature. The food is allowed to cure in the farm yard rather than in the field."

Neg. #45875. "Soja max. Soybean. Ritsuri, Chosen. Ox cart loaded with bundles of mature soybean plants. Plants cut yesterday and are hauled to farm yard to cure until threshed (November)."

Page 5914. Neg. #45876. "Soja max. Soybean. Ritsuri, Chosen. Ox cart loaded with bundles of mature soybean plants which are to be carted to the farm yard for storage until threshed."

Pages 5948, 5949, 5950 (27 Sept. 1930). In Heijo (Pyongyang, North Korea), Morse "visited Korean Farmers' Market Day at the Daidomon Gate. One of the most notable things was the abundance of shelled green soybeans and adsuki beans being sold as green vegetable beans."

One photo (p. 5949) in Heijo shows: "View of green soybeans (shelled) on sale at small farmer's stand. Market Day" (neg. #45902).

Another photo (p. 5949) shows "Korean farm woman on Market Day with bundle of green vegetable soybean plants and shelled green soybeans in large basket and shelled green adsuki beans in gourd" (neg. #45903).

A third photo (p. 5950) shows "Korean woman buying soybean sprouts from Korean farm woman on Farmers' Market Day" (neg. #54904).

Page 6113 (9 Oct. 1930). Green vegetable soybeans in the pod and shelled green soybeans were observed in Dairen, Manchuria. Address: Agricultural Explorers, USDA, Washington, DC.

316. Dorsett, P.H.; Morse, W.J. 1930. Soybeans in Chosen (Korea) (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 4989 (25 June 1930). W.J. Morse's notes. [Dorsett is in Dairen, Manchuria]. He is en route to Kokai [today's Kanggye, in North Korea], Korea. "We went to the railway station about 7:00 a.m. as our baggage had to be passed by the Japanese Customs. Our mission to Korea was explained to the officer and our suitcases and camera cases were opened, merely looked at, and then marked o.k.

"We left Antung [Dandong as of 2014] at 7:50 a.m. and after crossing the Yalu River arrived at Shingishu [today's Sinûiju, North Korea] on the opposite side of the river from Antung [today's Donggang, Liaoning province, China].

Page 4990. "Upon leaving Shingishu we entered rather an extensive rice country. Soybeans were noted to a very considerable extent but all were planted with corn as is done in Southern Manchuria. Some fields of millet have hills of soybeans planted along side of the rows.

"We arrived at Shin-Anshu, Korea at 12:25 p.m. and left on the 12:40 bus for Kokai and 'Zoysia,...' Soybeans were everywhere in evidence and seemed to be planted with every sort of crop. Even fields of soybeans and cucumbers planted together were noted.

Page 5003. W.J. Morse's notes. He is en route to Kokai, Korea.

Page 5013 (27 June 1930). W.J. Morse's notes. Kokai, Korea. "In the morning we went to the village agricultural society where we met the Village Master... We spent the morning at the farm looking over the experimental work with soybeans... Soybean breeding work is being carried on and several excellent varieties have been developed by the farm."

Page 5015. Negative #45314. *"Soja max.* Soybean. Kokai, Korea. View showing Korean grain merchant on Korean Farmers' Market Day. The pile of grain in front of the merchant is that of soybeans."

Neg. #45315. Soja max. Soybean. Kokai, Korea. View showing the purchasing of soybean seed samples from Korean grain merchant on Korean Farmers' Market Day."

Page 5035 (29 June 1930). W.J. Morse's notes. En route, Kokai-Kisen, Korea. "We left Kokai at 9:00 a.m. by bus... On the hillsides we saw some Korean farmers cultivating soybeans and corn with plows and also hoeing."

Page 5036. "In the evening Mr. Ritaro called on us and gave some very good data on the soybeans in the Kisen region [today's Hûich'ôn region in North Korea] He also brought samples of different grades and varieties. Before leaving he gave us some soybean samples representing the best varieties grown in this section." Neg. #45329. "Soja max. Soybean. Kisen, Korea. View showing Korean farmer and wife hoeing soybeans and corn with short handles hoes."

Page 5037. Neg. #45331. "Soja max. Soybean. Kisen, Korea. View of Korean farmer with plow used in cultivating soybeans and corn."

Page 5158 (14 July 1930). This is a letter written from Dairen, Manchuria, to Dr. A.J. Pieters, Senior Agronomist, Acting in Charge, Forage Crops and Diseases, Bureau of Plant Industry, USDA, Washington, DC. "Kokai was found to be rather a large Korean village snuggled in a very mountainous country along the right bank of the Seinoko [?] River (Photo #45318) which flows into the Yalu River... The village is situated at 41º N. Lat. and the temperature during December and January goes as low as 40º below zero. The ground is said to freeze to a depth of 2½ to 3 feet... The field crops are planted the first week in May and for the most part are corn, soybeans, sorghum and millet."

Page 5558 (19 Aug. 1930). Dairen, Manchuria. W.J. Morse's notes. "In view of the fact that the legume seed now mature has been collected in this region and that the millet is beginning to mature, we thought this would be the best time to visit Korea around the Heijo [Pyongyang, as of 2014 the capital of North Korea] to collect some of the missing links of our Korean story of the soybean industry. Last season, no observations or pictures (movie and still) of the growing crops were made, due to [our] late arrival in Korea. We were advised that soybeans in Northern Korea begin

© Copyright Soyinfo Center 2021

too mature the forepart of September. This will allow us to obtain pictures of the growing crop as well as data, methods of culture and harvesting, and return to Manchuria in time for note taking and the beginning of harvest. Not needing much in the way of supplies, we decided to try to get away tomorrow." Sent shipping boxes to Mr. Dorsett who is now in Peiping.

Page 5559 (20 Aug. 1930). En route to Heijo [Pyongyang], Korea. W.J. Morse's notes. "We left on the 9:00 a.m. express [train] for Heijo, Korea." Passed the stations from Chinchou to Wafangtien. "From Chinchou to Liaoyang very few soybeans were noted planted alone, and from Liaoyang to a few stations below Mukden kaoliang and millet were most extensively grown with very few soybeans in mixed or single plantings.

"Leaving Suchaton at 4:00 P.M. and going to Antung we began to see numerous fields of soybeans [planted] alone."

Page 5550. "Corn and soybeans and kaoliang and soybeans were being grown quite extensively. It was noted that the soybean fields were more general in the hill sections while the mixed plantings were on the lower lands. At the ends of the rows of the fields a few feet of hemp, castor beans, sesame or sunflowers were grown. This is said to be done to keep cattle out of the fields.

"We arrived at Antung at 7:55 P.M. where we remained over night."

Page 5561. A letter from Dorsett in Peiping, China, dated Aug. 20, 1930, to W.J. Morse c/o Yamato Hotel, Dairen.

Page 5563-5564. A letter dated 13 Aug. 1930 from W.J. Morse, c/o American Consulate, Dairen, Manchuria, to Mr. P.H. Dorsett, c/o U.S. Legation, Peiping, China. "Dear Dorsett: I had just started another letter to you when your came as I am beginning all over again."

"From recent reports from friends in the middle west [Midwest] the [soybean] oil industry [in Manchuria] is coming along by leaps and bounds. Mr. Cartter, my assistant at Holgate, in a recent letter thinks that it is going too fast. He is making a trip this summer with Dr. Jamieson of the Oils and Fats Lab. [Bureau of Chemistry and Soils, Div. of Forest Crops and Diseases, USDA] to visit the various soybean oil mills. From this you can see that I will have to get every bit of information on storage, analysing, grading (oil, cake and beans), shipping, varieties, methods of culture, etc. etc. I am positive that our best oil yielding beans will come from Manchuria. The soybean oil industry will be the biggest thing and I am going to try and serve it from A to Z, that is if my allotment holds out."

Page 5573 (21 Aug. 1930). En route Heijo, Korea. W.J. Morse's notes. "We left the [Antung, in Manchuria] station a little early to have our bagged passed by Japanese Customs before going into Korea. Our baggage quickly passed and we left Antung on the 7:50 a.m. train. At Shingishu, Korea, on the opposite side of the Yalu River from Antung, we set our watches ahead one hour.

"After leaving Shingishu we entered a very extensive rice paddy section. Soybeans were grown along the edges of the paddies as is so commonly done in Japan. In passing out of this large rice section we began to see mixed crops; soybeans and millet, soybeans and corn, kaoliang and soybeans, kaoliang and mung beans. The millet and soybean fields were very interesting as they were planted in various ways.

"We arrived at Heijo (Pyongyang), Korea at 2:18 p.m. and went to the Chosen Railway Hotel. All of the foreign rooms were occupied by representatives of the Corn Products Company and would be so for a year. This company is erecting near Heijo an immense plant for the manufacture of corn products. We arrived in a rain and it continued raining all night.

Page 5587 (22 Aug. 1920). Heijo, Chosen. W.J. Morse's notes. "In the morning we visited several Korean vegetable markets to note the farm products handles this season." A list of 20 products is given, including: "5. Soybeans (bundles of plants with pods) [probably green vegetable soybeans].

"In the afternoon, between showers, we visited grain markets in three different sections of the city. Millet, adsuki beans, mung beans and soybeans were the principal grains. Millet in several varieties predominated. Not as many varieties of adsuki beans and soybeans were noted as during our visit here last fall."

Page 5601 (23 Aug. 1930). Heijo, Chosen. W.J. Morse's notes. "The wild soybean was also found growing abundantly in waste places. The plants here appear to be somewhat different from those in Manchuria. The Korean plants have much larger leaves of a little different shape.

"Plants of the wild adsuki bean and the wild mung bean were also found. The former is very vining while the latter is a (Page 5602) bush type. Both species are now in full bloom."

Page 5603. Neg. #45649. "*Soja ussuriensis*. Wild soybean. View of wild soybean plants growing along roadside on outskirts of Heijo." Address: Agricultural Explorers, USDA, Washington, DC.

317. *Fortune.* 1930. Soy beans: Which may be glue, milk, cheese, sauce, varnish, axle grease, fertilizer, soap, soup, buttons, artificial leather, enamel. 1(5):102, 104. June.
• ***Summary:*** Discusses the history of the soybean in various countries. Its uses in the United States are outlined. A plastic named Satolite is used to make combs and buttons. In "Paris there is a cheese factory that makes Rocquefort [Roquefort] from soy bean curd." Soy bean "milk has more proteins than cow milk and little danger of contamination. Its flour contains four and one-half times more fat, four times more proteins, half as much water, and nearly half as many carbohydrates as the flour of wheat. These chemical ingredients make it a food, more interesting, perhaps, than

© Copyright Soyinfo Center 2021

palatable. Though the milk is supposed to be good for one (it arrests cases of retrogression, causes normal growth), it has generally to be drunk sweetened with sugar. Soy bean sauces are better spiced. (For the Chinese taste Lean & Perrins Worcestershire is too hot. The Chinese themselves make their sauces by exposing the crushed bean to sunlight and actually melting it. Certain Korean sauces are thus matured thirty years before they are considered palatable.) But if the bean's chemical make-up only indirectly contributes to its success as human food, it is nevertheless the basis of the bean's industrial importance. Because of its nitrogen, the bean is valuable as fertilizer and also as poultry and stock feed. And the bean's hereinbefore mentioned oil has proved of value to many a manufacturer of paints, enamels, lacquers, and even explosives."

The Anglo-Chinese Company at Harbin and the Suzuki Mill at Dairen, both of which use chemical solvent extraction, have succeeded in extracting virtually all of the oil from the soybean; Manchuria's traditional crude stone presses were able to extract only about half the soybean's oil content.

"Perhaps the greatest economic and industrial triumph of the soy bean occurred, oddly enough, in Denmark. Until some thirty years ago this pleasant country was more than self-supporting in the production of cereals, especially wheat. But U.S. mass production and low prices made for perilous and in some cases disastrous competition, even in Denmark's home markets. The Danes bethought themselves of raising live stock, imported the soy bean (using the oil for its usual purposes), and used it as feed for their live stock and poultry. Today 70 per cent of Denmark's export trade consists of live stock and animal products: milk, butter, cheese, bacon, ham, eggs, and the like. And for their country's regained economic health Danes give thanks to the soy bean...

"In the United States the paramount importance of soy bean is still its agricultural use. But it is significant that 75 per cent of the soy bean oil consumed in United States is being used by paint and varnish industries and in manufacture of linoleum, oil cloth, artificial leather. Lesser quantities are utilized in printer's ink, liquid soaps. Few soy beans are imported into this country."

Note: This is the earliest English-language document (Feb. 2007) seen that contains the term "mass production."

318. Dorsett, P.H. 1930. Re: He tires easily after illness. Plans have been materially changed (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. July 2. Unpublished log.

• ***Summary:*** Pages 5086-5087. This letter from Dairen, Manchuria, is a reply to Mr. Paul Russell. Assistant Botanist, Foreign Plant Introduction, Bureau of Plant Industry, USDA, Washington, DC.

"This is a belated reply to your kind letter under date of March 20th, which arrived in Dairen on the day that I was taken to a Japanese hospital [in Dairen], and where I remained in a critical condition for approximately two months.

"We were in hopes that the flowering cherry scions which we sent in could be grown at least in the open greenhouses at Bell, in place of what might well be designated as the morgue. However, the rulings of the Federal Horticultural Board are final, and if they prescribe growing them in special quarantine there is nothing that can be done to prevent it."

"I am beginning to feel in pretty good shape, but find that I tire rather quickly under exertion. Our plans for work during the remainder of the year, as you may already know, have been materially changed. Morse will remain with headquarters at Dairen and continue his research work with soybeans. I plan to leave Dairen shortly after July 15th for Peiping, for the purpose primarily of exploring in that region for wild legumes. At present Mr. Morse is in northern Chosen [Korea] getting seed and plants of what is supposed to be Zoysia" grass.

"I can do light work here in the laboratory and gradually getting such supplies packed as I am to take with me to Peiping."

Page 5090 to 5091. A letter of July 2 from Dairen to Mr. George M. Darrow, Senior Pomologist, Horticultural Crops and Diseases, Bureau of Plant Industry, repeats much of the above information in more or less detail. "I was taken sick with double pneumonia on the night of April 11th, and on the 14th was taken to a Japanese hospital, where I remained critically ill for the greater part of two months. I left the hospital on June first but am still under the doctor's care, though going to the laboratory and doing light work part time." Address: Agricultural Explorer, USDA, Washington, DC.

319. Dorsett, P.H.; Morse, W.J. 1930. In Dairen, Manchuria (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 5254-5255 (30 July 1930). Hsiungyaocheng, Manchuria. W.J. Morse's notes. "We went to the experiment station early in the morning and met Director Watanabe and Mr. Hisatake. Their station recently issued a bulletin on the diseases of the four principal crops of Manchuria, namely; soybeans, kaoliang, millet and corn. A copy was given us and it was found to contain excellent information on soybean diseases."

© Copyright Soyinfo Center 2021

"After lunch a trip was made by basha [horse-drawn cart, in Japanese] to the farming section to the west of Hsiungyaocheng. Soybeans were noted planted in kaoliang [*Andropogon sorghum*] to a considerable extent. The kaoliang rows were 21 inches apart and hills of soybeans were planted about every 12 feet just to the side of the kaoliang row. The same method of planting was also observed with millet and soybeans."

Neg. #45405. "Soja max. Soybean. Hsiungyaocheng, Manchuria. Soybeans and corn in alternate rows 21 inches apart. Corn planted about May 1 in 42 inch rows, [soy] beans planted about June 1st midway [between] the corn rows."

On pages 5256 and 5257 are panorama photos with illegible captions similar to Neg. #45405.

Page 5258-5259 (31 July 1930). Hsiungyaocheng, Manchuria. "W.J. Morse's notes: In the morning we went to the experiment station for a conference with Mr. Arakawa, the entomologist, regarding insects affecting soybeans in Manchuria. According to Mr. Arakawa, the leaf hopper does not occur in Manchuria."

"Mr. Arakawa is making very extensive studies on the damage to soybeans by the pod borer which is the most serious insect pest of the soybean in Manchuria. (We found this insect pest also the most in Hokkaido and the Main soybean sections of the Main Island [Honshu] of Japan.) There are no serious insect pests affecting soybean foliage. The grub or larva of *Lachnosterna* sp. [a genus of beetles] enters the stem of the soybean at the base and ofttimes does very serious damage in the early growth of the plant. This larva also does very serious damage to millet, adzuki beans and kaoliang."

Page 5261. Neg. #45409. "Soja max. Soybean. Hsiungyaocheng, Manchuria. Soybeans grown in the same row with corn. Corn planted in hills 42 inches apart (21-inch rows) about May 1. Soybeans planted midway [between] the corn hills about June 1st."

Neg. #45410. "Soja max. Soybean. Hsiungyaocheng, Manchuria. Soybeans grown in 21-inch rows in pear orchard for green manure. On South Manchurian Railway Experiment Station."

Page 5293-5294 (1 Aug. 1930). Feng Tai, China. "P.H. Dorsett's notes: We left on the 8:00 a.m. train this morning for Feng Tai" to look for alfalfa.

"We returned from Feng Tai to Peiping by motor car... Along the edges of bogs or low moist to wet places where reed grasses grow abundantly, we saw beans climbing to the top of reed grass 8 feet or more in height. We assumed that they were wild soybeans and verified this assumption by asking Chinese farmers. The plants impress us as being more robust and to have larger leaves than the wild soybeans we saw in abundance in Manchuria in 1925-1926.

"We also saw in actual operation the stripping of the lower leaves of kaoliang, interplanted to soybeans.

"The farmer told us that stripping is never done until the kaoliang is in full head. It is claimed that the stripping not only admits more air and light for the under-growing soybeans, but also benefits the kaoliang.

"We made a number of 3¼ by 4¼ pictures in an endeavor to secure good views of this interesting farm practice.

Pages 5300. Neg. #45425. "Soja max. Soybean. Near Feng Tai, China. A Chinese farmer at the edge of a field of kaoliang interplanted with soybeans. Note that he carries a palm leaf fan and a 'kasa' or umbrella to protect him from the sun."

Page 5301. Neg. #45426. "Soja max. Soybean. Near Feng Tai, China. A good crop of both soybeans and kaoliang. These are two very important crops in this section of China."

Neg. #45427. "Soja max. Soybean. Near Feng Tai, China. To the left is a portion of a planting of soybeans alone. To the right are soybeans planted with kaoliang which has recently been stripped of its lower leaves to a height of about four feet."

Pages 5302-5303. Negatives #45428, #45429, and #45430 show variations of the photo in #45427.

Pages 5306-5307. Negatives #45436, #45437, #45438 and #45439 show variations of the photo in #45427.

Page 5212 (2 Aug. 1930). Dairen, Manchuria. "W.J. Morse's notes: Another trip was made to the Dairen wharf warehouses and the S.M.Ry. storage yards to secure good samples and pictures of soybean shipping scenes. We found the wharf houses well filled with sacks of beans and there seemed unusual activity in bean exports. In our rounds of the warehouse we collected twenty-four samples of soybeans and one sample of mung beans. The beans of which samples were collected were said to have come from various parts of North Manchuria and were mostly for export to European countries for oil and meal.

"The German ship *Preussen* was being loaded with 3500 tons of [soy] beans. Nearby a Dutch ship was being loaded with beans. One Japanese freighter was taking on beans which were a little better quality than the oil beans and were being shipped to the main island for the manufacture of soy sauce and miso.

"Two Japanese freighters were being loaded with large amounts of soybean oil cake for shipment to Japan and other points for fertilizer and cattle feed." Page 5313. Neg. #45445. "Soja max. Soybean. Dairen, Manchuria. Loading the German freighter *Preussen* with 3500 tons of soybeans for Europe to be used for oil and oil meal, at the Dairen wharves."

Page 5380 (8 Aug. 1930). Dairen, Manchuria. "W.J. Morse's notes: We received a package of forty-one varieties of soybeans from the Kankyo Hokudo Prefecture Seed & Nursery Farm, Kyojyo, Chosen" [Kyojo, Korea]. Address: Agricultural Explorers, USDA, Washington, DC.

320. Stewart, Ralph T.; Wentz, John B. 1930. A defective seed-coat character in soy-beans. *J. of the American Society of Agronomy* 22(7):658-62. July. [5 ref]

• ***Summary:*** "During their breeding and genetic studies with soybeans (*Soja max*), the authors observed a defective seed-coat character in one of their crosses. Data were taken on the inheritance of the character and an attempt is made in this paper to interpret these data.

"Piper and Morse (2) reported that a number of black and brown varieties of soybeans were introduced from Korea which had the outer layer of the testa cracked so as to expose the inner white layer of the seed. In one variety, Widower, which had a black seed-coat, the splitting occurred in such a way as to give a net-like appearance of black and white color to the seed. The character reported in the present paper is very similar to, or possibly identical with, the one described by Piper and Morse." Address: Iowa State College, Ames. Stewart then went to Texas A&M.

321. Dorsett, P.H.; Morse, W.J. 1930. Tofu, soybeans in the pod, and soybean sprouts in Peiping, China (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 5431 and 5432 (13 Aug. 1930). "We visited an open street market in the northwestern part of the city this morning." Vegetables include: (1) "Soybeans in the pod, quite abundant." Also: "Pea sprouts. Soybean sprouts." "In the afternoon we went to the Temple of Heaven grounds and got more seed..."

Page 5434. Vegetable market scene. Hei Tan Pai Lou, Peking. Cucumbers, eggplants, soybeans,... displayed on the ground for sale" (neg. #45540). At the same market, photo of bean curd. "This Chinese bean curd looks firmer than the Japanese curd" (neg. #45541).

Page 5435. "Peiping. Square cakes of brown bean curd. The cakes of white curd are put into cold soy sauce and when the combination is brought to a boil the cakes are of a brown color" (neg. #45543).

Pages 5436 and 5437. Four photos taken in an open-air show: "Southern soybean curd, Peiping. This curd appears quite firmer than the ordinary curd. The curd, that is the grain, appears to be finer and is considered much better than ordinary curd. It also sells for more money." (2) "White and brown cakes of soybean curd in a Chinese market." (3) "To the left is a pile of shredded soybean curd, on the right a pile of the sheets of curd from which the shredded curd is made" (Negs. #45544-46). Note: Pressed tofu sheets are called (in Wade-Giles transliteration) *pai-yeh* or *ch'ien-chang p'i*. Pinyin: *Qian zang pi.* Tofu is pressed into very thin sheets that look like a 6-to-12-inch square of canvas.

Page 5455, 5456, 5467. This is a letter dated Aug. 14 from P.H. Dorsett in Peiping, China, to Mr. W.J. Morse, c/o Yamato Hotel, Dairen, Manchuria. "Dear Morse: I was delighted to get your letter of August 3rd, for it seems an awful long time since we left you and the family... on July 21st.

"Yesterday we visited an open street fruit and vegetable market which extends for several blocks along Chien-men [Chienmen, Chinman?] Street. It was surely an interesting experience. We saw bean curd at quite a number of stands, also soy sauce. The curd was in several different forms. The white, in somewhat thinner and smaller pieces, small pieces in different forms fried, also round and square brown cakes which they call dry curd [*doufu-gan*]. It is not really dry but is pressed much dryer than the ordinary curd and can readily be handled without breaking, The brown color, we learned, is the result of putting the curd in cold soy sauce and bringing the sauce to a boil."

Pages 5779 and 5780 (18 Aug. 1930). Letter from Mr. W.J. Morse in Dairen, Manchuria, to Mr. P.H. Dorsett, c/o U.S. Legation, Peiping, China. "Today by mail I sent you all of the negatives of pictures that I have taken up to date. The negatives were sent in two lots–one of the 3¼ by 4¼ and the other of the panoramas. Tomorrow I will send you the field reports to date which may be destroyed after they are copied in the report.

"I am planning to go to Korea for two to three weeks in the very near future to complete our movie story of the soybeans as well as the still picture story. We lack the connecting links–scenes of varieties, fields, methods of culture and harvesting–and I hope to get these if possible in a short time to complete the whole soybean story of Korea. I also desire to get some data on the growing varieties for you will recall that we did not see the beans growing at all. The Manchurian maturing season soon will be here and again I want to take notes on varieties and make a complete story of the Manchurian soybean. You can rest assured that I am

© Copyright Soyinfo Center 2021

going to collect all possible data, seed and products of the crop. I trust that my allotment holds out for I do not want to miss anything."

"I regretted very much to learn of Dr. Harvey Wiley's death [on 30 June 1930] as I knew him very well. Several years ago he came to see me about soybeans for his dairy farms up at Bluemount [Note: After leaving government in 1912, Wiley raised dairy cows and became head of the laboratories at *Good Housekeeping* magazine]. I started him with the Virginia as a silage bean and it was a great success. He became quite a soybean man and occasionally came around to talk soybeans with me.

"Your comments on the bean-curd at the Chinese market are very interesting and I hope to be able to see some of these different things when I come down to [China] some time this fall. I doubt if I will find anywhere in the Orient such a collection of products as we picked up in Japan last year. You will note in the field reports being sent you that lately we have stumbled across a few new products and we are always on the lookout for new ones." Address: Agricultural Explorers, USDA, Washington, DC.

322. Dorsett, P.H.; Morse, W.J. 1930. Kudzu seed (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. • ***Summary:*** Page 5449 (14 Aug. 1930). Dairen, Manchuria. W.J. Morse's notes. In the morning they called at the office of Mr. Ohara of the Manchu Nosen Shokai, at Pulentien, Manchuria, the northern border of the Kwantung Leased Territory. He had 100 pounds of the seed of *Zoysia pungans.* "The seed is to be shipped on a freighter leaving Dairen Aug. 19 and should arrive in San Francisco in about one month.

"With reference to kudzu seed, Mr. Ohara said that most of the seed was obtained from northern Korea and only small quantities obtained from the district between Mukden and Antung, Manchuria. The twenty pounds of seed ordered by us recently will come from Northern Korea so we ordered five pounds to be obtained from the Mukden-Antung District. Most of the orders for kudzu seed are received during September from the United States." Address: Agricultural Explorers, USDA, Washington, DC.

323. Dorsett, P.H.; Morse, W.J. 1930. In Chinchou, Manchuria (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 5479 (15 Aug. 1930). Chinchou, Manchuria. "W.J. Morse's notes: Left on the 9:00 a.m. bus for the Chinchou Experiment Station to have a talk with Mr. Nakatomi regarding soybean work. We were told that soybeans and kaoliang are seldom grown together. In some of the back hill or mountain districts some of the farmers plant soybeans and kaoliang together similarly to the planting of corn and soybeans. The blades of the kaoliang plant are never stripped from the kaoliang plants as Dorsett saw in the Peiping district. Kaoliang and mung beans or adzuki beans are most generally planted together in the Leased Territory.

"The soybean plots grown for green manure in the station orchards have been for the most part turned under which is done about the time the plants are just past bloom. The station is conducting some green manure experiments in an apple orchard using soybeans, alfalfa, millet, vetch and wheat. These crops are planted in the forepart of July and will be turned under about October."

Page 5617. This is a letter dated Aug. 28 from P.H. Dorsett, Agricultural Explorer, in Peiping, China, to Mr. Julean Arnold, U.S. Commercial Attache, Shanghai, China. He is sorry not to have been able to meet Mr. Arnold, but asks if Mr. Arnold has any statistics on the production or use of "American jute" [genus *Corchorus*] in China.

Page 5926-5927. "Package # 9, contains our quarterly report for the quarter ending June 30, 1930, The *original* is for the office and the *carbon copy* for Mr. W.J. Morse. The negatives for the report are also included in this package.

Packages #'s 10, 11, 12, and 13 contain seed, in regard to which the following detailed notes, we hope, will prove of interest and possible value." Seeds of many different plant species are described.

Page 5968 (29 Sept. 1930). Mukden, Manchuria. "W.J. Morse's notes: Awoke about 5 A.M. and upon looking out saw a few farmers cutting soybeans and kaoliang, For the most part, the crops have been harvested and many were curing in shocks in the fields."

"We arrived at Mukden at 6:20 a.m. As soon as the stores were opened we searched for the Hoton Shubyoen, Importer, Exporter and collector of seeds. The proprietor of this store advised that he collected seed of wild plants in Manchuria." Alfalfa "seed sells to the farmer for 80 sen per kin (1.1 lb).

"We left Mukden on the 3:58 p.m. train for Kaiyuan where the soybean farm of the S.M.Ry. is located.

"From Mukden to Kaiyuan, the crops for the most part have been harvested. Some soybean fields were being cut but only occasionally did we see a standing field. In many fields the bean plants were in shocks of upright bundles, while in other fields, the bundles were being placed in carts or being hauled to the threshing ground."

Page 5982-5983 (30 Sept. 1930). Kaiyuan, Manchuria. "W.J. Morse's notes: "Mr. Kofuka, director of the soybean farm called shortly after nine and advised that most of the

© Copyright Soyinfo Center 2021

soybeans in the Kaiyuan district had been harvested but we would be able to find some standing fields. The crops have mostly been harvested during the past two weeks.

"After soybeans are cut, they are tied in bundles with a kaoliang stalk. The bundles are placed in loose upright shocks and allowed to cure in the fields for about a week. The bundles are carted to the threshing ground and stacked in large round or oblong stacks along the sides of the threshing grounds. Soybeans are threshed first, then kaoliang heads, and lastly millet (the whole plant)."

"Near one threshing ground we saw many bundles of bean plants that had been cut before the leaves had fallen."

"As it was too muddy to get around very much in the country, we returned to the city and visited the Stock Exchange where soybeans (including oil and cake) and kaoliang are the only crops dealt in. As yet very few beans have appeared on the market. Threshing is mostly done during the latter part of October and in November."

Page 5983. Neg. #45934. "Soja max. Soybean. Kaiyuan, Manchuria. Bundles of soybean plants that had been cut before fully mature. When the Manchu farmer starts harvesting, he harvests all of his crops. Should he leave a field uncut, some kindly persons would harvest for him and also take the crop."

Page 5987. A table appears to show that P.H. Dorsett's total expenses for one quarter (3 months) are $1,261.02 or about $420 per month, including hotel, meals, travel, research expenses, mailing, etc.

Page 6004. USDA Bureau of Plant Industry Weekly Itinerary Report.

Page 6005. A table appears to show that W.J. Morse's total expenses for 3 months are $1,693.62 or about $423 per month.

Page 6030-6031 (2 Oct. 1930). Kungchuling, Manchuria. W.J. Morse's notes: Mr. Nakamoto, director of the station, advised: "Threshing season begins about the middle of October and extends until the latter part of November. The shipping season reaches its height during December and January, beginning about the middle of November."

"We also met Mr. Kochi in charge of swine investigations who stated that Chinese farmers did not feed soybeans to hogs. They do, however, feed soybean oil cake extensively after the hogs are six months old, the previous feeding being kaoliang bran. The skins from the mung bean seed obtained from mung bean vermicelli and noodle factories, and from sprouting places, are used exclusively as hog feed. Mr. Kochi advised that the Manchurian farmer has no soft pork problem as he desires soft pork and does not have ham or bacon to make."

Page 6032. Neg. #45948. "Soja max. Soybean. Kungchuling, Manchuria. Close-up view of Manchurian farmer showing type of sickle or knife used in harvesting soybeans.

Page 6036-6037 (3 Oct. 1930). Kungchuling, Manchuria. W.J. Morse's notes: "The threshing ground was being rolled after the heavy rains in preparation for the threshing of soybeans. This village is growing soybean seed of one of the improved varieties. The seed is a medium large glossy yellow, much larger than any of the native varieties we have seen. A large percentage of the plants had many 4-seeded pods."

"There were many excellent varieties and selections which looked as though they might be heavy grain yielders. We are in hopes that most of these will be included in the series promised us, for the early and medium sorts no doubt will be of great value for our corn belt and northern states."

Page 6038. Neg. #45951. "Soja max. Soybean. Kungchuling, Manchuria. Cutting soybeans with sickles or knives on a farm near Kungchuling."

Neg. #45960. Same as #45959 but a different view.

Page 6047-6048 (4 Oct. 1930). Kungchuling-Dairen, Manchuria. "W.J. Morse's notes: At Kaiyuan Dr. Lene Müller [Mueller, Muller], a scientist from Germany, sent to the Orient to study soybeans, got on the train to ride as far as Mukden to talk soybeans. Dr. Mueller has spent three months in the southern Amur district of Siberia where they are trying to grow soybeans extensively but with very poor success. She has spent about ten days in Manchuria and plans to spend a few days in Chosen and Japan studying varieties, breeding methods and utilization. She told of a wild species of soybean in the Amur district that matures in about 75 days.

"At Mukden, Dr. Mueller left us and Dr. Oza, teacher in the Mukden Agricultural High School, and at whose home Dr. Mueller is staying, got on the train. We found that he had visited Washington [DC] in 1927 and we had a visit on soybeans." Address: Agricultural Explorers, USDA, Washington, DC.

324. Dorsett, P.H.; Morse, W.J. 1930. Soybeans in Chosen

(Korea) (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 5616 (25 Aug. 1930). Heijo, Chosen. W.J. Morse's notes. "In the morning we went on a plant collecting trip in the Botandai [Botan-dai] and collected the following species." A list of 8 species is given, including 1 Pueraria (regular) and 1 Pueraria with leaf-spot.

"Some of the grain markets in West Heijo were visited in the afternoon. Millet seed predominated followed by adsuki beans and mung beans. Only one or two soybean varieties were found at each store. The soybean stock at this season is low and some of the dealers advised they would not have a full stock of varieties until the arrival of the new crop. We succeeded in collecting eleven samples of soybeans which appeared interesting for trial."

Page 5630 (26 Aug. 1930). Kosai, Chosen. W.J. Morse's notes. "We took an early morning bus for Kosai, about 30 miles northeast of Heijo and went to the Kosai Village Agricultural Society. We met Mr. Tajima, the agricultural director who gave us information concerning the crops in Kosai county. About 60 per cent of the total cultivated area is devoted to paddy and upland rice. Millet, kaoliang, adsuki beans, mung beans and soybeans are quite extensively grown but mainly in the hill and mountain regions. About 25,000 koku (125,000 bu.) [1 koku = 5 bushels] of soybeans are produced. Very few soybeans are produced for the sale of the seed. They are used chiefly for cattle feed, and for home use as miso, soy sauce and boiled beans. Adsuki [azuki] beans and millet are the principal foods and more attention is given to the culture of adsuki beans than other crops.

"On the way from Kosai to Heijo the various mixed plantings in which soybeans were included, were noted as follows:

"1. Soybeans and kaoliang.
"2. Soybeans, millet, adsuki beans.
"3. Soybeans, mung beans, buckwheat.
"4. Soybeans, castor beans.
"5. Soybeans, melons.
"6. Soybeans, corn (several methods).
"7. Soybeans, millet (several methods).
"8. Soybeans, mung beans."

Page 5631. Negative #45670. "Soja max. Soybean. Kosai, Chosen. Field of soybeans and millet. The millet in 21 inch rows and soybeans planted between two rows of millet. Every alternate middle is planted to soybeans.

Neg. #45671. "Soja max. Soybean. Kosai, Chosen. Buckwheat, mung beans and soybeans in same row. This mixed planting is quite common in this region.

Page 5632. Neg. #45672. "Soja max. Soybean. Kosai, Chosen. Mixed planting of soybeans and millet. Soybeans were planted at the edge of the millet rows when the millet was 2 inches high. Millet has just been harvested. Neg. #45673. "Soja max. Soybean. Kosai, Chosen. Soybean and millet field. The millet has just been harvested and the Korean boy is cutting the heads from the millet plants. Soybeans planted at intervals of about 8 feet along side of millet row."

Page 5635 (27 Aug. 1930). Chuwa, Chosen. W.J. Morse's notes. "We left on the 9:30 mixed train for Chuwa, south of Heijo and went at once to the Village Agricultural Society where we met the Village Master and an agricultural engineer. We were told that the west side of the county grows primarily paddy and upland rice while on the east side soybeans, millet, kaoliang, mung beans and adsuki beans were the leading crops.

"Soybeans are quite generally grown alone but are also grown extensively with other crops as corn, millet and kaoliang. Large seeded varieties are grown in the mixed plantings while in the single crop plantings the small seeded varieties are used. Native Korean varieties are chiefly grown though the Society has tried to persuade the farmers to grow the Heijo and Hokkaido which are improved varieties. Soybeans are quite generally grown in this county as a cash crop and are also used by the farmers as a food for oxen and in the home manufacture of miso and soy sauce. A large number of native varieties are grown in the county and the Village Master promised to collect and send us samples this fall.

Page 5636, "After our visit to the Agricultural Society we took the main road to Heijo, a distance of about 15 miles from Chuwa." "Along the way we saw many excellent fields of soybeans alone and in mixed plantings with corn, kaoliang, and millet. Various methods were used in these mixed plantings."

Page 5637. Neg. #45675. "Soja max. Soybean. Chuwa, Chosen. Field of soybeans and field of kaoliang in farming section about 12 miles north of Chuwa."

Page 5707 (1 Sept. 1930). Senkyori, Chosen. W.J. Morse's notes. "During the day we made a trip through the Senkyori section east of Heijo and covered about fourteen miles. Throughout the farming section we found soybeans extensively grown, both alone and in mixed plantings. In the mixed plantings, corn was the most generally grown, one stalk of corn from 4-8 feet apart in the row and from 2-4 hills of soybeans between the corn hills. Some fields of kaoliang were mixed with soybeans, with two hills of soybeans between the hills of kaoliang (4 feet apart)."

Page 5708. Neg. #45714. "Soja max. Soybean. Senkyori, Chosen. Close-up view of soybeans and millet. Soybean hills planted at intervals of 8 feet along side of the millet rows."

Neg. #45717. "Soja max. Soybean. Ritsuri [today's Yul-li, in North Korea], Chosen. Corn and soybeans in same row with one stalk of corn every eight feet and three hills of soybeans between corn hills. Corn thus planted is used as roasting ears."

Page 5719 (2 Sept. 1930). Ritsuri, Chosen. W.J. Morse's notes. "Mr. Lutz, agricultural advisor of the Union Christian College, took us in the morning near Ritsuri village where the farm of the Nippon Sugar Co. is located. This farm of 250 acres is primarily for the raising of sugar beets, but a four year rotation is followed: sugar beets, millet, soybeans and wheat." "We were taken over the farm by the manager and saw some excellent fields of soybeans.

Page 5730. "The wild soybean was found in great abundance along the roads and paths as was also the wild adsuki bean."

Page 5731. Neg. #45728. "Soja max. Soybean. Heijo, Chosen. Row of soybeans and kaoliang growing along the rice paddy in a rice section about four miles northwest of Heijo.

Neg. #45729. "Soja max. Soybean. Heijo, Chosen. View of soybeans and kaoliang growing on the edge of a rice paddy in a rice section about four miles northwest of Heijo.

Page 5733. (4 Sept. 1930). Chinnampo, Chosen. W.J. Morse's notes. "Left Heijo at 7:45 a.m. for Chinnampo where there is considerable shipping of soybeans. On the way the lowlands were given to paddy rice while the uplands were quite generally devoted to kaoliang and mung beans, millet, soybeans and adsuki beans. Soybeans were grown in all of the millet fields but at the present time about 90% of the millet has been harvested leaving the soybeans in full possession of the fields."

Page 5734. At Chinnampo we went too the Heian Nando Grain Inspection Office where we met the director, Mr. Ozeki. We were given considerable data on exports, inspection, grading, trading, varieties and uses of soybeans in this prefecture. The trade in trade in beans at the present time is rather dull. The price per koku (5 bushels) is ¥12.80, The highest prices are in the fall and winter when better grades of beans are obtained.

"We were taken to a Korean merchant who does a large export business in soybeans to Japan and who handles several varieties of soybeans. We visited the warehouse of this merchant and were given samples of the different varieties he had in stock (16). We were advised that mostly yellow beans are shipped to Japan for miso, soy sauce and bean curd [tofu]. Some black [soy] beans are shipped for cooking purposes but bicolored beans are not allowed to be exported." Address: Agricultural Explorers, USDA, Washington, DC.

Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 5739 (5 Sept. 1930). Taihei, Chosen. W.J. Morse's notes. "Yesterday while returning from Chinnampo it was noted that soybeans alone and soybeans in mixed plantings were very generally grown from Taihei to near Heijo, a distance of fifteen miles. This morning we started for Taihei..."

"Wild legumes were found in great abundance along the roadsides, especially the wild soybean. Wild adsuki beans and several species of lespedeza were also found in abundance along the roadsides. A small patch of wild soybean was found badly affected by leafspot. In previous trips in Manchuria and Korea we had not noticed leafspot on the wild soybean.

"In the mixed plantings of soybeans and other crops several small fields of castor beans and soybeans were found. The castor plants were anywhere from 2-4 feet apart in the soybean rows. In this region we saw more buckwheat and soybeans together than in any section yet visited. Hills of buckwheat were sown along side of the soybean row at intervals of 2-3 feet. Many fields of cucumbers and soybeans and melons and soybeans were observed. These were on ridged beds about 4 feet wide. The cucumbers and melons were planted up the middle of the beds while soybeans were planted in hills along the edges of the beds from 2-4 feet apart."

"Some excellent fields of soybeans alone were seen...

Page 5740. "A few kaoliang fields have been cut. In the millet and soybean fields at least 90% of the millet has been harvested. Many soybean fields are beginning too yellow and with good weather should mature rapidly.

Page 5771 (9 Sept. 1930). Shariin, Chosen. W.J. Morse's notes [Dorsett is in Peiping, China]. "We left at 9:30 a.m. to visit the Agricultural Experiment Station at Shariin to look over the soybean experimental work. From a short distance west of Kokai-Koshu [Kokaikoshu] we began to observe quite extensive plantings of buckwheat more than any section yet seen. Many large fields were sown alone but for the most part buckwheat was in mixed plantings. In most of the [soy] bean fields, two to four rows of buckwheat were grown on the sides. Mixed plantings of soybeans and buckwheat and mung beans and buckwheat were quite common.

After reserving rooms at the Shariin Inn we went to the Experiment Station where we met Mr. Hoshino, one of the crop assistants."

Page 5772. "Mr. Takehashi is at present on the Main Island and it is not known just when he will return. We were taken to visit some of the experimental plots between showers.

"In the soybean variety work, they have over 1,500 numbers under test. Over 200 are varieties that the Shariin station has been working with while 800 were received from the Suigen station the past spring. About 500 samples were received from the Chosen Fair last fall, representing the best native varieties from all prefectures in Chosen. In the variety tests and breeding work 10 plants are grown to a number, the plants being about [?] inches apart in the row and the rows about 30 inches apart. many very interesting varieties were noted in the various tests.

"The soybean expert, Mr. Sawamura, was sick today but may be with us tomorrow to give more information concerning the soybean work and also to take us out to some of the farming sections.

Page 5773. Neg. #45769. "Soja max. Soybean. Shariin, Chosen. View lengthwise of rows of soybean-millet field. Bean hills about 12 feet apart along side of millet row. No fertilizer was applied to this field.

Neg. #45770. "Soja max. Soybean. Shariin, Chosen. View at right angle to rows of millet-soybean field after the millet has been harvested. Hills of soybeans about half way up row ridge and about 12 feet apart. Rows 21 inches apart."

Page 5800 (10 Sept. 1930). Shariin, Chosen. W.J. Morse's notes. "In the morning we went to the Shariin Experiment Station where we met Mr. Sawamura, the soybean expert. With reference to not sending seed of the soybean varieties the past winter. Mr. Sawamura advised that when they came to check up the seed of the varieties the past winter they found the seed of many varieties did not check up with the native varietal names. They decided to grow the varieties again, correct the errors and send us seed of the 1930 crop.

"We were taken to the variety and breeding plots and the work [was] explained to us by Mr. Sawamura. All work is being done with native Korean varieties toward the development of improved pure strains. The varieties received from the 1929 Chosen Fair (500 numbers) showed some very interesting and valuable sorts. This is the collection we saw at the Fair last October and tried to secure. Through a misunderstanding, we only received six soybean seed samples. When the situation was explained to Mr. Sawamura, he thought he could give us the sample of each this fall. In addition he will give us samples of the 208 native Korean varieties the station has been working with.

"We then went out in the farming sections and saw some excellent fields of soybeans." See next page.

Page 5802. Neg. #45784. "Soja max. Soybean. Shariin, Chosen. Field of soybeans, adsuki beans, mung beans, and buckwheat in same rows (21 inches apart). A very common practice in this district. See next page.

© Copyright Soyinfo Center 2021

Mr. Yamazaki with reference to silos and silage in Daido County. He advised that he was going to look over some of the silos in a nearby section on Saturday and would be glad to have us go with him. Soybeans were grown also in this section but were used principally for cattle feed. As yet no tests have been made with soybean and corn silage. The silage for the most part is corn, weeds (grasses and legumes), and alfalfa. In 1929 there were five silos in the county and in this year (1930) there were forty silos scattered about in the county."

They then went to a hill section west of Heijo. "We found the wild soybean growing abundantly and it is quite evident there are two distinct varieties–one with narrow pointed leaves and the other with larger leaves more rounding at the tip. Again we found leafspot [disease] very bad on the wild soybean."

"On our way through the city in the morning we saw shelled green vegetables in baskets at several Korean vegetable stands. Mung bean sprouts are now on the market, more generally than when we first came to Heijo. At several stands soybean sprouts were noted for the first time."

Page 5814. Neg. #45795. "Soja max. Soybean. Shariin, Chosen. View of soybean-millet field on steep hillside about two miles west of Heijo. Millet has been harvested. [Soy] Bean hills are about 6 feet apart in row." Address: Agricultural Explorers, USDA, Washington, DC.

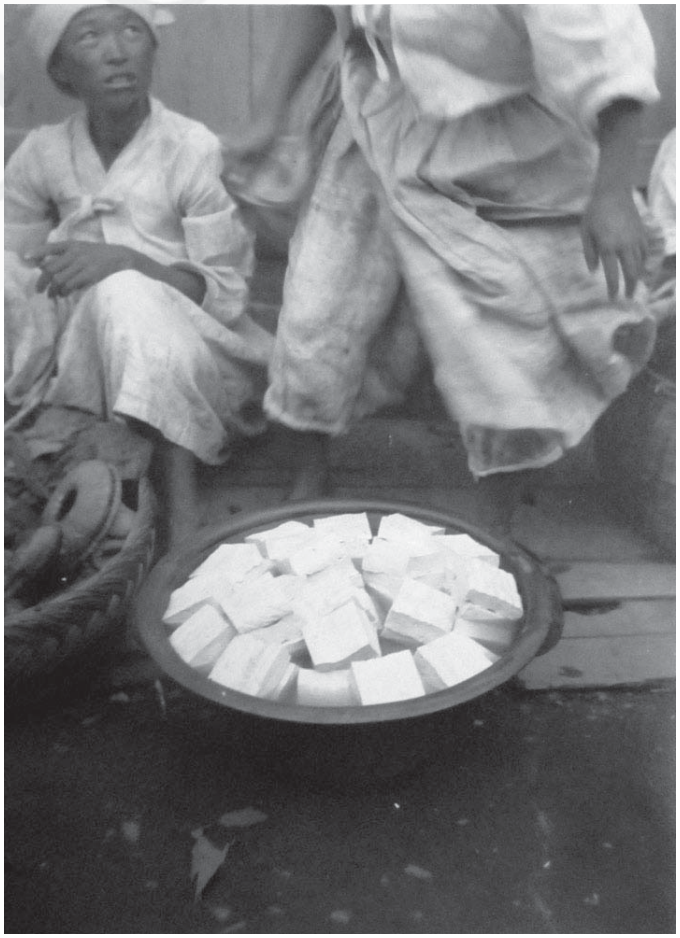
• ***Summary:*** Page 5658-5659 (30 Aug. 1930). Heijo. "In the morning we went to the Grain Inspection Office where we met the grain inspectors and went with them to the grain storage and shipping yard of a Korean grain merchant along the Daido [today's Taedong] River. Two hundred bags of soybeans were to be inspected and graded for shipment to the Main Island... At least 80% of the beans were found to have brown germs indicating either poor storage or curing of the beans. The inspectors refused to pass the seed in any grade. The merchant had expected 3rd or 4th grade and had sold the seed to an exporter in Chinnampo [today's Namp'o, the port city for Pyongyang].

"The following items on the inspectors cards were used in grading soybeans: 1. Koku. 2. Dirt or stones. 3. Trash–pods, stems, etc. 4. Rotten seed. 5. Immature seed. 6. Insect injured. 7. Broken seed. 8. Per cent total. 9. Remarks.

"As some boats were loading soybeans for shipment to Chinnampo we were able to secure still and movie pictures of inspection and landing of the small Korean boats.



After lunch we visited a grain market... We obtained nine samples among which were the largest yellow and green seed varieties [of soybeans] we have come across. These varieties are said to be used by the Koreans in making their own miso and soy sauce.

"In a small market place, we found jars of mung bean sprouts and dishes of bean curd at nearly every vegetable stand. Several stands had dishes of boiled mung bean sprouts, a product we have not seen before in our work.

Four photos (p. 5659-5661) show: "View of weighing bags of soybeans during inspection and grading in the storage and grading yard of the Korean grain merchant along the Daido River (Negs. #45699-702). Then 3 more similar photos are on pages 5662 and 5663.

Page 5661. A photo (see below) shows: "Soja max. Soybean. Heijo, Chosen. Small blocks of fresh soybean curd sold by Korean women in a Korean market" (neg. #45703).

Page 5751 (6 Sept. 1930). Heijo, Chosen. W.J. Morse's notes. We visited the office of the Heian Nando [today's P'yôgan-namdo in North Korea] Prefecture Grain Inspection Service... The earliest [soy] beans were said to be grown around Junsen [today's Sunch'ôn in North Korea] and harvest will begin between the 15th and 20th of this month. Crops are in excellent condition and above average yields

will be obtained. Junsen is the center of a large soybean grain producing region and the inspector advised that we should by all means visit the Junsen section.

"It was learned that market day was being held on the outskirts of the city, so we went to look over the products."

"At some of the small lunch stands scattered about the grounds, mung bean and soybean foods were being cooked and sold. Mung beans as batter cakes with chopped vegetables and fried soybean curd were the chief foods.

Page 5754. A photo shows: "Frying small blocks of bean curd on piece of sheet iron at small open lunch stand on Korean Market Day" (neg. #45752). Address: Agricultural Explorers, USDA, Washington, DC.

327. Morse, W.J. 1930. Re: Investigating soybean production in Korea (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Aug. 31. Unpublished log.
• ***Summary:*** Pages 5781 and 5782 (31 Aug. 1930). Letter from Mr. W.J. Morse in Heijo, Chosen [Pyongyang, North Korea], to Mr. P.H. Dorsett, c/o U.S. Legation, Peiping, China. "Well am over in Korea picking up missing links in our Korean soybean pictures and word story... We [Morse and Suyetake] left [Manchuria] on the 20th and arrived here on the 21st."

"... I feel that we will be greatly repaid even for a two or three week's visit. I simply had no idea that the beans were planted in so many different ways. From last season's data, I got the impression that soybeans were grown principally with millet. I find that they are planted with millet, corn, buckwheat, kaoliang, castor beans, and mung beans. In one section we found some excellent fields of buckwheat, soybeans and mung beans planted together. Many fields are planted to soybeans alone and we have seen many excellent fields We have taken many pictures and about 1½ reels of movies (here's hoping they are good)."

"The wild soybean about here seems to be larger than the one in Manchuria and I am wondering if it is not like the one you have found in China."

"Thus far we have collected over seventy-five seed and plant specimens The director of the experiment station has promised to collect seed of all the native Korean varieties of soybeans for us this fall. We have picked up several very interesting samples of soybeans. We have also the promise of the Agr. Soc. at Kosai to collect native samples in that region."

"Please send mail to Dairen address as I won't be so long in this region. As soon as I get what I needed here for the Korean story and some wild legume seed we will return to Dairen to begin soybean operations."

"P.S. With reference to soybean samples in China, I would like it very much if you would pick up small samples wherever you come across them." Address: Agricultural Explorer, USDA, Washington, DC.

328. Dorsett, P.H. 1930. Re: Collecting seeds and herbarium specimens (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Sept. 9. Unpublished log.
• ***Summary:*** Pages 5775 to 5778. This letter dated Sept. 9 is from P.H. Dorsett in Peiping, China to W.J. Morse, c/o Yamato Hotel, Dairen, Manchuria.

"Dear Morse: Come on over, the weather is cool and it is fine here."

"We spent a week in the vicinity of Hankou, the Chinese Great Wall, Ming Tombs and Tang Shan [Tangshan, a city in today's Heibei province], and secured some seed, a few pictures, and quite a number of herbarium specimens. We also spotted quite a number of plants of which we hope to get seed later."

Page 5776. "In a recent letter from Ben... he voices the opinion that all think I should return to Washington [DC] in December. Oh well, I guess I can stand it!

"Perhaps we had better give some consideration to the time and arrangements for our making the trip home. If you will, as soon as you conveniently can, let me know when you will be ready to sail and whether or not you will leave via Peking or Shanghai, Kobe or Yokohama. I will arrange my affairs so as to take the same steamer" with you and Margaret.

"One evening last week [in early Sept. 1930 in Peiping] we took dinner with Dr. Yamei Kin, and during the course of the conversation, which drifted, among other things, to soybeans and soybean products, the Doctor challenged my statement to the effect that I thought the Japanese utilized soybeans as human food more extensively than do the Chinese. She said the Chinese have a large number of soybean jams [jiang] and other products which are used extensively. Well, when you get to Peking, you will have to look these matters up. The Doctor may be right about this matter but I have my doubts."

Page 5777. "I am pleased to learn that you are there and are getting along so nicely in filling in the gaps of our Chosen [Korea] work last fall where additional data and pictures are required to round out a complete story of the soybean work in that region.

"We, to my surprise, find that throughout the regions we have visited about Peiping, that the soybean is grown here in conjunction with practically all other farm crops, but primarily with kaoliang, corn, millet, sesame, peanuts, etc. Jim and I did not observe this when we were here in 1924-25."

© Copyright Soyinfo Center 2021

"I suppose you will get seed of the large wild soybean. We expect to get seed here of the large leaved tall growing form."

Page 5778. "We will arrange to collect as many small samples of soybeans as is possible from the regions we visit... Very sincerely yours." PHD/rd. Incls. [Inclosures]. Address: Agricultural Explorer, USDA, Washington, DC.

• ***Summary:*** Page 5828-5829 (12 Sept. 1930). Heijo (today's Pyongyang) and Jidori, Chosen. W.J. Morse's notes. Neg. #45805. *"Soja max.* Soybean. Jidori, Chosen. Kaoliang-soybean field. Rows 21 inches apart. Two kaoliang plants every five feet apart in row and three hills of soybeans between the hills of kaoliang."

Page 5837. Neg. #45512. Silo. Ryojo. Chosen. Cement silo on Korean farm near Ryojo. Silo is 6 feet deep and 5 feet in diameter. It extends about 12 inches above ground and holds about 6,000 pounds of silage. Chopped corn (without the ears), alfalfa, and weeds are most commonly used. Wooden cover on silage is weighted with stones.

Neg. #45513. Korean silo. Ryojo. Chosen. Cement pit silo is 6 feet deep, 5 feet in diameter and the wall 4 inches thick. It holds 6,000 pounds of silage which lasts one ox from 3-4 months. Corn, alfalfa and wild legumes & weeds are used for silage."

Page 5842-5843 (15 Sept. 1930). Rikiho to Chuwa, Chosen. "Left by train this morning for Rikiho and walked from Rikiho to Chuwa." "Nearly all of the millet has been harvested and about 50 per cent of the kaoliang. The fields are for the most part mung beans, soybeans, adsuki beans and buckwheat. Many fine fields of soybeans were noted and are beginning to mature. All millet fields have only soybeans in them while the harvested kaoliang fields have mostly mung beans."

"Arriving at Chuwa we found market day on so we looked over the different farm products. In the grain section [?] kaoliang seed predominated followed closely by wheat. There are also more or less mung beans and adsuki beans but very few soybeans. Neg. #45815. *"Soja max.* Soybean. Chuwa, Chosen. Soybean section of grain market on Korean market Day. Farmers' Market Days are held in Korean villages and cities every 5 days."

Page 5844. A large and interesting vertical panoramic photo with illegible handwritten description.

Page 5871 (17 Sept. 1930). Heijo, Chosen. W.J. Morse's notes. "Field notes from August 17 to September 15, inclusive, as well as eighty-nine 3¼ by 4¼ negatives and 12 panoramas of pictures covering the above period were sent to P.H. Dorsett at Peiping, China to be included in our quarterly field trip report.

"In view of the fact that the Shariin Experiment Station soybean expert said it would pay us to visit the Suigen Experiment Station to see the soybean variety and breeding work, we left Heijo at 2:31 P.M. and arrived at Keijo [today's Seoul] at 8:50 P.M.

"In the Shariin region we noted as we passed through many excellent fields of soybeans and the crop seemed to be more advanced in maturity than we have observed elsewhere. Millet and soybeans are most generally seen. The hills of soybeans seemed [?] to be planted at no uniform distances apart along the millet rows. The hills ranged from 4 to 20 feet apart in different fields.

Pages 5879-5880 (18 Sept. 1930). Suigen, Chosen. W.J. Morse's notes. "We left early in the morning for the Suigen Experiment Station where we met Dr. Nagai, plant breeder of the station.

"The principal work at the station with soybeans consists of developing pure strains from native Korean varieties through selection and hybridization. The variety test is made up of about 80 varieties selected from more than one thousand samples of the native Korean, Japanese and Manchurian sorts.

"We were taken out to the experimental plots by Dr. Nagai and had an opportunity of seeing the grown varieties which we missed last season due to the lateness of our arrival in Chosen. In the variety test some excellent varieties were observed ranging from 3-4½ feet high and very prolific. Especially interesting and promising were the Chotan and Orusan, selections from native Korean varieties.

"In the selection tests, many hundred individual plant selections were being grown in 30 inch rows, the plants about 9 inches apart in the row. Dr. Nagai tries to have fifty plants per individual plant selection. In planting a seed is dropped every 8 inches so there is no thinning to do. There were many very promising selections but all of the grain type.

During the spring, Dr. Nagai received a full set of named American varieties from the U.S. Department of Agriculture. Each variety was given about two rods [1 rod = 16.5 feet] and with the exception of the very early sorts were showing up exceptionally well. The Harbinsoy (S.P.I. 54906) placed in the U.S. farmers' hands in 1927 looked to be the best and was highly spoken of by Dr. Nagai. The varieties ranging in maturity from 115-130 days appear to be best under Korean conditions in this section.

"After looking over the experimental plots we went to the farming section west of the station. Soybeans were grown in rows with susu (sorghum) and perilla, and with millet and susu. All of the crops are planted in beds 3-4 feet wide. In the planting of susu, millet and soybeans, the soybeans are sown first, right after barley harvest (about the 20th of June). The

© Copyright Soyinfo Center 2021

beans are sown in hills (4-6 plants per hill), four across the bed, 8-12 inches apart. At the same time susu plants 24-30 inches high, are transplanted in a row in the center of the bed at intervals of about 5 feet–4-5 susu plants per hill... Very few mung beans, adsuki beans and buckwheat are grown in this region in comparison with the planting of these crops in northern Korea. Soybeans are grown in mixture with many other crops such as cotton, cucumbers, upland rice and melons."

"Dr. Nagai found that the number of stems per leaf bore a direct correlation to the resistance of the plant to disease. The most susceptible plants had the largest number of stems per plant."

Page 5881. Neg. #45852. "*Soja max.* Soybean. Suigen, Chosen. Plot of 'Koshu' [?] a native Korean variety of soybeans in the variety test at the Suigen Experiment Station.

Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 5915-5916 (24 Oct. 1930). Junsen, Chosen. W.J. Morse's notes. "We left on the train this morning for Junsen which is in a mountain region and the center of a large section producing soybean seed. Near Shaninjo [today's P'yôngsông, North Korea] and for a short distance beyond this station we observed farmers cutting not quite mature soybean plants in the millet-soybean fields, The bean plants were being removed (the millet had been harvested for some little time) in order to fit the ground for planting barley or wheat. As we approached Junsen we noted many fields being plowed and a few being sown to barley or wheat.

Around Junsen, we saw more soybean fields and fewer mixed plantings. A few fields were noted here and there of mixed plantings of perilla, susu [sorghum, kaoliang], and soybeans..."

"At Junsen we went directly to the office of the Village

© Copyright Soyinfo Center 2021

Agricultural Society where we met the director. As yet, we were advised, no soybeans are ready for harvest in the Junsen region as crops are a little later than usual this season. From 70-80 per cent of the varieties grown in this region are improved varieties distributed by the Agricultural Society. The principal variety is the Heijo and the next in importance is the Oriarkon. Although both of these varieties have excellent seed they do not command as high prices as the native varieties. This is said to be due to the thick skin of the seed, a character in poor favor by manufacturers of soybean products such as tofu, miso and soy sauce... We collected a nice lot of information on soybean production in this area from the director who seems to be quite a soybean man. Soybean harvest will not begin until the middle of October so our chances of obtaining movies in this section of harvest scenes before leaving Korea are nil.

Negative #45878. *"Perilla* sp. Perilla. Junsen, Chosen. View of susu and perilla in field near Junsen. Perilla is quite generally grown in this mountain region but never alone. It is always grown with susu or with susu and soybeans."

Page 5933-5934 (26 Sept. 1930). Ritsuri, Chosen. W.J. Morse's notes. "We took the 9:00 a.m. bus for the Ritsuri farming section to search for soybean harvesting. When we arrived at the Nippon Sugar Beet Farm, we thought it would be a good plan to see the director to see if he could give some information as to the places where we might see soybean harvesting... he stated that a large field of soybeans was being harvested by some Korean farmers nearby.

"Upon arriving we found several Koreans cutting or rather breaking soybean plants. The plants are left for harvest until fully mature. In harvesting a long handled knife with a short curved blade is used and the plants are bent over the edge of the blade and snapped off instead of being cut off. Conditions were excellent for movie and still pictures, and several harvesting scenes were taken. With these pictures we now have a complete story–movie and still–of the Korean soybean industry.

"After this we left the farm for the main road to walk toward Heijo until the bus overtook us. Farmers were quite busy plowing the land and planting wheat and barley. We visited one of these fields and found small piles of compost soil distributed along the sides of the field. In examining the piles we fond that wheat was mixed with the finely pulverized compost. The land was thrown in ridges and a man with a basket of the wheat-soil mixture was dropping handfuls about every ten inches in the furrows. Another man with a stick was kicking the soil from the side of the ridges with his feet to cover the grain. It was found that 8-12 grains of wheat were dropped with every handful of soil.

"In the spring, (about the middle of May) soybeans are sown in hills along the ridges between the wheat rows. Following the soybeans, the ground is left fallow during the winter and the spring (the latter part of April), millet is sown on ridges. About the first of June, soybeans are planted in hills–anywhere from 8-25 feet apart–along side of the millet ridges.

"As we were going along the road, we met Mr. Lutz with his Korean assistant on their way to the sugar beet farm to purchase rye seed. We went along with them and then returned..."

Page 5935. Negative #45884. "Soja max. Soybean. Ritsuri, Chosen. Close-up view of Korean boy with harvesting knife used in harvesting soybeans. The mature bean plants are broken over the blade instead of being cut off.

Neg. #45885. "Soja max. Soybean. Ritsuri, Chosen. Old Korean farmer harvesting soybeans. The plants which are fully mature are broken over the edge of the sickle blade rather than cut off."

Page 5960 (28 Sept. 1930). Enroute Heijo, Chosen to Mukden, Manchuria. W.J. Morse's notes. "We left Heijo, Chosen, at 3:18 p.m. for Mukden, Manchuria. Along the way it was noted that nearly all of the susu and millet had been harvested. Soybean fields were fast approaching maturity but it will probably be ten days or two weeks before harvesting this crop... The rice plants are cured in shocks in the dry paddy or along the edge of the paddy.

"We arrived at Antung [Manchuria] about 7:45 p.m. where the train waited 30 minutes for Chinese Customs

Page 7653 (27 Jan. 1931). Tokyo, Japan. W.J. Morse's notes. P.H. Dorsett is in Peiping, China. "We received in the Consulate this morning a package of 52 samples of soybeans from the director of the Heian Nando Prefecture Seed and Nursery Farm, Heijo, Chosen. The samples represent native varieties collected by the director from farmers Northeastern Chosen.

"Mr. Suyetake came and we spent the day numbering and writing up the samples. Very fortunately the director obtained the native Korean name of each variety. In writing up this group some very interesting types were found. In coming from the Northern section of Korea they should be of some value to our middle and northern States." Address: Agricultural Explorers, USDA, Washington, DC.

331. Morse, W.J. 1930. Re: Am still in Chosen, but planning to leave soon. (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Sept. 16. Unpublished log.

• ***Summary:*** Pages 5909-5910. This letter dated Sept. 16 is from W.J. Morse in Heijo, Chosen [Pyongyang, North Korea] to Mr. P.H. Dorsett, c/o U.S. Legation, Peiping, China.

"Dear Dorsett: Am still in Chosen but am planning to leave within a few days as the soybeans in Manchuria are calling. The time spent in Chosen has been of the greatest value not only from the soybean standpoint but also from the wild legumes. This far we have collected 150 numbers of seed and plant material and have nearly filled the note books brought with data. We have two hundred feet of movie which we hope will turn out good. We expect to secure harvesting scenes within a few days as we saw several fields yesterday about fully mature. With these scenes the Korean soybean story will be complete. Am planning on making the Manchurian soybean story as complete as the Korean and the Japanese. I do not know how long it will take but I plan to stick it out.

"I am sending you under separate cover 89 3¼ x 4¼ negatives and 12 panorama negatives taken in Korea. With the panorama package is the report from August 17 to Sept. 15 inclusive. I hope that they reach you safely and in good condition. Also in the panorama package are two subvoucher books which were sent me from Forage Crops."

"In view of what you have said of the soybeans around Peiping and perhaps I could learn something in that section, I think I will plan on going down the forepart of October and will be with you three weeks or so. As I see the situation that would be my best time for I would like to see some of the Chinese fields and also see what products there are around Peiping. As I wrote you and also told you in Dairen, I want to make a thorough study of the soybean oil industry in Manchuria. Most of the oil mills will be in operation by Nov. 1 and field plant operations will be past so that I will be unhampered in making a complete study of storage, oil, oil cake and shipping.

"I have several letters from U.S. Experiment Station friends and they report that soybeans everywhere are doing fine in spite of the continued dry weather. This will be a big boost for the soy and will do much toward a greater increase in the oil industry. From all reports the oil mills have increased greatly this past season. So you can readily see that I will be expected to know all about the oil industry in Manchuria when I return. October is a little early for the oil industry and I think that this time would be best for the Peking visit as I would also like to get around in the farming sections a little with you. As I recall, Mr. Liu said there were not many products about Peking so that won't take much time. I wish you would let me know as soon as convenient if the October visit will find you home and suitable to get around the Peking district.

"As when you left, I have no definite plans as to exact time of visits to places. I have only the soybean industry to push ahead to and in this I am taking things as they come. This I find much better than in planning ahead for if plans are made it seems that always bobs up and changes things about. In other words I work today and let the morrow take care of itself.

"With kindest regards from all to all I remain

"Very truly yours, W.J. Morse, c/o American Consulate, Dairen, Manchuria." Address: USDA, Washington, DC.

332. Dorsett, P.H.; Morse, W.J. 1930. Soybean milk in Heijo (Pyongyang), Chosen [Korea] (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. • ***Summary:*** Pages 5905-5906 (22 Sept. 1930). Heijo, Chosen. W.J. Morse's notes. "After lunch we went to the Prefecture Seed and Nursery Farm. On the way we found mature seed of the wild soybean and collected a fair sized sample.

"At the station we met the director, Mr. Shiramura, and asked concerning the harvesting of soybeans. He thought we would have a better chance of seeing the harvest of beans

© Copyright Soyinfo Center 2021

around Junsen, which is an extensive soybean section and is in a mountainous region. When the soybeans are grown alone, the plants are allowed to become fully mature before harvesting.

"After returning from the Seed and Nursery Farm we visited a soybean curd factory. In addition to selling bean curd this factory sells about five gallons of soybean milk daily during the summer months. This factory runs two stone grinders and uses 4-5 bushels of dry beans daily. Various forms of fried bean curd are also sold by this factory. The same process of making bean curd and milk is used on the Main Island. In the milk, however, less water is used, thus giving a higher quality of milk. The milk is used only by the Japanese and sells for 4 sen per bottle (5 bottles to the quart)." Address: Agricultural Explorers, USDA, Washington, DC.

333. Morse, W.J. 1930. Soybeans in the Orient. *Proceedings of the American Soybean Association* 3:96-100. Eleventh annual field meeting. Held 10-12 Sept. 1930 in Illinois.
• ***Summary:*** This letter (which appears on pages 5196 to 5199 of the unpublished Dorsett-Morse Log) was written by William J. Morse on 20 July 1930 from Dairen, Manchuria, to Dr. W.L. Burlison, President of the American Soybean Growers Assoc. at the University of Illinois, Urbana. It is reprinted in full:

"Dear Soybean Friends:

"When the writer addressed a letter of your 1929 Annual Meeting, the soybean experience of the U.S. Department of Agriculture Oriental Agricultural Expedition was just beginning and there was but little to write about on this important crop of the Asiatic countries. It is quite different now, however, for explorations have been made in Hokkaido Island, Hondo (the main island of Japan [now called Honshû]), Korea and to some extent in Manchuria. If an attempt were made to write at all fully on the different phases of the soybean industry we have observed in these countries during the past year or more, a volume or perhaps several, would have to be written instead of a mere letter.

"It is recalled that last season the use of the soybean as a green vegetable was described. Throughout the season, it was found that the green vegetable was a very popular food with the Japanese from one end of the Japanese Empire to the other. The vegetable soybean is classed as a garden bean and as such is extensively grown by the Japanese truck farmers."

The authors were in Hokkaido from mid-August until early October, and they visited all the principal soybean sections. "The Obihiro station in the eastern part of the island [of Hokkaido] is conducting the most extensive work in breeding and variety testing. We succeeded in collecting a very large number of varieties and selections of this northern region as well as information on culture, harvesting, threshing, insect pests, and diseases. To supplement this material, we obtained a large number of still and motion pictures of very interesting scenes of the Hokkaido soybean industry."

They arrived in Korea on 20 Oct. 1929 and established headquarters at Keijo (Seoul). "We found Korea to be a most interesting country and different from anything we had seen in Japan. One of the most amazing things was the extent to which soybeans are grown. Almost equally amazing was the large number of native Korean soybean varieties we found in the various sections and at the experiment stations. At the Suigen Experiment Station, they have more than one thousand native Korean varieties and selections under test. The authorities were very generous and gave us samples of each. In addition to this collection, we obtained a few hundred samples from Korean farmers, grain merchants on village market days and from village and city grain dealers. The Korean Department of Agriculture added about 300 samples to our collection by obtaining seed of the principal varieties from the village agricultural societies in each of the prefectures of Korea.

"Altho the Koreans do not use the soybean as extensively for food as do the Japanese, considerable quantities are used and in quite different ways. The beans are used principally boiled with other grains such as millet or kaoliang. They are also used in making miso and soy sauce, but these products are made quite differently from those of Japan or China. Soybean sprouts are found very abundantly in all of the markets and at all of the small food stores. The beans produced in Korea are for the most part excellent quality and are largely shipped to Japan for the manufacture of miso, soy sauce, bean curd, and natto. Soybeans when soaked with chopped millet or kaoliang straw are used universally for feeding oxen and cows, the common work animals of Korea.

"We left Korea about the first week of December [1929] for our Tokyo headquarters and collected seed samples and products as we went along. From the latter part of December until the latter part of March, we put in full time collecting soybean products and learning of their use and manufacture. We succeeded in collecting a large number of interesting products, as the Japanese use the soybean very extensively in their daily diet. In the making of cakes, candies, and numerous other confections, the roasted soybean is used in a similar manner to the peanut in America. Of course, soy sauce, miso, bean curd, and natto are the principal soybean products and the ones most extensively used. As an example of the large use of miso, which is used as a breakfast soup with vegetables and also in preserving fish, vegetables, and meat, we visited three large miso factories in the Tokyo district and found that each produced about one million pounds of miso yearly. In addition to these three large factories, there were numerous small factories scattered thruout [sic] the same district.

"As the planting time was approaching in Manchuria,

© Copyright Soyinfo Center 2021

we left Tokyo the latter part of March and arrived in Dairen, Manchuria, the first of April. We expect to have headquarters at Dairen until late fall or early winter, working out in the various soybean sections of North and South Manchuria. This country is the real land of the soybean and Dairen, the real city of the soybean. In 1929, 29.2 percent of the total cultivated area of Manchuria was devoted to the growing of soybeans, producing more than 178,000,000 bushels of seed, thus leading all other crops in acreage and production. The Port of Dairen handles about eighty (80) percent of the exports of beans, bean cake, and bean oil.

Note: This is the earliest document seen (Aug. 2011) that uses the term "land of the soybean" in connection with or to refer to Manchuria.

"The planting season for soybeans in Manchuria begins about the first of May and extends to about the 25th of May in some northern sections. We, therefore, had an opportunity before the planting season, to study the methods of grading, storage and transportation of [soy] beans, bean cake and bean oil in the oil mills. The storage yards and warehouse yards of the South Manchurian Railway cover several hundred acres and the immense quantities of bags of beans and bean cakes stored in the open storage yards and in the warehouses are well worth seeing. In connection with the storage yards are the Dairen wharves where one may see daily the loading of freighters from European countries, America, Japan, and China with beans, bean cakes, and bean oil.

"We had rather expected to find a large number of products made from beans, bean cake, and bean oil but our findings thus far have been very meager. The oil is used in the manufacture of soaps, paints, lard substitutes, and salad oils, but only a very few factories are engaged in producing these products. The beans are used chiefly for oil and oil cake, but during the last three or four years, the demand of European mills for beans has had a serious effect, not only on the Dairen soybean oil mills, but also on the oil mills throughout North and South Manchuria. In Dairen, at the present time, only about forty-five soybean mills are active during the crushing season, whereas four years ago there were about ninety. The oil cakes are for the most part shipped to the Japanese Islands for feed and fertilizer (chiefly fertilizer), to China and the East Indies for fertilizer, and to America and Europe for cattle and poultry feed."

"Our experience in the field up to the present time has been the study of methods of planting and cultivation practiced in different sections of North and South Manchuria."

"We have collected quite a large number of seed samples during our travels thus far in Manchuria and have obtained some very interesting types. It may interest the members to know that we have visited Yingkou (Newchwang), the source of the Virginia and Wilson varieties. We obtained several other black and brown-seeded samples similar to the Virginia and Wilson, and are hoping that some of them may prove equally valuable. It was learned that the black and brown-seeded sorts are grown in some northern sections along the Liao River. In the study of varieties in different sections of North and South Manchuria, it has been very interesting to note the number of varieties, their utilization and adaptability to various soil and climatic conditions. At the Kungchuling Experiment Station, more than one thousand varieties and selections have been tested but at the present time only five hundred are under test. The Manchurian varieties do not succeed in the Japanese Islands or Korea and neither do the Japanese varieties succeed in Manchuria or Korea. The Korean varieties also give rather poor results in most parts of Manchuria.

"With this letter we are sending some lantern slides illustrating various scenes of the soybean industry in oriental countries. At some future meeting we hope to have our movie films so arranged that you may have an opportunity of seeing in motion the many, many ramifications of the soybean industry as we have seen them.

"We hope to be with you at your next annual meeting, that we may try to catch up with the rapid progress the soybean has made in the United States during the past two years.

"With best wishes for a most interesting and successful 1930 meeting, we remain

"Very truly yours,..."

Note 2. This is the earliest English-language document seen (Feb. 2004) that uses the term "vegetable soybeans" (not preceded by the word "green") to refer to green vegetable soybeans.

Note 3. This letter was reprinted in *Soybean Digest* (April 1945, p. 11-12). Address: USDA, Washington, DC.

334. Morse, W.J. 1930. Re: Just received your letter of Oct. 2 (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Oct. 5. Unpublished log.
• ***Summary:*** Pages 6121, 6122, 6123. This letter dated Oct. 5 is from W.J. Morse in Dairen, Manchuria, to Mr. P.H. Dorsett, c/o U.S. Legation, Peiping, China.

"Dear Dorsett: Your letter of Oct. 2 just handed me this morn and very glad to hear from you. The last letter was received at Heijo but I presume there may be some at the Consulate as I have had no mail for the past 10 days.

"Just arrived here last night from Kungchuling [Gongzhuling, Jilin]. In a previous letter you stated you were as busy as an old man with chickens. During the past 5 or 6 weeks I have felt many times like a mother duck with a big brood of chickens. I have been in sort of a daze for things have been moving so swiftly. Before I forget it, if you can catch 'old father time,' I wish you would grab him by the

© Copyright Soyinfo Center 2021

forelock and halt his progress for a time. I have never seen time pass so quickly. It seems but a few days ago that we left for Heijo.

"I do not believe it worth while to write you details from the Korean trip as you can get these from the quarterly report. The report and prints up to Sept. 16 were sent were sent you from Heijo. From that date to Oct. 1, I hope to get to you as soon as I have the films developed. I may say, however, that from every angle, I consider the trip to Korea a most successful one but must hold my breath and hope for the best regarding the movie films. I took about 40 feet of movie films which will give us the complete movie story of the Korean soybean. If the film is good, the whole story will be a mighty interesting one and so much different from those of Japan, Manchuria and China.

"On our trip we collected over 200 numbers with but very few soybeans. It was too early for the soys and these will be sent later to us in Dairen... You will recall last fall of the great disappointment in not receiving samples of the excellent collection of Korean varieties of soybeans on exhibit at the Keijo Fair. While on a trip to Shariin we found that the station had received samples of the whole collection and had them in a variety test plot. Or course, there were many duplicates, but as a whole, it was a most promising series of varieties and made me more anxious than ever to receive it. The station people promised to give us selections they have under test. You can be assured that I am going to keep after this collection until I get it.

"With all the data and pictures collected on the soybean in Korea, I think I could write a nice little book rather than a bulletin. The visit in the growing season was so valuable to my soybean work. The picture of culture, etc., given last fall by the station and other people and the actual picture were so much different in spite of the unusual weather conditions.

"While at Heijo I received word from Kaiyuan and Kungchuling, Manchuria, that soybean harvest are in progress. As soon as we finished our Korean harvest scenes (which were a little late on account of the unusual weather conditions), we went to Kaiyuan and ran into a rainy spell which was very unusual at this time. However, we made some harvesting scenes. We then went to Kungchuling and met another rainy spell, which also was very unusual for the season. It cleared up and we got some excellent harvest and storage scenes, that is if they develop up o.k. Dorsett, I swear if you hand us any unusual weather when we are in Peiping, I will throw you in a river."

"With regard to the visit to Peiping, I am hoping to get away within the next ten days or two weeks. There is some seed collecting I want to do around here. Then I want to get up the films and get some material off. The oil and threshing season begin here in November and then I want to devote the time from then on to a most thorough study of the soybean oil, storage, and shipping. I think I can have other work such as legumes all finished up so I can just live with my life work for a few weeks or so (just a few weeks of soybean heaven).

"I was much interested in the clipping regarding soybeans in Russia. While at Kungchuling I received a wire from Dr. Oga of Mukden advising that Dr. Lene Muller [Müller, Mueller] a soybean expert (perhaps expertess, for the Dr. is a lady), desired to get in touch with me. The experiment station wired that I was returning to Dairen the next morning. Later I received a wire stating that the Dr. would meet me at Kaiyuan and ride as far as Mukden so that we could have a soybean conference of two or three hours. I had a very interesting visit with Dr. Muller and learned we had had correspondence before I left America. She had just come from Russia where she had been studying the soybean, so I received a nice lot of information on the crop in Russia. In addition, she gave me much information on the soybean industry in Germany.

"At Mukden station, Dr. Oga, biology teacher at the Mukden High School, got on the train to see me and I was much pleased to learn that we had met in 1927 at Washington. He called at my office with regard to soybean work in the U.S."

"Well, old fellow, trust this finds you and your party well and we hope to see you all soon... After our return, I want wholly soybean work.

"With best wishes from all to all, I am

"Very sincerely,..." Address: Agricultural Explorer, USDA, Washington, DC.

335. Dorsett, P.H.; Morse, W.J. 1930. In Chinchou, Manchuria (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 6069-6070 (7 Oct. 1930). Chinchou, Manchuria. "W.J. Morse's notes: In a small valley section we found a large patch of wild soybeans (*Soja ussuriensis*) with mature seed. The leaves and seed are much smaller than the seed collected of the wild soybean in Chosen [Korea]."

"After lunch at Chinchou we went to a farming section southeast of Chinchou and at a small Chinese farm village we saw farmers cleaning soybeans by the wind method."

"At one of the yards we found them threshing a light green soybean, one of the nicest looking green varieties we have yet seen in Manchuria, It was said that this variety is used solely for food. Just outside the village we found some farmers cutting a filed of the Moshito soybean that had been planted with corn... During the say we collected seed of the following;" 11 species or varieties are listed including "1. Soja max–4 varieties." "6. Soja ussuriensis."

Page 6073. Neg. #45982. "Soja max. Soybean. Makaton, Manchuria. Small piles of mung beans and soybeans curing in the field. The plants were pulled instead of being cut. In

Page 6108 (8 Oct. 1930). List of soybean varieties being sent to USDA, Washington, DC. "#'s 7190, 7191, 7192, 7193, 7204, 7205, 7245, 7267, 7271, 7273, 7375, 7281, 7282, 7308, 7309. These 16 numbers of soybeans are all of interest. They are for the soybean collection of Foreign Crop Investigations."

Page 6112-6113 (9 Oct. 1930). Dairen, Manchuria. "W.J. Morse's notes: A visit was made to the main market to see the various products now in season." The following numbered list was made of the different things seen. It includes:

12. Green vegetable soybeans in pod.
13. Shelled green soybeans.
14. Soybean sprouts.

"We visited some Chinese and Japanese food stores to see if we could find any new soybean or mung bean products. At one store we found a new kudzu product–Kudzu vermicelli made up of fine sticks or straws and in small bundles. This product is used in soups and vegetable dishes."

Page 6114. This is a letter dated 9 Oct. 1930 from P.H. Dorsett in Peiping, China, to Mr. H.N. Vinall, Senior Agronomist, Forage Crops and Diseases, Bureau of Plant Industry, U.S. Department of Agriculture, Washington, DC.

"Dear Mr. Vinall. I very much appreciate your letter of August 5th which reached me here in Peiping on September 3, 1930.

"I am pleased to report that I feel that I am fully back to normal after my illness in the spring in Dairen, Manchuria. Since my daughter [Ruth] and I arrived in Peiping, July 22nd, we have been doing considerable field work and feel that the results really are quite satisfactory.

"Morse, as you no doubt know, remained with headquarters in Dairen and has been continuing his soybean investigations both in Manchuria and Northern Chosen. A recent letter from him indicates that his work in Chosen has resulted very satisfactorily. He also stated that he would likely get over to Peiping early in October to see what is being done with the soybean in Peiping and vicinity."

"After the Morses arrive here, he and I will likely make definite plans for our return home. I would like to remain another year, in fact outlined enough important work to keep me here another year, but was advised that all at the Office felt that I should return home with Morse this winter.

"I am resigned to their action in this connection."

Page 6151 (11 Oct. 1930) Chinchou-Nanzankai, Manchuria. "W.J. Morse's notes: "Another visit was made to the farming regions about Chinchou and Nanzankai to make observations on threshing and cleaning crops."

"In this section we have found only three varieties of soybeans, namely, black Moshito, brown Moshito and a light green variety (yellow germ) which is used for food. The Moshito varieties are used for forage and green manure purposes."

Page 6152. Neg. #46027. "Soja max. Soybean. Nanzankai Village, Manchuria. "Soybean plants spread out on threshing ground for first rolling of flailing."

336. Hepburn, Joseph S.; Sohn, Keum Sung. 1930. Do fu: An Oriental food. *American J. of Pharmacy* 102(10):570. Oct.
• ***Summary:*** "The Oriental food, known as *do fu* in Chinese and *doo pu* in Korean, is a soy bean preparation." The beans are soaked in cold water, then ground with the water. "The resulting mass is filtered through a coarse linen bag. The white, milky filtrate is heated in a vessel, with occasional stirring, until it begins to foam. Then a saturated solution of sodium chloride is added until coagulation is complete..."

A sample of *do fu,* purchased in the 'Chinatown' of Philadelphia [Pennsylvania], was found to have the following percentage composition: Total solids: 13.37%. Moisture: 86.63%. Ether extract: 4.65%. Crude fiber: None. Crude protein: 4.22%. Ash: 0.59%. Nitrogen-free extractives: 3.91%.

Note: This is the earliest English-language document seen (Aug. 2013) that uses the term "milky filtrate" to refer to soymilk. Address: John Clifford English Laboratories of Physics and Chemistry; Hahnemann Medical College and Hospital of Philadelphia.

337. Dorsett, P.H.; Morse, W.J. 1930. In Dairen, Manchuria (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 6514. Neg. #46246. "Soja max. Soybean. Dairen, Manchuria. Close view of coolies loading soybean oil cakes on flat cars in S.M.Ry. yards."

Page 6450 (14 Nov. 1930). Dairen, Manchuria. "W.J. Morse's notes: In the morning we went to the S.M.Ry. Wharves and storage yards. Along the wharves we found the warehouses well filled with beans and a German freighter and a Japanese freighter being loaded with a large tonnage of beans. Most of the beans were of the new crop from the Harbin and Changchun districts.

"We also went around the bean cake warehouses and found them being well filled up. At the present time 16 oil mills are operating turning out about 60,000 bean cakes per day. As yet there are no bean cakes in outside storage as there has been more or less meal exported to America this [year?]. In view of the high tariff on cake or meal into the U.S. this is rather unexpected.

"Several warehouses storing beans were visited and twenty-one samples were collected, representing many places in Central Manchuria.

Pages 6456-6457. This is a letter dated 16 Nov. 1930 from W.J. Morse, c/o American Consulate, Dairen, Manchuria, to Mr. Knowles A. Ryerson, Foreign Plant Introduction, S.P.I., U.S. Dept. of Agriculture, Washington, DC.

"Dear Mr. Ryerson; We are sending you today by commercial parcel post parcel packages numbers 229 and 230 which contain the following items:" Each package contains soybean products. No. 229 contains soybean seed and one sample of *Soja ussuriensis* (wild soybean).

"Parcel No. 230 contains mostly soybean seed samples collected from the Dairen Wharves seed storage warehouses. The samples represent seed from the various parts of Manchuria that are used for oil and oil cake. The soybean product is a Chinese soybean drink that is only made and used during the winter months. It consists of roasted soybean flour, walnuts, sesame seed, squash seed, kudzu flour, and pine nuts."

Pages 6458, 6459, 6460 (17 Nov. 1930). Dairen, Manchuria. "W.J. Morse's notes: We visited Prof. Matsushima of the S.M.Ry. Office and had a rather long talk on the present soybean situation in Manchuria. The price of soybeans is much lower than a year ago and the movement in beans is very slow due to the light demand from European countries. This is the first time that the bean situation has been so dull at this time of year."

"The demand for oil cake and oil meal from the United States is larger than one year ago at this time in spite of the high tariff on cake into the U.S. Bean cake from Harbin oil mills is said to be of poor quality, containing more or less dirt. In exporting from the Harbin district, bean cake or beans are not inspected, that is if the products are shipped to Vladivostok. If the beans are for export through Dairen, they must pass inspection before being placed in mixed storage.

"We were given a parcel of seed sent from the S.M.Ry. Exp. Sta. at Hsiungyaocheng." This parcel contained samples of 34 species, which are listed.

"After lunch we went to the motion picture laboratory of the S.M.Ry. to see about winding of negative film on spools. We were invited by Mr. Akutagawa in charge of the laboratory to inspect scenes of soybean storage and shipping which he made last February at Anda, Hankou, Harbin and Changchun, North Manchuria. In all he took 1735 feet of such scenes, and we had the pleasure of viewing them."

Pages 6510-6511 (22 Nov. 1930). Dairen, Manchuria. "W.J. Morse's notes: We went to the Nisshin Oil Mill in

© Copyright Soyinfo Center 2021

the morning and met Mr. M. Ogawa, who is acting for the general manager, Mr. Furasawa [Furusawa?]. At the present time the mill is not working at full capacity owing to the light demand for oil and oil meal or cake. More cake or meal is being shipped to the United States than at this time one year ago."

"The mill is now putting out only the English type of cake (oblong), and Mr. Ogawa promised to send three of these to our office for our soybean exhibit."

• ***Summary:*** Page 6617 (2 Dec. 1930). Harbin, Manchuria. W.J. Morse's notes. "About 8:00 A.M. Mr. Takiya of the S.M.Ry. office called to take us on a visit to Chinese merchants' storage yards and farmers' inns."

"After visiting the inns we went to the Sungari River which was frozen over and was open to ice traffic for the first time yesterday. Large strings of farm carts loaded with sacks of soybeans were coming across the ice road to Harbin, Still, motion and panorama pictures were taken of this traffic."

Page 6618. "Prof. B.W. Skvortzvow called and we met him at the hotel. He has not done any work on soybeans for the past two years. His only interest at the present time is in the botanical study of wild species of soybeans. He has collected two specimens in addition to *Soja ussuriensis*, namely *G. tomentosa* and *G. gracilis.* As he has no time or facilities for making a systematic study of these species he wishes the U.S. Department of Agriculture to take up the study in connection with the study of cultivated varieties from various parts of the world."

Page 6675-6676 (4 Dec. 1930). Kaiyuan, Manchuria. W.J. Morse's notes. "Mr. Kofuka, director of the S.M.Ry. soybean farm, called us by phone shortly after 8:00 a.m. At his office we found that he had collected fourteen native varieties of soybeans in the Kaiyuan district for us.

"We first went with Mr. Kofuka to one of the large storage yards of a Chinese merchant where we found great soybean activity... After being measured the beans were dumped into the Osier bins. Each bin is 18 feet in height and in diameter and holds four carloads of beans. In this yard there are more than seventy-five bins filled with beans and several more in the process of filling. This storage yard receives about one hundred farmers' carts of beans per day during the fall and winter bean season.

"After visiting a few more smaller storage yards we went to the open market place where many of the farmers bring their carts of grain and sell to the storage merchants. About 1,000 farm carts with grain arrive in Kaiyuan daily. There seemed to be considerable rivalry among the merchants for the farmers' grain and often it looked as though a free-for-all fight were taking place."

At 5:55 p.m. we left for Mukden arriving there at 8:20 p.m. We soon got in touch with Dr. Ogha, teacher of botany in the Mukden High School... Three years ago Dr. Ogha called at the office at Washington, DC, with reference to the U.S. soybean industry. We had a rather long conference

• ***Summary:*** Page 6820-6821 (21 Dec. 1930, Kobe, Japan. Mr. Morse's notes). "Mr. Saito at Dairen had advised us that there were many places in Kobe where meat was preserved in soybean miso." Had no difficulty in finding three such places, where "we found the men busy in packing meat in white miso. In the Kobe and Kyoto districts white miso is manufactured quite extensively. Small meat shops are the only establishments putting up the miso-preserved meat. For this product beef is used and white miso. Small slices of beef about the size of the palm of the hand and about ¼ inch thick are placed on a layer of miso (about ¼ inch thick), then a layer of miso and another layer of meat. About 1½ pounds of beef are packed with miso in each tub which sells for two yen. The meat is best after being preserved in miso about 7-10 days and does not keep well after two weeks except in rather cold weather. Miso preserved meat is always boiled. White miso is always used for preserving fish and meat (beef) while red miso is used for preserving vegetables, the red miso being considered too salty for meat. Several meat shops were visited and we always found the same products and same methods of preserving the beef. Apparently this product is very popular in the Kobe district. At one of the shops we were advised that there are some miso-meat preserving places in the Tokyo district." Photo: Small tubs of miso preserved meat displayed in front of a meat shop in Kobe.

Pages 6822-6823 (22 Dec. 1930, Kyoto, Mr. Morse's notes). At the Imperial Agricultural College they met Isawo Namikawa, Professor of Horticulture, who said that Kyoto is noted for several special soy products such as white miso, soy sauce, and natto. Kyoto soy sauce is lighter in color, not so heavy, and not quite as salty as soy sauce made in other parts of Japan. "In looking around Kyoto in our little spare time we saw no places where meat is preserved in miso."

Page 6826 (24 Dec. 1930). Tokyo, Japan. "W.J. Morse's notes:

"In the course of our wanderings we found a small meat shop where beef was cured in white miso. This idea was brought from Kobe and the same method followed. The owner of the shop said there were a few such places about Tokyo."

Page 6847-6848 (27 Dec. 1930). Tokyo, Japan. "W.J. Morse's notes: Two places were visited where beef is preserved in white miso. This method we were told was brought from Kobe and there are only a very few places in Tokyo. The places visited today were rather a combination meat shop and restaurant.

"The beef is cut in this slices and only white miso is used as is done in the Kobe district. Neither of the shops had ever tried red miso as they consider it too salty, nor

© Copyright Soyinfo Center 2021

had they tried preserving pork in either red or white miso. It was thought that pork could be preserved as well as beef in white miso. The miso-preserved meat is only broiled. The white miso is used only in preserving different kinds of fish and beef while red miso is used only for preserving vegetables. Meat and fish will not keep more than one month in white miso and vegetables preserved in red miso will keep indefinitely.

The meat is preserved in small wooden tubs with alternate layers of miso and slices of beef. Each tub holds about two pounds of meat. The meat becomes well seasoned through in about one week and is at its best in 7-10 days. In warm weather the meat will hardly keep two weeks.

"In visiting the food department of one of the large department stores we found a special sale was on with miso preserved meat in two-pound tubs and one-pound boxes. The meat was packed in the miso by the meat department of the store. We also found various kinds of fish preserved in white miso. In some cases, as salmon and tuna, slices of fish were used while with small fish as the *tai* (porgy [red seabream]) the entire fish was preserved."

Pages 6931-32 (7 Jan. 1931). Morse went to the Imperial Department of Agriculture in Tokyo and met the director, Mr. A. Manabe, who provided information, statistics, and recent publications on soybean acreage, production, utilization, and industries in Japan, Chosen [Korea], and Taiwan. These are the most complete yet received. Mr. Manabe stated that soybean acreage and production is gradually decreasing in Japan proper. This is due mainly to the increased acreage of more intensive farming, especially truck crops and rice. However the acreage of soybeans for green manuring purposes is increasing rapidly, especially in the southern half of the main Island and Kyushu Island.

Japan proper produces more than 2,500,000 koku of soybeans but uses over 7,500,000 koku; the difference is imported from Chosen and Manchuria. The soybeans imported from Manchuria are "are of much lower quality than beans from Japan proper and Chosen and are used primarily for the manufacture of soy sauce, miso, bean oil and bean cake. The beans from Japan proper and Chosen are utilized primarily for food, such as bean curd (Tofu), confections, flour and green vegetable beans. The following table gives the ratio in percent of soybean utilization in Japan:

Miso 22.7%. Soy sauce 22.7%. Bean oil and bean cake 21.6%. Bean curd [tofu] 15.4%. Green vegetable beans 0.8%. All other food uses 6.0%. Feeding purposes 6.2%. Green manure 2.5%. For planting [seed] 1.6%. Miscellaneous uses (other than food) 0.5%. Note: These figures total 100%. Thus, 22.7% of the soybeans used in Japan are used to make miso, 22.7% are used to make soy sauce, 21.6% are crushed to make soybean oil and cake, etc.

Page 6937 (10 Jan. 1931, Tokyo, Notes by Mr. Morse). Spent most of the day in the Shinjuku district looking up soybean products. "More String Natto in rice straw packages was observed in this section than any we have visited. At the stores we found considerable quantities of fish preserved in white miso and also fish preserved in sake mash. The latter is said to keep much longer than the miso preserved fish and if it keeps long enough might afford a good article of export to the United States, for undoubtedly it would prove far less harmful than some of the products [alcohol] now used in violation of the 18th amendment... Nearly all food stores carried a variety of vegetables preserved in red miso."

Page 6942-6943 (12 Jan. 1931). Kobe, Japan. "Notes by Mr. W.J. Morse: Left on the 8:25 express last night from Tokyo and arrived in Kyoto at 7:25 this morning. We had planned to visit the Imperial Agricultural College [in Tokyo] this morning but learned by phone that Prof. Kamikawa [?] was not in so we left for Kobe to visit the Department of Agriculture of that prefecturate.

"We met the director of the Bureau of Agricultural Products, to whom we had a letter of introduction from Mr. Sato of the South Manchurian Railway, at Dairen, Manchuria. We were told that in the Kobe perfecturate [sic, prefecturate] 11,719,550 kans [kan] of Manchurian oil cakes are imported yearly and of this amount 5,084,204 kans are used for feeding to cattle, hogs and poultry. One hundred and fifty beef cattle are killed yearly in the Kobe district and about one hundred thousand hogs are killed yearly in the same district.

"Although soybean oil cake is fed to both cattle and hogs the farmers hesitate to feed too much as it is said to produce yellow fat which is not preferred by butchers. The market demands a white fat, such as that produced by feeding rice bran and wheat bran... Excellent results have been had in using soybean oil cake for dairy cattle and poultry.

"During the past five years, several small oil mills in Kobe have been crushing Manchurian soy-beans for oil and oil meal. At the present time none [?] of the mills are crushing beans. One of the assistants of the Bureau accompanied us to a large miso meat preserving place. This establishment is a wholesale meat house and in addition packs 5,000 to 6,000 tubs of miso preserved meat yearly.

"The proprietor said that about 3,000,000 tubs are sold yearly. The small tubs, costing 70 sen each, hold about 2 pounds of beef. The meat will keep in cool weather about one month but the meat is cured at its best in about two weeks. It can be used from 7 to 10 days. The proprietor had one of his men pack a small tub so that we could see the method and take pictures. Afterwards he gave use the tub and meat that we might try it.

"The Kobe district is noted for its fine quality of beef." Three photos (p. 6946-47) show these small flat tubs.

Page 6945-46 (13 Jan. 1931). Kyoto, Japan. Visited a large miso factory, where both red and white miso are made. White miso is manufactured quite extensively in the

© Copyright Soyinfo Center 2021

Kyoto and Kobe districts; it keeps only about 1 month in the summer, but about 3 months in the winter. A table shows the most famous forms of miso made in Japan: Sendai miso–red. Kanto miso–red. Okazaki miso–black. Country miso–red. Kinzanji miso–red. White miso–white.

Pages 7003-7004 (19 Jan. 1931). Tokyo, Japan. W.J. Morse's notes. "At evening supper we had for dinner beef preserved in white miso. After broiling, the flavor of the meat reminded one of that of the sugar cured hams of the Southern States. The meat had been cured just eight days and was well flavored through."

Page 7116 (29 Jan. 1931). In a letter to Dorsett in Peking, Morse states that the broiled, miso preserved beef was "delicious" and tasted like ham. "I also had some white miso preserved fish. Although it was good, I did not care nearly so much for it as I did the beef." Address: Agricultural Explorers, USDA, Washington, DC.

• ***Summary:*** Page 7166 (10 Feb. 1931, Tokyo). Morse's notes: "We took parcels numbered 241, 242, 243 and 244 to the Embassy to send by diplomatic pouch on today's boat, President Taft.

"During the day worked with Mr. Suyetake on translations of soybean and data from Japanese publications from Manchuria, Korea and Japan." Address: Agricultural Explorers, USDA, Washington, DC.

343. Morse, W.J. 1931. Re: Sayonara. Outline for part of a "special report" on soybeans in the Orient (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Feb. 16. Unpublished log.
• ***Summary:*** Pages 7231 and 7232. Letter dated 16 Feb. 1931 from Mr. W.J. Morse, c/o American Consulate, Tokyo, to Mr. P.H. Dorsett, c/o Wagons-Lite Hotel [Wagons Lit Hotel, or *Grand Hotel des Wagons-Lits*], Peiping, China.

"Our last night in Japan and this is my 'Sayonara' letter in the Orient. Two years tomorrow or rather day after tomorrow we left Washington, DC, and embarked on agricultural exploration work. After two years I agree with the words I often heard you say:

"It's a great life"–if you don't weaken. Morse quotes the entire poem.

Note: This poem was created by cartoonist Gene Burns and syndicated by the *New York Evening Telegram* from 1915 to 1919; the phrase became a rallying cry for American soldiers during World War I.

"At odd times I have been raking over the accumulation of data collected in Japan, Korea, Hokkaido and Manchuria and written up tentative outlines which I want to revise somewhat going back [to the USA]. I am enclosing a copy of the one on Manchuria which you may glance over to see the kind of data I have been collecting. It is not for the report (quarterly) but merely an outline for separate reports and I thought you might be interested. I may have gotten myself in 'Dutch' [in trouble] getting so detailed information on the soybean in the soybean country of the world (and where they look on America as their soybean enemy), but I secured it here, there and everywhere."

Note 1. The "Agricultural Report on Manchuria" mentioned above was finished by Morse in 1932 and titled "Soybeans–Manchuria." It contains 181 pages (28 cm = 8½ x 11 inches), 174 numbered photos with excellent captions, and 28 tables. Typewritten, but never published, it was attached to the end of this long log. A detailed description is given. This report on Manchuria is probably only a part of the "special report" referred to on pages 3230, 3497, 3555, and 6196 of this main report, since that "special report" promised to contain detailed information on the processes used to make different soyfoods such as miso, shoyu, yuba, and tofu. Morse apparently was never able to find the time or will to write the complete "special report," however this part of it is very detailed, useful, and impressive.

Note 2. Talk with Knowles A. Ryerson. 1983. Aug.

© Copyright Soyinfo Center 2021

28. W.J. Morse definitely did not write the entire special soybean report he intended to after returning from his trip to the Orient. Why? He got swept up in the growth of the U.S. soybean production and processing industries and had no one to help him with his work during the Great Depression. He was swamped! Address: Agricultural Explorer, USDA, Washington, DC.

344. Found, N. 1931. A cheap substitute for milk. *China Medical Journal* 45:144-46. Feb.
• ***Summary:*** This review of five articles on soybean milk was originally contributed to the *Mansen no Ikai*, June 15, 1930.

"Only in 1900 was it scientifically studied and found to have a high protein content, reaching 44% in the soy bean flour.

"In Japan it was found that nitrogen from this source was easily absorbed, especially if taken in a mixed dietary.

"John Ruhrah of Baltimore [Maryland] first recommended and used it as a supplementary infant food in 1909.

"Dr. Ernest Tso (Peiping Union Medical College) used soy bean milk as the main diet of an infant six weeks old for eight months and showed that this allowed the occurrence of rickets, which, however, could be cured by adding calcium and cod liver oil to the diet.

"In Peiping in 1928 he made metabolic studies on two such infants and confirmed chemically the lack of calcium, sodium and chlorine as well as vitamines other than A and B. He also showed that the phosphorus content was adequate. The nitrogen absorption is up to 90% of the intake and nitrogen retention is from 17% to 26% of the intake. His conclusion was that soy bean milk proteins are easily digested by a young infant and are capable of producing continuous growth. For best results calcium must be added and cod liver oil fed for vitamines.

"Following this, formulae were made out to correct the deficiencies.

"Dr. VanBuskirk has shown that the mortality rate per 1000 Korean children during the first five years of life are, 180, 127, 102, 59 and 39, which is especially high for the second and third years as compared with most other countries.

"Recently at the Evangelistic Center, Seoul, a practical experiment has been made in feeding large numbers of children with this milk and it is found that the cost per feeding is only about three sen as compared with 10 sen for canned cream.

"The method of preparation used is as follows:

"Soak the beans over night in 8 times their weight of water.

"In the morning remove the shells [hulls] and grind in a mill.

"Boil for five minutes.

"Filter through a sieve.

"For 1000 grams of the filtrate:

"Add 20 grams of starch, previously made into a paste with a little of the filtrate and add 60 grams of sugar.

"Add 1.5 grams of calcium lactate.

"Add 1 gram of salt.

"This gives a mixture with 4.4% protein, 1.8% fat and 1.5% carbohydrate, the pH is 6.8.

"Codliver oil [Cod liver oil] must also be given.

"Drs. Hill and Stuart in Boston [Massachusetts] have also worked out a formula for a dried powder which gives good results in cases where cows milk is not tolerated. They report the main protein in soy bean as *glycinin* and give a detailed chemical analysis." Address: Severance Union Medical College, Seoul, Korea.

345. Dorsett, P.H. 1931. Just finished packing in Peiping, China (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 7322 (14 March 1931). Peiping, China. P.H. Dorsett's notes: "It was about noon when we finished packing and every trunk we have is chuck full [chock full] for we are all taking back a lot of equipment and some supplies.

"Our baggage comprises 12 Government trunks and two personal trunks besides a portable typewriter, four cameras, and three hand bags, and it looks as though we still have to get another hand bag. If nothing happens, we get away tomorrow on our long return trip to the United States.

"This is my second exploration trip to the Orient and now the work in the field for me is drawing to a close. At least at my age, 69 the 21st of this coming April, it hardly seems possible, even though I feel fit, that the officials at Washington will want me again to go into the foreign field for them. Would I like to? yes, for there is still much to be done in Japan and the Orient. I believe that a year and perhaps more could be spent to very great advantage in Hokkaido. It impressed me as being a rich field in which to explore for ornamentals. I also believe that a year could be spent to good purpose in Chosen [Korea]. We were very much impressed with the variety and types of soybeans found in the limited area Dorsett and Morse explored, and we feel sure that some additional specimens of ornamental trees and shrubs could be picked up in that region. Far North Manchuria, we feel quite sure is rich in promising forest trees and ornamental flowering shrubs. Japan and China have as yet been hardly touched and they are filled with plant possibilities for introduction into America." Address: Agricultural Explorers, USDA, Washington, DC.

346. United States Department of Agriculture (USDA),

Office of Information, Press Service. 1931. U.S. plant explorer collects new soybean varieties in Orient (News release). Washington, DC. 2 p. March 28.

• ***Summary:*** "After a two-year search for new varieties of soybeans in Japan, Korea, and Manchuria, Wm. J. Morse of the U.S. Department of Agriculture has returned from the Orient with a collection of about 4,000 lots of seed and more than 300 samples of products made from soybeans.

"Mr. Morse, who is in charge of soybean investigations for the Bureau of Plant Industry, hopes that some of the many varieties represented in his collection will meet the needs of the wide range of industries using soybeans in this country."

Note: This is the earliest document seen (Aug. 2011) stating that W.J. Morse is "in charge of soybean investigations" (or "head of soybean investigations" or "director of soybean investigations") at USDA.

"Oil manufacturers, he says, want soybeans with high oil content, whereas farmers who feed hogs want low oil content. Packers discriminate against hogs fed or pastured on soybeans because of the soft pork which results from the oil. Few varieties of soybean grown on a large scale in this country have an oil content less than 15 per cent or more than 20 per cent. Some of those grown in Manchuria, however, run as high as 22 per cent in oil...

"The manufactured products in Mr. Morse's collection range from high-quality oils to beans specially treated to drive devils away during certain religious festivals [*mame-maki* at *Setsubun*].

"'Next to rice,' he says, 'the soybean is the principal food crop in the Far East, and it is the principal source of protein in the Oriental diet. No one variety is adapted to all parts of the Orient, nor is any one variety suited to all the many uses to which the beans are put. For instance, certain varieties are grown solely for oil, those that thrive in Manchuria being noteworthy for their high oil content. Other varieties are planted with a view to making soy sauce, a condiment already in favor in the United States, bean curd, used by Buddhists as a meat substitute, or miso, a common ingredient of Japanese soups. Some varieties are grown to provide a green vegetable [edamame] that is to the eastern table what green peas are to the western table. Part of the crop in certain sections is roasted for use as a coffee substitute or in confections where it answers the same purpose as peanuts in American candy and cakes.'

"The beans were gathered from a wide territory varying greatly in climate and in cultural conditions. As soon as they reached Washington [DC] they were sent to the experiment farm at Arlington, Virginia, for observation and quarantine. When it has been determined that they harbor no insect pests or plant diseases the beans will be grouped and sent to the department's field stations, each group to the section best suited to its growing requirements, and planted. Recommendations for their ultimate introduction into the United States will depend on the results of these field tests. If they do as well here as in their native fields, Mr. Morse says, some of these new introductions will probably become staple sorts here." Address: Washington, DC.

347. South Manchuria Railway. 1931. Soya beans. *Report on Progress in Manchuria.* Second, to 1930. 307 p. See p. 4, 5, 8, 40, 76, 137, 144, 152, 154-55. (Dairen, Manchuria). [1 ref. Eng]

• ***Summary:*** "The soya bean, to-day commanding a world market, and kaoliang, used as the staple food of the native population and also as cattle fodder, are the most important among agricultural products. The production of soya beans, amounting at present to about 221,000,000 bushels, or 5,300,000 tons, annually, has doubled during the last 14 years... The commercial importance of the soya bean and its products–oil and cake–has made Manchuria famous. They are so predominant that they now constitute more than 60 per cent. in value of the entire export trade of Manchuria. Of 4,721,000 tons of beans and bean products exported in 1929, more than 41% went to Japan, about 44% to Europe, 13% to China, and the rest to the United States and other countries. Next to beans, millet is now the most important crop producing 171,000,000 bushels every year."

"Manchuria is often described as the 'granary of Asia,'... But its agricultural destiny was not generally realized until the South Manchuria Railway Company, running through the valley of the Liao River, brought large supplies of Manchurian [soy] beans to Dairen, whence they were shipped to waiting markets in Europe.

Soya beans (Chapter 94) is one of ten chapters in section VII titled agriculture. "The story of the Manchurian bean is a striking romance in economic history. The Japanese, though naturally regretting the loss of the Liaotung, the 'legitimate fruit' of the Sino-Japanese war, found some compensation in the discovery of the Manchurian bean, which revolutionized the fertilizer industry and became a substitute in the Japanese rice-field for the dry-herring fertilizer then extensively used. Ever since, the Japanese have been the heaviest purchaser of the Manchurian bean. The first trial shipment of this legume was made in 1908 by the Mitsui Firm of Japan, being sent from Dairen to Liverpool, and this was the beginning of a new industry in England, Germany, Denmark and Holland. The major portion of the beans destined for Europe was for the mills at Liverpool and Hull, England; for those at Copenhagen, Denmark, and Rotterdam and Amsterdam, Holland. Germany's consumption subsequently became greater than all, and this, though interrupted during the European war, is recovering. At the time of the universal shortage of food during the great war, the Manchurian bean played a very important part in the world's food supply."

"The influence of the Manchurian bean on national economy is remarkable. Denmark was more than self-supporting in the production of cereals, specially wheat,

© Copyright Soyinfo Center 2021

until 30 years ago. But Danish products found themselves unable to compete with American large-scale production, even in the home market. Aided by the Manchurian bean, the Danes turned extensively to stock breeding. The bean is imported, the oil extracted and used for manufacturing margarine (vegetable butter), soap, etc., while the residue of cake is extensively used as feed for live-stock, which totaled as many as 18,524,000 head in 1926, besides many million run of poultry. The consequence was the development of an enormous export trade in animal products, butter, cheese, bacon, ham, eggs, and also live-stock. The value of this great trade is some 1,027 million kroner [krone], or more than 70% of Denmark's total export. Holland, to some extent, is in a similar position."

Total world production of soybeans in 1928-29 was estimated at 353,842,000 bushels, of which Manchuria accounted for 63% (22 bushels/acre), China proper 25% (16 bu/acre), Korea 6% (12 bu/acre), Japan 5% (19 bu/acre), and the USA 1% (16 bu/acre).

Manchurian soya beans are divided into 4 classes according to color–yellow, white eye-brow [yellow with white hilum], green, and black. The chemical composition of these beans, according to analyses made in 1927 by the Central Laboratory at Dairen is: Yellow (18.19% crude fat/39.94% crude protein), black (14.74/41.00), green (18.96/40.12). Thus the green are highest in oil and the black are lowest. The black are highest in protein and the yellow are lowest. Address: Dairen, Manchuria.

348. *Flour & Feed.* 1931. U.S. plant explorer collects soy bean varieties in Orient. 31(12):18, 27. May.

• ***Summary:*** After a two-year search for new varieties of soy beans in Japan, Manchuria and Korea, William J. Morse of the USDA has returned with a collection of about 4,000 lots of seed and more than 300 samples of products made from soy beans. Mr. Morse is in charge of soy bean investigations for the Bureau of Plant Industry.

Manufacturers of soy bean oil want beans with a high oil content whereas those who feed the meal to hogs want low oil beans.

Mentions soy sauce, bean curd [tofu], miso, varieties grown to provide a green vegetable, and those that are roasted for use as a coffee substitute or as an alternative to peanuts. Some soy beans are specifically treated to drive devils away during certain religious festivals.

349. Rosenberger, E.T. 1931. The soy bean milk as a food: Methods for workers. *Missionary Review of the World* 54(5):371-72. May.

• ***Summary:*** "Having received letters from different countries regarding Soy Bean Milk I am giving in these columns a full explanation of the preparation, uses and benefits of it.

"In the first place it is a fact that the diets of Oriental countries are not suited to the proper nutrition of young children because of the lack of milk in them. Milk has been found to be the foundation of all foods for growing children in all countries. However, cow's milk is not available in all of these countries, and it behooves us to find a substitute. This substitute has been found in the Soy Bean Milk which has been perfected by Dr. Ernest Tso of the Peking Union Medical College. It takes its place so highly because it is so very rich in protein which sets off the heavy rice diets of these countries. It is also quite rich in fat and mineral matter, and last, but not least, it is much cheaper. A bottle of cow's milk costs ten sen whereas a bottle of Soy Bean Milk costs two sen.

"It has been used very largely in our work at the Social Evangelistic Center, Seoul, Korea, as a supplementary feeding, and also as an entire food. For the latter it must be modified, and this modification will be given with the recipe at the end of this feeding method. We have even fed one case of marasmus on the Soy Bean Milk.

"The picture of before and after using it will illustrate the success. This baby was brought from an extremely poor home where there were five children–the father totally blind, the mother half blind. It was a case of giving the baby the Bean Milk or letting it starve, so we immediately commenced feeding it and watching it very closely. It gained a pound the first month and the second month likewise. Then for a time during the winter there was a standstill, but the pictures will show the results of this attempt after one year's Bean Milk feeding.

"The Soy Bean as an important food dates back to remote history. It is said that it appears in the Chinese Materia Medica of Shen Nung in the year 2838 B.C. China to this day uses very little dairy or meat products, but they have lived for centuries on a diet remarkably well balanced by the use of the Soy Bean. It is said that Buddhist monks consecrated at birth to the priesthood are carried through the entire period of childhood on the diet of the Soy Bean curd.

"We feel that it is one food which we should encourage to be used for small children in Korea where the mortality rate is high and the children have such an inadequate diet. It is one food that we can safely advocate, make and use because the price is not prohibitive.

"Soy Bean Milk

"1. One part beans well washed

"2. Eight parts of pure tap water

"3. Soak over night

"4. Grind through native mill

"5. Boil whole quantity five minutes.

"6. Put through sieve–the result is milk

"Beans should be half milled and skins removed, if possible.

"Additional note: To each liter of Soy Bean Milk (1000 c.c. or 32 oz.) add 20 grams of starch either from rice or corn. This is cooked in the same way as you would prepare

© Copyright Soyinfo Center 2021

cornstarch pudding. Also add 60 grams of sugar and 1½ grams of calcium lactate and one gram of table salt to this mixture. The calcium lactate is best added while the milk is cold or else after the mixture is boiled or it might curdle. It should be first mixed with a little cold milk and then added.

"About the same quantity of this mixture as cow's milk is used to feed the babies–according to their caloric requirements. No child should have more than 1000 or 1100 c.c. a day of this milk. In a little baby it may produce frequent stools, which should be well watched under a doctor's care. Cod liver oil should be part of the feeding from the beginning of the use of Soy Bean Milk–at first 6 to 8 c.c. per day and gradually increased to 15-20 a day."

Photos show: (1) A Korean woman, seated on a chair, holding her child before feeding. (2) Same baby a few months later. Address: Child Welfare Dep., Social Evangelistic Center, Seoul, Korea. Phone: GTUL 841-9811.

350. *USDA Plant Inventory.* 1931. Plant material introduced by the Division of Foreign Plant Introduction, Bureau of Plant Industry, January 1 to March 31, 1930 (Nos. 82600 to 86755). No. 102. 111 p. Sept.

• ***Summary:*** Soybean introductions: *Soja max* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae.

No. 84569-85023. "From Chosen [Korea] and Japan. Seeds collected by P.H. Dorsett and W.J. Morse, agricultural explorers, Bureau of Plant Industry. Received January 20, 1930.

No. 84578-85023.

No. 84578-84904. Collected at the Suigen Agricultural Experiment Station, Dec. 2, 1929.

No. 86002-86154. "From Japan. Seeds obtained by P.H. Dorsett and W.J. Morse, agricultural explorers, Bureau of Plant Industry. Received February 26, 1930."

Note: PI numbers with special significance. "No. 84928. No. 3224. *Kanro.* A medium-sized, nearly round, dull yellow bean, slightly mottled with brown with a pale to dark-brown hilum." The name "Kanro" was continued in the USA.

No. 85666. No. 3085. *Hokkaido Tsurunoko.* Obtained in a grocery store, January 6, 1930. A very large oval yellow bean with a pale hilum. This is one of the largest seeded yellow varieties and is used only for food purposes." Later given the name "Hokkaido."

No. 85053-85673 (p. 56). "From Chosen [Korea] and Japan. Seeds collected by P.H. Dorsett and W.J. Morse, agricultural explorers, Bureau of Plant Industry. Received January 30, 1930.

No. 85053-85671 are all soybeans. 85053-85660 are from the Agricultural Experiment Station, Suigen, Chosen, December 2, 1929.

"No. 86038. No. 3538. *Kurodaizu* ["Black soybean"]. Large, oval, slightly flattened, black." Later renamed "Hiro."

"No. 86129. No. 3684. Toiku Shichigo (Station No. 7). Medium large, nearly round, light yellow, with russet-brown hilum." Later renamed "Toku."

Note: On 22 April 1931 the Office of Foreign Plant Introduction was renamed the Division of Foreign Plant Introduction. This is the 2nd earliest known issue containing soy introductions to reflect that change of names. Actually, No. 101 of June 1931 was the very first. Address: Washington, DC.

351. **Product Name:** La Choy Soy Sauce.
**Manufacturer's Name:** La Choy Food Products.
**Manufacturer's Address:** Detroit, Michigan.
**Date of Introduction:** 1931 November.
**Wt/Vol., Packaging, Price:** Glass bottle.
**New Product–Documentation:** W.L. Burlison and O.L. Whalin. 1932. *Journal of the American Society of Agronomy* Aug. p. 594-609. "The production and utilization of soybeans and soybean products in the United States." See p. 608. "La Choy–soy sauce" is listed as a soybean product produced in the United States.

W.L. Burlison. 1936. *Industrial and Engineering Chemistry* 28(7):772-77. July. "The Soybean: A Plant Immigrant Makes Good." See Table II, p. 775. States that La Choy-Soy sauce was on the market during the latter part of 1931.

Ad in *Soybean Digest.* 1944. Sept. p. 12. "Genuine soy sauce." Soybean Blue Book. 1947. p. 72-73. The 2¼ by 3½ inch display ad is titled: "Genuine Soy Sauce" from "LaChoy Food Products, Archbold, Ohio. Division of Beatrice Foods Company."

Shurtleff & Aoyagi. 1982. History of Soy Sauce. p. 105. "One of the earliest importers and marketers of soy sauce in America was La Choy Food Products. The company was founded to produce mung bean sprouts in Detroit, Michigan, by Mr. Ilhan New (a Korean) and Wally Smith. Soon they were doing a booming business and by 1922 they were importing fermented soy sauce from China in wooden barrels to use as a seasoning in their Asian food products. In the early 1930s they began buying HVP soy sauce from Huron Milling Co. (now Hercules) and A.E. Staley, and selling it in small bottles as La Choy Soy Sauce. In 1942 the company moved to Archbold, Ohio, and the next year was acquired by Beatrice Creamery Co. (now Beatrice Foods) which by 1944 was advertising the soy sauce widely. In 1963 Beatrice/La Choy acquired the Oriental Show-You company and began making and marketing their first fermented soy sauce. In 1981 La Choy was the world's largest Chinese food plant... Their fermented soy sauce, which accounted for 10-15% of their fermented soy sauce sales, was sold under the brand Oriental Soy sauce. In addition to the traditional soybeans, wheat, salt, and water, it also contained HVP, corn syrup, caramel color, and sodium benzoate preservative."

Joe Staudt. 1985. Horizons (Beatrice Grocery Group). Summer. p. 1-7. In 1920 Wally Smith and Ilhan New, two friends from the University of Michigan, founded La Choy

© Copyright Soyinfo Center 2021

Foods in Detroit. Their first product was bean sprouts. In 1922 the business was incorporated as La Choy Food Products. The first La Choy-owned plant was built in Detroit in 1937. The Archbold, Ohio plant was built on its present site in 1942. The Company's long association with Beatrice started in 1943, when La Choy was bought by the Chicago-based company and became Beatrice's first non-dairy operation.

Note: This is the earliest known HVP soy sauce sold at retail in the United States. With this product began the long battle (still fierce in 2004) concerning the definition of soy sauce. In our opinion, U.S. regulations should have required that the La Choy product be labeled "imitation soy sauce"–but soy sauce was a minor product in America in the early 1930s, the nation was in the midst of the Great Depression, and nobody cared very much about soy sauce terminology.

352. Morse, W.J. 1931. 6. Utilization of soybeans and soybean products in Oriental countries. *J. of the American Society of Agronomy* 23(12):1067. Dec. Presented as part of Symposium on Soybeans. Leader: W.J. Morse.
• ***Summary:*** Manchuria, the largest soybean-producing country in the world, had a production of more than 5,000,000 tons of which more than 400,000 tons were used for food, 253,000 tons for feed, and 225,000 tons for seed. The remainder, more than 4,000,000 tons, was used in the production of oil and oil meal and for export. Japan in 1929 used over 39,000,000 bushels of soybeans of which only 13,000,000 bushels were grown in Japan proper, the difference being imported from Manchuria and Korea. The following shows the various ways in which this large amount of beans was utilized by the Japanese people: Miso, 22.7%; soy sauce, 22.7%; soybean oil and oil cake, 21.5%; bean curd, 15.4%; confections [roasted whole soy flour], 6.1%; forage, 6.2%; green vegetable beans, 0.8%; green manure, 2.5%; seed, 1.6%; miscellaneous, 0.5%.

Note: This is the earliest document seen (Oct. 2019) that gives industry or market statistics on green vegetable soybeans (edamame) for any geographical region. Address: U.S. Dep. of Agriculture [Washington, DC].

• ***Summary:*** Subtitle: "The 25th anniversary number containing a survey of the Manchurian Incident and League Council's Proceedings."

Note: The "Manchurian Incident," also called the "Mukden Incident" took place on the night of 18 September 1931. A bomb exploded on the tracks of the Japanese railway north of Mukden. A Japanese Colonel ordered a full-scale attack against the Chinese troops in Mukden, and General Honjô, hearing of the crisis, called out the whole Kwantung Army–which proceeding to take over Manchuria. "By early 1932 the conquest of all Manchuria had been completed. In March 1932 Manchuria was proclaimed an independent state under the last Ch'ing ruler (P'u-yi). The Lytton Commission of the League of Nations visited Manchuria in the spring of 1932 and condemned Japan as an aggressor. The report was adopted by the League of Nations, from which Japan withdrew in protest the following year. By this time the Japanese armies had already moved west from Manchuria to occupy about 5,000 square miles of the Inner Mongolian province of Jehol." (Fairbank, Reischauer, and Craig. 1973. *East Asia: Tradition and Transformation.* p. 707-08). Address: Dairen, Manchuria.

359. Stewart, C.L.; Burlison, W.L.; Norton, L.J.; Whalin, O.L. 1932. Supply and marketing of soybeans and soybean products: Tables 1-19 (Document part). *Illinois Agricultural Experiment Station, Bulletin* No. 386. p. 425-544. Dec.
• ***Summary:*** Tables show: (1) Value of the soybean crop in Illinois, 1928-31. (2) Soybean production in selected countries, average 1909-13, annual 1920-31 (in tons of 2,000 lb). The countries: Manchuria, Korea, Dutch East Indies, Japan, United States, total for these 5 reporting countries. (3) Soybean production in the United States by geographic divisions, 1929. The greatest production was in the "East North Central" states; 4.977 million bushels comprising 57% of total U.S. production.

(4) Production of gathered soybeans in selected states and in the United States, 1922-1931 (thousand bushels). In 1922 the top six soybean producing states were North Carolina (1,600), Illinois (812), Ohio (465), Indiana (240), Virginia (208), and Missouri (165). Total USA: 4,333. In 1924, Illinois (1,380) passed North Carolina (1,160) to become the leading U.S. producer. In 1931 the top six states were Illinois (6,055), Indiana (3,062), North Carolina (1,498), Missouri (1,080), Iowa (578), and Ohio (560). Total USA: 14,917.

(5) Total equivalent solid acreage of soybeans grown in selected states and in the United States in 1922-1930 (thousands of acres). In 1922 the top 4 states were North Carolina (224), Illinois (169), Tennessee (154), and Indiana and Alabama (113, tie). Total USA: 1,226. In 1923 Illinois passed North Carolina to take first place. In 1930 the top 4 states were Illinois (719), North Carolina (478), Iowa (463), and Indiana (402). Total USA: 3,758. (6) Yield per acre of gathered soybeans in selected states and in the United States, 1922-1931 (bushels per acre). In 1922 the U.S. average was 13.8 bushels. Iowa had the highest: 22 bushels. In 1931 the U.S. average was 15.6 bushels. The top 4 states were Ohio (20), Indiana (17.8), Illinois (17.5), and Iowa (17).

(7) Proportion of soybean acreage gathered for beans, cut for hay, and interplanted with other crops, Illinois, 1922-1931. Gathered for beans rose from 32.1% in 1925 to 55.7% in 1930. Cut for hay rose from 41.4% in 1922 to 54.4% in 1931. Interplanted with other crops dropped from 20.1% in 1922 to 1.3% in 1931. (8) Production of soybeans in twelve leading Illinois counties, with rank by years, 1929-1931. The top four counties were Christian (692,200 bu in 1931), Champaign, Piatt, and Moultrie. (8A) Soybean varieties in Illinois: Varieties gaining favor: Illini, Manchu, Dunfield, Mansoy, Laredo. Holding their own: Ebony, Virginia, Ilsoy, Peking, Black Eyebrow, Wilson V [Wilson-Five], Hurrelbrink. Losing favor: Haberlandt, Mammoth Yellow, Hamilton (Ohio 9035), Ito San, A.K., Midwest.

(9) Varieties of soybean seed offered for sale by growers, in order of frequency of offers printed in Farm-Bureau publications, Illinois, 1921, 1925, and 1931. For each year the varieties are listed under nine crop reporting districts, and also for the entire state. In 1921 for the entire state, in descending order of frequency: Midwest, Ebony, A.K., Peking, Ohio, Ito San. In 1925: Manchu, Midwest, A.K., Ebony, Virginia, Ilsoy, Ohio, Black Eyebrow, Haberlandt, Peking, Wilson, Ito San. In 1931: Illini, Manchu, Virginia, Ilsoy, Ebony, A.K., Mansoy, Dunfield, Peking, Wilson, Midwest, Black Eyebrow, Haberlandt. (10) Average cost of producing soybean in Illinois and Indiana for specified periods, 1921-1930. The highest return above computed cost per acre (profit) is from soybeans gathered for seed using a combine: $9.55/acre. When soybeans are cut for hay, a loss usually results.

(11) Imports of soybean oil, soybean oil meal and cake, and soybeans, United States, 1915-1931. (12) Duties levied on soybean oil, soybean oil meal and cake, and soybeans under recent tariff acts, United States, 1909-1930. In 1909 and 1913 all three commodities were on the "Free list." In 1921 oil the tariff on oil was 20 cents per gallon (2.67 cents per lb); the other two were free. In 1922 the tariff on oil was reduced to 18.75 cents per gallon (2.5 cents per lb), the tariff on soybeans was ½ cent per lb (30 cents per bushel), and meal was free. In 1930 the tariff on oil was increased to 26.25 cents per gallon (3.5 cents per lb, not less than 45% *ad valorem*), the tariff on meal and cake was $6/ton, and the tariff on soybeans was increased fourfold to $1.20/bushel.

(13) Domestic production of soybean oil and other vegetable oils from domestic materials, United States,

© Copyright Soyinfo Center 2021

1912-1931 (thousands of pounds). Statistics are given for cottonseed oil (the leader by far during the entire period), peanut oil, olive oil, corn oil, linseed oil, soybean oil, and total vegetable oil. Soybean oil rose from 751,000 lb in 1922 (the first year for which figures are given) to 39,129,000 lb in 1931. The ranking in 1931 was: Cottonseed oil (1,417,226 x 1,000 lb), linseed oil (203,613), corn oil (113,145), soybean oil (39,129), peanut oil (13,730), and olive oil (1,509).

(14) Imports of foreign vegetable oils, oil equivalent being used for oil-bearing materials, United States, 1910-1931 (thousands of pounds). Statistics are given for soybean oil, coconut oil and copra, peanut oil, olive oil (edible), olive oil (inedible, including olive oil foots), palm oil (incl. palm kernel), linseed oil and flaxseed, all other vegetable oils and materials, total vegetable oils and materials. For net soybean oil imports, the earliest figure is 24,784 in 1912; it peaked at 335,439 in 1918, and had fallen to 4,018 in 1931. Total vegetable oils and materials imported increased from 440,412 in 1910 to 1,525,114 in 1931.

(15) Exports of soybean oil and five other leading vegetable oils, United States, 1919-1931 (thousands of pounds). Statistics are given for soybean, cottonseed, coconut, linseed, corn, and peanut. The leading export throughout this period was cottonseed oil. For soybean oil exports, the figure for the last half of 1919 is 27,715 and fir 1920 it is 43,512. Thereafter the amount exported each year is very small, rising from 1,944 in 1921 to 5,448 in 1931.

(16) Total production, imports, exports, and net balance of vegetable oils and animal fats, exclusive of butterfat but inclusive of fish oils, United States, 1912-1931. (17) Use of soybeans, by acreage, United States, 1915, 1929, and 1930 crops. The percentages of the entire crop acreage in 1915 are: Hay 52%, grazed 15%, plowed under 4%, and gathered for beans 29% (of which: Seed 18.2%, human food 0.9%, and feed 9.9%). In 1930: Hay 56%, grazed 14%, plowed under 4%, and gathered for beans (11,975,000 bushels) 30% (of which: Seed 10.5%, crushed or ground 11.5%, and feed 8.0%).

(17A) Commodities in which soybeans or soybean products are used (p. 460): Food products (USA and Canadian), feed products, industrial products. (18) Soybean oil meal produced and imported into the United States, 1922-1930 (tons of 1,000 lb). Domestic production increased from 3,811 tons in 1922 to 110,000 tons in 1930. Imports increased from 15,612 tons in 1922 to 55,107 tons in 1930. Total of domestic production + imports increased from 19,423 tons in 1922 to 165,107 tons in 1930.

(19) Adaptability of soybean oil to use in various products (p. 464): The products are: Drying products (paint, varnish, linoleum and oil cloth, waterproof goods), soap products (hard and soft soaps), edible products (Lard compounds, cooking oils {if odor permanently eliminated}, salad oils, fountain drinks, candy, mayonnaise, margarin), miscellaneous (core oil, printer's ink). Four levels of adaptation and a maximum percentage are given for each use: Probable, inferior, satisfactory, and superior. The two superior adaptations are paint (to prevent yellowing), and soft soaps. Note: "The margarin industry was one of the first to use considerable amounts of soybean oil and at present it absorbs in the United States approximately 750,000 pounds annually."

360. Stewart, C.L.; Burlison, W.L.; Norton, L.J.; Whalin, O.L. 1932. Supply and marketing of soybeans and soybean products: Tables 20-49 (Document part). *Illinois Agricultural Experiment Station, Bulletin* No. 386. p. 425-544. Dec.
• ***Summary:*** Tables show: (20) Total industrial utilization of soybean oil and percentages used in specified industries, United States, 1916-1931. The total pounds used rose from 143.34 million in 1916 to a peak of 335.44 million in 1918, then fell to a low of 7.53 million in 1924, rising slowly to 35.50 million in 1931. In 1917 (the peak year) soybean oil comprised 10.3% of all oils used in soap industry. In 1918 it comprised 4.6% of all oils used in the lard-substitute industry and 2.6% of all oils used in the margarin industry.

(21) Iodin [iodine] numbers, saponification numbers, acid numbers, and uses of oils and fats (p. 471). Values are given for: Chinese tung or wood oil, coconut oil, corn oil, cottonseed oil, fish oil, linseed oil, palm oil, palm kernel oil, peanut oil, soybean oil, tallow, whale oil. For soybean oil: Iodin number 124-148. Saponification number 189-194. Acid number 2-7. Uses: "Considerable quantities go into paint, varnish, enamel, linoleum, and waterproofing products. Used in soaps. Utilized in a large variety of food products. Used in core oils."

(22) Utilization of soybeans and soybean products by amounts, United States, 1930 crop: Beans (bushels)–Feed, seed, ground (for food {200,000 bu}, for feed), crushed, total (11.975 million bu). Oil (lbs): Edible purposes (Oleomargarine {750,000 lb}, lard substitutes {500,000 lb}, other food products {4,750,000 lb}), paint and other industries (paint and varnish, linoleum and oil cloth, other uses), soap kettle, increased stocks including oil equivalent, total (37.2 million lb). Meal (tons): Feed (commercial feeds, other feeds), food (flour {850 tons}, infant and diabetic foods {50 tons}), other uses including glue, total (110,000 tons).

(23) Estimated distribution of gathered soybeans according to use, Illinois, 1926-1931 crops. The four categories for each year are (with figures for 1931): Used by oil mill and feed manufacturers (50%), used for seed in state (22%), used for seed outside state (13%), used for feed on farm (15%).

(24) Extent to which soybeans came from local sources or were shipped in from outside the locality, and extent to which beans sold went to local purchasers or were shipped out of the locality, 151 identical country elevators and local seed dealers, Illinois, 1930 and 1926 crops. (25) Soybeans purchased by 151 country elevators and local seed dealers,

© Copyright Soyinfo Center 2021

Illinois, 1931 crop. Gives figures for 10 crop reporting districts. (26) Proportion of soybean crop leaving growers' hands that was out of their hands by middle of November, December, and January, Illinois, 1922-1932 (crop storage). Typically about 60% (range 30-70%) was out of their hands by Jan. 15.

(27) Estimated proportion of soybean seed shipped out of the locality by wholesale dealers and jobbers before specified dates in January, selected states and United States, 1919-1931 crops. The states are: Illinois, Indiana, Missouri, and North Carolina. For the USA, 38.9% on average had been shipped by Jan. 26. (27A) Soybean varieties marketed in different sections of Illinois, 1926 crop (11 localities) and 1930 crop (13 localities). The leading varieties of soybeans marketed in Illinois are Illini, Manchu, Midwest, A.K., Virginia, and Ebony.

(28) Estimated costs (cents per bushel) of handling soybeans for all purposes by 166 identical country elevators and local seed dealers, Illinois, 1930 and 1931 crops. For 9 crops reporting districts gives the percentage recleaned (23-30%) and the costs of recleaning and other costs. (29) Costs of handling soybeans other than cleaning by identical country elevators and local seed dealers in leading producing counties, Illinois, 1926, 1930, and 1931 crops. Costs 3.2 to 4.4 cents per bushel.

(30) Costs of raw materials and other items of soybean oil production, United States and selected foreign countries, 1923-1924 (per bushel of soybean crushed). The foreign countries are Manchuria (All Manchuria, Dairen only), Japan, Great Britain. The total cost is lowest in all Manchuria (6.26 cents) and highest in the USA (10.21 cents). (31) Estimated cost of handling soybeans used mainly for seed, 151 identical country elevators and local seed dealers, Illinois, 1926 and 1930 crops. (31A) Cost per bushel of moving soybeans from central Illinois on board boat at New Orleans [Louisiana], 1931 crop.

(32) Carloads of soybean federally inspected in leading soybean producing states, 1928-1932. The states are Illinois, Missouri, Indiana, North Carolina, Ohio, and Virginia. The most carloads were inspected in Illinois (in Peoria (2,412) and Chicago (1,284)). (33) Federal grade requirements for yellow, green, brown, black, and mixed soybeans (Grades 1-4 plus sample grade and Extra No. 1).

(34) Digestible nutrients in feed products of soybeans (soybean hay, seed, straw, seed and straw, oil meal; incl. yield per acre and digestible protein). (35) Digestible nutrients in soybean oil meal and other protein feeds (Incl. linseed meal {old process}, cottonseed meal {41%}, gluten meal, wheat middlings, wheat bran, tankage). Only tankage has a higher "feeding value" than soybean meal. (36) Total gross value of products obtained from a bushel of soybeans at different prices of oil and meal. Gives figures when the price of a pound of soybean oil ranges from 2½ cents to 10 cents per pound, and the price of meal ranges from $15 to $40 per ton.

(38) Average farm prices of soybeans by seven selected crop reporting districts, Illinois, January-May, 1925-1931. The average price over the years ranges from $1.70 to $2.07 per bushel. The lowest price in one year was $0.97/bu in 1931 in Champaign. (39) Average monthly farm prices of soybeans in three crop reporting districts important in soybean production, Illinois, October-June, 1925-1930 crops. The price is always lowest in October and highest in June. So storage pays.

(40) Average prices paid to producers for soybeans by 151 identical country elevators and local seed dealers, Illinois, October-July, 1930 and 1926 crops (Dollars per bushel). (41) Average yearly wholesale selling prices of soybean seed, selected markets; quotations given for first five months of the following year, 1919-1931 crops. The places are: Chicago, Illinois; Louisville, Kentucky; Kansas City, Missouri; Minneapolis, Minnesota; and Baltimore, Maryland. The average price of the ten year period at various cities ranged from $2.25 (Baltimore) to $2.80 (Minneapolis). Prices were highest in 1920, lowest in 1932.

(42) Retail selling price of good-quality soybean seed in selected states, March-May, 1926-1932. The states are: Illinois, Indiana, Iowa, Kentucky, Missouri, Ohio, Tennessee. (43) Average prices paid to producers for thresher-run soybeans and average wholesale and retail selling prices, Illinois, 1925-1931 crops. Prices were highest in 1925, lowest in 1930. In 1925 the average price paid to farmers was 63.6% of the retail price, and the average wholesale price was 90.9% of the retail price.

(44) Average advertised price of soybean seed offered for sale by producers, by varieties, Illinois, March-June 1920-1930. The varieties are: Illini, Manchu, A.K., Midwest, Ebony, Virginia, Wilson, Black Eyebrow, Peking, Ito San, Ilsoy, Haberlandt, Ohio, Dunfield, Mansoy.

(45) Exports of soybeans from eight selected exporting countries, 1923-1930. Gives figures (1,000 lb) for total, China, Japan incl. Chosen [Korea], and Netherlands. (46) Imports of soybeans into selected countries 1913, and 1919-1931. Gives figures (1,000 lb) for total, Denmark, Japan incl. Korea, France, Germany, Netherlands, United Kingdom, United States. Figures in footnote for Sweden and Italy. The leading importers are now Germany, Denmark, and United Kingdom.

(47) Imports of soybean oil into seven selected countries, 1913 and 1919-1931. Gives figures (1,000 lb) for total, Denmark, Japan (incl. Chosen), France, Germany, Netherlands, United Kingdom, United States. Gives figures in footnote for Algeria, Austria, and Sweden. (48) Exports of soybean oil from eight selected countries, 1913 and 1919-1931. Gives figures (1,000 lb) for total, China, Denmark, Japan incl. Chosen, France, Germany, Netherlands, United Kingdom, United States. Figures in footnote for Algeria, Sweden, Austria, and Italy.

© Copyright Soyinfo Center 2021

(49) Exports of soybean cake from Manchuria as a whole and from the port of Dairen, with destination of bean cake from Dairen, 1926-1931 (tons of 2,000 lb). Exports from Dairen to Japan, Korea, Europe, United States, China, Other destinations.

• ***Summary:*** Glycinin is denatured almost completely into a glutelin-like protein, soluble in 0.2% sodium hydroxide, by the oil-extraction process. The rates of digestion of natural and denatured glycinin by enzymes, and the action of papain and castor-seed powder on the oil, were studied. Viscosities of mixtures of the oil with organic solvents were measured.

Thanks to Mr. K. Sugiyama, president of Honen [Hohnen] Oil Co. Address: Hokkaido Imp. Univ., Sapporo, Japan.

363. U.S. Dept. of Commerce, Bureau of Foreign and Domestic Commerce. Foodstuffs Div. 1932. The market in Germany and other European countries for American soya beans. Washington, DC: Foodstuffs Div. 9 p. Mimeographed unpublished manuscript.
• ***Summary:*** This report is a revision of Special Circular #344, published in July 1932. Contents: Introduction. Importance of Hamburg and Germany as a Market for American Soya beans. German and European consumption of soya beans (1930-1931; and Germany 1927-1931). Disposition of United States crop of soya beans. United States exports of soya beans by month (1931-32). Quality standards and sale terms for American soya beans. Lower price for American beans because of bulk shipments. German market for soya bean cake. Other cattle feedstuffs not a serious competitor to soya beans. Increasing imports of soya beans [are taking market share] away from other oilseeds (table, 1913-1931). Capacity of the important European mills. Direct sales to German mills not recommended–Hamburg agents in better position than London to watch experimental shipments to German buyers. Exchange conditions affecting bean purchases. Bank credits more difficult. Speculation in the Hamburg trade. Unilever Group not dominant in the German market. (its affiliated mills consume about 200,000 tons/year). German efforts to cultivate soya beans from American stock not successful: Russia, Sweden, northern France (imports are increasing), United Kingdom (Unilever plays the major role), Denmark, Netherlands. Conditions in the producing areas: China (South Manchuria 2,163,527 tonnes; North Manchuria 2,057,247 tonnes), Chosen [Korea; 1,982,084 acres].

The estimated yearly capacity (in long tons) of major German mills for soybeans in 1931, ranked in descending order of size, is: 1. F. Thörl's Oelfabriken, Harburg-Elbe, 246,000. 2. Hansa Muehle, Hamburg, 197,000. 3. Stettiner Oelwerke A.G., incl. Toepfer's Oelwerke GmbH, 197,000. 4. Noblee & Thörl, Harburg-Elbe, 148,000. 5. Brinckman & Mergell, Harburg-Elbe, 128,000. 6. Henke & cie., C. Thywissen, Norddeutsche Oelwerke A.G., and P.J. Stahlberg, 118,000.

Note 1. This is the earliest document seen (May 2015) that contains the company names "Noblee" or "Noblee & Thörl / Thorl."

Note 2. This is the earliest document seen (May 2016) that mentions "Toepfer's Oelwerke GmbH" or that states it is now a part of Stettiner Oelwerke A.G.

Note 3. This is the earliest document seen (Aug. 2016) that mentions the German soybean crusher Brinckman & Mergell.

In Russia, according to reliable sources, the Soviet Government had a total of 1,088,000 acres of soybeans under cultivation in 1932 in the following areas: Ukraine 717,500 acres, Russian Far East 247,000 acres, Northern Caucasus 123,500 acres. Russia is making increasing use of the Trans-Siberian Railroad in bringing soybeans into Russia for export via the ports of Leningrad and Murmansk. Why? The country is believed to be in great need of foreign exchange. From Jan. 1, to May 15, 1932 rail shipments were about 194,450 tons.

Unilever's affiliated mills consume about 200,000 tons/year of soybeans. "The British demand for soya beans is very largely in the hands of the Unilever organization which, with its Holland affiliations, owns or controls a number of the most important British, German, and Swedish crushing plants. It is known to be the general policy of the Unilever combine to purchase its oilseeds through a central buying committee, which not only contracts for the raw commodity, but also apportions the amount to be crushed by each plant. It is estimated that Unilever, including associated companies, do probably 75 per cent of the oilseed crushing of Europe and the United Kingdom." Address: Washington, DC.

Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon (Log of Dorsett-Morse Expedition). 181 p. Illust. 28 cm.

• ***Summary:*** (Continued): The "History" section of this book (p. 30) states: "According to Chinese literature, the soybean was grown as a farm crop in China proper more than 5,000 years ago. The origin of soybean culture in Manchuria is not definitely known but is supposed to have been brought from Central China districts many centuries ago. At first the beans were grown only for food but when they became a source of oil, production gradually increased. The production of soybeans, however, was more or less localized until after the Chinese-Japanese war [first Sino-Japanese war, Jan. 1894 to Jan. 1895] at which time Japan began to import the oil cake for fertilizing purposes, resulting in a sudden expansion of demand for this product. The Japanese-Russian War [Russo-Japanese war, 1904-05] brought about a wider interest in the soybean and its products, successful shipments being made to Europe about 1908, and the soybean soon assumed world-wide attention. Acreage and production increased by leaps and bounds so that the soybean became one of the most important staple crops and exports of Manchuria.

"Importance: The soybean is the most important agricultural crop in Manchuria today and business circles depend to the greatest extent upon the market situation of the soybean and its products oil and oil cakes. Soybeans make up more then one-fourth of the staple crop acreage of Manchuria, the annual production of seed being around 180,000,000 bushels. As the big cash crop of the region providing fully one-half of the farm income in northern Manchuria and more then one-half of the total volume of freight handled by Manchurian railways, the soybean is a dominating factor in the economic life of the country. From two-thirds to three-fourths of the soybean crop is exported."

Maps: Map of Manchuria (p. 2).

Tables: (1) Climatic conditions in the most important regions in Manchuria. These are: Dairen, Mukden, Changchun, Harbin, Tsitsihar. For each region is given: Latitude. Temperature in July and in August. Growing season (days). Rainfall (inches). Warm season rainfall * (percent). * Period from May to August inclusive.

(2) Area, total population, and population per square mile of the Three Northern Provinces. They are: Liaoning (Fengtien), Kirin, and Heilungkiang [Heilongjiang]. The latter has by far the largest area (211,385 square miles), but by far the smallest population (5.134 million), and by far the lowest population density (24 people per square mile).

(3) Total acreage of cultivated and uncultivated land in the Three Northeastern Provinces. Liaoning 19.1% cultivated. Kirin 22.9% cultivated. Heilungkiang 6.9% cultivated.

(4) Percentage of production and cultivated area of ordinary crops in Manchuria, 1930. Source: Manchuria Yearbook, 1932-33. Gives both sets of figures each year from 1924 to 1930 for soybeans, other beans, kaoliang, millet, maize, wheat, and other cereals. In 1926 production of soybeans first passed production of kaoliang to become the leading crop in Manchuria.

(5) Percentage of principal crops by agricultural regions in North Manchuria for 1929 and 1930. The agricultural regions are: South of Harbin, Harbin, East of Harbin. Below Sungari River, Hu-hai, West of Harbin. other places. Soybeans are the leading crop for both years in most of these regions. Data furnished by R. Kadono, Research Office, South Manchuria Railway, Harbin, Manchuria.

(6) Acreage of principal crops by agricultural regions in Manchuria, 1929. Figures are given for 15 regions; most are not the same as those in Table 5.

(7) Agricultural production in Manchuria in 1930. Figures are given for the three provinces, the total of the three, and for the Kwantung Leased Territory & South Manchuria Railway (SMR) Zone. Kirin province is by far the leading soybean producer with 2.364 million metric tons. Total soybean production in this area in 1930 was 5.318 million metric tons.

(8) Estimated production of soybeans by districts in Manchuria, 1931 (in bushels). Manchuria is divided into South Manchuria (where 79.783 million bu were produced) and North Manchuria (where 116.952 million bu were produced). Each of the two parts of Manchuria is divided into about 8 districts. By far the biggest soybean producing district is the Chinese Eastern Railway–eastern section in North Manchuria (41.361 million bushels).

(9) Soybean introductions [to the USA] from China, Japan, Manchuria, and Chosen (Korea) classified according to seed color. Fifteen different seed colors are given. By far the most common seed color (2910 out of 4578 total, or 63.5%) was straw yellow. The total number of introductions from each country were: Chosen (Korea) 3379 (or 73.8% of the total). Japan 577. Manchuria 511. China 111.

(9a, p. 39) Named native varieties of soybeans grown in different sections of Manchuria. Thirty-six names are given, in alphabetical order.

(9b, p. 42), Criteria for soybean plant selection each fall at Kaiyuan Experiment Station. Seven criteria, each of which is record for each selection.

(9c, p. 45). Time of planting soybeans. Ranges from April 25 to May 10 at Changchun to May 15 to May 20 at Laiyang.

(10) Number of labor units expended for staple crops of Manchuria. Gives figures for soybeans, wheat, kaoliang, millet, and corn. For each crop gives: Labor units per acre.

© Copyright Soyinfo Center 2021

Value of crops per acre in 1922, 1923, and 1924. Return per "labor unit" in 1922, 1923, and 1924. Soybeans usually gave the highest return per "labor unit"–but sometimes wheat gave the highest return.

(11) Future and spot transactions of the produce exchanges in Manchuria under Japanese supervision. Gives figures for the years 1913, 1918, 1923, 1928, and 1929. For each year gives: Amount of future delivery in silver yen. Amount of spot delivery in silver yen. Total. The total increased from 41.3 million in 1913 to 16,538 million in 1929. Part of this increase was clearly due to inflation.

(12) Soybean inspection grades of the South Manchuria Railway, 1923-1929, inclusive. Figures are given for each year. The three main categories are perfect seed, imperfect seed, and dirt. Under perfect seed, the two subcategories are yellow and colored. Under each of those are Excellent, 1st grade, and 2nd grade. Under imperfect seed, the two subcategories are injured and immature. Under each of those are Excellent, 1st grade, and 2nd grade.

(13) Physical analysis of standard samples from mixed storage soybeans for 1931-32.

(14) Physical analysis of standard samples for 1931-32. There are five classes of soybeans: Special, 1st class, 2nd class, 3rd class, and 4th class. For each class there is a column for yellow beans, green beans, brown beans, black beans, worm-eaten beans, unripe beans, and foreign matters.

(15) Physical analysis of soybeans in mixed storage for the year 1930-31. The five classes and seven columns are the same as for table 14.

(16) Results of physical analysis of Manchurian soybeans during the last ten years. Starts with 1923-24 and ends with 1931-32. The eight columns given for each year are the seven in table 14 plus one for "discolored beans."

(17) Amounts of bean oil and bean cake obtained from 100 kin (132.2 pounds) of soybeans by different milling systems. The 3 systems are round cake system, plate cake system, and [solvent] extraction system.

(18) Composition of bean cake or meal produced by three different milling systems.

(19) Total production of bean cake (pieces) in Manchuria in 6 localities for 1926-1930 inclusive. Source: The Manchuria Yearbook, 1932-33, p. 194.

(20) Location, number, systems, and production of soybean oil mills in 6 localities in Manchuria, 1926.

(21) Bean cake (pieces) producing capacity of oil mills in 6 localities in 24 hours, 1925-1931.

(22) Principal Manchurian exports for 1929, value in Haikwan taels. Soybeans are #1 with 40% of the total value. Ban cake is #2 with 15%. Ban oil is #4 with 5%.

(23) Exports of staple products through Dairen during the first 7 months of 1930, 1931, and 1932. Both quantity (short tons) and value (dollars).

(24) Exports of soybeans, soybean cake, and soybean oil from Manchuria to foreign countries, 1909-1930.

(25) Amount of soybeans of 1929 crop rejected for various reasons by the Chinese Eastern Railway. Eight different reasons are given with the amount rejected in tons for each reason. No. 1 reason is "Mixture of earth," followed by "short weight."

(26) Comparison of bean cake exports from Dairen, Newchwang, and Vladivostok from Oct. 1929 to March 1930, with same previous season. Figures given for the following countries: Japan proper, China proper, Formosa, Chosen (Korea), and other countries.

(27) Bean cake (pieces) exports according to destination (same destinations as in Table 26).

(28) Exports of soybean oil according to destination, 1931 (same destinations as above). Address: USDA, Washington, DC.

366. Ryerson, Knowles A. 1932. Plant explorers bring valuable new species and varieties to U.S. *Yearbook of Agriculture* (*USDA*) p. 297-302. For the year 1930. See p. 298.

• ***Summary:*** "In the spring of 1931, P.H. Dorsett, of the Division of Foreign Plant Introduction, and W.J. Morse of the Division of Forage Crops and Diseases, returned from the Orient after a search of more than two years for new varieties of soybeans. Their travels took them to Japan, including Hokkaido, the northernmost island, the peninsula [sic, island] of Saghalin [Russian: Sakhalin; Japanese: Karafuto; the island belonged to Japan until Aug. 1945], to Manchuria, Chosen (Korea) and China. Almost 3,000 soybean varieties were obtained in these great soy-producing areas.

"Special attention was also paid to other legumes of possible value to American agriculture, and important collections of mung beans, lespedeza, alfalfas, and Melilotus varieties were made. Other valuable field-crop introductions resulting from this expedition include collections of barleys, wheats, and grasses.

"A number of valuable horticultural contributions were also obtained. A special study was made of the oriental persimmon and about 200 introductions were made from Japan, China, and Chosen. In Peiping the expedition discovered the fruit being processed on a large scale to remove astringency, and made a thorough study of the methods used. Investigations of the outdoor storage of this fruit, begun during a previous expedition, were continued." Address: Bureau of Plant Industry, USDA.

367. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1933. The Manchurian soy bean situation. 26(7):184-88. Feb. 13.

• ***Summary:*** "The Manchurian soy bean acreage for 1933 probably will be no larger than that of 1932, according to Assistant Agricultural Commissioner Fred J. Rossiter at Shanghai. Unsettled political conditions are expected to continue to restrict the acreage. A large number of farmers

© Copyright Soyinfo Center 2021

have left their homes, while others have lost their work animals and will leave the land uncultivated."

"The amount of soy beans and bean products available for export during the crop year ending September 30, 1933 is considered to be about 30 per cent less than the amount available in 1931-32."

"Review of the 1931-32 season: While the United States disposed of [exported to Europe] over two million bushels of soy beans in Europe during the crop year, which ended September 30, 1932, Manchuria shipped to the same destination fifty-six million bushels of beans and the equivalent of over fifteen million bushels in the form of bean oil."

Tables show: (1) Manchuria: Exports of soy beans, bean cake and bean oil, by countries, year ended September 20, 1932. Includes exports from Dairen, Newchwang, Vladivostok and Manchuli. The exports are to Europe, Leningrad, Japan (incl. Chosen [Korea] and Taiwan), China, East Indies [Indonesia], United States, Others, and Total. Soy bean exports totaled 2,993,923 short tons, with the largest amount going to Europe (1,477,033). Soy bean cake exports totaled 1,503,395 short tons, with the largest amount going to Japan (980,911). Soy bean oil exports totaled 154,418 short tons, with the largest amount going to China (101,784).

(2) Manchuria: Average monthly price of soy beans and soy bean products at Dairen in silver yen and United States currency, 1929-30 to 1932-33.

368. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Economics*). 1933. The world situation in oils and oilseeds. 27(14):352-76. Oct. 2.

• ***Summary:*** German trade in soy beans has increased. Two full page tables show: (1) Netherlands: Imports of fats and oils, 1928-1932 (includes 20,000–54,000 short tons of soybeans and large amounts of soybean oil). (2) Netherlands: Exports of fats and oils, 1928-1932 (includes 231–344 short tons soybeans and 11,000–17,000 short tons of soybean oil).

The section titled "Soy beans" states: (p. 367) "The total production of soy beans last year in the five leading soy bean producing countries: Manchuria, Chosen [Korea] and Dutch East Indies, each shows a substantial increase, Chosen producing 677,326 short tons against 634,506 in 1931 and Dutch East Indies 165,345 short tons compared with 141,602 during the previous year. In the United States, on the other hand, 397,350 short tons were harvested, a reduction of about 13 per cent from that of 1931 but about 8 per cent larger than the quantity harvested in 1930. The amount produced by Japan during the past year is not available at the present time. See table, page 374."

A 3rd table (p. 368) shows the production of oilseeds in terms of oil in major producing countries from 1929-30 to 1932-33. The amount stayed about constant during this period, ranging from 1.24 to 1.37 million pounds.

A 4th table, titled "Soybeans" (p. 368) shows the production of soybeans in major producing countries in 1909-1913 (average), 1921-1925 (average), and yearly from 1929-30 to 1932-33 (estimate). The amounts in 1931-32 were (in short tons): Manchuria 3,289,657. Chosen [Korea]: 634,506. USA 458,130. Japan 381,551. Dutch East Indies (today's Indonesia): 141,602.

369. *Foreign Crops and Markets* (*USDA Bureau of Agricultural Relations*). 1933. Oils and oilseeds: Manchuria has larger soy bean crop. 27(14):348-50. Oct. 2.

• ***Summary:*** "Since mid-July the movement of [soy] beans to Europe has been unusually small in view of the German restrictions on imports of the bean and its products."

Tables show: (1) "Manchuria: Exports of soy beans and bean products, by quarters, seasons 1931-32 and 1932-33." Shows [soy] beans, bean cake, bean oil, and total. These exports are from Dairen, Newchwang, Vladivostok, and Manchouli [W.-G. Man-chou-li, Manzhouli]. Note: Manzhouli is an inland port in Nei Monggol {Inner Mongolia}, northern China, near the border with Russia. As of Jan. 2008 Manzhouli is China's busiest land port of entry, and is responsible for 60% of all imports from and exports to Russia and Eastern Europe. They apparently travel by rail on an east-west axis.

(2) "Manchuria: Exports of soy beans and bean products by countries of destination, Oct. to June, 1931-32 and 1932-33." The countries are Japan [incl. Korea and Formosa], Europe [incl. exports via Manchouli to Leningrad], China, America [USA], Malaysia, and Others. Europe buys the most whole soy beans, Japan the most bean cake, and China the most bean oil.

370. *USDA Plant Inventory.* 1933. Plant material introduced by the Division of Foreign Plant Introduction, Bureau of Plant Industry, January 1 to March 31, 1932 (Nos. 95552 to 98256). No. 110. 96 p. Nov.

• ***Summary:*** Soybean introductions: *Soja max* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae.

No. 95706-96383. "From Chosen [Korea]. Seeds arranged for by the Dorsett and Morse expedition and sent through the American consulate at Tokyo, Japan. Received January 26, 1932. A collection of soybeans presented by the Seisen Shijo (western branch) of the Agricultural Experiment Station of the Chosen Government, Shariin, October 24, 1931. 95706-9578. From the Zenra-Nando Prefecture." For example, the first accession: "95706. No. 7971. Station no. 1. Medium size, straw-yellow with dark-brown hilum; heavily mottles with brown.

No. 95719-95740. From the Zenra Hokudo Prefecture.

Note: PI numbers of special significance: "No. 95727. No. 7992. Station no. 22. Large size, straw- to olive-yellow with pale hilum; slightly mottled with brown." Later renamed "Nanda," which means "What's that?" in Japanese.

No. 95741-95776. From the Keisho-Nando Prefecture.

371. Tanaka, T. 1933. Chôsen no jimbun chishi gaku teki kenkyû [Anthropogeographical studies on Korea]. *Chiri Kyoiku* (*Geographical Education*) 17:40-45, 256-63, 376-82. [Jap]*

372. *Japan Times Year Book.* 1933. Serial/periodical. Published by The Japan Times, Tokyo. 27 cm. [Eng]

• ***Summary:*** Merged with: Japan Year Book (Tokyo, Japan: 1905), to form: Japan-Manchoukuo Year Book. This book has a larger format than the Japan Year Book. On the title page is printed "(Third Edition). Near the front are nine maps (black and white): Japan (incl. Chosen [Korea] and Manchokuo) [sic] with each of Japan's provinces numbered and named, Karafuto (southern half), Hokkaido, Northern Hondo [Honshu], Central Hondo, Western Hondo, Kyushu, Taiwan, and Chosen [Korea].

Facing p. 72 is Appendix XII: Japanese weights and measures. 1 koku = 1.80391 hectolitres.

Page 140. A table shows the "Principal agricultural crops" of Japan and the quantity and value produced in 1928-30. For "soya beans":

5.370 million hl [hectoliters] in 1928

4.789 million hectoliters in 1929

5.473 million hectoliters in 1930.

Production of "azuki beans" was 24.6% that of soya beans in 1928.

Another table (p, 141) shows cultivated area, production, and value for soya beans, azuki beans, and foxtail millet in 1929 and 1930. For soya beans:

4.789 million hectoliters in 1929

5.478 million hectoliters in 1930

Page 213. In the section on the foreign trade of Japan in 1931, important items include "Beans" (worth 37.677 million yen compared with 49.734 million yen in 1930, a decrease of 12.1%) and "Bean cakes" (worth 44.179 million yen compared with 66.417 million yen in 1930, a decrease of 22.2%).

Page 221. About agriculture in Chosen [Korea]. "Soya beans are exported chiefly to Japan for manufacturing soy [sauce], the export amounting to 4.490 million koku valued at 17.554 million yen in 1930.

Page 301. Chapter 43 is titled "Kwantung Leased Territory and Railway Zone." Japan believes that it now (since 1931) controls these two parts of Manchuria. The latter is officially known as the "South Manchuria Railway Zone."

Page 307. Contains a table that lists the principal agricultural products in the Kwantung and the Railway Zone. They are (in descending order of total production in both areas): peanuts (1.032 million koku), maize (921,071 koku), kaoliang (270,529 koku), millet (216,644 koku), soya beans (156,895 koku). Note that soya beans are much less important than they were 20 years ago.

Page 308. "The most important Manchurian industry is the [soya] bean oil industry, and in this field, the Kwantung territory occupies a very important position. The capacity of bean oil produced at Dairen is nearly 70 percent of the entire bean oil producing capacity of Manchuria." A table gives the number of oil mills at Dairen (1924-1931), their capacity in terms of [soy] bean cakes, and the percentage of the total Manchurian capacity controlled by Dairen. The number of mills increased from 82 in 1924 to a peak of 84 in 1926, then decreased to 53 in 1931. The capacity in bean cakes increased from 285,000 cakes in 1924 to a peak of 297,400 cakes in 1931. The percentage of total capacity increased from 55% in 1924 to 69% in 1931.

A second table [which makes no sense] gives the actual production of cakes in Dairen mills from 1924 to 1931: It increased from 27.087 million cakes in 1924 to a peak of 40.939 million cakes in 1926, then decreased to 22.980 million in 1930.

373. Morse, W.J. 1933. Soybeans now a major crop in United States; Few grown before 1898. *Yearbook of Agriculture* (*USDA*) p. 198-205. For the year 1933.

• ***Summary:*** Contents: Variety adaptation. Variety utilization (incl. bean curd, bean milk, soy sauce, miso (bean paste), bean sprouts, green vegetable beans, bean flour, roasted beans, bean confections [made using roasted whole soy flour], beverages, oil and meal, special fermented bean products). Soybean oil and meal industry. Soybean meal. Soybean oil. Soybeans for human food. Soybeans as an export crop.

"Variety adaptation: The Virginia, Laredo, Manchu, and Biloxi have a greater range than most other varieties. The Virginia, Mansoy, and Harbinsoy varieties excel on the less

© Copyright Soyinfo Center 2021

productive types of soil, while on better soils the Mansoy and Harbinsoy give inferior results.

"Since the Department of Agriculture began to introduce soybean varieties more than 7,000 samples of beans have been collected from Japan, Chosen [Korea], Manchuria, China, Taiwan (Formosa), Java [in today's Indonesia], Sumatra, and India. There are more than 2,000 distinct types in this large collection, ranging from 75 to more than 200 days in reaching maturity. At present about 40 varieties are generally grown in the United States."

"In Japan, where the soybean is used extensively as a green vegetable, more than 60 varieties, ranging in maturity from 75 to 160 days and differing in flavor, are grown solely for this purpose. The soybean in used in the United States primarily as forage, being preserved either as hay or silage, or cut and fed green as soilage, and is also pastured extensively with hogs and sheep."

"Soybeans for human food: In Asiatic countries the soybean is grown primarily for the beans, which are used largely in the manufacture of numerous food products that supply the principal source of protein in the Asiatic diet as that in the diet of western people is furnished chiefly by meat and dairy products. "Oriental people use very few dairy and meat products, yet for many centuries they have lived on an apparently well-balanced diet of which the protein is derived largely from the soybean.

"The most commonly used soybean foods in the Orient are soy sauce, miso or bean paste, bean curd, bean milk, bean flour, roasted-bean confections, green-vegetable beans, bean sprouts, roasted bean flour, boiled beans (with rice, millet, or sorghum), coffee substitute, and health drinks made from roasted soybeans.

"In the United States the soybean and its products have attracted attention as an article of food at various times, but only within the last three or four years have there been any extensive investigations along this line by commercial interests. Soybean flour, made by grinding either the whole bean (preferably yellow-seed varieties) or the press cake after the oil has been removed from the beans, is finding increasing favor in the manufacture of various products, such as malted milk, macaroni, vermicelli, spaghetti, noodles, crackers, cookies, ice-cream cones, breakfast foods, health foods, diabetic foods, and infant foods. Within the last year several large baking companies have began using 15 to 20 per cent of soybean flour in making bread and cakes." Address: Bureau of Plant Industry, Washington, DC.

374. Terry, Thomas Philip. 1933. Terry's guide to the Japanese Empire, including Chôsen (Korea) and Taiwan (Formosa), with chapters on Manchuria, the Trans-Siberian railway, and the chief ocean routes to Japan: a handbook for travelers, with 8 specially drawn maps and 23 plans. Revised and augmented ed. Boston and New York: Houghton Mifflin Company; London, Geografia, Ltd. [etc., etc.]. cclxxxlv + 799 p. Maps (some folded). Index. 17 cm. With 85 unnumbered pages of ads at the end and 9 at front of book. • ***Summary:*** A digital version of this book is available on HathiTrust.

In the section on "Japanese Inns" we read (p. xxxvi): "Later the traveler may learn that the place enjoys fame for some savory specialty–eels boiled in soy,..."

In the same section we read (p. xl): "... the other of beans, bean-curd or something of that nature. Salt is not provided unless asked for. Many of the dishes are cooked in soy, a tiny dish of which is supplied for dipping bits into before eating them."

In the section on "Japanese Food" we read (p. xlii): "Sukiyaki restaurants are features of many cities." "Some of it is delicious, and the more the foreigner eats of it the more he likes it. Those dishes which are mawkish to the American palate can sometimes be rendered appetizing by the addition of the excellent shoyu sauce (which is quite salty), grated cheese, etc."

In the same section (p. xliii): "The soy-bean (*daizu; ômame*) ranks first in extent, variety of use, and value among the pulse of Japan, and in point of nutriment is quite near to meat. It contains nearly two fifths of its weight in legumin, nearly one sixth in fat, and is rich in nitrogen. It is to the Nipponese what frijoles are to Mexicans and garbanzos (chick-peas) to Spaniards. Of the numerous varieties some are made into curd [tofu], and into the widely celebrated bean-sauce (the Worcestershire of Asia) called *shoyu* (*sho,* soy; *yu,* oil), and which is almost as indispensable as rice. It forms the daily relish of the rich man and the beggar, and is in as general use as tea and tobacco."

In the same section (p. xlv): *Teriyaki:* fish in a sauce of soy, mirin, and sugar. "*Sashimi:* raw fish cut in thin slices and eaten after being dipped in *shoyu.–Kabayaki:* fish which is first steamed then dipped into soy and roasted (or eels cut open on the dorsal line, covered with soy mixed with sugar, and roasted)." "*Hachi-zakana:* a large fish salted and broiled, or boiled in soy.–*Uman:* picked-up fish or fowl boiled (with lotus-roots and potatoes) in soy and flavored with mirin... *Iri-tamago:* eggs stirred, then boiled in shoyu."

In the same section under "Rice" (p. xlvi): "*Azuki-meshi:* rice and red pea-beans mixed (boiled). *Mochi:* small dough-cakes made of rice and sold throughout Japan.–*Sushi:* a general name for food of boiled rice and fish, eggs, vegetables, etc., seasoned with vinegar and soy. As an affix [suffix] the form is changed into *zushi... Inari-zushi:* fried tôfu stuffed with *chirashi-zushi...* A differentiation of this popular food is the *Kombumaki:* baked or roasted fish wrapped in *kombu,* then tied, and boiled in sugar and soy... *Tsukudani:* small fish boiled in soy and used as a relish or condiment (named for Tsukudajima, a place in Tokyo famous for its preparation)... *Oden:* a stew (greatly enjoyed by the proletariat) of fried bean-curd, lotus-roots, potatoes, etc."

In the same section (p. xlvii): "Soup (*shiru*). *Tôfu-jiru:*

© Copyright Soyinfo Center 2021

bean-curd soup.–*Miso-shiru:* bean soup with vegetables."

In the section on Yokohama (p. 24) is a long quotation from Commodore Matthew Perry's *Narrative* (Vol. 1, p. 357): There was an exchange of gifts: "'The return gifts from the Emperor and the princes included beautiful specimens of gold lacquer; bronze; silver; porcelain; many rolls of fine silk brocade and pongee; many lacquered articles of rare merit; a number of rolls of fine crape; figured matting; jars of soy; coral and silver ornaments;...'"

In the section on Tokyo (p. 113): "*Sukiyaki* (pronounced skee-yah'-key) customarily is prepared by the host, who, with his guests, squat round a small electric brazier brought to a private room floored with soft matting and bright with flowers. Slices of red meat (beef), onions, leeks, bamboo-shoots, mushrooms, bean-curd and various seasoning vegetables, along with shoyu sauce are placed in the hot dish where a good soup stock is already sizzling. When all is cooked (a question of a few minutes) it is served with a raw egg, in a dainty lacquered bowl, and eaten with chopsticks (*o-hashi*–spoons are available)... To eat sukiyaki once is always to want it. It is filling and satisfying. Many Sukiyaki restaurants are found throughout Japan. Every city has one or more."

In the section on "Kyoto–Inari Shrine" (p. 438): At the *Inari-matsuri,* which falls on June 5, "the people eat *Inari-zushi,* or fried *tôfu* stuffed with boiled rice, since *tôfu* is the favorite food of the fox popularly believed to be the messenger of Inari (and by extension, the God of Rice)."

In the section on Kyoto to Koya-san (p. 515): At the inns on Koya-san, a mountain above and to the west of Kyoto, vegetarian [sic, vegan] Buddhist priests prepare the meals: "Meals are served in one's apartment; the food is purely vegetable, and after the second day distressfully unpalatable. Fish, flesh, fowl, butter, cheese, eggs, milk bread, coffee, and other necessaries of life are absent, and are replaced by seaweed, greens, bamboo-shoots, cabbage, daikon in various unappetizing forms, and other garden-truck which one eats as a novelty the first meal and rejects with an involuntary tightening of the throat when it is offered at the second and third. In addition there are flabby mushrooms boiled in very thin water without seasoning; the omnipresent boiled rice without sugar, milk, or salt; a bean-curd (tofu) for which one acquires a liking only after much patient effort; a yellow substance (known as yuba) made of the skin of bean-curd, and looking and tasting like thin-sheet rubber; and insipid sugarless tea. Hot sake can be had when called for."

In the section on "Korean agriculture" (p. 699): "Agriculture is the national industry and it gives occupation to six or seven millions of the people. The native methods are so primitive that ere long the production will be trebled by the modern system introduced by the Japanese... The chief crops are rice, beans, pease, millet, wheat, barley, tobacco, cotton, castor-oil, potatoes, melons, and peppers. The people are inordinately fond of lettuce, and nearly every yard has a plot of it. Besides teaching the Koreans methods for the development of the land on scientific lines, the Japanese have established model farms, miniature cotton and tobacco plantations; horticultural, forestry, and seedling stations, and besides stocking the country with fresh seeds and new agricultural tools, they have taught the people how to breed and care for live-stock, and have quadrupled the yearly output of Korean silk. The country has been referred to as a 'natural orchard,' and experts are supplanting certain of the poorly developed fruits with American pears, grapes, apples, etc."

In the section on "The Korean Pony" (p. 737): "The Korean Pony (prototype of the Japanese pony) is one of the most salient features of Korea. The breed is peculiar to it. The animals used for burdens are all stallions, from 10 to 12 hands high, well formed, and singularly strong, carrying from 160 to 200 lbs. 30 M. [miles] a day, week after week, on sorry food..." "They are fed three times a day on brown slush as hot as they can drink it, composed of [soy] beans, chopped millet-stalks, rice-husks, and bran, with the water in which they have been boiled. Every attempt at friendliness is resented with teeth and heels."

In the section on "Korean characteristics" (p. 725): "The very poor only take two meals a day, but those who can afford it take three and four. Among the dishes dear to the native heart are pounded capsicum, bean curd [tofu], various sauces of abominable odors, a species of sour kraut (*kimshi* [*kimchi*]), seaweed, salt fish, and salted seaweed fried in batter. 'Hot dog' in the literal sense is the piece de resistance of the Korean menu. There are no harder or more constant drinkers than the Koreans, and the vice is common to all classes."

In the section on Manchuria (p. 756): "From Heijo the rly. [railway] continues N.W. near the sea. Beyond 209 M. Shin-anshu, we cross the Seiseiko, then the Daineiko. The junks which here spread their broad sails to catch the breeze which blows above the tree-tops, come and go laden with timber from the Upper Yalu, wild silk cocoons, furs, soya-beancake, rice and kindred products."

375. Hepburn, Joseph Samuel; Sohn, K.S.; Devlin, L.P. 1934. Biochemical studies of soy bean milk and chicken protein. *J. of the Franklin Institute* 217(2):213-21. Feb. (Chem. Abst. 28:2042). [5 ref]

• ***Summary:*** "In Korea, soy beans are used extensively as a foodstuff. They serve as the basis of two foods, Doo Pu [known as Do Fu in Chinese] and soy bean milk... The Korean people passed immediately from a primitive condition to the status of an agricultural community without the intervention of a pastoral age. For this reason, soy bean milk was the only milk used by the Koreans as an accessory food until the introduction of cows in comparatively recent times. Even at the present time, soy bean milk is much used as a food and beverage especially during the summer

© Copyright Soyinfo Center 2021

months."

"Soy bean milk" gives results of feeding tests on albino rats, showing that soybean milk had about the same protein content as cow's milk, and that other nutrient compounds were present to a lesser extent. Values given for soybean milk and cow's milk (in parentheses) are: Protein 3.5% (3-4%); carbohydrate 0.61% (4.6-5.0%); fat 2.35% (3-6%); calcium 0.034% (0.120%); phosphorus pentoxide 0.091% (0.23%). It curdled at a lower acidity than cow's milk, and in feeding, the ration containing soybean milk produced gain in weight less rapidly and with less efficiency than that containing cow's milk. Chicken protein is a less efficient protein than caseinogen in the diet of young rats. Address: John Clifford English Laboratories of Physics and Chemistry, Hahnemann Medical College and Hospital of Philadelphia.

• ***Summary:*** "Résumé: The object of this paper is to present new evidences of the linkage relation between the genes for the form of leaves and the number of seeds per pod of soybeans. The varieties used are 'Wearucong' and 'Yanta', the former having broad leaves and two-seeded pods and the latter narrow leaves, and three-seeded pods. The results obtained in crossing experiments on the characteristics concerned are summarized as follows:

"1. The narrow leaf (r) is a simple recessive to the broad leaf (R) and in F2 the ratio of the latter to the former is about 3:1. This relation holds true for the two characteristics with regard to the number of seeds per pod, i.e., the two-seeded (F) is dominant over the three-seeded (f), segregating in F2 in an average ratio 3:1.

"2. There is a linkage relation between R and F, the crossing over value being about 10 per cent.

"3. The action of the gene for leaf form interferes to some extent with the action of the gene for seed number per pod, and a number of genes other than the leaf form gene seem also to interfere with the action of the gene for seed number per pod." Address: Chosen Sotokufu Noji Shikensho Nishi Sen Shijo (Sariin), Korea.

• ***Summary:*** Page 454: "Leguminous plants:... During the past decade area has been pursuing a slow, downward movement, while a sharp reduction was experienced by production. More than 72% of the total area and 67% of the total production were occupied by soy-beans and red beans."

Soy-beans were planted on 341,752 ha which produced 4,351,806 hectoliters worth 31,724,890 yen.

Red [azuki] beans were planted on 119,101 ha which produced 1,002,988 hectoliters worth 9,752,490 yen.

Page 1083: The section on Chosen [Korean] agriculture [Korea is a Japanese colony] states that rice and barley plus wheat are the two most important crops. "Third in importance comes the soy bean. In earlier times it was far from being an important produce owing to ignorance on the part of Korean farmers of the proper method of preparation, such as drying and assorting. It is now, however, in high esteem on the Japanese market where there is a demand for it not only as food, but for chemical industrial purposes, and thus the amount exported to Japan is yearly on the increase. In 1930 the total area under cultivation was 803,000 cho and the amount produced reached 4,410,000 koku, which was an increase of more than six times, compared with the year 1910.

"Millet is for most Koreans what rice is for the Japanese people. They depend more upon it than upon rice on account of its cheapness in price. The Korean farmers sell their rice, but use their millet crops for their daily diet,..." Note: Do they voluntarily sell their rice?

Page 1168: The section on Manchoutikuo [sic] agriculture states that the great majority of exports go to Japan, with China a close second. The principal export commodities include soy beans (worth 143.899 million Haikwan taels in 1932; #1 in value), bean cakes (66.311 million HT; #2 in value), and soy bean oil (24.511 million HT; #4 in value after coal).

Page 1172: A large table shows "Export of agricultural crops, 1929-1931" from Manchuria. For each is given the

© Copyright Soyinfo Center 2021

quantity in piculs (1 picul = 133.33 lb) and value in yen. For soya beans:

46.012 million piculs in 1929
33,536 million piculs in 1930
46.897 million piculs in 1931

The first section below this table states: "Soy beans: Manchoutikuo produces about three-fifths of the total production of soy beans in the world. The beans contain about 10 per cent. of oil, and the cake which is obtained in pressing the beans is exported as fertilizers. The latest figure for production of soy beans in Manchoutikuo was 4,430,000 tons and its total plantation area 3,878,000 hectares. The average crop [yield] per hectare was 1,122 kg.

Kaoliang comes next in importance after soy beans. "It serves as the diet of the people. Its production is 3,722,000 tons a year..."

382. Japan-Manchoukuo Year Book. 1934. Tokyo, Japan: Japan-Manchoukuo Year Book Co. 26 cm. First annual issue. [Eng]

• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. The Preface begins: "The far reaching political and economic changes which have taken place in the Far East within recent years have created the need for a year book covering the Japanese Empire and Manchoukuo [pronounced mahn-CHO-ku]. Especially to be noted is the growing relationship between Japan and Manchoukuo; hence any volume which discusses one, without consideration of the other, would be incomplete."

A table near the front gives "Weights, measures, and moneys." 1.80391 hectoliters = 1 koku = 5.11902 dry bushels (USA). 1 yen = $0.4984 dollars (USA) = 2.583 French francs = 2.0924 German marks.

A large color map (2-page spread) shows Japan, Manchoukuo, Chosen [Korea], Karafuto, and Taiwan–as well as the railways in each country.

Page 360: A large table shows the yield (in koku per tan) of 15 major Japanese crops, from 1904-08 to 1931–including rice, barley, naked barley, wheat, soya beans, red beans, etc. The yield of soya beans increased from 0.77 in 1904-08 to 0.86 in 1930.

Page 364: A table shows the production (in hectoliters) of beans, potatoes, and sweet potatoes in Japan from 1927 to 1931. For soya beans:

5.886 million hectoliters in 1927
5.370 million hectoliters in 1928
4.780 million hectoliters in 1929
5.473 million hectoliters in 1930
4.481 million hectoliters in 1931.

Production of red [azuki] beans in 1931 was 25.2% of soya beans.

Pages 626-34: The chapter on Agriculture in Manchoukuo begins: Widely different views are entertained as to the possibilities of Manchoukuo as a field of agricultural enterprises. Undoubtedly, they are immensely greater than those of mountainous Japan or Korea, but to liken them to those of the great agricultural regions found in North and South America seems to have no ground. The soil is not in general so rich, and in many places has been much exhausted, nor is the area of arable land so extensive, nor the climate so moderate. One great advantage it has had over most other countries in Eastern Asia is the comparative thinness of its population, but this advantage is fast being diminished by the constant influx of Chinese immigrants from the South. Taking all these things into consideration, Manchoukuo is yet the most favored spot for agriculture in the Far East, and its opportunities may well be termed 'immense,' which epithet is often met with in Japanese publications on that country.

"The great mass of level land, extending over the whole of Central Manchuria and comprising the basins of the Liao, Sungari, Nonni, and Hulan, the productiveness of which can compare favorably with any part of Japan or Korea, is by itself as large as the whole of the Chosen Peninsula or of the mainland of Japan,..." The forecast for soya bean production in Manchoukuo in 1933 is 5.216 million metric tons. Manchuria is divided into north and south. About half of the total crop production is grown in each area.

Page 627: A table shows "Production of crops in Manchoukuo, 1931." For soya beans:

1.175 million metric tons in Mukden.
2.414 million metric tons in Kirin.
1.637 million metric tons in Heilungkiang.
5.227 million metric tons total.

Soya beans had the largest production of any crop in the country in 1931, followed by kaoliang (4.497 mmt) then millet (2.960 mmt).

Page 628: A large table gives "Crop output in Manchoukuo," 1922-1931. For soya beans:

3.088 million metric tons in 1922.
3.088 million metric tons in 1923.
3.448 million metric tons in 1924.
4.173 million metric tons in 1925.
4.775 million metric tons in 1926.
4.816 million metric tons in 1927.
4.834 million metric tons in 1928.
4.849 million metric tons in 1929
5.297 million metric tons in 1930.
5.227 million metric tons in 1931.

Page 629: A large table shows "Cultivated area in Manchoukuo classified by crops, 1931. (Hectares)." For Soya beans:

Mukden 960,030
Kirin 1,902,210
Heilungkiang 1,338,350
Total: 4,200,590 ha

Previous year 4,118,450. "In one of the publications of the Chinese Maritime Customs" [*The Soya Bean of*

© Copyright Soyinfo Center 2021

*Manchuria,* 1911, p. 6] we read: "But when the Manchurian farmer pulls out the whole plant by the roots, or, having cut the crop with his sickle, proceeds to cut up the roots with a mattock for fuel, he is preventing the work of the bacillus radicicola from bearing its fruit and depriving his land of the provision made for it by nature. Thus, the soil in South-west Manchuria, where agriculture has been carried on for 400 years, has been bereft of all vegetable and organic matter and no longer bears harvests. The wonderful natural loaminess of the soil in the newer regions further north–for instance, at Shwangchengpu, where it is said that no manure is or ever has been used by the farmers in the 40 years since the land has been cultivated–this loaminess will assure good harvests for many years to come; but in the course of time even the richest soil will become exhausted, and to prevent such a disaster steps should be taken to inform the ignorance of the peasants who are at present deriving such great profits from their crops. If they could be shown the value of the process of 'turning under' the green bean plants after the harvest, the fertility of the land might be preserved."

Page 630: In this chapter on Agriculture, a section on "Soya beans" appears on pages 630-34. Contents: Introduction. Cultivation of soya beans. Different species. Uses of the soya bean. Bean oil. Bean cake. Near the start of the Introduction we read: It was the soya bean that introduced Manchuria into world trade, "and it is still the soya bean that makes Manchuria famous. So predominant is the position of the soya bean and its products, bean oil and bean cake, in the trade of Manchoukuo, that these three articles now constitute nearly one-half the value of the entire exports of the country. Sir Alexander Hosie called them, 'the Wealth of Manchuria.' They are indeed the wealth of the country, which has been growing ever since the time of Sir Alexander, and is still growing. Without the 'three articles,' by which term [soya] beans, bean cake, and bean oil are collectively called by the Japanese, the trade of Manchoukuo would, at a stroke, shrink to one-half its present amount, not only in export but most probably in import also, for experience has shown that Manchoukuo seldom buys more than it sells."

A large table (p. 630) titled "Soya bean output in Manchoukuo: Classified according to districts" is divided into South and North Manchuria. It shows how many metric tons were produced in each district in 1931 and 1932.

On page 634 is a long, interesting discussion of: "Kaoliang: Apart from its trade value, kaoliang or tall millet may be considered even more important than soya beans, in that it is the staple food of the native population, and the principal grain food of the numerous animals engaged in the farm-work and in the immense carrying trade of the three provinces.

"Before soya beans attained their present importance, half the total area of the cultivated land in Manchuria was devoted to kaoliang, and a large amount of it was exported to the provinces of China. Of late, however, the cultivation of kaoliang has given place to that of [soya] beans in many places, so that at present, in the northern part of South Manchuria, where beans are cultivated most extensively, about 50 per cent. of the whole cultivated area is devoted to beans, and only 20 to 30 per cent. to kaoliang. It is said that 8 pounds of seed suffice to sow an acre of land, producing in good years 10 to 12 cwt. [hundredweight] of grain. In a bad year or on poor soil, only a third of this quantity will be harvested. The crop is easily affected by climatic and soil conditions, and for this reason its cultivation is confined chiefly to Mukden Province, and in that province, too, it does not grow well in the Liaotung Peninsula or in the mountainous south-east.

"Kaoliang is not only used as a food-stuff for man and beast in Manchoukuo, but the native spirit is also made out of it. Nor are the grains the only useful part of it; the stalks play a very important role in Manchoukuo. The outer leaf layers, are woven into mats, so much required in the trade of the country, for roofing ricks and packing loads of grain and beans, and for numerous other purposes. The stalks are also utilized for fencing, bridging, and housebuilding, and where wood and coal are unobtainable or dear they are used for fuel.

"Kaoliang spirit, extensively used in both Manchoukuo and Mongolia, is colorless and transparent, and possesses a strong flavor, which peculiarly appeals to the taste of the natives.

"Kaoliang used to be an article of home consumption, and its market outside Manchuria was at most confined to China proper, but after the outbreak of the European War a trial shipment was made to Europe as grain food for horses, and being successful it has since continued to be exported. It is also exported to Japan, and the demand for it there is constantly increasing."

383. *Manchoukuo Year Book* (*The*). 1934. 1934. xxix + 852 p. See p. 234-35, 256-59, 267-79, 350-51, 396-97, 399-409, 466. Published by Minami Manshu Tetsudo Kabushiki Kaisha, Toa-Keizai Chosakyoku (South Manchuria Railway Co., East-Asiatic Economic Investigation Bureau), Tokyo. [Eng]

• ***Summary:*** Chapter 10, "Agriculture," discusses soya beans in detail. Some 34% of the "value of the manufacturing products represent the products of bean oil mills using soya beans as raw material" (p. 234).

Table 1 shows that agricultural products occupy about 50% (of the value in Haikwan taels) of total exports from Manchuria during 1929, 1930, and 1931. Of the manufactured products, [soy] beancake, [soy] bean oil and bran, which are directly produced from agricultural raw materials, constitute 80% of the total (p. 235).

The South Manchuria Railway (S.M.R.) has played a leading role in developing Manchurian agriculture

© Copyright Soyinfo Center 2021

(especially [soy] bean production) and expanding exports. A table (p. 256) shows the SMR's revenues from passengers and freight for selected years from 1907-1931. Freight revenues are, overall, about seven times as large as passenger revenues. The main source of freight revenues is coal, followed by [soy] beans and beancake (Source: SMRC Business Report). "The export of soya beans, beancake, and bean oil has increased three to four times in the past twenty years." The SMRC as established an Agricultural Experiment Station where crops (such as beans) and animals have been improved, bringing much benefit to Manchurian farmers. SMRC's work has contributed both directly and indirectly to the agricultural development of Manchuria by Han Chinese and by Korean settlers (p. 256).

Before the Manchurian incident, Japanese farmers were oppressed by the Northeastern military leaders and found it practically impossible to farm outside the South Manchuria Railway zone. Thus, before the Manchurian incident, only 730 Japanese households were engaged in agriculture in Manchuria. "The contribution made by Koreans to the development of agriculture in Manchuria cannot be overlooked... their entrance into the interior of Manchuria began only after the Russo-Japanese War" [1904-05]. A table (p. 257) shows the number of Japanese settlers and Korean settlers in Manchuria from 1908 to 1930. The number of Japanese settlers increased from 56,433 in 1908 to 288,784 in 1930. The number of Korean settlers increased from 51,070 in 1910 to 607,119 in 1930.

The Wanpaoshan incident happened just before the Manchurian incident (p. 257). Note: The Wanpaoshan Incident (Jap: *Manpozan jiken*) was a minor dispute between Chinese and Korean farmers which occurred on 1 July 1931, prior to the Mukden Incident [best known in Japan as the Manchurian Incident]. Although the issue was trivial, it was highly sensationalized in the Japanese and Korean press, and used with considerable propaganda effect to increase anti-Chinese sentiment in the Empire of Japan prior to the invasion of Manchuria [in Sept. 1931] (Source: Wikipedia, May 2009). As of May 2009 Mukden is known as Shenyang.

"The agricultural development in Mongolia was suddenly brought about after the Russo-Japanese War, and particularly after the establishment of the Republic of China [on 1 Jan. 1912], as the former policy of protecting the ancient kings of Manchuria was abolished, and the settlement of the Han [Chinese] race was encouraged. The Mongolians were more and more oppressed and obliged to retreat gradually to the inner desert districts, and the barren fields of Mongolia came to be rapidly cultivate by the Han settlers.

"Manchuria was made a great agricultural country by the joint efforts of the Hans, Japanese, Koreans, and Russians, with the Hans as the main factor; Manchuria came to have intimate relations with the world economy through its export agricultural products."

Agricultural products in the three provinces of Fengtien, Kirin, and Heilungkiang: Among the legumes are soya beans, Indian beans, and green peas. Table 13 shows the cultivated area (hectares) and production (metric tons) of these crops: (1) In the three provinces: Soya beans: 4,102,990 ha and 5,124,760 metric tons. Other legumes: 353,190 ha and 54,467 metric tons. (2) In the Kwantung Leased Territory and South Manchuria Railway Zone: Soya beans: 31,923 ha and 17,595 metric tons. Other legumes: 54,467 ha and 160,193 metric tons. Statistics are also given in Table 13 for Kaoliang (#2 crop after soya beans in area and production), millet (#3), maize (#4), wheat (#5), etc. Soya beans account for nearly 30% of the total acreage (p. 258-59).

Table 22 (p. 267) shows that area and production of soya beans in 1933 was larger Northern Manchuria than in Southern Manchuria. A long section titled "Soya beans" (p. 267-70) gives details about all aspects of soya beans, bean oil, and beancake, including exports.

Table 23 (p. 278), titled "Exports of principal agricultural products," gives statistics from 1922 to 1931 for quantity exported and value (in H.K. Taels) for 9 major products. The leading every year is either soya beans or beancake; bean oil is also important.

A section titled "Export of soya beans, beancake, and bean oil in recent years" (p. 279) includes Table 24, "Export of soya beans, beancake, and bean oil through the four ports of Dairen, Yingkow, Antung, and Vladivostok," total tons and relative index from 1926-27 to 1932-33.

The Dairen Agricultural Company, established in 1929, brings Japanese immigrants to Manchuria and helps them to become land-owning farmers; it does not operate any farms directly (p. 300).

The origin of Japanese administration on the Liaotung peninsula, the southern end of Manchuria, started in 1905 during the Russo-Japanese War. In Nov. 1906 Japanese first began to administer agricultural programs in Manchuria by issuing the regulations for the Kwantung Government Agricultural Experiment Station, and the establishment of the agricultural experiment station at Dairen. This station is now located at Chinchow (Chin-chou, or Jinzhou, in Liaoning province, as of 2009) (p. 300-01). On p. 302 is a full page of references to Japanese documents that served as the sources for the tables in this chapter on agriculture in Manchuria. Almost all were compiled and published by the South Manchuria Railway Co. (SMRC).

Chapter 14, "Industry," begins with a "General outline" (p. 350-51). Although Manchuria is rich in natural resources, modern industry did not develop until about 30 years ago. Before that, small enterprises supplied the needs of immediate neighborhoods. With the eastern advance of Russian influence and the establishment of Russian administration in Manchuria near the end of the 19th century, several modern industries appeared. "Before any general industrial development could take place, however, the

© Copyright Soyinfo Center 2021

Russo-Japanese War (1904-05) broke out, and as the result of the war, Japan came to administer the Kwantung Leased Territory and the railway zone. Since that time modern industry has developed in Manchuria"–including oil milling. Industry in North Manchuria [where Harbin is located] is inferior to that in South Manchuria in capital and equipment. Discusses the North Manchuria Railway.

A section on "Chemical industry" (p. 396-409) discusses oil milling in great detail.

Page 466 shows miso and soy sauce production in Manchuria. The 17 Japanese-run plants make 2,800 tonnes of miso and 4,550 tonnes of soy sauce. The 44 Manchurian-run plants make no miso and 1,381 tonnes of soy sauce. The number of factories in each major city and the capital assets of the companies are listed. Dairen is the main center of Japanese miso and soy sauce production, followed by Mukden, then Port Arthur. Hsinking is the main center of Manchurian soy sauce production.

Note: This Year Book was published from 1931 to 1941 by Japanese interests (SMRC) to justify the Japanese occupation and development of Manchuria after the "Manchurian incident."

384. Mukai, Seizo. 1934. Manshû daizu oyobi sono seihin [The soybean of Manchuria and its products]. Tokyo: Iwamatsudo Shoten. xvii + 340 p. Illust. 28 cm. [Jap]
• ***Summary:*** Contents: Preface. Part I: Introduction. The position of soybeans in the world and in Manchuria. Soybeans in Manchuria and Japan.

Part II: Soybeans: Outline, varieties, cultivation, character, quality and appraisal, usage of soybeans, packaging and shipping, demand of the production and foreign trade (Manchuria, Japan, Korea, Taiwan, China, South Pacific Ocean, Europe and USA), the custom of selling and buying.

Part III: Soybean cake/meal and soybean oil. Outline, varieties, method of production, quality and appraisal, usage (Cake: Fertilizer, fodder, raw material for foods, for drugs, and for the chemical industry. Table of soybean cake usage. Oil: Table of soybean oil use), packaging and shipping (pulp and oil), production, consumption, and trade (supply and demand in Manchuria, Japan, Korea, Taiwan, China, South Pacific and India, Europe and USA), the custom of selling and buying.

Part IV: Remarks. Bibliography.

Appendix: Table of equivalents in Manchuria, money system, rate of exchanging money, about the money the Central bank makes in Manchuria, money exchange, amount of exporting, soybean and soybean cake/meal related exchange rate table, important Japanese & Manchurian market weight and volume exchange rates, general or Manchurian abbreviation of words.

Photos, charts & graphs: 21 such items are described. Address: Manchuria.

385. Woodhead, Henry George Wandesforde. ed. 1934. China year book. Shanghai, China: North China Daily News & Herald. xxvi + 854 p. Vol. 16. Index. 22 cm.
• ***Summary:*** In Chinese, the title of this book is *Chung-hua nien-chien.* In chapter III, "Soy-beans and bean products are discussed on pages 41-42.

A table (p. 55) shows exports of vegetable oils from China in 1931. In descending order of weight (thousand piculs) they are: [Soy] bean oil 1,463. Wood oil 865. Groundnut oil 814. Unclassified 36. Tea [seed] oil 21. Castor oil 14. Sesamum seed oil 3.

The three most valuable oils in descending order of value (1,000 H. Taels) are: Wood oil 20,416. [Soy] bean oil 16,991. Groundnut oil 12,734.

In Chapter 5, a multi-paged table titled "Principal exports, 1932 and 1933," shows (p. 129): Exports of yellow [soy] beans to Egypt (incl. Anglo-Egyptian Sudan), Formosa, Germany, Great Britain, Hongkong, Italy, Japan, Korea, Netherlands, Netherlands India [Dutch East Indies; Dutch: *Nederlands-Indië*], Philippine Islands, Straits Settlements and F.M.S. [Federated Malay States], U.S.S.R. [USSR] (Russia) Asiatic Routes, Other countries. The five leading importers of yellow [soy] beans, in descending order of weight imported (in million piculs), are: U.S.S.R. [USSR] (Russia) 4.479. Japan 3.331. Germany 3.222. Korea 0.759. Netherlands India 0.555. Total: 17.269.

On the same page are exports of beancake to Japan, Korea, Norway, USA, U.S.S.R. (Russia) Asiatic Routes, Other countries. The three leading importers, in descending order of weight imported (in million piculs) are: Japan 5.854. U.S.S.R. (Russia) 2.119. Other countries 1.979.

Note: This is the 2nd earliest English-language document seen (May 2020) that contains the term "U.S.S.R." in connection with soybeans–even though the Soviet Union was formed on 30 Dec. 1922.

In Chapter 7, a table (p. 153) shows the foreign and domestic trade at seven major Manchurian ports: Aigun, Harbin, Hunchun, Lung-Chingtsun, Antung, Dairen, Newchwang. Dairen does by far the largest volume of trade, followed by Harbin, then Newchwang.

On page 153 a table shows the quantity (piculs) of [soya] beans, bean oil, and beancake exported from (1) China including Manchuria, and (2) Manchuria alone. For each of the three products and two categories the amount sent to Japan, Europe, and Other countries is given. Europe imports almost all of the bean oil. Other countries get the largest amount of the beans and the beancake.

Also discusses Mongolia: Religious organization (Chapter 4, p. 70-71), including Lamaist Buddhism and "Living Buddhas." Also discusses Tibet (Chapter 4, p. 88-91). This section begins: "Geography: Tibet, sometimes called the 'Roof of the World,' consists of (1) the Lama kingdom of Tibet with its provinces and dependencies; (2)

© Copyright Soyinfo Center 2021

the semi-independent native states of Kam, under Chinese protection; and (3) the Kokonor [Koko-nor / Koko Nur] Territory, under the control of the Chinese Amban [a Manchu word meaning "high official"] residing at Hsi Ling, in Kansu. Note: Wikipedia states (June 2008): "The Qing Emperor appointed the amban in Tibet, who represented Qing suzerainty over the Buddhist theocracy of Tibet, and commanded over 2,000 troops stationed in Lhasa. The chief amban was aided by an assistant amban (Bangbàn Dàchén) and both of them reported to the Qing Court of Colonial Affairs. Their duties included acting as intermediary between China and the Hindu kingdom of Nepal (Ghorkhas Country); a secretary (Yíqíng zhangjing) dealt with native affairs. Three Chinese commissioners (liángtái), of the class of sub-prefects, were stationed at Lhasa, Tashilumbo and Ngari.

"The Qing imperial resident in Tibet was introduced in 1727 and most ambasa [high officials; A Manchu word, plural of amban] were appointed from the Manchu Eight Banners, a few were Han Chinese or Mongol. The Emperors used ambasa to influence Tibetan politics, and the Qianlong, Jiaqing and Daoguang Emperors each decreed that the Dalai Lama and Panchen Lama were bound to follow the leadership or guidance of the ambasa in carrying out the administration of Tibet."

A brief biography of Li Yu-ying (Courtesy name: Shih-tseng) appears on p. 693. Address: 1. B.A., formerly editor of the "North-China Daily News"; 2. M.J.I., Editor of the "Peking and Tientsin Times".

386. Gray, George Douglas. 1935. The soya bean in international trade. *Foreign Affairs* 13(2):340-42. Jan.
• ***Summary:*** This article begins: "The soya bean has been described as unquestionably the most important food plant in the world." The soya bean is Manchuria's principal crop. "Under Japanese management [in part, since shortly after 1905], its culture has been developed and its uses extended. It has had a dominant part in drawing 30,000,000 Chinese to Manchuria, and it has aided them in building there a prosperous community. "The profit from its transport and sale has in large measure supported the Japanese adventures on the mainland of Asia."

Table 1 gives "World soya bean production." Manchuria, with 10,184,928 acres under cultivation produces 208,298,428 bushels or 20.4 bushels/acre, which is 59.3% of world production. China proper, with 5,635,000 acres under cultivation produces 89,340,000 bushels or 15.8 bushels/acre, which is 25.4% of world production. Japan, with 913,836 acres under cultivation produces 15,238,873 bushels or 16.6 bushels/acre, which is 4.3% of world production. Korea (a province of Japan since 1910), with 1,942,922 acres under cultivation produces 20,431,754 bushels or 10.5 bushels/acre, which is 5.8% of world production. The U.S.A., with 1,373,000 acres under cultivation produces 18,146,000 bushels or 13.2 bushels/acre, which is 5.2% of world production. The world, with a total of 20,049,686 acres under cultivation produces 351,355,046 bushels of soybeans.

Note: This is the earliest document seen (Jan. 2005) that gives detailed total soybean production or area statistics worldwide.

Table 2, "Trade of Manchuria (in millions of Haikwan taels)" shows Manchuria's imports, exports, total trade, and balance of trade for the years 1907, 1917, and 1927-1932. In 1907 Manchuria had a negative balance (-8.6). In 1917 the balance began to be positive (+2.5), but by 1927 the balance was strongly positive (+139.0) rising to +255.0 in 1931.

Table 3, "Exports of Manchuria (in millions of Haikwan taels)" shows Manchuria's 5 main exports (both value and percentage of total) from 1927 to 1932. In descending order of value in 1932 they are soya beans, coal, kaoliang, millet, and pig iron. In 1927 soya beans, with a value of 219.5 accounted for 54.5% of exports. In 1932 soya beans, with a value of 234.6 accounted for 60.8% of exports.

Table 4, "Imports of soya bean and soya bean oil" [from Manchuria] shows the imports of each, in tons, in 1930 and 1932, by the following countries: United Kingdom, United States, France, Holland, Denmark, Germany, Italy, Belgium, and Japan. In 1932 the world's top 4 importers of soya beans were Germany (1,168,300), Japan (481,600), Denmark (288,864), and the UK (159,938). In 1932 the world's top 4 importers of soya bean oil were Japan (72,240), UK (27,343), Belgium (5,600), and Germany (3,739).

Reprinted in Proceedings of the American Soybean Association. 1935. Aug, p. 39-43. Condensed in Soybean Digest. Dec. 1940. p. 4-5. [75 ref]

• ***Summary:*** Contents: Introduction. Acreage, production, and price of soybeans in the United States (Table II shows production in Manchukuo, Chosen [Korea], Japan, and the Dutch East Indies from 1929-1934). Uses for soybeans (incl. in ice cream, ice cream cones, candies, puddings, salad dressings, sausage filler). Chemical composition of soybeans. Processes for the removal of the bitter taste from soybeans. Extraction of soybean oil (by hydraulic pressure, Anderson expeller, or new European solvent process). Yield of oil and meal from soybeans. The method of analysis of soybean flour. Chemical composition of soybean flours: Soybean flour output in the United States, minerals, carbohydrates, quality of the protein, vitamins, lecithin and fats in soybean flour. Soybean flour in the diet: Cost of protein and fat, calcium, and carbohydrates in soybean flour. The use of soybean flour in baking. Effect of enzymes of soy flour on bread: Digestibility of soybean bread, increased absorption claimed for soybean flour, cost of soybean bread. Conclusions.

"The most expensive food constituents are minerals, vitamins, proteins, and fats. Soybeans flour is rich in all of these food constituents and yet relatively cheap. The moderate cost of soybean flour makes it possible for people of small incomes to obtain the maximum of these essential nutritional constituents required by the body which in the form of other foods might be beyond their reach."

"The first successful attempt to prepare a soybean flour which would be free from the disagreeable beany taste, which would remain fresh almost indefinitely (that is, not develop rancidity), and which would retain, practically unchanged, the original composition of the bean is described in the Berczeller patent (1924). This process consists in subjecting the cleaned soybeans to the action of saturated steam for 10 to 15 minutes. The beans are then dried, cracked in order to remove the hulls, and ground into flour. Such flour has a sweet, pleasant, nut-like taste (a characteristic of most flours obtained from soybeans which have been subjected to a special beany-taste removing treatment) and may be kept for many months without spoilage due to the development of rancidity. A later patent (1932) issued to this inventor consisted in subjecting soybeans (dry or soaked) to steam distillation (see also Berczeller, 1933). In making soybean flour by this process in this country, the beans used, generally the yellow variety, are first treated to destroy insects and insect eggs. The beans are then cleaned or freed from impurities, washed to remove the dirt, and subjected to the patented process. The beans are then dried and passed through cutting machines and the hulls are removed by aspirators and bolting machines. The cut beans are then aerated with warm air and ground in a special air-cooled mill, the fine flour being bolted through a special bolting machine" (p. 446).

Soybean oil mills in ten U.S. states now have a total annual crushing capacity of about 10 million bushels (p. 448).

Tables show: (1) Acreage, production, and average price per bushel of soybeans (1932-33, for 10 leading states and the USA total). (2) Annual soybean production, in bushels, in 5 countries (USA, Manchukuo, Chosen [Korea], Japan, Dutch East Indies, 1929-34). (3) Chemical composition of soybeans (minimum, maximum, and average). (4) Fat and protein content of soybeans grown in 15 different U.S. localities. (5) Mineral content of various legumes and grains (air-dry basis). (6) Composition of the component parts of soybeans (cotyledons, embryo, seed coat). (7) Composition of many soybean flours. (8) Composition of high fat, press cake, and solvent-extracted soybean flours. (9) Composition of solvent-extracted soybean flour and other legume flours (bean, pea, lentil). (10) Mineral content of selected foods, incl. soybean flour. (11) Composition of the mineral portion of grains and other seeds. (12) The composition and the mineral and vitamin content of selected foods. (13) Composition of selected foodstuffs. (14) Retail cost of foods and their components [soybean flour is by far the least expensive source of protein and calcium]. Formula and method for making soybean bread (using 20% soybean flour). Formula and method for making whole wheat bread. (15) Composition of representative flours. (16) Composition of representative types of bread. (17) Correlation of loaf volume and urease content of soybean flour used in making bread. Address: Food Research Div., Bureau of Chemistry and Soils, USDA.

• ***Summary:*** This article begins: "The soybean is a plant of early cultivation in China, and for more than four thousand years has been used largely by the Chinese and other Oriental nations as human food. It is first mentioned in the "Ben Tsao Gang Mu" [Bencao Gangmu], an ancient Chinese materia medica, written in the year 2838 B.C.

"The Occident has been under the false impression

© Copyright Soyinfo Center 2021

that the Oriental lives almost wholly on rice. Rice is used extensively, but if we are to correct our traditional view of the rice diet, we can amend our statement by saying that it is the soybean which is probably the most universal article in the Oriental dietary. Especially is this true of the more than six hundred million dwelling in eastern Asia. During the centuries the use of the soybean has spread from its original home in Shantung [Shandong province] and Manchuria throughout China, Korea, Japan, the Philippines, the Dutch East Indies [today's Indonesia], and to a limited extent to India itself.

"The Chinese make practically no use of dairy products, and the majority of the people consume a very meager amount of meat; yet, in spite of this, they have lived for centuries on what appears to be a remarkably well-balanced diet by the use of the soybean." Address: PhD, Chief of Chemistry Dep., Nashville Agricultural Inst. [Madison College, Madison], Tennessee.

390. *New York Times.* 1935. Soy bean exports start. Cargo leaves Chicago in new rivalry with Orient. Oct. 27. p. 30.
• ***Summary:*** "The steamship Barrie cleared for Montreal yesterday with 47,000 bushels of soy beans–the first export shipment of that crop from Chicago in three years... The shipment, officials said, signalized the development of a new export field. Heretofore European markets have purchased soy beans from Manchukuo, Korea or Japan... American producers are making a bid for European business on the basis of quality, consignors of the first cargo said."

Page 37: Under "Articles and preparation of food." Bean sauce is often added to kimchi.

"Soy beans are boiled, mashed, and made into cakes. These are dried and stored some months and allowed to mold and ferment. When ripe they are broken and soaked in salted water, then strained. The liquid is boiled to the right concentration and used as a condiment in many foods in every Korean home.

"Bean and pea curd, precipitated soft proteins, are used with soup and eggs or served with bean sauce and an oil prepared from sesame seed.

"Sprouted beans are common, both beans and sprouts being boiled and served with sauce." Address: D.D.S., M.S., F.A.C.D., Dental Dep., Severance Union Medical College, Seoul, Korea.

392. Japan-Manchoukuo Year Book. 1935. Tokyo, Japan: Japan-Manchoukuo Year Book Co. Index. 26 cm. Second annual issue. [Eng]
• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. On the title page, just below the title but in small letters we read: "Cyclopedia of General Information on the Empires of Japan and Manchoukuo." Below that is a small map showing the Japanese empire, circled, as part of East Asia–under which is printed: "Neither is Understandable Without the Other." Below that are listed the cities and names of 15 agents worldwide. This book was published in mid-December 1934.

In the Japan and Manchoukuo parts of the book, soya beans are most widely discussed in the respective chapters on Agriculture (p. 353 and 713). In each case, information given the previous year is updated one year: See p. 359, 363 (Soybean production in Japan in 1932 was 4,351,814 hectolitres).

Page 716: Soybean production in Manchoukuo in 1933 was 4.601 million metric tons on 3.747 million hectares.

Page 717: Export of soya beans in 1932 was 42.536 million piculs [1 picul = 133.33 lb weight Avdp] worth 144.304 million Hk. Tl. [Haikwan taels]. Export of soya beans in 1933 was 39.111 million piculs worth 169.095 My [Manchoukuo yen?].

A large table (p. 717) shows "Staple exports as classified by destinations in 1932 (in piculs). Soya beans were exported to the following countries–in descending order of amount exported:

Germany 10.474 million piculs
Soviet Russia 7.520 million piculs
China 7.246 million piculs
Egypt 6.997 million piculs
Japan 5.568 million piculs
Great Britain 1.348 million piculs
Chosen [Korea] 0.905 million piculs.
Netherlands India [today's Indonesia] 0.849 million piculs
Netherlands 0.369 million piculs
Hongkong 0.355 million piculs
Denmark 0.340 million piculs
Italy 0.212 million piculs
Belgium 0.145 million piculs
Central America 0.125 million piculs
France 0.030 million piculs
Straits Settlements 0.022 million piculs
Philippines 0.0088 million piculs
Norway 0.0082 million piculs
British India 0.0028 million piculs
Sweden 0.0024 million piculs
United States 0.0012 million piculs
Siam [today's Thailand] 0.00028 million piculs.

Other major export crops were kaoliang, maize, millet, groundnuts, wheat and buckwheat.

© Copyright Soyinfo Center 2021

Page 714 is all about "Soya beans" which are the most important staple product of the country and has been grown for many years before the opening of Newchwang while some had been exported to the ports of South China. At the time of the Russo-Japanese war (1904-05) the Japanese became aware of the value of the bean, especially of the bean cake for use as fertilizer, but the article did not enter upon its career as an important factor in international trade until 1910 when the Mitsui Bussan Co. made a trial shipment of 100 tons to England. Since then, mainly through the continued experiments of the Central Laboratory, maintained in Dairen by the S.M.R. [South Manchuria Railway], many new uses, have been found for soya bean until today the articles manufactured either wholly or partially from beans, bean oil and bean cake include more than thirty items, among which the following may be mentioned: soy [sauce], sauces, soups, condensed milk, casein, cheese, salad oil, crackers, macaroni, flour [probably roasted], confectionary, glycerine, explosives, enamels, varnishes butter and lard substitutes, edible oils, salad oils, water-proof material, linoleum; paints, soap, celluloid, rubber substitutes, printing-ink, lighting and lubricating oils, etc. Bean cake is also used extensively for fodder and as fertilizer.

"The S.M.R. Agricultural Experiment Station at Kunchuling [Kungchuling] and elsewhere have through continuous experiments and distribution of superior seeds to Manchurian farmers increased the crops by 10 to 20 percent 'while the oil content of such improved beans have been increased by more than ten percent. The use of these improvements is being advocated by means of poster campaigns and other forms of propaganda, while demonstrations are being carried out to instruct the farmers in new methods. At the same time a new industry of manufacturing beans into oil and cakes has sprung up, the modern methods rapidly replacing the old-fashioned presses.

"Soya bean output in 1934 is as follows:

A large table (p. 718) titled "Output of soya bean" [in Manchoukuo, according to districts] is divided into South and North Manchuria. It shows the following for each district in 1934: Cultivated area (hectares). Output per hectare (kgs.). Output in 1934 (metric tons). Actual output in 1933 (metric tons). Increase or decrease (metric tons). Rate of increase (1933 = 100).

393. Lunden, J.C. 1936. Om dyrkning af soyaboenner [On the cultivation of soybeans]. *Statens Forsogsvirksomhed i Plantekultur, Meddelelse* 41:668-70. [Dan]

• ***Summary:*** Translation of the periodical: Danish Governmental Research in Agriculture Report 246. January 1936. B. Guidelines.

Translation of the text:

Every several years, the question of soybean growing in Denmark is put forward, but with the previously-conducted agricultural tests there has yet to be any significant harvest.

At the government's research stations, the growing of soybeans has been attempted repeatedly. In statements on this topic from 1912, government adviser K. Hansen stated that for approximately 20 years (the first time in 1881) he conducted cultivation trials with many different soybean varieties, but on only one single occasion was able to obtain a few mature seeds. In 1912, samples of Manchurian soybeans were sown at all of the research stations. The researchers all stated that the varieties of soybeans they tried ripened much too slowly. At some locations, flowering began in August and there were a few pods, but in most locations the soybeans did not flower or form pods, and in none of the locations were there any mature seeds as growth was stopped by frost which appeared in September or early October, at the latest. Moreover, as a stall-feed crop soybeans could also not compare with commonly used crops like peas, fava beans, alfalfa or turnips, since soybeans grow too slowly and provide too small of a yield.

Soybeans are particularly at home in a continental climate and are an old agricultural plant in Asia, where they are widely grown in northeastern China (Manchuria), as well as in Korea and Japan, i.e. at the same latitude as Spain and Italy, since soybeans require high temperatures.

To illustrate soybean crops from 1930-1933, the following average numbers were reported, according to information from the Department of Statistics (note: hkg = 100 kg): The greater part of the world's production is grown in Manchuria, which has a distinct continental climate favorable for soybeans. The average soybean yield for 1930-1933 for Manchuria is indicated to be more than 12 hkg per ha, for Japan and the US approximately 10 hkg, for Korea approximately 7 and for Russia approximately 5 hkg per ha. Manchuria has had higher yields of soybeans than of wheat, Korea and the US nearly similar average yields of wheat, while Japan and Russia have had significantly higher yields of wheat than of soybeans. Denmark has had 2-6 times as great a yield of wheat, at 28.4 hkg per ha, as the aforementioned countries have had of soybeans.

Since soybeans have a very nutritious seed, which combines a high content of nitrogen-containing substances with a very high fat content, there has been work in many locations over the last decades to expand the area of soybean growing. For this purpose, it has primarily been North America, Russia and several Central European countries that have fortunately gotten into work improvements with soybeans.

At the request of Aarhus Oliefabrik A/S, test growing was conducted at Als, Aero and Lolland in 1933, with earlier varieties of soybeans, under the leadership of the secretary at that time, R. Kampp, and in the hot summer mature seeds were grown. No precise yield calculation was done, but for some varieties the yield was 12-21 hkg per ha (Report from the Agricultural Commission from 1931).

Additionally, in 1934 and 1935 a number of soybean

© Copyright Soyinfo Center 2021

varieties were grown at government research stations at Lyngby, Tystofte, Abed, Spangsbjerg and Studsgaard, including Manchurian and German varieties from the test plantings arranged by Aarhus Oliefabrik A/S, and earlier varieties received directly from the US, Canada, Central Europe and Russia, and finally a sample from the College of Agriculture.

During the germination study of the samples at the National Seed Research Center, it was discovered that the sprouts were often attacked by bacteria, which just like with garden peas, can greatly damage the sprout. The soybeans were generally sown in the first half of May, and the seed was inoculated with nitrogen [fixing bacteria] beforehand. Approximately 30 kg of seeds of ha were planted. The row distance was 50 cm and the plant distance approximately 10 cm. The nice summers of 1934 and 1935 had above normal heat and sunshine. The soybeans grew slowly, however. The earliest varieties began to flower in late July, and in 1934 these were mature in late September, while in 1935 not until into October and for both years the crop had to be dried artificially.

At Tystofte and Lyngby, the best varieties yielded 5-8 hkg of seed per ha in 1934, and somewhat less in 1935, while from spring corn normally 35-40 hkg of kernels is obtained. At the other research locations the soybean yield was not determined, but in 1934 is was estimated to be about one quarter of a normal corn crop at Abed, and at Spangsbjerg a slightly mature seed was also harvested. In 1935, the soybeans were ruined by frost in May at Abed and by wind at Spangsbjerg. At Studsgaard, no usable seed was grown.

Therefore, in the studies conducted during the last three warm and sunny summers, even the best of the tested soybean varieties gave a much smaller yield than spring corn, and in cooler summers with more rain the yield was even less, or the crop failed altogether.

Since the price of soybeans adopted in Denmark in recent years has been 13-15 ore per kg, according to the present results the growing of soybeans is not economically viable here in Denmark.

Translated by Thor Truelson.

Note 1. This is the earliest document seen (April 2016) concerning the cultivation of soybeans in Denmark. This document contains the earliest date seen for soybeans in Denmark, or the cultivation of soybeans in Denmark (1881). The source of these soybeans is unknown.

• ***Summary:*** "7. Colombia. Soya is a crop for temperate countries, but may be acclimatised to the hot regions of Colombia as demonstrated at the Agricultural Experiment Stations of Valle Cauca and Tolima and in various regions of the Administration of Choco. It is probable that certain varieties from England and North Canada might be adapted to the cool soils of the country. Important trials in acclimatisation are now in progress in all the agricultural experiment stations in Colombia: Palmira, Armero (Tohima), and *Tulio Ospina,* in the government of Antioquia... The varieties which have given the best results are: Brazilian Yellow, Manchu, Lexington and Biloxi...

"Generally speaking the varieties which have given the best results in Colombia are as follows: Biloxi, Otootan, Brazilian, Mammoth Yellow, Hahto, Laredo, Lexington, Taikozan (black), Midwest or Mongol, Hollybrook, Easycook, Manchu, Korea (light brownish colour), Virginia, Wilson Five. The growth period varies from 75 to 100 days for the early varieties and 100 to 170 days for the late varieties. In respect of yield in seed, the Agricultural Experiment Station of Valle has obtained the following results:–*Biloxi:* 1,500 to 2,000 kg. *Otootan:* 1,600 to 2,200 kg. *Mammoth Yellow:* 1,000 to 1,500 kg. *Hollybrook:* 1,400 to 1,800 kg. *Laredo:* 1,500 to 2,200 kg. Farmers in Colombia wishing to obtain soya seed can apply to the Agricultural Experiment Station of Palmira and the Farmers' Society of Antioquia.

"8. Costa Rica. A certain number of tests have been made in this country with soya with both good and bad results. The crops suffered either from attacks by nematodes which infest the roots or from the excessive humidity of the region. For this reason the enthusiasm which was shown at one time for this crop has diminished greatly and at present different varieties of haricot beans are preferred for consumption. On the other hand, owing to the limited area of the country, commercial cultivation of soya for industrial purposes does not offer sufficiently advantageous prospects. Note: This is the earliest document seen (March 2021) concerning soybeans in Costa Rica, or the cultivation of soybeans in Costa Rica.

"9. Cuba. Soya grows in all the provinces of Cuba, chiefly in Havana, Pinar del Rio and Santa Clara. Trials with this crop are carried out by the Secretariat for Agriculture and the Agricultural Experiment Station of Santiago de las Vegas.

"In Cuba no native varieties are cultivated. The varieties introduced are as follows: Soya S.P.I. 40.125, Wilson Five, Bocket, Biloxi, Arlington, Mammoth Yellow, Columbia, Peking, Otootan, Ito San, Dixie, Midwest, Haberlandt, Chiquita, Illini, Dunfield, Tokio, Virginia, Early Brown, George Washington, Tarheel Black, Lexington, Harbinsoy, Hispida, Mansoy. The variety Otootan has given the best results in the deep, dry soils of the region of Havana. It yields abundant leaf material and a large harvest of seed.

"10. Dominican Republic. The Department of Agriculture carried out numerous trials with soya several years ago and came to the conclusion that, even when the soil was treated with materials specially imported for this purpose, the trials were unsatisfactory. Consequently, this plant has never been cultivated in this country except for experimental purposes. Note: This is the earliest document seen (March 2021) concerning soybeans in the Dominican Republic, or the cultivation of soybeans in the Dominican Republic. This document contains the earliest date seen for soybeans in the Dominican Republic, or the cultivation of soybeans in the Dominican Republic (several years before 1936). The source of these soybeans is unknown.

"11. Equator [Ecuador]. The Direction of Agriculture

© Copyright Soyinfo Center 2021

has recently imported a few varieties of soya with a view to encouraging the introduction of this crop. Trials with these varieties are now in progress. Note: This is the 2nd earliest document seen (March 2021) concerning soybeans in Ecuador, or the cultivation of soybeans in Ecuador. This document contains the 2nd earliest date seen for soybeans in Ecuador, or the cultivation of soybeans in Ecuador (1936). The source of these soybeans is unknown.

"12. Guadeloupe. Soya cultivation has been tried in this country. The Service of Agriculture (*le Service de l'Agriculture*) has recently introduced a certain number of varieties, which have been distributed to planters and grown in gardens." A summary of the observations made by Mr. Hazael-Massieux on 5 varieties cultivated in the Botanical Garden is given.

"13. Guatemala. The cultivation of soya, restricted to a limited area, is beginning to give good results. Setbacks were experienced at first owing to the fact that the necessary nitrogen is not used in cultivation. On the other hand, this leguminous plant did not find markets easily as the native population were unappreciative. At the present time this situation is reversed as the natives now consume soya and large quantities of soya are being sown in the regions of Pinula and Salama. It is also grown in Alta Verapaz." Note: This is the 2nd earliest document seen (March 2021) concerning soybeans in Guatemala, or the cultivation of soybeans in Guatemala. This document contains the earliest date seen for soybeans in Guatemala, or the cultivation of soybeans in Guatemala (1926). The source of these soybeans is unknown. Address: Rome, Italy.

398. Sasaki, Shûiku. 1936. Studies on some constituents of soybean seeds and their transformations during germination. *J. of the Department of Agriculture, Kyushu Imperial University, Fukuoka* 5(2):51-116. Aug. 3 (Chem. Abst. 31:4697). [99 ref. Eng]

• ***Summary:*** Contents: Introduction. Methods of germination of soy-bean seeds. General analysis of nitrogenous compounds of the seeds and the seedlings by general analysis. Quantitative determination of amino-acids in the proteins of the seeds and the seedlings by the Van Slyke method. Amino-acids isolated from the hydrolysate of the protein of the seeds. Organic bases of the seeds. Monoamino-acids and acid-amide in the juice of the etiolated seedlings. Organic bases in the juice of the etiolated seedlings. Transformation of carbohydrates during germination. Starch produced during germination. Transformation of oil during germination.

Sasaki investigated the changes in composition occurring in Japanese and Korean soybean varieties during germination up to 12 days. There was no change in total nitrogen at the end of 5 and 10 days. However after 5 days, a decrease of 21% in protein nitrogen and a corresponding increase in non-protein nitrogen was observed. After 12 days of germination, 5% of the starting soybean weight was isolated as asparagine; this is in agreement with the results obtained by Dunn et al. (1948).

The total carbohydrates increased from 22.6% in the seed to 25.8% by the 5th day, based on the starting weight of the seed, and then decreased slightly to 25.1% by the 10th day. Stachyose and sucrose were used up during the first 5 days, at which time reducing sugars reached a maximum of 4.7% and then decreased. Starch and dextrin increased steadily from 0.4to 9.0%, based on the starting seed weight, during the first 10 days of germination. Petroleum ether extractables [fat] had decreased 17.0% by the 5th day and 37.0% by the 8th day of germination. From this study it appears that during the first 5 days of germination the loss in oil weight is equivalent to the gain in carbohydrate weight. Address: Dep. of Agriculture, Kyushu Imperial Univ., Japan.

399. *Times of India* (*The*) (*Bombay*). 1936. Use of soya milk suggested. Sept. 8. p. 15.

• ***Summary:*** Dr. K.D. Dadachanji, who practices medicine in Bombay, has strongly urged the "adoption of vegetable soya milk as a substitute for cow's or buffalo milk." He says that it can be made for less than a pice [192 pice = 1 rupee] per seer if prepared at home–and for still less if made in a modern factory.

He says that soya milk is widely used by the people of China, Korea, and Japan to good advantage. If the Municipal Corporation of Bombay were to start a soya milk factory in that city, he says, the problem of pure milk supply could be solved.

Note: This is the earliest of 117 articles or ads seen (Sept. 2010) in *The Times of India* that contains the term "soya milk," or that mentions soya milk (regardless of how it is spelled) in connection with India.

400. Morse, W.J. 1936. Soybeans in the United States: In relation to world production and trade. *Proceedings of the American Soybean Association* p. 55-64. 16th annual meeting. Held 14-16 Sept. in Iowa. [2 ref]

• ***Summary:*** The slow advance of soybean "cultivation in Western Countries was undoubtedly due to the lack of adapted varieties for various soil and climatic conditions. Increase of acreage and production in the United States is closely correlated with the introduction of varieties from the Orient. In less than thirty years the acreage of soybeans in the United States has increased a hundred fold–from about 50,000 acres in 1907 to nearly 5½ million acres in 1935. During this period the United States Department of Agriculture has brought about 10,000 introductions of soybeans from the soybean regions of the Far East and the culture of the crop has spread from a few states in the early days to twenty-seven states at the present time.

"In Manchuria, often called 'the land of beans,' the soybean is grown to a greater extent than in any other

© Copyright Soyinfo Center 2021

country. It occupies about 25 per cent of the cultivated area and is relied on by the Manchurian farmer as a cash crop. With its rise as an international trade commodity, it is truly the 'Wealth of Manchuria.' Chosen [Korea] and Japan are large producers and southward from China the soybean is cultivated to some extent in India, Siam [later renamed Thailand], the Philippines, Cochin China, and during the past decade the production has nearly doubled in the Dutch East Indies. In Siberia extensive experiments have been under way to extend the cultivation of the crop but progress has been slow and Siberian beans have not yet been a factor in international trade.

"The production of soybeans in the Western World is concentrated largely in the Corn Belt States of the United States. Beginning with the experiments of Haberlandt in Austria in 1877, the soybean has been grown experimentally in most of the European countries but in general the climatic conditions are not well suited to its culture with the possible exception of certain regions, such as the Ukraine in the U.S.S.R. Varying degrees of success have been obtained in different regions of Africa, especially South Africa where yields of 25 to 35 bushels per acre have been obtained. Experiments in nearly all South American countries and Mexico have shown some successful results [as] in Argentina and Cuba but acreage is not extensive. In Canada, considerable interest had been shown in the crop but its culture–about 15,000 acres–is confined chiefly at present to the Province of Ontario. The future trend of the crop for commercial purposes undoubtedly will be concentrated largely in the United States, Canada, and certain regions of the U.S.S.R."

A table (p. 56) shows the increase in production of soybeans (in million bushels) during the 10-year period from 1925 to 1935 in the world's top five producing countries: Manchuria 92.67 -> 140.4. United States 5.190 -> 39.64. Chosen (Korea) 18.72 -> 21.96. Japan 18.31 -> 13.31 (1933). Netherland India [later Indonesia] 3.536 -> 6.676 (1934).

"Bean trade was an ancient and flourishing institution when the ports of China were first opened to the commerce of the Western World. In 1835, Newchwang (Yingkow, Yingkou), in South Manchuria, was an important port of shipment for the great coastal trade in beans, bean cake, and bean oil to the ports of southern Chinese provinces and other oriental regions. Manchuria is still the chief source of world trade in soybeans and from here the beans and bean products oil and cake move principally to other provinces of China, Japan, the Philippines, the East Indies, and to other countries of Northwest Europe. In 1908, about 7,000,000 bushels of beans were shipped out through the port of Dairen, chiefly to Chinese and Japanese ports. For the period 1925-1929, the average annual shipments to China, Japan, and European countries were 62,353,566 bushels. The first successful shipment from Manchuria to Europe was made to an English oil mill in 1907, and as an important source of vegetable oil and animal feed the beans soon found a market not only in English oil mills but in other European countries and America. Since 1931, when American-grown soybeans were first exported to European markets, chiefly to the oil mills of Germany, there has been an open European market to the American farmer. With economical methods of production and high quality beans, America is in a position to compete for the 50,000,000-bushel trade in European markets."

Two tables (p. 58) show international imports and exports of soybeans by major trading countries for an average 5-year period (1925-29) and for 1934. The leading importers in 1934 (preliminary, with imports in million bushels) are: Germany 33.57. Japan 20.29. Denmark 9.910. United Kingdom 6.615. Netherlands 4.695. Sweden 3.426. Italy 0.739. United States 0.006. The leading exporters in 1934 are: Manchuria 44.21 (down from 62.35 in 1925-29). Japan 0.025. Netherlands 0.0009.

"In recent years, the oil milling industry of Manchuria has declined quite markedly. During the height of processing beans for oil and cake, more than 90 mills were in operation, while late in 1930 not more than 25 mills were crushing beans. The decline in this industry has been due chiefly to a decreased demand for bean cake as fertilizer, the low price of silver, and almost the entire suspension of bean oil export due to the development of the oil extraction industry in Europe. In European countries it has become more profitable to import soybeans than to import bean oil."

Two tables (p. 59) show international imports and exports of soybean oil by major trading countries for an average 5-year period (1925-29) and for 1934. The leading importers in 1934 (preliminary, with imports in million lb) are: Netherlands 44.00. Belgium 27.60. United Kingdom 24.13. Austria 22.07. Morocco 20.28. Sweden 12.55. Also listed are: Norway 8.701. Algeria 0.004. The leading exporters of soybeans in 1934 (preliminary, with imports in million lb) are: Manchuria 122.6. Denmark 41.80. Netherlands 26.05. Germany 24.99. Sweden 8.98. Japan 7.95 United States 2.040.

"Practically all exports of soybean cake and meal have originated in Manchuria and average about 1,375,000 tons for the five-year period 1926-31. About 70 per cent of this exportation went mainly to Japan, Chosen, and China. Cake and meal shipments to European countries went chiefly to Germany, although considerable quantities were exported to Denmark, Sweden, the Netherlands, and Finland. The average importation of soybean meal and cake into the United States for the five-year period 1930-1935 was 31,726 tons."

"The rise of the soybean to a crop of special importance in the world's commerce and in the industry of the United States is one of the most remarkable agricultural developments of recent times." Address: Bureau of Plant Industry, USDA, Washington, DC.

401. LeClerc, J.A. 1936. The soy bean is becoming Americanized. *Bakers Weekly* 76(13):56. Dec. 24.
• ***Summary:*** Contents: Introduction. Important food. What it contains. Raises food value.

"When consumed in the body the bean yields an alkaline ash, which is one more point in favor of this good food product." Foods discussed include: Soy bean milk. Cheese [tofu]. Soy bean flour ("In this country soy beans are being utilized for food purposes chiefly in the form of flour. The flour is produced mainly in one of two ways, viz., either by grinding and bolting the pressed cake after the bulk of the oil has been extracted [removed] from the bean or by grinding and bolting the specially treated (steamed) whole bean"). Roasted soybeans. Soy sauce. Soy bean oil.

The article ends: "New uses are being continually found for soy bean flour. For example, it may be mixed with cocoa; it may be used as a part substitute in the making of confectionery chocolate, macaroni, ice cream and mayonnaise; it may be used in soda water drinks just as malted milk is now being used. The specially treated soy bean may be roasted and in that form consumed as are peanuts. The hydrolyzed soy bean protein forms the chief ingredient of soy sauce. The soy bean shares with egg yolk as the chief source of lecithin. Soy bean oil is finding a ready market because of the various industrial and food uses to which it may be put."

An oval portrait photo shows J.A. Le Clerc. Address: Bureau of Chemistry and Soils, United States Dep. of Agriculture.

402. Sadaoka, Sueichi. 1936. [On the ancient cereals and beans discovered in the old capital ruins, Fuyo, of Kudara, one of the ancient nations in the Korean peninsula]. *Nogyo Oyobi Engei* (*Agriculture and Horticulture*) 11:2437-3443. [2 ref. Jap]
• ***Summary:*** Introduction: Our ancestors had been taking leaves, roots and fruits of wild plants as their own food in very ancient times. Nevertheless, in the time before Jimmu, who was the first emperor of Japan, people had already utilized five principal plants as crops–rice in paddy field, pearl millet, barnyard millet, wheats (including barley) and beans in upland field.

In the time after the first emperor, Jimmu, many descriptions of rice can be found in some historical documents, but we can find only quite limited descriptions of the silkworm, mulberry tree, hemp, and some edible fruits. As for wheats, we have the following historical description: sericulture and wheat crops in Sinki 1150 [A.D. 490] were very productive..., and 1000 [?] of wheat seeds were given to the king of Kudara from the 29th year of emperor Kinmei's era. As for pearl millet, we can read the following historical record issued by the emperor's government in Sinki 1360 year [A.D. 700]; pearl millet is as important a crop as rice. so it should be preserved as much as the total volume of the seed could support people's food sufficiency for about 9 years' use...

It will be a very interesting problem to confirm what kinds of cereals and legumes were grown in ancient times. Ancient cereals and legumes can be occasionally discovered in burn condition at shell mounds and the remains of houses in ancient times. Burnt rice grains have already been discovered at Kinkai, Kinkai-gun, Keisho Nando (in Korea), Naka, Tsukushi-gun, Fukuoka-ken, and Nagamine, Yame-Gun in Fukuoka-ken. They were considered to be products of more than 1900 years ago according to the investigations of Katô.

The very place where the author discovered many burnt cereals and legumes this time is considered to be the ruins of old food storehouses for supply to Kudara troops. These cereals might have been burnt when Kudara was conquered by some neighboring enemies. If so, they are the products of about 1,300 years ago and, in other words, the products of about 600 years later than the time that the burnt rice grains mentioned previously were produced. The author has a very strong interest in these cereals because many kinds of cereals were discovered there.

The next section (1) is on the history of Fuyo. It was the fifth capital of the Kudara kingdom. The very intimate relationship between Kudara and Japan lasted for 100 years plus several decades from emperor Kimmei's era until emperor Tenchi's era.

The next section (2) is: On the position in the soil profile where ancient cereals and beans were found. Kudara perished about 1300 years ago. The author conducted archaeological investigations in 1926 and 1927 [when Korea was part of Japan]. Eventually he found rice, wheat, mung beans, hulled barley, rye and azuki beans–in descending order of the numbers of each obtained. In addition he had a chance to look at burnt soybeans (at the Fuyo county government office) previously dug out from this place. Afterwards, Saburô Sugi discovered burnt soybeans at another place near the ruins and showed them to the author. Therefore the author considered that soybeans were possibly preserved in the storehouses at the time Kudara was thriving.

The next section (3) is: Some comparisons between ancient burnt rice, wheats and beans, and present varieties of these crops. Address: Chusei Nando Agric. Exp. Station [Japan].

Page 221: Table 296 (full page). Soybeans and soybean oil: International trade (principal importing and exporting countries), average 1925-29, annual 1933-35. For soybeans: The main exporting countries are China and Manchuria. The main importing countries in 1935 are Japan and Germany. For soybean oil: The main exporting countries are Manchuria, Denmark, and Germany. The main importing countries are The Netherlands and the United Kingdom. One source is the International Yearbook of Agricultural Statistics. Address: U.S. Dep. of Agriculture, Yearbook Statistical Committee, Washington, DC.

404. Inahara, K. ed. 1936. Japan Year Book. Tokyo: The Foreign Affairs Association of Japan. 1389 p. See p. 464-65, 478, 1081, 1178-79, 1182.

• ***Summary:*** Page 464: In 1934 in Japan soy-beans were grown on 336,378.84 ha and produced 3,902,774 hectoliters of beans worth 29,185,101 yen. In 1934 azuki beans were grown on 119,491.24 ha and produced 1,126,554 hectoliters worth 10,391,920 yen. Thus, azuki bean production was 28.9% as much as soy-bean production.

Page 1081. The section on Chosen [Korean] agriculture states that the soy bean is one of the most important crops, after rice, barley, wheat and rye. “In 1934 the total the total area under cultivation was 795,000 cho and the amount produced reached 3,813,000 koku, which was an increase of more than five times compared with the year 1910.”

Pages 1178-79. The pages on “Foreign trade” show that in 1933 imports to Manchoukuo first surpassed exports, and this new trend has continued until the most recent year, 1935, when imports were valued at 604 million Haikwan taels, compared with exports of only 421 million.

Page 1182. A large table gives production of major crops in Manchoukuo, 1929-1935 in metric tons. For soy beans:

4.849 million metric tons in 1929.
5.298 million metric tons in 1930.
5.227 million metric tons in 1931.
4.268 million metric tons in 1932.
5,205 million metric tons in 1933.
3.841 million metric tons in 1934.
3.822 million metric tons in 1935.

Other crops in the table are other legumes, kaoliang, millet, maize, wheat paddy-field rice, upland rice, and other cereals.

In 1935 soy beans were grown on 3.249 million ha with a yield of 1,180 kg/ha.

The country now has an abundance of food to feed the roughly 30 million inhabitants. The surplus crops are exported every year.

A large table shows “Exports of agricultural products, 1931-1935.” Exports of soy beans in 1935 were 29.203 piculs worth 130.053 million yen.

At the end is a large, colored fold-out map of the Japanese empire. There are many ads on unnumbered pages.

viii + 282 p. Bibliography, p. 276-82. No index. 25 cm. [90 ref. Fre]

• ***Summary:*** A superb early work, containing extensive original information, looking at developments with soybeans and soyfoods country by country, worldwide.

Contents. Preface (p. 1). A. Cultivation of soy (*soja;* p. 4): 1. Botanical description, selection, classification of the varieties. 2. Cultivation properly said. 3. Enemies and illnesses.

4. Cultivation in the various countries: 4a. The Americas (p. 38): Antigua, Argentina, Bermuda, Brazil, Canada, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, USA (gives details on all varieties grown, and describes production, history, varieties, and cultural practices in North Carolina, Illinois, Indiana, Iowa, Maryland, Massachusetts, Mississippi, Missouri, New York, Ohio, West Virginia, Wisconsin, Conclusion), Guadeloupe, Guatemala, British Guiana, Dutch Guiana, British Honduras [Belize], Jamaica, Barbados, Martinique, Mexico, Montserrat, Peru, Puerto Rico, El Salvador, Trinidad and Tobago, Uruguay.

4b. Europe (p. 101): Germany, the Danubian countries, Austria, Spain, France, Great Britain, Hungary, Italy, Netherlands, Poland, Romania, Switzerland, Czechoslovakia, Turkey, USSR.

4c. Asia (p. 128): Ceylon, China and Manchuria, Cyprus, Federated States of Malaysia, British India (incl. Punjab, Bihar and Orissa, Burma, Berar, Madras Presidency, Bombay Presidency, Bengal (incl. Nepal, Bhutan, Sikkim, and the district of Darjeeling), Assam, North-West Frontier Province, United Provinces), Netherlands Indies, Indochina (incl. Tonkin, Annam, Laos, Cambodia, and Cochinchine), Japan, Palestine, Siam.

4d. Africa (p. 146): French West Africa, Algeria, Belgian Congo, Cyrenaica, Egypt, Eritrea, Madagascar, Morocco, Mauritius (Ile Maurice), Reunion (Réunion), Rhodesia, Anglo-Egyptian Sudan, Tripolitania, Tunisia, Union of South Africa.

4e. Oceania (p. 153): Australia, Fiji Islands, Hawaii, New Caledonia, New Zealand, Philippines.

B. Utilization of soya (p. 158): 1. The soybean in human nutrition and in industry: Whole soybeans, chart of the uses of whole soybeans, use of soya in the green state (green vegetable soybeans), soy sauce (*dau-tuong* of the Annamites, or *toyo,* named shoyu by the Japanese, or *chau-yau* or *chiang yoo* by the Chinese), condiments and sauces based on soya in the Netherlands Indies (*tempe, ontjom, tempemori* and *tempe kedele* [various types of tempeh and onchom, p. 168-70]), *tao tjo* [Indonesian-style miso], *tao dji* [fermented black soybeans], *ketjap, ketiap benteng* [Indonesian-style soy sauce], soymilk (*le lait de soja*), yuba (*crème de lait de soja*), tofu (*le fromage de soja*) and fermented tofu (*des fromages fermentés,* made by Li Yu-ying near Paris), soymilk casein (*caséine du lait de soja,* for industrial use, including vegetable albumin, or galalithe [galalith]" [isolated soy protein], and artificial wool), soy lecithin (*lécithine de soja*), soy flour (*la farine de soja,* incl. soy bread, soy pastries, and soy cocoa).

Note 1. This is the earliest document seen (Sept. 2010) that uses the term *benteng* or *ketiap benteng* to refer to an Indonesian-style soy sauce.

2. Soy oil (p. 194): Food uses, industrial uses (including soaps, products resembling petroleum, paints, varnishes, linoleum, and artificial rubber), extraction, directory of U.S. manufacturers of materials and equipment for soybean processing, directory of U.S. and Canadian manufacturers of food products based on soya (*produits alimentaires à base de soja,* p. 205-06), directory of U.S. manufacturers of industrial soy products (p. 206-07).

3. Soybean in the feeding of domestic animals (p. 207): Forage, hay, silage, pasture, soybean seeds, the minerals in soybeans, soya as a feed for dairy cows, cattle, buffaloes, sheep, hogs, horses and mules, poultry.

4. Use of soya as fertilizer (p. 257). C. The trade of soya and of its by-products (p. 363): Production of soybeans in the principal countries, economic importance of soybean cultivation in the USA, soybean trade/commerce including tables of the major importers and exporters, and amounts traded annually in 1931-1934, price of soybeans, cost of production.

List by region and country of people and organizations that responded to a questionnaire sent by IIA (p. 273-76). Bibliography of main publications consulted, listed by region and country of publication.

Reunion (*Ile de la Réunion*)*:* "The soybean (Le Soja) is only cultivated as an experimental crop, on a few square meters at the agronomic station" (p. 148).

Fiji (*Iles Fidji*)*:* Soybean cultivation is not yet practiced in this colony; however soybean seeds are currently being imported in order to conduct a trial.

New Caledonia: In 1928 soybean cultivation was introduced to New Caledonia.

Note 2. This is the earliest document seen (Dec. 2007) concerning soybeans in Bhutan, Costa Rica, Dominican Republic, El Salvador, Guatemala, Israel, Jamaica, Madagascar, Morocco, New Caledonia, Palestine, Peru, or Réunion, or the cultivation of soybeans in Bhutan, Costa Rica, Dominican Republic, El Salvador, Guatemala, Israel, Jamaica, Madagascar, Mexico, the Middle East. Morocco, New Caledonia, Palestine, Peru, or Réunion. It is also the earliest document seen (Dec. 2007) concerning soybeans in connection with (but not yet in) Cyprus; it is stated that soybeans are not grown on the island of Cyprus. Soybean cultivation is not practiced in the Italian colonies of Eritrea (Erythrée, now part of Ethiopia) or Cyrenaica (Cyrénaïque, now part of Libya).

Note 3. This document contains the earliest date seen for soybeans in Bhutan, New Caledonia, or Réunion, or the cultivation of soybeans in New Caledonia (1928), or Bhutan

© Copyright Soyinfo Center 2021

or Réunion (1936) (One of two documents).

Note 4. This is the earliest French-language document seen (March 2020) that mentions tempeh, which it calls "tempe" (p. 168). It notes that, in general, the indigenous people of the Netherlands Indies use soybeans mainly to make *tempe*, a product which, throughout central and eastern Java, takes the place reserved for *ontjom* in western Java. Tempeh is found in two forms: either in large flat cakes which are cut at the time of sale into small square morsels, or wrapped in folded banana leaves. A detailed description of the preparation of each of these two types of tempeh is given as well as another type of tempe, called *tempemori*, which is made with soybeans and coconut presscake.

Soybean cultivation is not known to be practiced in the following countries or colonies: Antigua, Barbados, British Honduras (renamed Belize in about 1975), Trinidad and Tobago.

Note 5. The name "Georges Ray" is mentioned in this book on an unnumbered page. Address: Rome, Italy.

406. Japan-Manchoukuo Year Book. 1936. Tokyo, Japan: Japan-Manchoukuo Year Book Co. xii + 1258 p. Index. 26 cm. Third annual issue. [Eng]

• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. On the title page, just below the title but in small letters we read: "Cyclopedia of General Information on the Empires of Japan and Manchoukuo. Appendices: Who's Who Business Directory." Below that is a small map showing the Japanese empire, circled, as part of East Asia–under which is printed: "Neither is Understandable Without the Other." Below that are listed the cities and names of 18 agents worldwide. This book was published in late-December 1935.

In the Japan and Manchoukuo parts of the book, soya beans are most widely discussed in the respective chapters on Agriculture. In each case, information given the previous year is updated one year.

Page 359: A large table gives the yield of rice and other cereals in koku per tan from 1904-08 to 1933. For soya beans the yield in 1933 was 0.86.

Page 364: Table 29 shows production of "Beans, potatoes and sweet potatoes" in hectolitres from 1929 to 1933. 1.80391 hectolitres = 1 koku = 5.11902 dry bushels (USA). For soya beans:

4.789 million hectoliters in 1929
5.473 million hectoliters in 1930
4.481 million hectoliters in 1931.
4.352 million hectoliters in 1932.
5.053 million hectoliters in 1933.

Page 767: A large table shows "Crop output" (metric tons) in Manchoukuo yearly from 1922 to 1935* (* = estimate). For soya beans:

3.088 million metric tons in 1922
3.262 million metric tons in 1923
3.448 million metric tons in 1924
4.174 million metric tons in 1925
4.776 million metric tons in 1926
4.817 million metric tons in 1927
4.834 million metric tons in 1928
4.849 million metric tons in 1929
5.298 million metric tons in 1930
5.227 million metric tons in 1931
4.268 million metric tons in 1932
5.205 million metric tons in 1933
3.500 million metric tons in 1934
3.995 million metric tons in 1935

The other principal crops shown in the table are other beans, kaoliang, millet, maize, wheat, rice, and other crops (incl. groundnuts).

Page 788: A large table gives a crop forecast for 1935. Production of soya beans is expected to increase 17%.

On p. 788-89 is a long section of text on "Soya beans" identical to that in the 1935 Year Book. Soybean production in Manchoukuo in 1933 was 4.601 million metric tons on 3.747 million hectares.

Page 717: Export of soya beans in 1932 was 42.536 million piculs [1 picul = 133.33 lb weight Avdp] worth 144.304 million Hk. Tl. [Haikwan taels]. Export of soya beans in 1933 was 39.111 million piculs worth 169.095 My [Million yen? / Manchoukuo yen?].

A large table (p. 717) shows "Staple exports as classified by destinations in 1932 (in piculs). Soya beans were exported to the following countries–in descending order of amount exported:

Germany 10.474 million piculs
Soviet Russia 7.520 million piculs
China 7.246 million piculs
Egypt 6.997 million piculs
Japan 5.568 million piculs
Great Britain 1.348 million piculs
Chosen [Korea] 0.905 million piculs.
Netherlands India [today's Indonesia] 0.849 million piculs
Netherlands 0.369 million piculs
Hongkong 0.355 million piculs
Denmark 0.340 million piculs
Italy 0.212 million piculs
Belgium 0.145 million piculs
Central America 0.125 million piculs
France 0.030 million piculs
Straits Settlements 0.022 million piculs
Philippines 0.0088 million piculs
Norway 0.0082 million piculs
British India 0.0028 million piculs
Sweden 0.0024 million piculs
United States 0.0012 million piculs
Siam [today's Thailand] 0.00028 million piculs.

Other major export crops were kaoliang, maize, millet,

© Copyright Soyinfo Center 2021

groundnuts, wheat and buckwheat.

Page 714 is all about "Soya beans" which are the most important staple product of the country and has been grown for many years before the opening of Newchwang while some had been exported to the ports of South China. At the time of the Russo-Japanese war (1904-05) the Japanese became aware of the value of the bean, especially of the bean cake for use as fertilizer, but the article did not enter upon its career as an important factor in international trade until 1910 when the Mitsui Bussan Co. made a trial shipment of 100 tons to England. Since then, mainly through the continued experiments of the Central Laboratory, maintained in Dairen by the S.M.R. [South Manchuria Railway], many new uses, have been found for soya bean until today the articles manufactured either wholly or partially from beans, bean oil and bean cake include more than thirty items, among which the following may be mentioned: soy [sauce], sauces, soups, condensed milk, casein, cheese, salad oil, crackers, macaroni, flour [probably roasted], confectionary, glycerine, explosives, enamels, varnishes butter and lard substitutes, edible oils, salad oils, water-proof material, linoleum; paints, soap, celluloid, rubber substitutes, printing-ink, lighting and lubricating oils, etc. Bean cake is also used extensively for fodder and as fertilizer.

"The S.M.R. Agricultural Experiment Station at Kunchuling [Kungchuling] and elsewhere have through continuous experiments and distribution of superior seeds to Manchurian farmers increased the crops by 10 to 20 percent 'while the oil content of such improved beans have been increased by more than ten percent. The use of these improvements is being advocated by means of poster campaigns and other forms of propaganda, while demonstrations are being carried out to instruct the farmers in new methods. At the same time a new industry of manufacturing beans into oil and cakes has sprung up, the modern methods rapidly replacing the old-fashioned presses.

"Soya bean output in 1934 is as follows:

A large table (p. 718) titled "Output of soya bean" [in Manchoukuo, according to districts] is divided into South and North Manchuria. It shows the following for each district in 1934: Cultivated area (hectares). Output per hectare (kgs.). Output in 1934 (metric tons). Actual output in 1933 (metric tons). Increase or decrease (metric tons). Rate of increase (1933 = 100).

• ***Summary:*** Describes the soybean, its history in the United States, the advantages of planting it, its uses as oil and vegetable milk, its use in industry, and prospects for the future. Contains eight photos: (1) William Morse of the USDA standing in front of many floor-to-ceiling shelves filled with food products made from soybeans. (2) Green vegetable soybeans in their opened pods. (3) Horse-drawn carts with sacks of soybeans and silos filled with soybeans in Manchuria. (4) William Morse pouring whole soybeans into his left hand from a can held in his right hand. On a nearby wooden box, apparently containing the same type of soybeans, is written in Japanese (from right to left) *"Hakka mamé,"* which means "peppermint soybeans." (5) Two farmers in a field of shocked soybeans. (6) A Korean girl pounding soybeans in a tall wooden mortar. (7) A Chinese courtyard filled with vats of fermenting soy sauce, each covered with a conical braided bamboo lid. (8) Two farmers wearing straw hats inspecting soybeans in a field.

408. Morse, W.J. 1937. Soybean variety studies of the United States Department of Agriculture. *Proceedings of the American Soybean Association* p. 16-18. 17th annual meeting. Held 14-16 Sept. at Urbana, Illinois.

• ***Summary:*** "One of the outstanding results of soybean improvement work in the United States has been, the realization of the importance of varietal adaptation... Varietal adaptation is obviously the reason why practically every locality in the soybean regions of the Orient has its own local varieties... Of the large number of introductions obtained from Asia, the same variety rarely has been secured a second time unless introduced from the same locality... Before numerous introductions were made by the Department, beginning in 1898, there were not more than eight varieties of soybeans grown in this country, and the culture of these varieties was confined to limited areas in a few states... Seed samples were obtained through consuls, missionaries, seedsmen, government agencies, and foreign explorers until by 1909 we had 175 varieties; by 1913, 427 varieties; by 1919, 629 varieties, by 1925, 1133 varieties, and at the present time more than 2,500 distinct types. Since 1989 the Department of Agriculture has made more than 10,000 introductions of soybeans from China, Manchuria, Japan, Chosen [Korea], Java, Sumatra, Siberia, and India. This large collection, ranging in time of maturity from 75 to 200 or more days, has show wide differences in adaptation to soil and climatic conditions..."

After preliminary testing at Arlington Farm, Virginia, the introductions are sent to various experiment stations for cooperative studies...

"The soybean has been used chiefly as a forage crop in the United States and for many years breeding work tended largely toward the development of varieties for hay, silage, and pasture. With the rapid development during the past few years of the soybean for oil, food and industrial purposes, acreage for bean production has increased greatly. The improvement and development of varieties adapted to a wide range of conditions and uses undoubtedly has been one of the most important factors in increased acreage and seed production."

"Extensive cooperative investigations with more

© Copyright Soyinfo Center 2021

than 3,000 introductions and selections of soybeans have been carried on during the last three or four years with experiment stations and special cooperators in 44 states and the insular possessions, Hawaii and Puerto Rico. Many of these selections gave outstanding results when compared with standard varieties in different sections and are being increased for more extensive field tests. Several of the varieties in different sections were found especially suitable for use as green shelled beans, dry edible beans, or beans of high oil and protein content, as commercial beans.

"In 1936, more than 5,000 individual soybean plant selections from introductions and natural hybrids were under test at Arlington Farm. Although improvement work at Arlington has been largely plant selection, some hybridization work has been started, especially with the wild soybean and the most promising cultivated types. Oil and protein studies have been conducted along with the breeding work, analyses being made of introductions grown in the same and under different environmental conditions. An extensive series of varieties, introductions and selections at Arlington Farm ranged from 12 to 26 per cent oil and from 28 to 50 per cent protein... In view of the interest in soybean oil for paint purposes, studies were conducted to show the range in iodine number. The results of these investigations showed a range from 118 to 143 for domestic varieties and 155 for the wild soybean.

"The increasing use of soybeans for food has resulted in a demand for varieties especially suited for various food purposes. Extensive cooperative cooking experiments with the Bureau of Home Economics of the Department of Agriculture and with several state experiment stations have shown considerable variation in flavor and cooking quality in both the green and dry beans of edible varieties from the Orient. The most promising of these have been named and distributed to special cooperators by several state experiment stations. Some of these varieties are especially valuable as green shelled beans, flour, dry edible beans, roasted salted beans [soynuts], bean curd, bean milk, and bean sprouts." Address: Bureau of Plant Industry, USDA, Washington, DC.

409. *Foreign Crops and Markets* (*USDA Foreign Agricultural Service*). 1937. Bumper crops in Chosen [Korea] forecast. 35(21):319-20. Nov. 20.
• ***Summary:*** "Record or near record harvests of most major crops in Chosen this year have been forecast, according to a report received from Vice Consul Ralph Cory at Seoul." Production of "soybeans is only slightly below that of record years."

A table titled "Chosen: Production of specified crops, 1935-1937," gives estimates for rice, cotton, millet and "soybean" for these three years. For soybean: 1935 final estimate–22,401,000 bushels. 1936 final estimate–19,375,000 bushels. 1937 first estimate–22,606,000 bushels.

• ***Summary:*** This volume presents information formerly published [until 1935] in the statistical section of the Yearbook of Agriculture" (p. 1).

Page 218: Table 290. Soybeans: Acreage, yield, production, and season average price per bushel received by producers, by States, average 1928-32, and annual 1935 and 1936.

Page 218: Table 291. Soybeans: Production in specified countries, 1924-25 to 1935-36 (in 1,000 bushels). The countries are: United States, Manchuria, Chosen (Korea), Japan, Netherland India (later Indonesia). Note: Data from Manchuria are reports from the South Manchuria Railway and do not include the large production of China proper. Manchuria is by far the biggest soybean producer in 1936, with 155.424 million bu produced. U.S. production increased from 4.947 million bu in 1924 to 44.378 million bu in 1935.

Page 219: Table 291. Soybeans: Average price per bushel received by producers, United States, 1926-27 to 1936-37. The weighted average price ranged from a low of $0.48 in 1931-32 to a high of $2.00 in 1926-27.

Page 219: Table 203. Soybeans for seed: Average wholesale selling price per bushel at Baltimore [Maryland] and St. Louis, Missouri, 1926-1925. The price in St. Louis ranged from a low of $0.94 in 1933 to a high of $2.66 in 1929.

Page 220: Table 294. Soybeans crushed and crude oil produced by quarters, 1926-27 to 1935-36 (in 1,000 pounds). The total soybeans crushed increased from 335,000 bu in 1926-27 to 25,181,000 bu in 1935-36. The total soybean oil produced rose from 2.650 million lb in 1926-27 to 208.964

© Copyright Soyinfo Center 2021

million lb in 1935-36.

Page 220: Table 295. Soybean oil, domestic crude: Average price per pound, in drums, New York, by months, 1929-30 to 1936-37.

Page 221: Table 296. Soybeans and Soybeans and soybean oil: International trade (principal importing and exporting countries), average 1925-29, annual 1933-35.

Page 225: Table 394. Hay, tame by kinds: Acreage and production, United States, 1919-1936. Note: Soybean, cowpea, and peanut vine hay are grouped together. Their total acreage rose from 2.332 million acres in 1929 to a peak of 8.027 million acres in 1934, falling to 6.829 million acres in 1936. Their total production rose from 2.078 million short tons (1 short ton = 2,000 lb) in 1929 to a peak of 7.788 million short tons in 1935, falling to 5.411 million short tons in 1936 (preliminary).

Page 265: Table 471. Imports of principal agricultural products into the United States by countries, 1928-29 to 1935-36. Soybeans were imported from China, Japan, Kwantung, Germany, other countries, and total. The total decreased (because of the Smoot-Hawley Tariff Act of 1930) from 76,366 tons in 1928-29 to 18,277 tons in 1935-36.

Page 368: Table 471 continued. Soybean oil was imported from Kwantung, China, Japan, other countries, and total. The total decreased from 17.172 million lb in 1928-29 to 11.284 million pounds in 1935-36 (because of Smoot-Hawley).

Page 371. Table 472. Oil cake and oil-cake meal: International trade, average 1925-29, annual 1933-35. The main cakes are from cottonseed, flaxseed, peanuts, corn, etc. Soybean cake is not included in this table. The principal exporting countries in 1925-29 were the USA, USSR, and British India. The principal importing country in 1925-29 was Germany (by far).

Page 372: Table 473. Vegetable oils: Exports from the United States, 1909-10 to 1935-36. The main vegetable oil exported (by far) in 1909-10 was cottonseed oil at 223 million lb. but by 1935-26 it had been reduced to a trickle, 3.5 million lb. Soybean oil was first exported in 1919-20 when 67.7 million lb were exported. This decreased to 4.4 million lb in 1935-36.

Page 372: Table 474. Vegetable oils: imports into the United States, 1909-10 to 1935-36. Statistics for soybean oil imports started in 1911-12 with 28.021 million lb, increasing to a peak for 336.825 million lb in 1917-18 (during World War I), then decreasing to 11.284 million lb in 1935-26.

Soybeans are also mentioned on pages 378 (farm business and related statistics. Crop and livestock summary: Acreage, production, numbers and value, average 1928-32, and annual 1935 and 1936), 381 (total acreage an total farm value of principal crops, by States, 1935 and 1936. Note: Soybeans are not separated out from the many crops grown, Illinois and Iowa have the largest farm value in 1936: 368 and 363 million dollars respectively). 382 (gross income from farm production, USA, by commodities, 1934 and 1935). Address: U.S. Dep. of Agriculture, Yearbook Statistical Committee, Washington, DC.

412. Descartes de Garcia Paula, Ruben. 1937. A soja como materia prima para industria [The soybean as a raw material for industry]. Rio de Janeiro, Brazil: Instituto Nacional de Technologia (Ministerio do Trabalho, Industria e Commercio). 21 p. 24 cm. [4 ref. Por; fre]

• ***Summary:*** Contents: Introduction. Names of the soybean in different languages. Table showing production of soybeans in leading countries: Manchuria, China, Japan and Korea, United States, Russia, Netherlands Indies. Chemical composition of soybeans in China and Japan, Russia, Hungary, England, and USA (tables {p. 9-11} showing chemical composition, based on research in USA and Brazil); for each variety is given the percentage composition of water, oil, protein (*proteinas*), carbohydrates, cellulose, and ash. Analyses of 7 soybean varieties (made in the USA by USDA): Austin, Ito San, Kingston, Mammoth, Guelph, Medium Yellow, Samarow. Analysis of 11 varieties grown in Sao Paulo, Brazil: Peking, Wilson Five, Minsoy, Dunfield, Mandarin, Haberlandt, Virginia, Habaro, Dixie, Mammoth Yellow. Analysis of 6 varieties grown in Parana (Aksarben, Edano, Hermann, Mammoth Yellow, Mammoth Brown).

Brief studies of the chief soybean products: oil (*oleo*), cake (*torta, residuo proveniente da extracçao do oleo*), flour (*farinha de soja*), lecithin (*lecithina*), and casein (*caseina de soja*). List of potential industrial products. List of food products. French summary.

Highlights the importance of the soybean in the general economy and especially as a raw material for industry. The possibilities of the crop for Brazil are considered.

Note 1. This is the earliest Portuguese-language document seen (Sept. 2016) that mentions soy oil, which it calls *oleo*.

Note 2. This is the earliest Portuguese-language document seen (Dec. 2020) that uses the term *caseina de soja* or the word *proteinas* to refer to protein in connection with soybeans.

Note 3. This is the earliest Portuguese-language document seen (Feb. 2016) that mentions lecithin in connection with soybeans.

Note 4. This is the earliest Portuguese-language document seen (Sept. 2016) that uses the word *torta* to refer to soybean cake. Address: Rio de Janeiro, Brazil.

413. Hill, Albert F. 1937. Economic botany; a textbook of useful plants and plant products. New York, NY: McGraw-Hill Book Company, Inc. x + 592 p. Illust. (many photos). Index. 24 cm [157* ref]

• ***Summary:*** Chapter 9, “Fatty oils and waxes,” has two sections (p. 211, 216-17) on “Soybean oil” which is a semidrying oil. It notes that the soybean, “indigenous to

© Copyright Soyinfo Center 2021

Eastern Asia, and a food plant of paramount importance in that region, also yields a valuable oil which is extracted from the seeds (Fig. 89, B).” “In recent years soybeans have become a crop (Fig. 92) of major importance in American agriculture.”

The next oil mentioned is sesame oil.

Chapter 9, “Fatty oils and waxes” contains a table (p. 227) titled “1935 imports of important fatty oils, waxes and saponins.” These imports are apparently to the USA. It is divided into five sections:

(1) “Oil seeds and other raw materials”: raw materials” in descending order of amount (million pounds): Flax 983.3. Copra 454.1. Sesame 146.3... Soybean 0.248.

(2) “Inedible expressed oils” (million pounds): Coconut 353.4. Palm nut 297.5. Tung 120.0... Soybean 14.24

(3) Edible expressed oils: Cottonseed 166.6. Peanut 80.72. Olive 70.78. Sunflower 37.05.

(4) “Oil cake”: Soybean 107.4. Copra 103.7. Cottonseed 59.7... Peanut 6.57. Thus, the main imports of soybeans are in the form of cake.

Chapter 13, “The history and nature of food plants” has a 6-part table showing Alphonse de Candolle’s understanding of the antiquity of plants. The oldest plants are listed in table (A) “Old World species cultivated for over 4,000 years.” These include the soybean and 28 other plants.

The section on the “Origin and distribution of food plants” states (p. 301) that the soybean originated in “Southeastern Asia.” Note: Since the 1970s it has generally been believed that the soybean originated in the eastern half of North China (Hymowitz 1970).

Chapter 16, “Legumes and nuts” has a section on “Soybeans” (p. 357) which states:

“The soybean is a native of Southeastern Asia, where over 1,000 varieties are grown.” Manchuria [now under Japanese control] is the leader in commercial production, followed by Korea, Japan, and the Dutch East Indies [today’s Indonesia]. The soybean is by far the most important legume in the “Far East, where soybeans are used everywhere in the daily diet of the natives to supplement rice.” Also mentioned are soybean sauce, the flour, soybean milk, soybean sprouts and soybean oil, “an important drying oil.” Soybean production in the USA in 1935 was 43.63 million bu, of which 50% were grown in Illinois; the total is double the production of 1934.

An appendix, “Systematic list of species discussed” includes under Leguminosae (p. 540): *Glycine Soja* (L.) Sieb. & Zucc. *Glycine Max* (L.) Merr. *Soja Max* (L.) Piper–Soybean.

Note: The author is a bit confused about the correct scientific name (Latin binomial) of the soybean. Address: Research Asst. in Economic Botany, Harvard Univ.

414. Inahara, K. ed. 1937. Japan Year Book. Tokyo: The Foreign Affairs Association of Japan. 1240 + 32 p. See p. 474-76, 625, 987, 1071-72, 1076-78.

• ***Summary:*** The Preface indicates that this book was published in about Sept. 1937.

Pages 475-76. “Leguminous plants:... During the past decade area planted has been pursuing a slow, downward movement, while a sharp reduction experienced by production was more than made good by the increase of 1933. Soya beans and azuki (red) beans are predominant both in area and production.

Soy-beans were planted on 335,345 cho which produced 2.261 million koku worth 34,333,000 yen.

Azuki beans were planted on 109,389 cho which produced 5.333 million koku worth 10,620,000 yen.

Note: It is surprising that Japan produced a much larger volume of azuki beans than of soy-beans. Perhaps azuki bean production should be 0.533 million koku.

Page 625. A large table shows production of vegetable oils in Japan (in yen) from 1936 to 1935. In 1926 rapeseed oil was the most valuable oil in Japan (13.474 million yen) followed closely by soya bean oil (13.386 million yen). The same general relationship existed in 1935; rapeseed oil was still the most valuable oil in Japan (20.019 million yen) followed by soya bean oil (15.329 million yen).

Next in value in 1935 were perilla oil (10.494 million yen), cottonseed oil (7.129 million yen), other oils (6.743 million yen), copra oil (5.376 million yen), sesameseed oil (2.835 million yen), linseed oil (3.691 million yen), groundnut oil (0.595 million yen), camellia oil (0.439 million yen), and paulownia oil (0.227 million yen).

A second table shows production of animal oils and tallow (in yen) from 1926 to 1935. These were much less important than vegetable oils, being worth only about one-sixth as much in total. Beef tallow and cod oil were the two most important animal oils in 1935.

Page 987. The section on Chosen [Korean] agriculture states that the soy bean is one of the most important crops, after rice, barley, wheat and rye. “In 1935 the total the total area under cultivation was 791,857 cho and the amount produced reached 4,375,278 koku, which was an increase of more than five times compared with the year 1910.”

Page 1071. A large table shows “Values of principal articles exported abroad (in Manchoukuo yuan),” in 1935 and 1936. The export item of greatest value was soy beans, which increased from 130.053 million yuan in 1935 to 216.474 million yuan in 1936.

The item of 2nd greatest value was [soya] beancake, which increased from 51.370 million yuan in 1935 to 53.126 million yuan in 1936.

The export item of 4th greatest value (after coal) was [soya] bean oil, which increased from 20.132 million yuan in 1935 to 21.282 million yuan in 1936.

Page 1072. A large table on “Quantities of principal articles exported abroad” (from Manchoukuo in piculs; 1 picul = 133.33 lb) are: The export item of greatest weight

© Copyright Soyinfo Center 2021

was soy beans, which increased from 9.203 million piculs in 1935 to 32.539 million piculs in 1936.

The item of 2nd greatest weight was [soya] beancake, which decreased from 16,925 million piculs in 1935 to 14,026 million piculs in 1936.

Another important export item was [soya] bean oil, which decreased from 1.479 million piculs in 1935 to 1,109 million piculs in 1936.

Page 1076. Two large tables show "Cultivated area and production of cereals" (in hectares and metric tons), 1929-1935. For soy beans:

3.822 million metric tons in 1935–grown on 3.249 million ha.

Other crops in the table are other legumes, kaoliang, millet, maize, wheat paddy-field rice, upland rice, and other cereals.

Page 1077 gives "Crop forecast by provinces (metric tons)." Soy beans is the first crop on the list. The provinces are:

Pinkiang 1,083,886 metric tons
Fengtien 985,362 metric tons
Kirin 980,789 metric tons
Lungkiang 464,940 metric tons
Sankiang 260,592 metric tons
Antung 154,664 metric tons
Chinchow 151,108 metric tons
Chientao 91,383 metric tons
Heiho 2,729 metric tons
Total 4,175,453 metric tons.

Also on p. 1077 a table shows "Exports of agricultural products, 1933-1935." (Quantity in piculs, value in yen). Soy beans was by far the leading export:

39.111 million piculs in 1933
41.308 million piculs in 1934
29.230 million piculs in 1935

Page 1078. "Soy Beans: Manchoukuo produces about 60 per cent of the total production of soy beans in the world. The beans contain about 10 per cent of oil, and the cake which is obtained in pressing the beans is exported as fertilizer. The latest figure for production of soy beans in Manchoukuo was 3,820,000 metric tons and its total plantation [planted] area 3,249,000 hectares. The average crop per hectare was 1,180 kg."

415. Japan-Manchoukuo Year Book. 1937. Tokyo, Japan: Japan-Manchoukuo Year Book Co. 32 + xiii + 1304 p. Index. 26 cm. Fourth annual issue. [Eng]

• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. On the title page, just below the title but in small letters we read: "Cyclopedia of General Information on the Empires of Japan and Manchoukuo. Appendices: Who's Who Business Directory." Below that is a small map showing the Japanese empire, circled, as part of East Asia–under which is printed: "Neither is Understandable Without the Other." Below that are listed the cities and names of 18 agents worldwide. This book was published in mid-November 1936.

In the Japan and Manchoukuo parts of the book, soya beans are most widely discussed in the respective chapters on Agriculture. In each case, information given the previous year is updated one year.

Page 359: A large table gives the yield of rice and other cereals in koku per tan from 1904-08 to 1935. For soya beans the yield in 1935 was 0.67.

Page 369: Table 27 shows production of "Beans, potatoes and sweet potatoes" in hectolitres from 1929 to 1934. 1.80391 hectolitres = 1 koku = 5.11902 dry bushels (USA). For soya beans:

3.902 million hectoliters in 1934

Page 846: Two large tables show "Area under various crops (in hectares)" and "Amount of crops (metric tons)" in Manchoukuo yearly from 1924 to 1935. For soya beans: 3.822 million metric tons in 1935

The other principal crops shown in the tables are other beans, kaoliang, millet, maize, wheat, rice, upland rice, and other cereals.

Page 847: The section on "Soya beans" has a new paragraph on the end: "Soya beans are exported to Japan, China, Europe, the South Seas and almost all other countries of the world. Their exports for the last few years are given below:

2.207 million metric tons in 1930
2.834 million metric tons in 1931
2.562 million metric tons in 1932
2.523 million metric tons in 1933
1.976 million metric tons in 1934
1.892 million metric tons in 1935

Page 915: A pie chart shows principal exports from Manchoukuo in 1935. In descending order of importance they are: Soya beans 30.9%. [Soya] bean cake 12.2%. Coal 9.6%. [Soya] bean oil 4.8%. Groundnuts 3.6%. Other beans 3.1%, etc.

Page 893 is all about soya beans in Industry in Manchoukuo. In recent years, exports of bean cakes have "been hard hit by the world-wide economic depression and the growth of the sulphate of ammonia [ammonium sulfate fertilizer] industry.

"There are more than 3,000 bean oil mills throughout Manchoukuo, but those with worthy equipment are 402 in number as may be seen from the following table (as shown by the returns of the Dairen Bean Oil Association).

The large table, titled "Bean oil mills" shows the number of mills in each locality for each for the following localities: Dairen 50, Yinkow 20, Antung 23, Harbin 43, South Manchuria 238, North Manchuria 28. Total: 402. Also given for each locality are the number of pressing machines (hydraulic or screwing [screw presses]) and the production capacity per day of beancake (pieces) and bean oil (kin).

© Copyright Soyinfo Center 2021

A small table (p. 893) shows the "Output of bean-cake and oil" in 1932. Bean cake was worth 72.1 million yen whereas bean oil was worth 31.6 million yen.

Four large tables (p. 893-94) show "Exports of bean oil and bean-cake by countries, 1932-1935. About 70% of the soya bean oil (by weight) is exported to China, whereas about 48% of the bean-cake is exported to Japan & Chosen [Korea] and about 34% is exported to China.

Page 897: A long section titled "Soy" [sauce] states: "In sympathy with the rapidly increasing number of Japanese residents since the foundation of the country [Manchoukuo], the soy industry has made marked developments. The output of soy in Kwantung Province, which was as limited as 14,500 koku in 1931, increased to 22,000 koku in 1932, to 25,000 koku in 1933 and to 27,000 koku in 1934. It is observed that 30 per cent. of the output is exported to Manchoukuo and 10 per cent. to China. The shipments to the former have of late begun to shrink in contradistinction to the increase in the local consumption. This is due to the growing development of soy brewing in Manchoukuo. Prior to the 1931 incident there was almost no production of soy in Manchuria, but at present it is produced to the extent of about 30 per cent. of the output of Kwantung Province. Thus, the Manchoukuoan soy is gradually invading the market along the S.M.R. line hitherto monopolized by the Kwantung brewers. The import of soy from Japan is reckoned at 10,000 koku a year. In 1935 the Kwantung Province Soy Brewing Association was composed of fifteen members. Principal soy breweries in whole Manchoukuo are the Dairen Soy Co., the Ikeda Shoten and the Shimaki Shoten, Dairen, and the Mukden Shoten and the Iyokoku Shoten, Mukden the Manshu Shoyu, Hsinking; and the Okada Shoten, Liaoyang.

"According to the Manchurian Industrial Statistics, in 1932 there were 79 soy breweries, which were responsible for the production of 105,778 hectolitres, valued at ¥1,599,548."

416. Kale, F.S. 1937. Soya bean: Its value in dietetics, cultivation and uses. With 300 recipes. 2nd ed. Baroda State, India: Baroda State Press. xxx + 375 p. Illust. (35 leaves of plates, described in a separate record). Index. 22 cm. 2nd ed. 1937. [66 ref]

• ***Summary:*** Contents: 1. Deficiencies in the Indian diet and soya bean as a means to rectify them. 2. History of the origin and growth of soya bean: Derivation of the word soya bean, origin of soya bean, literature, primitive man and soya bean, name of the plant, home of soya bean and its expansion, varieties of soya bean, the culture of soya bean is very remote (It "has been the chief article of diet in China for over 7,000 years."), reference of soya bean in old Chinese records, how and when soya bean became known to Europeans, soya bean in England (from 1890; J.L. North and Henry Ford), soya bean in France (from 1739), soya bean in Italy, soya bean in other countries of Europe, soya bean in United States of America, India and soya bean.

3. The use of soya bean: Importance of soya bean, dietetic importance, industrial importance, agricultural importance (Russia, Mussolini in Italy), medical importance, soya bean is alkalising in its effect ("Soya bean milk as well as its flour is used in foods for invalids and infants, like Nestle's food"), longevity and soya bean.

4. World trade in soya bean: Imports to Europe, production of soya bean in Manchuria (58% in North Manchuria), exports from Manchuria, oil and cake industry in Manchuria, soya bean production in Japan, in America, in Africa, in Australia, in Europe, in Java, in India, in other British possessions, estimate of world production of the soya bean, the desirability of the expansion of soya bean cultivation, imports and exports of soybeans, soya bean oil, and soya cake–1913-1927: Denmark, Holland, United States, Great Britain, Japan, France, Russia, China, Germany, Norway, Korea. Source: International Institute of Agriculture, Bureau of Statistics, 1921, p. 420-21. A table (p. 38) shows statistics for world production of soybeans "as estimated by the leading firm of London soya bean dealers" for various years from 1923 to 1929. This includes individual statistics each year for China [incl. Manchuria], Japan, and USA. The world totals in tons are: 3,095,000 (for 1923-25). 3,397,000 (for 1926). 4,325,000 (for 1927). 6,000,000 (for 1928), and 6,570,000 (for 1929; incl. China 5,250,000; Japan 550,000; USA 250,000; Java & Dutch East Indies 120,000; Other Asiatic countries & Africa 400,000).

5. Botany of the soya bean plant. 6. Classification of soya bean. 7. Cultivation of soya bean. 8. Diseases and pests of soya bean. 9. Cultivation of soya bean in India. 10. The constituents of soya bean. 11. Soya bean milk. 12. Soya bean flour. 13. Industrial uses of soya bean. 14. Enriching soil by addition of nitrogen and use of soya bean as fodder. 15. Food requirement of the human body. 16. European and American soya bean recipes. 17. Diabetic dishes, Mahatma Gandhi's experiments at Magan Wadi and opinion of scientists on soya bean. 18. Chinese and Japanese soya bean dishes: Toffu [tofu] or soya bean curd: Digestibility, utilization, toffu khan, toffu nao [doufu nao], tze toffu (fried bean curd), chien chang toffu (thousand folds), hsiang khan, kori toffu (frozen toffu), preservation of toffu. Natto. Tokio natto and Kyoto natto etc. Hamanan natto [Hamanatto]. Yuba. Misso [miso]. Soya sauce. Soya bean confectionery. Roasted beans (Chinese).

19. Indian soya bean dishes: Hindustani dishes, Moglai dishes, Gujarati dishes, Maharashtrian dishes, Bengali dishes, Goa dishes, Tanjore dishes. Appendixes. 1. Acreage of soya bean in Manchuria during the last 5 years. 2. Total figures of export during last 5 years. 3. Bibliography. 4. Some opinions about the first edition of this book.

The preface begins (p. iii): "This little book is written in response to innumerable inquiries I have had from time to time after the inauguration of the plantation ceremony of

© Copyright Soyinfo Center 2021

Soya Beans at the State Agricultural Experimental Station by H.H. the Maharaja Gaekwar of Baroda in November 1933.

"A few months after this a food exhibition was held in Baroda where many Soya Bean dishes–Indian, European and Chinese–were exhibited. The leading papers and journals all over the country spoke in very glowing terms about the Soya Bean dishes that were exhibited... Later on at the request of Messrs. Mitsui Bussan Kaisha Ltd., a leading Japanese Firm in Bombay, a Soya Bean Exhibition and Restaurant were run in the Japanese village at the H.O.H. fete. So keen was the interest and enthusiasm evinced by the cosmopolitan public of Bombay that seats in the restaurant had to be reserved in advance. The presence of H.E. the Governor and Lady Brabourne and many Indian princes was an additional evidence of the ever growing popularity of the tasty Soya Bean dishes served there.

"At the closing of the H.O.H. fete many prominent people of Bombay requested me to continue the restaurant at a convenient place in the city, and asked me to open soya-bean milk centres for the children of the poor who could not afford to buy cow's milk. Many were ready to finance any scheme that I would propose, but unfortunately my time was not my own as I had to attend to my duties in the State and could not take advantage of their generous offer.

"The Departments of Agriculture of the various provinces of India as well as many Indian States asked me to supply them with literature regarding the cultivation and the uses of this most useful bean. The Department of Commerce and Industry of the Government of Bombay inquired if I could furnish them with information about the machinery for the extraction of Soya-bean milk. Letters of inquiries from private individuals kept pouring in daily from all parts of India. All this has induced me to undertake the preparation and the publication of this book...

"From the number of experiments carried on in the Baroda territories and outside it, I feel sure that the Indian soil is most suitable for the cultivation of soya bean...

"The leading thought of the day in India is, 'Village uplift,' and 'Rural reconstruction.'

"Baroda, 7th January 1936, F.S.K. (p. iv)

"Preface to the Second Edition: I feel grateful to the public for having given such a hearty reception to the first edition of my book. It is running into a second edition within a year...

"Now, Soya Bean Bakeries and Restaurants have been started in the city of Bombay and in many other towns in India, and Soya Bean products are exhibited in almost all the exhibitions...

"I feel highly thankful to His Highness the Maharaja of Baroda who gave me an opportunity last year of visiting Russia, where I have seen that seven to ten per cent. of Soya Bean flour was being added to the wheat flour in order to enhance the nutritive value of the bread. The Soya Research Institute at Moscow is making researches into the nutritive, industrial and economical values of Soya Bean. I have seen there the actual working of the Soya-bean milk extracting plant. They make casein out of Soya-bean milk. Soya-bean cream is sold in the market.

"I visited the dietetic clinics in England, France, Germany, Austria and other European countries, where doctors prescribe Soya Bean bread for diabetic patients. In Russia, rickets and consumption are treated by Soyolk extracted out of Soya Bean...

"France is growing Soya Bean on côlt de jura [sic, Côte d'Azur, on the Mediterranean?]. In England, through the efforts of Mr. J.L. North, Soya Bean is realised as a field crop for the last two years.

"Paris, 3rd April 1937. F.S.K. (p. ix)."

Note: author's name is pronounced KAL-ay, not KAYL (rhymes with tail or sail). (Continued). Address: Food Survey Officer, Baroda State, India.

418. Morse, W.J.; Cartter, J.L. 1937. Improvement in soybeans. *Yearbook of Agriculture* (*USDA*) p. 1154-89. For the year 1937. [67 ref]

• ***Summary:*** Contents: History of the soybean. World distribution and production. Utilization of the soybean (with chart). Improvement of soybean varieties. Methods in breeding: Natural and artificial crossing, mutations. Inheritance studies and cytology: Plant characters (flower, stem, pubescence, and foliage; height of plant and maturity; pod-bearing habit and pod characters; sterility, growth habit), seed characters (color of seed coat, hilum, and cotyledon; other seed characters), yield of seed. Disease resistance. Identification of genes and chromosomes. Selected references on genetics of the soybean. Appendix: 1. Workers identified with soybean improvement: United States, foreign countries. 2. List of soybean genes (table). 3. Linkage of soybean characters (table). 4. Soybean varieties: Origin and varietal characteristics (table listing 101 named soybean varieties; for each is given the place and date of introduction or origin, days to mature, flower color, pubescence color, and seed characters {coat color, germ color, hilum color, seeds per pod, seeds per pound}, uses {dry-edible beans, forage, green-vegetable beans, grain}).

The section titled "History of the Soybean" states: "The early history of the soybean is lost in obscurity. Ancient Chinese literature, however, reveals, that it was extensively cultivated and highly valued as a food for centuries before written records were kept. It was one of the grains planted by Hou Tsi, a god of agriculture. The first record of the plant is contained in a materia medica describing the plants of China, written by Emperor Sheng Nung [sic, Shen Nung] in 2838 B.C. The crop is repeatedly mentioned in later records and it was considered the most important cultivated legume

© Copyright Soyinfo Center 2021

and one of the five sacred grains essential to the existence of Chinese civilization. Seed of the plant was sown yearly with great ceremony by the Emperors of China, and poets extolled its virtues. The records of methods of culture, varieties for different purposes, and numerous uses indicate that the soybean was perhaps one of the oldest crops grown by man."

Note 1. This is the earliest English-language document seen (Nov. 2017) which states that: (1) The soybean was one of the "five sacred grains." (2) "The early history of the soybean is lost in obscurity." (3) The soybean was planted at an early date by "Hou Tsi, a god of agriculture." (4) The "soybean was perhaps one of the oldest crops grown by man." It is also the earliest document seen (May 2014) in which William Morse mentions the mythical Chinese emperor "Sheng Nung" in connection with soybeans.

More broadly, this entire story linking Shen Nung with the earliest written record of the soybean, is completely incorrect. Yet because the story was written by Morse (highly regarded as America's leading authority on the soybean) in a USDA publication, it has unfortunately been repeated, and this source cited, again and again down to the present day (see Hymowitz 1970; Hymowitz and Shurtleff 2005).

Note 2. This is the earliest English-language document seen (May 2014) in which the emperor's name is spelled "Sheng Nung."

Note 3. This is the earliest document seen (July 2007) in which William Morse tries to write an early history of the soybean in China. Unfortunately, he does not cite his sources.

The section titled "Improvement of soybean varieties" states: "In the United States, more than 50 percent of the acreage devoted to soybeans is used for forage and pasture; breeding work, therefore, has tended largely toward the development of varieties for hay, silage, and pasture. The development of such varieties as Virginia, Laredo, Otootan, Wisconsin Black, Manchu, Wilson-Five, Kingwa, Peking, and Ebony by selection from introductions has been the principal factor in the increased use and acreage.

"Beginning with 1929, the use of soybean seed by oil mills has led to a demand for yellow-seeded varieties of high oil content. Agronomists and plant breeders have attempted to meet this demand by making large numbers of selections from foreign introductions and locally grown varieties and by analyzing these for oil content. This has brought about the development of several superior oil varieties and has resulted in a large increase in production of beans for milling purposes. The most popular of these varieties are Illini, Dunfield, Mukden, Mandell, Scioto, Mansoy, Manchu, Mamredo, Delsta, and Mandarin. Results of analyses with more than 1,000 selections and varieties have shown a range of from 12 to 26 percent in oil content. From studies of the oil content of varieties grown in a given locality, it seems possible, from the breeding standpoint, to produce varieties high or low in oil, at least within the known ranges of variation exhibited by common varieties." (p. 1161-62).

Soybean varieties that have excellent flavor and become soft in less than 2 hours of cooking include Easycook, Bansei, Rokusun, Jogun, Chusei, and Sousei. These are "now in the hands of growers and seedsmen. Experiments by commercial firms have shown that these varieties are superior to commercial varieties for the manufacture of food products, such as bean flour, roasted beans, bean milk, and bean curd [tofu].

"In Japan, certain varieties of soybeans were found that were used solely as green shelled beans. Ranging in maturity from 75 to 170 days, many of these introductions, and selections from them, have been found especially promising for the various sections of the United States. The vegetable soybean offers an excellent food of high nutritional value, especially in the fall when other green beans are lacking and in sections where the Mexican bean beetle prohibits the growing of garden beans. As a result of selection, cooking tests, and adaptation studies, eight green vegetable varieties–Hahto, Kura, Kanro, Hokkaido, Higan, Chusei, Sousei, and Jogun–have been introduced in various sections of the country" (p. 1163).

Photos show: (1) "The late Charles Vancouver Piper, agronomist, United States Department of Agriculture, 1902-26. Pioneer in the introduction and development of soybean varieties for United States conditions." (2) "Storage yard of a Chinese grain merchant near Kungchuling, Manchuria. More than 80 osier bins, each holding four cartloads of soybeans, were in this yard." (3) A Manchurian farmer and how he harvests, threshes and cleans soybeans by methods learned from his ancestors; comparison with modern U.S. machine harvesting. (4) "Millions of soybean oil cakes are stored in warehouses in Manchuria awaiting shipment to Japan, Chosen, China, and the East Indies, where they are used for fertilizing purposes and for cattle feed." A person looks up at the towering stacks. (5) Coolies loading large sacks of soybeans on a freighter for shipment to the oil mills of Europe. One man has hoisted a huge sack onto his back. (6) Five Manchurian farmers who have been awarded certificates and prizes for producing high-quality soybeans. (7) Twenty seeds of a natural soybean hybrid showing peculiar types of coloration. (8) Illustration (line drawing) of a soybean flower and its parts enlarged. Front view, side view, parts of the corolla (standard, wing, one of the keel petals), stamens, pistil. (9) A. Stems and pods of fasciated soybean plants; B. Determinate pod-bearing type; C. Indeterminate pod-bearing type. 10. Chromosome chart showing four groups of linked genes in soybeans.

A table (p. 1157) shows: "Increase in production of soybeans over an 11-year period, 1924-25 to 1935-36, inclusive, in the principal producing countries of the world" (Manchuria, Chosen [Korea], Japan, United States, Netherland India).

Soybean seed size (p. 1177): "The range in size of

© Copyright Soyinfo Center 2021

soybean seed varies according to the variety, each variety having its own typical seed size. Varieties and introductions tested at the Arlington Experiment Farm ranged in average weight of 100 seeds from about 4 grams for the smallest to about 40 grams for the largest." Address: 1. • ***Summary:*** "One of most striking agricultural developments in the United States in recent times is the rapid rise of the soybean. In 1907 there were 50,000 acres; in 1935, nearly 5,500,000. In 1920, seed production was 3,000,000 bushels; in 1935, about 40,000,000. Remarkable progress has been made in the last few years in developing food and industrial uses. Soybean breeding to meet varied cultural, food, and industrial needs is being conducted by the United States Department of Agriculture and by experiment stations in 32 States, and more than 10,000 introductions have been made for study and experiment. In spite of extensive investigations, the work of developing this versatile plant to its fullest possibilities is still in its infancy."

"The soybean is grown to a greater extent in Manchuria, often called 'The Land of Beans,' than in any other country in the world (fig. 2). It occupies about 25 percent of the total cultivated area and is the cash crop of the Manchurian farmer (fig. 3). Chosen [Korea] and Japan are large producers, and south of China the soybean is cultivated more or less in the Philippines, Siam [Thailand], Cochin China [southern Vietnam], India and the East Indies.

"In the central part of the Union of Soviet Socialist Republics the districts of the Don and the southwest are

© Copyright Soyinfo Center 2021

said to be especially suited to the culture of this crop. In Czechoslovakia, in 1935, commercial beans were produced on a small scale. Rumania has also succeeded in growing soybeans of high quality, and the production of the seed is rapidly increasing. In other parts of the world, particularly Germany, England, South Africa, British East Africa, Algeria, Egypt, New South Wales, and New Zealand, soybeans have been tried or are being grown in a small way.

"In the Western Hemisphere the production of soybeans is concentrated chiefly in the Corn Belt region of the United States. in 1920, 14 States produced 3,000,000 bushels of seed, the leading States being North Carolina, Virginia, Alabama, Missouri, and Kentucky–North Carolina producing about 55 % of the total. By 1931, seed production had increased to nearly 15,500,000 bushels, with Illinois, Indiana, North Carolina, and Missouri leading. In 1935, about 40,000,000 bushels of seed were produced, of which about 37,50,00 bushels (92 percent) were harvested in Illinois, Indiana, Iowa, Missouri, and Ohio, the first three States producing about 87 percent of the total. In Canada, production is confined chiefly to the Province of Ontario, where about 15,000 acres are being planted to this crop."

Note: The Don is one of the major rivers of Russia. It rises southeast of Moscow, and flows for a distance of about 1,950 kilometers (1,220 miles) to the Sea of Azov, which is just north of the Black Sea and which borders on southeastern Ukraine. The main city on the river is Rostov on Don, and its main tributary is the Donets.

In 1935 in Czechoslovakia soybeans were produced commercially on a small scale.

Note: This is the earliest English-language document seen (April 2020) that contains the term "Union of Soviet Socialist Republics" in connection with soybeans–even though the Soviet Union was formed on 30 Dec. 1922. Address: 1. Senior Agronomist; 2. Assoc. Agronomist. Both: Div. of Forage Crops and Diseases, Bureau of Plant Industry [USDA, Washington, DC].

421. Woertge, Karl Heinz. 1937. Entwicklung und weltwirtschaftliche Bedeutung der Sojabohnenerzeugung und -verarbeitung [Development and international economic significance of soybean production and processing]. Thesis, Friedrich Alexander University, Erlangen, Coburg, Germany. 119 p. 28 cm. [112 ref. Ger]

• ***Summary:*** Contents: Foreword. Part I: History and culture of the soybean. 1. History, natural requirements and technology of soybean production; chemical composition of the soybean. 2. Occurrence of the soybean and methods of production in various countries: Asia (Manchuria and China, Japan, Korea, Formosa, Dutch East Indies, other Asian countries incl. British India, Cochin China, Ceylon), America, Europe (Southeast Europe, Austria, USSR, France, Italy, England, Poland, Switzerland, Czechoslovakia, Germany), Africa and Australia.

Part II. Scale and global economic significance of soybean production in the main producing areas. 1. General overview of world soybean production: Production for seeds, for fodders. 2. Scale of soybean production in the main producing areas: Asia (Manchuria, Japan, Korea, Formosa, Dutch East Indies [Java and Madura/Madoera]), America, Europe (Southeast Europe, USSR).

Part III. Development and global economic significance of soybean processing. 1. Soybean processing possibilities: A. Processing soybeans to make foods: Asia (general, methods used in China and Japan to make vegetable-type soybeans and salads, koji, soymilk, shoyu [soy sauce], miso, natto, tofu, methods used in the Dutch East Indies), Europe (general overview, preparation of soybean meal, soymilk, coffee- and chocolate substitutes). B. The soybean as an oilseed: General, methods of obtaining the oil (in Asia, Europe, USA), use of soy oil (as human food, other). C. Obtaining lecithin from the soybean. D. Use of soybean press-cake for livestock feed. E. Use of the soybean meal for fertilizer. 2. World trade in soybeans, soy oil and soybean cake/meal (*Sojakuchen/Sojaschrot*)*:* World trade in soybeans (Manchuria, Asia, Europe, USA), world trade in soy oil, world trade in soybean meal.

Closing remarks: The state of the world soybean market with special consideration for the current German conditions. Appendixes and tables. Address: Nuernberg [Nuremberg], Germany.

• ***Summary:*** "Although the soybean had attracted attention at

© Copyright Soyinfo Center 2021

various times as an article of food in the United States, it was not until the World War [World War I], when a cheap source of protein was being sought, that the soybean was really considered seriously as an article of diet for Americans. The dried beans were prepared in many ways but owing to the time required for cooking, the peculiar taste, and improper methods of processing, soybean products were not generally accepted. During this period cooking tests were conducted with all of the varieties and introductions then available in an attempt to find varieties lacking the unpleasant bean taste and which would cook quickly. Only two such varieties were found–the Easycook and Hahto. Some progress was made in getting people to eat these varieties..."

"Oriental varieties of soybeans are distinguished not only according to seed and plant characters but also according to use, such as for curd [tofu], sprouts, green vegetables, roasted beans, and numerous other food products. Attempts to obtain suitable edible varieties from oriental countries through correspondence met with but little success. During agricultural exploration work in the Orient from 1929 to 1931, many varieties of soybeans were found in Japan and Chosen [Korea] which were used solely as green shelled or dry edible beans. These edible types, ranging in maturity from 75 to 145 days, have been under test for the past six years at various experiment stations throughout the United States." In addition, "extensive investigations of the cooking qualities and composition of the green shelled and dry edible beans have been made by various Departments of Home Economics. Many of these varieties were judged much superior to the commercial varieties in flavor, texture, and ease of cooking. Moreover, tests indicate that the flour from most of the edible varieties has a better flavor than the available commercial soybean flours... Thirty-one of the varieties introduced as edible beans have been found sufficiently promising to be assigned varietal names, shown in table 1, and have been distributed into those regions to which they seem especially adapted. Although the supply of seed of these varieties at present is quite limited, seed stocks are being increased rapidly at several experiment stations and by various growers to meet the growing demand for edible soybeans... Both the green (immature) and dry beans contain much more fat and protein and less carbohydrates than other leguminous seeds. Few naturally occurring foods are as rich in protein as soybeans... The soybean is also a good source of some of the mineral elements, containing more calcium and phosphorus than any of the cereals and excelling most foods as a source of available iron. Because of the alkaline elements in soybeans, they belong to the class of alkali-forming foods.

Table 1, titled "Characteristics of edible varieties of soybeans" (p. 32) lists the following 31 varieties: Agate, Aoda, Bansei, Chame, Chusei, Easycook, Fuji, Funk Delicious, Goku (the smallest bean in this table; 3,216 seeds/lb), Haberlandt, Hahto (the second largest bean; 1,250 seeds/lb), Hakote, Higan, Hiro, Hokkaido (the largest bean; 1,232 seeds/lb), Imperial, Jogun, Kanro, Kura, Nanda, Osaya, Rokusun, Sato, Shiro, Sioux (the next to smallest bean in this table; 3,000 seeds/lb), Sousei, Suru, Toku, Tokyo, Waseda, Willomi. For each variety the table shows: F.P.I. number, number of days to ripen, seed color (green, straw yellow, olive yellow, brown, black), hilum color (brown, black, pale), seeds per pound, oil content and protein content (% on moisture-free basis), and use (green vegetable, or dry edible).

"Some commercial concerns are now canning the green beans and at the Illinois Agricultural Experiment Station attempts to preserve green soybeans with freezing storage methods have been very successful.

"Extensive nutritional studies revealing the unique dietary value of the soybean and its products during recent years have had much to do with the rapid and growing popularity of the soybean as a food."

Note: This is the earliest document seen (Nov. 2020) that mentions the soybean varieties Aoda or Sioux. Address: Bureau of Plant Industry, USDA, Washington, DC.

424. Kishlar, Lamar. 1938. Soja max–The soybean. In: Soybean Nutritional Research Council, ed. 1938. The Composition and Nutritive Properties of Soybeans and Soybean Oil Meal; A Literature Review. Chicago: SNRC. 62 p. See p. 7-9. Oct. [9 ref]

• ***Summary:*** "This is the success story of an immigrant plant which came in to America and made good. This is the story of Soja Max, the soybean, who waited 5,000 years for his big chance, and, when opportunity knocked, made a lasting place for himself in American agriculture and commerce on the basis of merit and merit alone.

"The soybean is a native of Asia. It is one of the oldest crops grown. How long ago man started to cultivate the soybean no one knows. Some say that soybeans have been grown for 25,000 years (Breedlove, 4 June 1936, p. 12). The first written record seems to be a Chinese book on Materia Medica, *Pen Ts'ao Kong Mu* written by Emperor Shen-nung about 4,800 years ago (Horvath, May 1931, p. 36).

"Even the name is cloaked with mystery. For the salted soybeans [fermented black soybeans], the early Chinese had a word pronounced 'Shi.' Another word, 'Yu,' was given to the oil used as a condiment. Later the term 'Shi-yu' [fermented black soybean sauce] was applied to the plant and to the raw beans" (Chicago J. of Commerce, 20 June 1936, p. 14).

"Linnaeus, the first botanist to make a scientific study of the leguminous plants, applied the Greek word, glycine, meaning sweet, to all the ground nut species of legumes. Since the soybean had very large nodules on the roots, he called it Glycine Max. Many years later Moench found that the soybean was a distinct genus. He renamed it Soja Hispida. More modern authorities have shown a preference for Soja Max, the name which has become generally

© Copyright Soyinfo Center 2021

accepted.

"The soybean was a long time in coming to America. In 1804 a Yankee Clipper ship, searching the Chinese ports for a return cargo, loaded several bags of soybeans as reserve food supply and brought the first importation to America" (Burlison 1936).

"More than one hundred years passed. A few soybeans were raised mostly as botanical curiosities. In 1907, Dr. C.R. Ball of the United States Department of Agriculture, described twenty-three varieties of soybeans, all that were then known in the United States (6). These included fifteen introductions by the United States Department of Agriculture between 1900 and 1905. The remaining eight were brought by individuals from the Orient, several by the way of Europe.

"By 1913, the list had grown to 427. By 1925, 1,133 varieties were described. In all more than 7,000 samples of seed have been collected from Japan, Chosen, Manchuria, China, Formosa, Java, Sumatra, and India (3). Of these, there are more than 2,000 distinct types, which have maturities ranging from 75 to more than 200 days. These types and varieties have been grown in various places, the less promising varieties being discarded, until, at present, more than 100 named varieties are widely grown, or are being increased for greater distribution in the United States (7).

"The soybean is a summer leguminous annual (1). The pods are from 1 to 2½ inches long and contain from 2 to 4 seeds. The root tubercles, which permit this plant to build up the fertility of the soil, are large and abundant. The stems, usually strong and woody, grow from 2 to more than 6 feet in height. The flowers are small, sweet-pea shaped, and white or purple in color. The seeds which grow in the pods may, when mature, be yellow, green, brown; or black in color. Some seeds are round; some are oval; while some are flat like a lima bean.

"Some varieties of soybeans are useful only as an oil seed or for feed. They are so hard that several hours' boiling fails to properly soften them. However, some of the newer varieties are useful for food and, when cooked, are delicious eaten as a vegetable. The University of Illinois has tested 467 varieties of vegetable or edible soybeans and has given six, a very good, and seventy, a good rating (8). The soybean was probably first utilized for the production of oil and meal in the United States about 1910 by an oil mill on the Pacific Coast. The beans were imported from Manchuria.

"During the World War, the general shortage of fats and oils made it necessary to import very substantial quantities of Manchurian soybean oil. This oil was frequently of very poor quality because of the crude equipment on which it was made. Often it was shipped from the Orient in five gallon kerosene cans which had been improperly cleaned, and the contaminated oil was ruined for edible purposes. In 1918 import figures show that 336,000,000 pounds of soybean oil were imported from the Orient (9).

"The production of soybean oil from domestic seed was started, in a small way, in North Carolina in 1916. The first oil was produced in a cotton oil mill in the off season, using cotton oil presses. In 1920, soybean oil was produced in Chicago Heights, Illinois, using an expeller. In 1922, oil was made by the A.E. Staley Manufacturing Company of Decatur, Illinois. At first, only one expeller was used, but two more were installed shortly afterward, and about 90,000 bushels of beans were crushed that year (9).

"From this modest beginning, the soybean processing industry has grown until soybean production in the United States reached a peak for the crop year 1935-36 when some 44,378,000 bushels were harvested. Over half of this production was processed, yielding a total of approximately 600,000 tons of soybean oil meal. The year 1938-39 is expected to exceed the record of 1935-36. When one realizes that the industry produced only 21,000 tons of soybean oil meal for the crop year 1928-29, it is obvious that a product must have merit to increase in volume 30 times during years when all feedstuffs were cheap and plentiful.

"Thus, the Asiatic visitor was quick to catch on to American ways, to thrive on American soil, in American climate. He grows nearly everywhere that corn or cotton can be grown. When history is finally written, the story of Soja Max will be the greatest success story of the great World Depression." Address: USA.

• ***Summary:*** The world's leading soybean exporters in 1937 (in million lb) were: Manchuria 3,350, Korea 343, Other countries 179. The world's leading soybean importers in 1937 (in million lb) were: Japan 1,670, Germany 1,324, Denmark 542, Sweden 258, and Netherlands 220. Address: England.

426. *Revue Internationale des Produits Coloniaux et du Material Colonial*. 1939. L'extraction des dérivés du Soja [The extraction of soy derivatives]. 14(158):76-77. Feb. [Fre]
• ***Summary:*** This communication from the French commercial attaché in Tokyo describes the activities of several large, modern Japanese soybean processing companies in Manchuria. The modern soybean crushing mills use solvents, such as benzol or ethyl alcohol. The latter process, studied since 1926 by Dr. Masayasu Sato of the Central Laboratory, South Manchuria Railway Company (SMRC), is patented in England, Japan, France, Italy, and Denmark. The Sato process is used commercially by the Manchuria Soya Bean Engineering Co., a private company with capitalization of 1.5 million yen subscribed by the SMRC and by the Nippon Food Stuff Engineering Co., an affiliate of Nippon Sangyo K.K. The factory / mill, which processes 80 metric tons (tonnes) per day of soybeans, and has the capacity to be within 300 tonnes, is located on the outskirts of Dairen, Manchuria. The company has also

© Copyright Soyinfo Center 2021

studied the processes for extracting from the oil a number of special products such as lecithin, vitamin B, a food condiment, saponins, and sugars. The residual cake, which is in the form of flakes named Soya Rex Flakes, would be of great food value. These products are to be produced by an affiliate, with capitalization of £200,000, the Manchurian Society for Soya Products, which is presently constructing a factory at Kawasaki, near Yokohama.

The sodium glutamate which is extracted from the cake could rival a condiment widely used in Japan under the name Aji-no-moto. The Society for nitrogen based fertilizers created this last April an affiliated firm with a capital of £10,000,000, a fourth of which is paid out, called "the Soya Bean Chemical Engineering Co." that will produce, exclusively a dozen products all derived from the soy oil or soya cakes in a factory currently being built at Konan (in Korea), where the master company already owns a very important group of chemical industries. Among these new products, we quote: amino-acid, oil based paints, boiled oil and lecithin used in tanning hides.

Several factories, among them Honen, Nisshin, and Nikka, that up until now were just producing soja oil, will now start outputting derivatives. Mentioned are substitutes for butter, wheat flour, soap, oil for human consumption, boiled oil for the printing industry.

The Japanese chemical industry, as is being done in Germany, is thus throwing itself systematically into the exploitation of this very complex raw material, the soybean, that it will find at its door step, on the Manchukouo [Manchurian] territory.

427. Cates, J. Sidney. 1939. Big-time performance for soys. *Country Gentleman* 109(3):23, 78-79. March.

• ***Summary:*** Today, over 7,000,000 acres of soybeans are planted in the United States. But the soybean has not hit the "big-time" by accident or chance. "It is one of the few great American crops coming into its own by research, planned research, patient effort and design. The late C.V. Piper, a scholar, a dreamer and philosopher, who for many years headed the [USDA] Office of Forage Crops at Washington [DC], was the man who guessed that the soybean might find a large place in our agriculture if we were only equipped with regionally adapted varieties that somewhere in the world must already exist.

"Back in 1907, Piper picked W.J. Morse, a shy, sturdy New York State farm boy who stood up with distinction under the regimen of required studies at Cornell University, and turned over to Morse the task of building a new crop plant for American field agriculture.

Nearly a decade ago [in Feb. 1926] Piper passed away, but Morse, whom he selected for his soybean work, can now look back over the thirty-one years and scan a record of achievement which I do not believe could be matched even by Piper's hopes and dreams. If there ever was a one-man-made crop in this country, it is the soybean. And W.J. Morse is the man."

"In 1907 when Morse started work with the crop, there was probably less than 50,000 acres of soys in the whole country.

"Morse realized that if the crop were ever to become national, varieties adapted to the different sections must be developed. And so a dragnet was set for all the soy varieties the Orient had to offer. And through the years Morse has put more than 10,000 different lots of imported beans through his tests. And the Morse test is not just a routine affair. It consists of an intimate personal study of every single bean plant growing in the little plots of these introductions.

"A less exacting man than Morse might have put these lots of beans through a test and got nowhere, for not in a single case has an introduction led immediately and directly to the establishment of a new commercial variety in this country. These introductions, as they come in, are not pure strains. In fact, always a wide variation of plant types are found growing in these little plots of so-called varieties brought in from other lands. Year after year, for more than three decades, Morse has literally lived his summers out in the fields selecting the most promising-looking plants from each of these introductions. And it is from single-plant selections made by Morse that we have developed 90 per cent of the commercial soybean varieties today.

"Back in 1913, the first variety well adapted to the Corn Belt was introduced. This was the well-known Manchu. There followed such sorts as Virginia and Wilson."

The new trend, north and south, is toward growing soybeans for their seeds, "as higher-yielding varieties have been developed for the different sections and as a new and simple way of harvesting has been devised.

"The big grain yields have been in the Midwest, many of the growers getting around forty-five bushels to the acre. In Wisconsin, yields as high as fifty bushels have been secured... The drift everywhere is toward an earlier type of bean."

"With soybean oil coming into the picture with prospective large-scale use for paint and varnish, one weakness in the present commercial setup is that the oil mills have not yet offered a premium price for high oil-content varieties. Morse has consistently carried along oil-content studies of all his introductions, and there are now some splendid seed-yielding sorts which carry from 21 to 23 per cent oil, while the ordinary run of beans carries only 18 to 19 per cent. One of Morse's varieties, the Dunfield, a Midwest adapted bean, very seldom runs under 20 per cent oil." It has yielded as high as 23.3 per cent. "A sliding price scale based on percentage of oil might prove highly advantageous to both the grower and the oil mill."

Note: This is the earliest document seen (Aug. 2011) that discusses the many advantages of adopting the practice of buying and selling soybeans on the basis of their

© Copyright Soyinfo Center 2021

composition (oil or protein content).

"And while chemical and heat treatment already show great promise of making over soy oil into a quick-drying paint oil, Morse has started still another attack on this problem.

"Quick-drying oil: In Manchuria there are found little trailing, small-seeded, wild forms of soybeans. These wild soybeans rarely ever carry an excess of 10 per cent of oil, but this oil has a peculiar property. It has what the chemists call an 'iodine number,' which runs up to 155. In ordinary soy oil the iodine number is rarely over 130.

"This so-called iodine number is the key to how rapidly an oil will dry, the higher the number the quicker the drying. This wild soybean oil is a quick dryer, and therefore should be an excellent paint oil without any treatment."

"When Morse came back from the Orient in 1931, after a two-year stay studying this great Oriental crop, he brought with him a large collection of a radically new type of soy–the green-vegetable type. Previous explorers had missed this type of bean because, in the Orient, they go by an entirely different name. In Manchuria and Japan–the home of this bean sort–ordinary field beans are called *Daizu,* while the green-vegetable beans are called *Eda Mame.* Previous explorers, asking for *Daizu* never in a single instance got *Eda Mame.* Morse, living close with the bean growers, soon picked up this distinction and brought home the new product in all its variations.

"Today, from this material he brought back there have been developed something like seventy-five distinct green-vegetable varieties, fitting an even wider range of country than do the field-bean kinds. They vary in maturity all the way from seventy-five to one hundred and fifty days. One of these varieties matures seed at Winnipeg, Canada."

On pages 78-79 are three special sections to the article: (1) "Quick-drying oil:" Wild soybeans are found in Manchuria. They are small seeded and the viny plants have a trailing habit. The seed rarely contains more than 10% oil, but this oil has a very high iodine number (up to 155) which means that the oil dries quickly and is good for paints. The iodine number of regular soybeans is rarely above 130.

(2) "Late soybean news:" At the great soybean laboratory [U.S. Regional Soybean Industrial Products Laboratory] at Urbana, Illinois, researchers are extracting new compounds from soybean meal. These include a "laminated plastic" with almost metallic hardness and strength, a synthetic fiber closely resembling wool, and powdered, water-based paints. Not to mention 75 distinct "green-vegetable varieties" of soybeans for human food; they vary in maturity from 75 to 150 days. One of these matures seed at Winnipeg, Canada.

(3) "A clamor for seed:" An article that the present writer (Sidney Cates) wrote about green vegetable soybeans in *Country Gentleman* led to thousands of letters from readers to state experiment stations requesting the new types of soybeans. "Many canners are now packing the green beans, and I have never eaten anything more delightful from a tin can."

Photos show: (1) "The Korean version of the 'two-row planter;'" two workers with seed baskets in a field. (2) Crop machinery. (3) A field of soybeans at midseason. (4) Chinese storage bins for beans, made of "great 'ropes' of twisted straw."

seen (Jan. 2013) that contains the modern term "soy sprouts."

Industrial uses of soybean oil and residue: the regional industrial products laboratory in Urbana, Illinois, staffed by 40 men.

Figures show: (1) Bar chart of the world's principal soybean producing countries in 1924-25, and in 1935-36. In 1936, Manchuria was by far the leader, followed by the USA, Chosen [Korea], Japan (whose production has decreased since 1925), and Netherland India [today's Indonesia].

(2) A map of the eastern half of the United States, with carefully located 50,000-acre dots showing areas of heaviest soybean production. Between 1934 and 1939, the area increased 5-fold in Mississippi and 21-fold in Minnesota. The area in Oklahoma decreased.

(3) A graph shows that the number of combines used to harvest soybeans in Illinois skyrocketed from 0 in 1924, to about 20 in 1925, to about 75 in 1926, to about 300 in 1927; by 1935 the number had increased to an estimated 3,000. (4) A photo shows a combine harvesting soybeans.

(5) A photo of a "Superior field of Indiana soybeans probably cultivated for the last time as plants shade most of the field's surface. Two-row corn cultivators or "beet cultivators may till four such soybean rows simultaneously.

(6) A graph shows soybean oil imports into the United states; these imports increased dramatically during World War I, peaking in 1918 [at 335.98 million lb].

(7) A map shows the location of soybean oil mills in the United States. There are large numbers in Illinois, Indiana, Ohio, Iowa, and North Carolina.

(8) A bar chart shows "Utilization of soybean oil processed in the United States" in 1934, 1935, and 1936. In 1934 the 30 million lb was used mostly by the drying oil industry. In 1935 the 140 million lb was used mostly for [lard] compounds and vegetable shortenings. In 1936 the 280 million lb was still used mostly for compounds and vegetable shortenings, but a significant amount was used for oleo, other edible, the drying oil industry, and soap.

(9) A photo shows a mill for removal of oil from Corn Belt soybeans; the processing plant serves an area tributary to Champaign, Illinois, and ships the oil to Chicago factory area.

"Soybeans provided some of the none-too-kindly remembered 'coffee' rations to Union Civil War soldiers. Sausage makers, at times, put up to 50 per cent soybean flour in part of their product."

Note: This is the earliest English-language document seen (Dec. 2012) that uses the term "Salted Soys" to refer to soynuts.

430. Morse, W.J. 1939. Soybeans–The world around. *Proceedings of the American Soybean Association* p. 39-44. 19th annual meeting. Held 11-12 Sept. at Madison, Wisconsin.

• ***Summary:*** Contents: Introduction. Asia: China, Manchoukuo [Manchuria], Chosen (Korea), Japan, Netherlands Indies [Indonesia], Philippine Islands. Europe. Rumania. North and South America. Africa. Australia.

In Europe, production is presently "confined largely to European Russia, Bulgaria, Yugoslavia, Czechoslovakia, and Rumania. In Europe as a whole, slightly more than 3 million bushels of seed were produced in 1938, 80 per cent of which was produced in Bulgaria, Rumania, and Yugoslavia. The largest increase has been in Rumania, due chiefly to the fact that Germany, by guaranteeing purchases, has given a certain stability to cultivation... Russian scientists have for the past several years carried on extensive experiments with the soybean. At the present time the principal areas of cultivation are the Ukraine and certain regions in northern Caucasus.

"Previous to the World War, Europe absorbed about 50 per cent of the exports of soybeans from Asiatic countries, the largest of the imports being taken by the United Kingdom, with Denmark and the Netherlands taking the remainder. In the post-war period [after World War I] important changes took place, Germany taking first place as an importer and other nations entering into the international trade in the bean and its products. At present Germany still holds first place as an importer of soybeans, followed by Denmark, England, Sweden, and the Netherlands. Among other countries that have increased their imports are France, Norway, Latvia, and Italy...

In South America, soybeans are at the experimental stage. "Successful results have been obtained in Cuba, Argentina, Brazil, Chile, and in some parts of Mexico."

"Africa: Extensive experiments have been conducted with the soybean in various parts of Africa for many years but as yet it is an unfamiliar crop to the majority of African farmers. It has been successfully cultivated in the upland, midland, and coast districts of Natal and throughout Gambia, Sierra Leone, Nigeria, and the Gold Coast Colony. In the cotton and corn growing districts of Belgian Congo the soybean has been grown successfully for forage and food purposes. Results in all cases, however, indicate that more and better varieties, and improved methods of culture and harvesting are essential before the soybean becomes a factor of much economic importance in African agriculture. The crop is advised more as a crop for domestic use than the European market. It is of interest to note that in 1938 nearly 4 million pounds of soybean meal were used in native rations in the mine compounds of South Africa.

"Australia: Successful results have been obtained with a few American varieties in Victoria and Queensland, but thus far efforts to establish the soybean as a commercial crop have been disappointing. At the present time, however, more extensive tests are being conducted to obtain adapted varieties in order to produce beans on a commercial scale."

A table (p. 43) gives "Acreage, production, and imports of soybeans by countries (Compiled from official sources),"

© Copyright Soyinfo Center 2021

based largely on 1938 statistics. The countries are: Austria, Belgo-Luxembourg [Belgium], British Malaya, Bulgaria, Canada, China, Chosen (Korea), Czechoslovakia, Denmark, Estonia, France, Germany, Hongkong, Italy, Japan, Kwantung, Latvia, Manchoukuo, Netherlands, Netherlands Indies, Norway, Poland-Danzig, Rumania, Sweden, Taiwan (Formosa), United Kingdom, United States, U.S.S.R. (Russia), Yugoslavia.

Leading soybean producers are: China 217,192,000 bushels (1936), Manchoukuo 170,269,000 bushels, United States 57,665,000 bushels, Chosen 18,480,000 bushels, Japan 13,473,000 bushels (1937), Netherlands Indies 9,873,000 bushels (production minus seed for planting), U.S.S.R. 2,502,000 bushels, Rumania 1,804,000 bushels.

Leading soybean importers include: Germany 28,766,356 bushels (the world's largest soybean importer), Japan 27,796,787 bushels (#2 worldwide), Estonia 195,475 bushels, Latvia 86,347 bushels, and Poland-Danzig 19,106 bushels. Address: USDA Bureau of Plant Industry, Washington, DC.

431. Morse, W.J.; Cartter, J.L. 1939. Soybeans: Culture and varieties. *Farmers' Bulletin* (*USDA*) No. 1520 (Revised ed.). 39 p. Nov. Revision of April 1927 edition, further revised in 1949.

• ***Summary:*** Contents: History. Description. Distribution and production. Climatic adaptations. Soil preferences, Varieties (classified by length of growing season into 7 groups, and divided within each group into "Seed, forage, green vegetable, and dry edible" types). Description of varieties (describes 125 varieties). Preparation of the seedbed. Fertilizers and lime. Inoculation. Time of seeding. Methods of seeding. Rate of seeding. Depth of seeding. Cultivation. Soybeans in rotations. Soybeans in mixtures. Soybeans drilled in small grains. Cost of production. Insect enemies of soybeans. Soybean diseases. Other enemies of soybeans.

"History: Ancient Chinese literature reveals that the soybean was extensively cultivated and highly valued as a food centuries before written records were kept. The first record of the plant is contained in a materia medica describing the plants of China, written by Emperor Sheng Nung in 2838 B.C. Methods of culture, varieties for different purposes, and numerous uses are repeatedly mentioned in later records, indicating the soybean to be of very ancient cultivation and perhaps one of the oldest crops grown by man. It was considered the most important cultivated legume and one of the five sacred grains essential to the existence of Chinese civilization. Soybean seed was sown yearly with great ceremony by the emperors of China, and poets through the ages have extolled the virtues of the plant in its services to humanity.

"The soybean was first made known to Europeans by Engelbert Kaempfer, a German botanist, who spent 2 years, 1691-92, in Japan. Seed sent by Chinese missionaries was planted as early as 1740 in botanic gardens in France..."

"Distribution and production: The soybean is grown to a greater extent in Manchuria than in any other country in the world. It occupies about 25 percent of the total cultivated area and is relied upon by the Manchurian farmer as a cash crop. China, Japan, and Chosen [Korea] are large producers and the soybean is cultivated more or less also in the Philippines, Siam, Cochin China, Netherland India [later Indonesia], and India. In other parts of the world, particularly Germany, England, Soviet Union, France, Italy, Czechoslovakia, Rumania, Mexico, Argentina, Cuba, Canada, New South Wales, New Zealand, Algeria, Egypt, British East Africa, South Africa, and Spain, various degrees of success have been obtained."

The section on diseases discusses the following: Purple spot of seeds, bacterial blight, bacterial pustule, mosaic, wilt, brown spot, sunburn or aphid injury, downy mildew, pod and stem blight, anthracnose, sclerotial stem rot, frog-eye spots, and *Pythium* root rot.

A table (p. 6-7) shows different varieties of soybeans recommended for four different uses (seed, forage, green vegetable, or dry edible), classified by the length of the growing season. Green vegetable–Very early (100 days or less): Agate, Sioux. Early (101 to 110 days): Bansei, Chusei, Goku, Kanro, Waseda. Medium early (111 to 120 days): Fuji, Hakote, Hiro, Hokkaido, Jogun, Kura, Osaya, Sato, Shiro, Sousei, Suru, Toku, Willomi. Medium (121 to 130 days): Chame, Funk Delicious, Imperial. Medium late (131 to 140 days): Aoda, Hahto, Higan, Rokusun. Late (141 to 160 days): Nanda.

Dry edible–Early (101 to 110 days): Bansei, Chusei, Goku, Kanro, Waseda. Medium early (111 to 120 days): Hokkaido, Jogun, Osaya, Sousei, Suru, Toku, Willomi. Medium (121 to 130 days): Funk Delicious, Imperial. Medium late (131 to 140 days): Easycook*, Haberlandt*, Higan, Rokusun, Tokyo*. Late (141 to 160 days): Nanda. Note: All dry edible varieties except three (Easycook, Haberlandt, and Tokyo–which are followed by an asterisk (*)) are also included in the green vegetable group. But many in the green vegetable group are not included in the dry edible group.

Detailed descriptions of the following 125 varieties are given (p. 7-17): Agate, A.K., Aksarben, Aoda, Arksoy, Avoyelles, Bansei, Barchet, Biloxi, Black Beauty (same as Ebony), Black Eyebrow, Cayuga, Chame, Charlee, Chernie, Chestnut, Chiquita, Chusei, Clemson, Columbia, Creole, Delnoshat, Delsta, Dixie, Dunfield, Early Green (same as Medium Green), Early Virginia Brown (same as Virginia), Early Wilson (same as Wilson), Early Wisconsin Black (same as Wisconsin Black), Early Yellow (same as Ito San), Easycook, Ebony, Elton, Fuji, Funk Delicious, George Washington, Georgian, Goku, Guelph (same as Medium Green), Habaro, Haberlandt, Hahto, Hakote, Harbinsoy, Hayseed, Herman, Higan, Hiro, Hokkaido,

Hollybrook, Hongkong, Hoosier, Hurrelbrink, Illini, Ilsoy, Imperial, Indiana Hollybrook (same as Midwest), Ito San, Jogun, Kanro, Kingwa, Kura, Laredo, Large Brown (same as Mammoth Brown), Large Yellow (same as Mammoth Yellow), Late Yellow (same as Mammoth Yellow), Lexington, Macoupin, Mamloxi, Mammoth Brown, Mammoth Yellow, Mamredo, Manchu, Mandarin, Mandell, Mansoy, Medium Early Green (same as Medium Green), Medium Early Yellow (same as Ito San), Medium Green, Medium Yellow (same as Midwest), Midwest, Minsoy, Missoy, Monetta, Morse, Mukden, Nanda, Nanking, Norredo, Northern Hollybrook (same as Midwest), Ogemaw, Old Dominion, Oloxi (formerly Coker's Black Beauty), Osaya, Otootan, Ozark, Palmetto, Pee Dee (Coker's 31-15), Peking, Pine Dell Perfection, Pinpu, Richland, Rokusun, Sato, Scioto, Shiro, Sioux, Sooty, Sousei, Southern Green, Southern Prolific, Soysota, Suru, Tarheel Black, Toku, Tokyo, Virginia (selection {19186-D} from the Morse variety at Arlington Experiment Farm in 1907), Waseda, Wea, White Biloxi, Willomi, Wilson, Wilson-Five, Wisconsin Black, Woods' Yellow, Yelredo (a nonshattering selection, Coker's 319), Yokoten. Address: 1. Senior Agronomist; 2. Assoc. Agronomist, Div. of Forage Crops and Diseases; Both: USDA Bureau of Plant Industry, Washington, DC.

432. International Institute of Agriculture. 1939. Oils and fats: Production and international trade. *Studies of Principal Agricultural Products on the World Market* No. 4. Part I. 345 p. See p. 59-76. [Eng]

• ***Summary:*** Nine major oilseed crops and their respective oils are discussed: cottonseed, groundnut, linseed, soya beans (p. 59-76), sunflower seed, colza seed–rapeseed–mustard seed, sesame seed, castor seed, perilla seed, others (hemp seed, poppy seed, maize/corn). I. Grinenco wrote section IV titled "Soya beans and soya bean oil." Contents: I. Production (p. 59-68). Areas of production: Table 18 shows "Areas cultivated for soya." Average 1924-1928, 1929, 1930, 1931, 1932, 1933, 1934, 1935, 1936, in China, Manchukuo, Chosen [Korea], Japan, Netherlands Indies [Indonesia], United States, U.S.S.R. [USSR, p. 61-62] (Territory in Europe and Asia), Europe.

Table 19 shows "Areas cultivated for soya" during the same time periods shown above. In 1936 the world's leading soybean producing countries (in 1,000 metric tons) were: China 5,911.0, Manchukuo [Manchuria] 4,175.5, United States 816.0, Chosen [Korea] 487.1, Japan 339.8, Netherlands Indies (Java and Madura) 247.4, U.S.S.R. [USSR] 44.3, Kwantung 17.7, Taiwan 4.4.

Table 20 shows "Area and production of soya in China by provinces (average 1931-1935)." The leaders in total production are (in 1,000 metric tons): Shantung 1,980.7, Kiangsu 1087.4, Honan 765.0, Szechuan 517.0.

Table 21 shows "Production of soya in Manchukuo by provinces in 1936 (in 1,000 metric tons):" Northern provinces: Pinkiang 1,083.9, Kirin 980.8, Lungkiang 464.9, Sankiang 260.6, Chientao 91.4, Heiho 2.7. Total north: 2,884.3. Southern provinces: Fengtien 985.4, Antung 154.7, Chinchow 151.1. Total south: 1,291.2.

Table 22 shows "Area cultivated for the production of soya bean in the United States (in 1,000 ha):" Figures are given for Illinois, Indiana, Iowa, Ohio, North Carolina, Mississippi, Missouri, Other states. Total.

II. Trade (p. 68-76). Principal countries exporting soya beans: Manchukuo, Chosen [Korea], The United States. Principal countries importing soya beans: Germany, Denmark, Sweden, Netherlands, France, Norway, Latvia, Italy, Japan, Chosen, Netherlands Indies. Principal countries exporting and importing soya oil: Manchukuo, Japan, United Kingdom, Austria, Czechoslovakia, Finland, French Morocco, Hong Kong. III. Conclusion (p. 76).

Concerning Norway: Table 24 (p. 71) shows "Net world imports of soya beans (in 1,000 metric tons)," yearly from 1929 to 1936, plus average 1909-1913, and average 1924-1928. A footnote shows that in 1910-11 Norway imported 700 tonnes of soybean oil, followed by an average of 100 tonnes in 1924-28. Norwegian imports of soybean oil were zero from 1929 to 1932, then 2,200 tonnes in 1933, rising to 15,300 tonnes in 1934, then 15,700 tonnes in 1935, and 22,900 tonnes in 1936.

Concerning Finland: Pages 74-75 state that Finland imports soya oil. Finland's first recorded imports were in 1931, when 684 metric tons (tonnes) were imported. By 1936 Finland was importing 2,565 tonnes of soya oil a year. Note: This is the earliest document seen (May 2002) concerning soybean products (soy oil) in Finland; soybeans as such have not yet been reported. This document contains the earliest date seen for soybean products (soy oil) in Finland (1931).

Concerning Latvia: Page 72 states: "Among the countries that have increased their imports of soya beans are France, Norway, and Latvia, although the quantities imported up to the present are relatively small." They are so small that no statistics are given. Address: Villa Umberto I, Rome, Italy.

433. International Institute of Agriculture. 1939. Oils and fats: Production and international trade. *Studies of Principal Agricultural Products on the World Market* No. 5. Part II. 423 p. [Eng]

• ***Summary:*** Contents: Section II. Land animal fats. Butter. Pig fats. Beef and mutton fats. Trends in world production of and world trade in fats of land animals. III. Marine animal oils and fats. IV. Production and consumption of fats and oils in certain countries. V. Utilisation of fats and oils. VI. Prices of fats and oils (with graphs). Address: Villa Umberto I, Rome, Italy.

434. Japan Year Book 1939-40. 1939. Tokyo: The Foreign Affairs Association of Japan. 26 + 1220 + 26 p. With folded map of Japanese empire. See p. 412-13.

• ***Summary:*** The Preface indicates that this book was published in about Sept. 1939. The editor's name is not given.

Pages 412-13. "Leguminous plants:... Area of leguminous plants in 1937 was 606,184 cho and the production was valued at ¥96,048,470. During the past decade the area planted has been pursuing a slow downward movement, while a sharp reduction experienced by production was more than made good by the increase of 1933. Soy-beans and azuki (red) beans are predominant both in area and production. In 1937

Soy-beans were planted on 331,572 cho which produced 2.842 million koku worth 50,848,576 yen.

Azuki beans were planted on 104,288 cho which produced 0.833 million koku worth 17,272,620 yen.

Note: Production of azuki beans in 1937 in Japan was 29.3% that of soy-beans.

435. Japan-Manchoukuo Year Book. 1939. Tokyo, Japan: Japan-Manchoukuo Year Book Co. xxiv + 1202 p. Index. 26 cm. Sixth annual issue. [Eng]

• ***Summary:*** Each year book is divided into two main parts: Japan, and Manchoukuo. This book was published in late 1938.

In the Japan and Manchoukuo parts of the book, soya beans are most widely discussed in the respective chapters on Agriculture. In each case, information given the previous year is updated one year. The Foreword states: "A special feature of this issue is the supplement entitled Japan's Economic Position in China."

Page 332: Table 23 shows production of "Beans, potatoes and sweet potatoes" in hectolitres from 1927 to 1936. 1.80391 hectolitres = 1 koku = 5.11902 dry bushels (USA). For soya beans:

4.751 million hectoliters in 1936

Page 760: In the chapter on Railways. Table 5 shows "Staple commodities hauled" from 1931-1938.

1931–4.927 million metric tons (mmt) soya beans & other beans, 0.739 mmt bean cake, and 0.103 mmt bean oil.

1932–7.435 million metric tons (mmt) soya beans & other beans, 0.851 mmt bean cake, and 0.091 mmt bean oil.

1933–7.643 million metric tons (mmt) soya beans & other beans, 0.566 mmt bean cake, and 0.030 mmt bean oil.

1934–5.102 million metric tons (mmt) soya beans & other beans, 0.601 mmt bean cake, and 0.029 mmt bean oil.

1935–5.427 million metric tons (mmt) soya beans, 0.502 mmt bean cake, and 0.026 mmt bean oil.

1936–4.407 million metric tons (mmt) soya beans, 0.428 mmt bean cake, and 0.025 mmt bean oil.

1937*–2.676 million metric tons (mmt) soya beans, 0.233 mmt bean cake, and 0.022 mmt bean oil. * = Excluding North Chosen Line.

1938*–2.640 million metric tons (mmt) soya beans, 0.321 mmt bean cake, and 0.024 mmt bean oil. * = Excluding North Chosen Line.

Below this table is a section about the new freight rates.

Page 761: Table 6 shows "Soya-bean freight rates in yen per metric ton. Table 6A shows rates F.O.B. Rashin [Rason, Rajin, a port city on the east coast of Korea, 20 miles from the Russian frontier] from 12 localities Table 6B shows F.O.B. Dairen. from the same 12 localities.

Below that and on page 762 is a history of the South Manchuria Railway Company.

Page 759: A large table shows "Area under various crops (in hectares)" yearly from 1924 to 1938. In 1938 soya beans were planted on 3.784 million hectares.

Page 760: A large table shows "Output of principal of crops (metric tons)" in Manchoukuo yearly from 1924 to 1938. The latter year is an estimate. For soya beans: 4.381 million metric tons in 1938.

The other principal crops shown in the tables are other beans, kaoliang, millet, maize, wheat, rice, upland rice, and other cereals. The text about "Soya beans" is repeated on this page and the next.

Page 761: A table shows soya bean exports from Manchoukuo (in metric tons) from 1930 to 1937. Exports in 1937 were 1.974 million metric tons.

436. Matagrin, Am. 1939. Le soja et les industries du soja: Le soja en Afrique et en Australie [The soybean and soy industries: Soya in Africa and Australia (Document part)]. Paris: Gauthier-Villars. x + 390 p. See p. 57-58. 18 cm. [Fre]

• ***Summary:*** There are no indigenous soybean varieties in Africa, but soybeans were introduced by the English to the Cape [South Africa]; then to the Orange Free Province, Rhodesia, and Transvaal, and also to Nigeria, the Gold Coast [later Ghana], and Côte d'Ivoire. Likewise, they were introduced by the French to Dahomey [later Benin] and Togo. Today soybeans seem to offer good promise everywhere, but production has been developed only in southern Africa. In northern Africa, earlier trials, which were rather indecisive due to the lack of selection and lack of human experience (except for those of Asian peoples), have been undertaken more seriously since 1918 in Algeria, then in Tunisia and then in Morocco; the coastal regions, where irrigation is unnecessary, seem more favorable.

Elsewhere, it is important to get early maturing varieties in order to avoid dehiscence of the pods under the influence of the summer heat.

Note 1. Seedpods of some soybean varieties dehisce at maturity. That is, they split lengthwise along the natural line of the pod and discharge the contents of the pod–the soybean seeds.

The sandy and rocky soils, which are sometimes well tolerated by soybeans grown in the USA (North Carolina, etc.), are poorly suited in Algeria.

Following the advice of Mr. Rouest, we could try planting the seeds in two rows (20 to 25 cm apart), leaving

© Copyright Soyinfo Center 2021

between the two rows a space of about 1 meter of fallow (unplanted) land. In Tunisia, the climate and the vast territory offer advantages to many soybean varieties, and the trials which began in the 19th century, have now reached a certain amplitude / developed prosperously.

Note 2. Haberlandt (1878, p. 6) states that he obtained one green-seeded soybean from Tunis [later renamed Tunisia] in 1873 at the Vienna World Exhibition (*Wiener Weltausstellung*).

In Morocco, where 35,000 to 50,000 tonnes per year of other beans (*d'autres fèves*) are produced, at least one-third of which is exported (including the bean of Safi, which reminds one of the horse bean or dry kidney bean {*féverole*} of Egypt), this crop succeeds in the regions that are rather cool zones or that allow irrigation. This crop could enrich the soils with nitrogen in the valley of Sebou and the area around Fez, the small market-garden valleys of Mogador, perhaps even on the plains or plateaus of the Chaouïa and of the Doukala [Doukkala; the latter two places are now both in Morocco].

As for Egypt, it has already been worked over by the English propaganda, and soy has spread in the valley of the Nile, beside the horse-beans (*féveroles*) which have an ancient reputation.

In Australia this Asian legume is finally being cultivated successfully. It began at the start of the 20th century in the southeast, and today it grows all along the eastern coast (Queensland, New South Wales, Victoria). From there it somehow spread a bit to Tasmania and toward Adelaide, and above all to New Zealand, where it was welcomed. It does not seem that British New Guinea [later renamed Papua New Guinea] contributed its transmission, although the Dutch region of this large insular territory [Dutch New Guinea, later named Irian Jaya = Irian Barat or West New Guinea] did adopt the soybean, either from Mindanao (Philippines) or from Java [Indonesia].

Tables show: (1) Production and utilization of soybeans in the USA in 1934 and 1935, by states (in 100 metric tons) (p. 18-19). (2) Quantity and value of soybeans, soybean cake, and soybean oil imported into the USA from 1909 to 1928 (p. 26). (3) Importation of soybeans and soy oil into Great Britain (from 1913), Germany (from 1922), Netherlands (from 1913), Denmark (from 1913), and Sweden (from 1930) (all in Europe) in 1913, 1922, 1925, 1930, 1933, 1934, and 1935 (p. 41). (7A) Production of soybeans in China, Manchuria, Korea, and Japan (all in East Asia) in 1928 and 1935 (p. 51). (7B) Soybean trade among countries in Asia in 1909-13, 1922-23, 1924-25 incl. China and Manchuria, Japan, Korea, Dutch Indies, Java and Madura, Formosa, British and French possessions (p. 51).

Note 3. This is the earliest document seen (March 2021) concerning soybeans in Dahomey (later Benin), Côte d'Ivoire (Ivory Coast), or Togo, or the cultivation of soybeans in Dahomey, Côte d'Ivoire, or Togo. This document contains the earliest date seen for soybeans in Dahomey, Côte d'Ivoire, or Togo, or the cultivation of soybeans in Dahomey, Côte d'Ivoire, or Togo (1939; one of two documents for Côte d'Ivoire). The source of these soybeans is unknown. Unfortunately, the author gives no documentation for this early cultivation of soybeans in Dahomey, Côte d'Ivoire, and Togo.

Note 4. Matagrin says (without citing any source) that soybean trials were conducted in Tunisia (a protectorate of France from May 1881 to 1956) in the 19th century. If that were true, this document would contain the earliest date seen for the cultivation of soybeans in Tunisia. In 1869, Tunisia declared itself bankrupt. An international commission, with representatives from France, the United Kingdom, and Italy took over its economy. In 1878 Friedrich Haberlandt wrote that he had obtained 20 varieties of soybeans at the Vienna World Exhibition in 1873; at least one of these, he said, came from Tunis (Tunisia). How did soybeans get to Tunisia in order to be tested there? One possibility is that they were sent there from France by the Society for Acclimatization, which reported that it was conducting soybean trials in neighboring Algeria a few years before 1880. Address: France.

437. Matagrin, Am. 1939. Le soja et les industries du soja: Produits alimentaires, huile de soja, lécithine végétale, caséine végétale [The soybean and soy industries: Food products, soy oil, vegetable lecithin, and vegetable casein]. Paris: Gauthier-Villars. x + 390 p. Illust. 18 cm. [300 ref. Fre]

• ***Summary:*** Contents: Introduction. 1. The agricultural, industrial, and commercial history of soya: Asiatic origins and propagation in Europe, soya in America (its cultivation and industries), soya in Europe, Asia, Africa, and Oceania (1936) (1. Admission of soya in the agriculture and industry of European nations (p. 35): Soya in France, soy industry and commerce in central and northern Europe {England, Germany, Holland, Denmark, Sweden, Poland, Austria and Hungary, Switzerland}, penetration of soya into southern Europe {Iberian peninsula, Italy, Balkan countries of Dalmatia, Istria, Yugoslavia, Greece (p. 47), Bulgaria, Romania, Ukraine}, the grandeur and decadence of soya in Russia. 2. Soya in modern Asia (p. 51): China and Manchuria, Japan, Korea, Formosa, French Indochina {Tonkin, Cambodia, Cochin China}, the British and Dutch Indies {Siam, Assam, Bengal, Burma, Ceylon, India, Straits Settlements [later Singapore] / Malacca}, western Asia {Turkestan, Persia (p. 57)}. 3. Soya in Africa and Australia (p. 57-58): South Africa, Rhodesia, Nigeria, Gold Coast [later Ghana], Cote d'Ivoire, Dahomey, Togo, Algeria, Tunisia, Morocco, Egypt, Australia {Queensland, New South Wales, Victoria}, Tasmania, New Zealand, not yet in British New Guinea [later Papua New Guinea], Philippines, Java).

2. The botany and agronomy of soya: The plant, its names, its botanical characteristics, its varieties (original and

© Copyright Soyinfo Center 2021

created by selection), the cultivation of soya.

3. The general chemistry of soya: Chemical composition of the plant, structure and chemical composition of the beans.

4. Using soya in soyfoods and soyfood products: Whole soybeans (whole green, dry, sprouted, roasted and salted {*soja á l'état vert, fève de soja sèche, fève grillée, fève salée de soja, fèves de soja salées,* p. 166-67}, soynut butter {*un mélange rappelant les beurres végétaux*}, soy coffee, soy confections {*confiture de soja*}, soy chocolate, soy sprouts {*fèves de soja germées, germes de fèves de soja*}), soymilk and tofu (*le lait et le fromage de soja;* soymilk cream, concentrated soymilk, soymilk powder / powdered soymilk, fermented soymilk {*lait fermenté, yoghurt, kéfir, koumys,* p. 189}, fermented tofu {*fromages de soja*}), okara (*pulpe résiduaire de la préparation du lait de soja*), fermented soy products (solid, paste, and liquid condiments; natto, miso, and shoyu [soy sauce]; kiu-tsee and lactic ferments), soy flour and bread.

5. The soy oil industry and products derived from it: Extraction and refining of soy oil, properties and use of soy oil.

6. The vegetable lecithin industry: Extraction of vegetable lecithin, properties and use of vegetable lecithin.

7. The vegetable casein industries and plastic materials based on soya: Soybean cakes and flours from which the oil has been removed, use of such cakes and flours, in the crude state, as a raw material for plastics, manufacture and use of vegetable protein, soybean cellulose for artificial silk, soya furfural and furfuraldehyde (phenolic resins). Conclusion: How to launch soya industries in France. Important terms. A bibliography appears at the end of each chapter.

Note 1. This is the earliest French-language document seen that uses the terms *Fève grillée, fève salée de soja,* or *fèves de soja salées,* "roasted soy beans" to refer to soynuts.

Note 2. This is the earliest French-language document seen (April 2005) that mentions soynut butter, which it calls *un mélange rappelant les beurres végétaux.*

Summary: Matagrin wrote two previous books: *Manuel du Savonnier* (Paris, no date given) and *L'Industrie des Produits chimiques et ses Travailleurs* (Paris, 1925).

Francis G. Beltzer, a practical chemist, became a major force in visualizing new industrial uses for the soybean in the West. By contrast, Li and Grandvoinnet (1912) paid little attention to soy oil in their book, devoting only 3 pages out of 150 to the subject, and only ½ page to industrial uses, while largely ignoring lecithin. These two books had a great influence on soy in France and they nicely complement each other (p. vi).

*The Soybean,* by Piper & Morse (1923), was published in both New York and London. Horvath was a Russo-American chemist. Italians who made important contributions to the soybean were professors Bottari, Mattei, Panatelli, and Tito Poggi (p. vii).

Leon Rouest, French the agronomist, wrote an important book titled *Le soja français et ses applications agricoles et industrielles* (Chateauroux 1936). Since 1920 he has devoted himself to the culture of soybeans and to the selection of acclimatized varieties. He was director of the Laboratory of Soja in the north Caucasus from 1930 to 1935, and in 1921 he had already published a book, *Le soja et son lait végétal.* His new (1936) book benefitted from the collaboration of Henry de Guerpel, an agricultural engineer and mayor of Percy-en-Auge, who was also an indefatigable prophet of soybeans in France, until his untimely death in Jan. 1937.

Anyone in the world can order (from the U.S. Government Printing Office in Washington, DC) the many U.S. publications about soybeans from the USDA or state agricultural experiment stations. These substantial works are based on careful research and enriched with numerous tables and photos–a fine example of the key role that governments can play in introducing and popularizing soya. Recently J.A. LeClerc (of USDA's Bureau of Chemistry and Soils) said the soybean has become a naturalized American (p. viii).

More than a century ago Lord Byron wrote *Beppo,* the first Western poem on soy. It was an account of a carnival at Venice, Italy, in 1818. He advised the tourists to bring "Ketchup, Soy [sauce], Chili-vinegar."

Maurice Druel was one of the young engineers who worked with competence to launch a soy industry in France (p. x).

For an early chronology of soybeans and soyfoods in France (1856+, see pages 8-12). 1857-58: Lechaume planted soybeans at Vitry-sur-Seine and got encouraging results. A report by the National Society for Acclimatization declared: "The acclimatization of the soybean is complete."

1859–Setback for the first tests by Vilmorin with Chinese beans that were too late, but success by Dr. Turrel in le Var.

1862-69–Success of Mme. Delisse, in Gironde.

Then the Franco-Prussian war arrested these tests, so the center of interest moved to central Europe. The world exposition of Vienna in 1873 and Friedrich Haberlandt. In his book one finds the first analyses of the seed by Steuf, of the cake by Woelker / Voelker, the results of texts by Berndt on oil extraction (p. 9).

Podolie is in Ukraine.

Of Haberlandt's 148 trials in 1877, only 12 failed for lack of warmth. Much new agronomic information was accumulated.

Back in France: 1874-80–Society of Horticulture d'Etampes (Seine-et-Oise) grew a yellow Chinese variety which succeeded. This "soja d'Etampes" was studied intensively from the chemical and agronomic points of view by Lechartier and various authors. A doctor from the region prepared, for his personal use, a vegetable cheese (tofu). But the grain did not find buyers so its cultivation did not spread. There now remain only 2 or 3 innovators to cultivate

© Copyright Soyinfo Center 2021

soybeans and on 5-10 acres maximum. But Chinese soybeans mature in the region of Paris, as in 1879 at Marseille.

1880–While the tests of Boursier in l'Oise have succeeded. and while Olivier-Lecq, ardent propagator of soybeans, distributed 100 kg to farmers in the north, the national Society for Acclimatization organized cultural trials all over France. Results were obtained in each of the regions, some with record yields. The general objection of the farmers was the difficulty found in using the soybean as a legume (it was too hard) or to find buyers.

As Paillieux said so well: "Our point of departure has not been happy one; the soybean has been presented simply as a new legume" (p. 10).

The German successes in soybean cultivation were studied by Wein in 1881 (p. 10).

In the 1880s there was a big growth of interest in vegetarian diets in Europe. Compare this with the USA (p. 11).

Li Yu-ying: After his 1905 speech, in 1908 he created a laboratory for studies, which soon founded the factory La Caseo-Sojaine at Vallees, near Colombes (Seine), administered by a French-Chinese company. This establishment made soyfoods using imported soybeans, especially tofu (p. 12).

Dr. Bloch of France recommended thin sheets of pressed tofu as a reserve ration for troops.

Lever Bros. soap works used lots of soy oil in Britain (p. 12).

The British did some cultural trials in India, Burma, Siam (Thailand), and South Africa.

Japan, in effect, annexed Korea in 1895.

It was only after 1905 that soybean tests took place, first in Guyana, where the soybean matured easily.

Soybeans were grown for forage more in the South of USA than in the north. Continued. Address: France.

• ***Summary:*** During the past decade, one finds from time to time in the agricultural journals, articles which vaunt the merits of this legume and call the attention of agriculturists of the interest in its culture in France.

The total soybean consumption of Japan proper, Korea and Formosa, during the fiscal year 1937-38, was 1,650,000 metric tons, of which 25% was used by oil mills and 50% at the table (condiments, soymilk, and tofu). Address: Paris, France.

440. Krauss, Frederick G. 1940. Diversified agriculture in Hawaii. *Honolulu Advertiser* (*The*) (*Hawaii*). Feb. 18. p. 42.
• ***Summary:*** "The Soja (Soy Bean): The most versatile of annual field crops. Potentially an important leguminous 'grain' (seed), forage and hay, and green manuring crop for Hawaii, with industrial possibilities."

"Introduction: No other crop is used for so many purposes as is the soybean, or of which there are so many agronomic forms, making it adaptable to many cultural conditions. For centuries the most important legume in Asiatic countries, it is fast gaining a like ascendancy in some parts of the continental United States, notably in Illinois, Iowa, Indiana, and on especially to North and South Carolina to and throughout much of the cotton Belt. Strange to say, although the crop has been experimented with in California for twenty years, it has rarely produced above a thousand pounds of seed per acre under the most favorable conditions that could be supplied there, and at $40.00 per ton, such small yields would be unprofitable. Consequently the soybean has not become established on the Pacific Coast, nor does it seem likely to, which has resulted in continued heavy importation of the seed from the Orient.

"It is the writer's opinion that light intensity, or 'length of day' growing factor, termed photoperiodism (the response of the plant to relative length of day and night), is the limiting factor in the region rather than other climatic conditions such as temperature, humidity, etc., too often attributed to causes of failure in crop production.

Hawaii's Adaptability: As to Hawaii's adaptability to the profitable production of the soybean (also termed

© Copyright Soyinfo Center 2021

the soja from its generic name), many varieties have been tested over a long period. Krauss in Bulletin No. 23, entitled *Leguminous Crops in Hawaii*, published by the Hawaii Experiment Station in 1911, records the successful culture of some dozen varieties, ranging from very dwarf types, which mature in 60 to 100 days, to varieties which attain a height of 4 feet or more, and requiring 4 months to mature. In succeeding years the Hawaii Experiment Station has added numerous other varieties, the most outstanding among them being the two Biloxi varieties from Mississippi. All together at least 200 varieties have been tested in cooperative field trials, among them some 40 varieties collected by the writer in China and Japan in 1909, 1927, and 1936.

"From this extended experience we would affirm that at least a half dozen varieties are available to the commercial grower that will produce average crops of a ton of seed per acre under favorable conditions.

"The writer would estimate that 2000 to 5000 acres might gradually be brought into this crop in rotation with potatoes corn and other similar field crops, including even sugar cane and pineapples. Such an acreage should produce from 2000 to 5000 tons of seed which would justify the setting up of a small oil expressing plant, and or a mill for producing soybean flour such as the well known British manufactured 'Trusoy' flour [launched in 1932] and several American brands, in addition to supplying the local demand for beans used in the manufacture of Oriental products such as tofu (soybean curd) and its by-product kirazu [okara], tonyu (soybean milk), miso (fermented rice and soybeans), shoyu (soybean sauce) and other, which together necessitate the importation of some 2½ million pounds annually, the product of more than a thousand acres. Lastly should mention be made of the important remaining by-product should Hawaii see fit to set up a soybean expressing plant– the resultant oil cake which is one of the most satisfactory sources of food from a vegetable source, used for livestock feeding, feeding especially for dairy cows. Large quantities of this feed concentrate are imported into Hawaii, at a cost ranging from $40 to $50 per ton.

"History and Adaptability; Botanical Characteristics: The soybean (*Soja max*), relatively new to American commercially, is one of the oldest and most important food crops grown in the Orient. The plant was referred to in Chinese literature at least 4800 [sic, 3100] years ago. It was first introduced into the United States about 1800 [sic, 1765]. However, it is only since 1908 [sic, 1890] that the crop has become generally known to those places of the United States where it now flourishes. The Hawaii Agricultural Experiment Station began conducting extensive experiments with the crop in the middle 1900s. By 1910 a hundred varieties were under comparative test at the Pensacola Street Station [in Honolulu] (See Bulletin 23, Leguminous Crops for Hawaii, 1911). In 1909 the writer collected some 40 varieties in China and Japan, which were added to the already large collection under test. One of these new Asian varieties, O-too-tan, is now said to be a foremost variety in the southern states, where it is grown in excess of a million acres, principally as a hay and silage crop (see such southern seed catalogs as Wood's, Reuter's and Hastings–the latter terms it the 'Hawaiian' soybean).

"To indicate the importance of the soybean as an Asiatic crop, mention may be made of Manchuria's production of 142 million bushels, in Korea 250 million bushels are produced and in Japan 11 million bushels, and in Netherland-India [today's Indonesia] 7.5 million bushels as of 1935. During the same period the United States produced about 40 million bushels, while in 1907 less that 50,000 bushels were produced, Remarkable progress has been made in recent years in the United States in the developing of food and industrial uses from the soybean, especially in the manufacture of oil, flour and oil meal cake, and lastly, plastic materials such as is being used in the automobile industry, in greatly increasing volume. Henry Ford alone used 2 million pounds of soybean oil, the product of 10,000 acres of soybeans annually, for the manufacture of the enamel with which he coats his automobiles. The resultant soybean meal, by-product after the oil is extracted, is used for making plastics used in numerous automobile parts. At present about 45 soybean oil mills are in operation in the United States. These, during the 1935-36 season produced 209 million pounds of oil, the product of 25 million bushels of soybeans grown on a million acres. The price paid for these beans is a few cents below $1.00 per bushel of 60 pounds. So important has the domestic soybean industry become that an exhaustive text by A.A. Horvath has recently been published by the Chemical Publishing Company under the title *The Soybean Industry* (second edition 1939).

"Description of the Plant:" A long, typical botanical description follows.

"(To Be Continued Next Sunday)." Address: PhD.

441. Ozouf, René. 1940. Le soja [The soybean]. *Journal des Instituteurs et des Institutrices* (*France*) 86(12):47. March 2. [2 ref. Fre]*

• ***Summary:*** This article appears in the section of this issue titled "Partie Scolaire," in the subsection titled "Pour les Grandes et les Adultes." Contents: Introduction. Its cultivation (one of the oldest cultivated plants in the world, widely cultivated for ages in East Asia (especially Manchuria)), it is an annual, which prefers temperate climates, there are more than 1,200 varieties, cultivated in the Corn Belt of the USA, and in Korea, Japan, Java, the USSR, Romania, Hungary, Bulgaria, Yugoslavia, and France (but yields here are low).

Its utilization: The bacteria in the nodules on its roots are a source of nitrogen fertilizer. It can be used as a green forage crop, like lucern / alfalfa. If this is dried, it can be made into hay or silage. Pigs can be raised on soybean

© Copyright Soyinfo Center 2021

pasture in the open air. It is much appreciated as a green manure. Because the seeds are rich in nitrogen, protein and oil, it is utilized in the form of beans or of oilseed presscake for the feeding of all farm animals. It also has many uses as an industrial product. Above al, it is used as a source of oil and cake / meal.

The modern soybean utilization industry is most highly developed in Manchuria, where the principal centers are (in order of importance) Dairen, Harbin, Antung and Yingkou (W.-G. Ying-k'ou; formerly Newchwang or Niuchwang); in China, above all in Nanking and Shanghai; in Korea at Konan (in today's North Korea) and in the ports of Seishin (Ch'ongjin, Chongjin, in today's North Korea), and Rashin; in Japan at Kobe-Osaka and Tokyo-Yokohama; in Siberia, in the Russian Far East at Khabarovsk and Vladivostok.

In Europe, Germany is in first place in the various soy industries, and especially of oil, lecithin, and cakes. Hamburg and its surroundings are the leading center, followed by Bremen, Stettin [part of Germany in 1940; Szczecin, in Poland as of July 2014], Berlin, etc. In the years immediately preceding the war of 1939, the Reich imported 40-50% of the soybeans produced in Manchuria. Hull is the principal soybean crushing center in England. Throughout Scandinavia the soybean is transformed into cake and margarine, as well as in the Netherlands and in Belgium. In France, two factories that make oil and lecithin are in operation near Arras and Lille.

In the United States soybean processing industries are developed everywhere, particularly in Chicago [Illinois] and Milwaukee [Wisconsin] and in the towns of Illinois and New York. Ford automobile factories use soybeans to make plastic accessories.

Soybean trade and commerce.

442. Burlison, W.L. 1940. Importance of soybeans to American agriculture (With some notes on soybean research). *Proceedings of the American Soybean Association* p. 27-30, 34-35. 20th annual meeting. Held 18-20 Aug. at Dearborn, Michigan.

• ***Summary:*** Contents: List of 11 things that the future of the soybean as an important Illinois crop is dependent upon–according to G.L. Jordan, Dep. of Agricultural Economics, Univ. of Illinois. Where do we go from here in soybean production? Table 1–Annual production of soybeans in five leading countries from 1925-1939: USA, Manchuria, Chosen [Korea], Japan, Netherland India. Table 2–World production of soybeans in 1,000 bushels (excluding China) from 1925-1939, including percentage increase each year over 1925. These figures include, in addition to the countries shown in Table 1, Kwantung, Taiwan, U.S.S.R., Rumania, Bulgaria, Yugoslavia, and certain other small countries in Europe. U.S. soybean production as a percentage of world production. Why this rapid increase in U.S. soybean production? Rapid increase in U.S. soybean production during the past 6 years. Research leads the way: List of typical research projects at larger corn belt agricultural experiment stations.

Extracts from letters on the future of soybeans in Illinois from thoughtful observers: H.G. Atwood, Allied Mills, Inc., 26 Dec. 1939. G.G. McIlroy, President, American Soybean Association, 7 Dec. 1939. W.J. O'Brien, The Glidden Co., 8 Dec. 1939 (use of oil in paints). N.P. Noble, Swift and Company Soybean Mill, 8 Dec. 1939 (Swift has now built soybean mills at Cairo, Illinois; Des Moines, Iowa; and Fostoria, Ohio. Swift is using larger quantities of soybean oil in their various products). Edward J. Dies, National Soybean Processors Assn., 14 Dec. 1939. D.F. Christy, Acting Director, USDA Office of Foreign Agricultural Relations, 17 Feb. 1940. E.F. Johnson, Ralston-Purina Company, 21 Dec. 1939. H.P. Rusk, Dean and Director, Illinois Experiment Station, 22 May 1940. J.W. Hayward, Archer-Daniels-Midland Company, 24 May 1940.

Growth in the number of soybean crushing mills in the USA from about 10 in 1925 to approximately 75 in 1939. Increase in soybean yields in Illinois from 13.5 bushels/acre in 1925 to 24.5 bushels/acre in 1939. Growing industrial utilization of soybeans. Conclusion: "The importance of soybeans to American agriculture is bound to be of greater significance as the years go by."

Concerning research: "Our research program on soybeans in this country is nothing less than remarkable. In 1937 a list of soybean projects was published by H.M. Steece, Specialist in Agronomy, Office of Experiment Stations, U.S. Department of Agriculture." In 1937 some 53 agricultural experiment stations were conducting 258 separate investigations on soybeans. "By far the largest number of these have to do with the varieties and methods of production." A photo (p. 29) shows a tractor pulling a combine harvesting soybeans in Indiana.

Note: This is the earliest English-language document seen (March 2003) that uses the term "soybean research" (see subtitle) to refer to research on soybean production. Address: Head, Dep. of Agronomy, Univ. of Illinois.

443. Noda Shoyu K.K. 1940. Noda Shôyu K.K. Nijûnen-shi [Twenty-year history of Noda Shoyu, Inc.]. Noda, Japan: Noda Shoyu K.K. 733 p. Illust. No index. 22 cm. [Jap]

• ***Summary:*** This is the earliest known major history of Kikkoman; it was written largely by Mr. Morio Ichiyama. Contents: Preface. 1. History: Before the establishment of Noda Shoyu K.K. (The origin and its changes {Thoughts on its origin, Tokugawa period, Meiji period, beginning of the Taisho period}, development of shoyu industry and the town of Noda, Noda Shoyu Jozo Kumiai, family trees and family traditions of the Mogi, Takanashi, Horikiri, and Ishikawa families, virtues of the family), foundation of Noda Shoyu K.K. {the opportunity to unite, the establishment of a joint undertaking}, 20 years after the establishment. 2. Organization and management. 3. Plants (17): Korea,

© Copyright Soyinfo Center 2021

Jinsen?, Keijo plants. 4. Fermentation process: Special products (mirin, miso, sauce), testing center. 5. Business. 6. Cultural welfare facilities. 7. Connected enterprises: K.K. Noda Shoyu Ginko, Sobu Tetsudo K.K., Noda Transportation K.K., Gomei Company Senshukai, Foundational Juridical Perdon Kofukai, Manchuria Noda Shoyu K.K., Choshi Shoyu K.K.

Appendixes. Timeline / time table / chronology: Ranking of capital investments of shoyu producing companies in Japan, graph of yearly shoyu production in Japan, sales of shoyu, mirin, and miso by the company, sales of the company's shoyu comparing by area and also container, the company's shoyu exporting map, average sales of the company's shoyu, prices of raw materials of shoyu production, prices of shoyu in different type containers.

Pages 461-65 give an introduction to and description of each of the major brands produced by companies presently in the Noda Shoyu group. Under the Kikkoman brand, we learn that the producer of this brand of shoyu is the Saheiji MOGI family. It is said that the logo was designed by Manpei SARANUMA. It is said that the meaning and origin of the brand is as follows. The first "big army of God" in Japan was honored at a place named *Shimousa no Kuni, Kikkô mountain* (*Kikkô-zan*), *Katori Shrine* (*Jingu*). The name of the mountain, Kikkô, was used in the brand. The tortoise (*kamé*) symbolizes long life and is thus a symbol of happiness. It is said that a tortoise lives for 10,000 [*ichi-man*] years. The grace with the tortoise is born shows high-class dignity with supernatural power.

Pages 466-480 show all of the shoyu brands (including minor ones) produced by companies in the Noda Shoyu group. For each brand, the name, year of introduction, quality rank, and area where sold are given. Early brands, those introduced before the start of the Meiji period (1868), are read from top to bottom, right to left.

The Saheiji MOGI line produced a total of 15 shoyu brands. The earliest was introduced in 1784. Early brands were: Kikkôman (Tenmei 2 = 1784), Kikkôdai (Tenmei 2 = 1784), Azumaichi (Tenmei 2 = 1784), Yamataika (Tenmei 2 = 1784).

The Shichirouemon MOGI line produced a total of 58 shoyu brands. The earliest was introduced in 1772. Early brands were: Kihaku (Anei 1 = 1772), Kagikashiwa (Anei 1 = 1772), Fujikashiwa (Anei 1 = 1772), Shôchikuba (Anei 1 = 1772), Kikkôkashiwa (Tenmei period = 1781-89), Hôzan (Kaei 2 = 1849).

The Shichizaemon MOGI line produced a total of 30 shoyu brands. The earliest was introduced in 1830. Early brands were: Kushigata (Tenpo 1 = 1830).

The Hyôzaemon TAKANASHI line produced a total of 39 shoyu brands. The earliest was introduced in 1772. Early brands were: Jôjû (Anei 1 = 1772), Betatakara (Anei 1 = 1772), Tachitakara (Anei 1 = 1772), Jigamisakari (Anei 1 = 1772), Fundonokina (Genji 1 = 1864), Fujitakara (Kaei 2 = 1849).

The Fusagoro MOGI line produced a total of 48 shoyu brands. The earliest was introduced in 1753. Early brands were: Minakami (Ansei 2 = 1855), Fujimasa (Hôreki 3 = 1753).

The Noda Shoyu Goshi Gaisha produced a total of 13 shoyu brands, the Keizaburo MOGI line produced a total of 7 shoyu brands, the Monjiro HORIKIRI line and the Kanzaemon YOSHIDA line each produced one brand, and the Nihon Shoyu K.K. produced 2 brands, but all were introduced after the start of the Meiji period (1868).

A section on exports (p. 650-) notes that it is not clear when direct exports of shoyu from Japan to the western world began, but at some time during the Bunsei (1818-1830) or Tempô (1830-1844) periods it was shipped to Holland along with other goods. In 1854 (at the start of the Ansei period, 1854-1860) an American ship came to Japan and during the stay they bought some Japanese shoyu. Also during this same Ansei period it is said that special shoyu was made for export. Made by Sairinko SHIMAZU, it was bottled and shipped via Holland House (Oranda Yashiki) in Nagasaki.

Contains many photos and illustrations. Two of these, on unnumbered pages near the front of the book, are of special interest: (1) MOGI Shichirouemon (lived 1860-1929) was the first president and CEO (*shodai torishimaru shacho*) of Noda Shoyu Inc., which began operations on 1 Jan. 1918 and was the forerunner of today's Kikkoman. An inspiring tribute and eulogy to him appears in: Fruin, W. Mark. 1983. *Kikkoman: Company, Clan, and Community* (Harvard University Press, see p. 129-54). In 1889 he assumed headship of the Kashiwa family branch, then became the most influential director of the Noda cartel. After 1900 he was probably the most widely known and respected shoyu maker in Japan.

(2) MOGI Saheji was the first senior executive manager (*jomu torishimaruyaku*) of Noda Shoyu Inc. Saheji succeeded Shichirouemon as president of Noda Shoyu Inc. Saheiji is the name of a *bunke* or branch family. Anyone born or adopted into the family takes the name. So at one time this Saheiji was the head of a branch family of the Mogi clan that had among its brands, the Kikkoman brand.

Note 1. Fruin (1983, p. 302-03) further clarifies the relationships: Since the establishment of Noda Shoyu, Inc. "in 1918, kinship has been employed not for interfamily cooperation but for interfamily rivalry. Household membership has become all-important in determining access to the upper reaches of corporate power. Consider the following statistics... Of the twenty-eight main and branch households in the three Mogi, Takanashi, and Horikiri *dôzoku* (see figure A-1),... the percentage of households" by lineage that engage in shoyu manufacture is as follows: "Horikiri, 13; Takanashi, 50; Mogi, 53." But "within the overall Mogi clan one main and two branch households

© Copyright Soyinfo Center 2021

contend. The importance of the subdivisions within the Mogi clan is revealed by the fact that, although eight of the company presidents to date have been Mogis, within the greater Mogi lineage 63 percent of the company presidents can be traced to the Kashiwa branch household of Mogi Shichirouemon, 25 percent from the Mogi-sa group of Mogi Saheiji, and only 12 percent from the main house of Mogi Shichizaemon. Household hegemony was reflected as well on the first board of directors, with 67, 22, and 11 percent representation for the households of Mogi Shichiroeumon, Saheiji, and Shichizaemon respectively."

Note 2. A *dôzoku* is a lineage or clan composed of several stem families or descent groups, called *ie* (Fruin, p. 343, Glossary). Address: Noda, Japan.

444. Bazore, Katherine. 1940. Hawaiian and Pacific foods: a cook book of culinary customs and recipes adapted for the American hostess. New York, NY: M. Barrows and Company. xxiii + 286 p. Illust. Index. 24 cm. [79* ref]
• ***Summary:*** This is a remarkable book. The author has a good understanding of the various ethnic groups in the Hawaiian Islands.

In the chapter on "Chinese Foods and Food Customs" (p. 43-58) is a section titled "Beans and Bean Products" (p. 50-51) which notes that the Chinese use many kinds of beans, including soybeans. From the soybean a "'milk' is extracted which does not, however, contain the nutrients found in cow's milk. A dark brown pungent salty liquid is soy sauce or soya. From red beans comes *hung see yau*, a red soya sauce which is sweet and sharp flavored..."

"Footnote: The Romanized names of Chinese foods are given in the Cantonese dialect. For these, the author is indebted to Dr. Wing-tsit Chan, Professor in the Oriental Institute, University of Hawaii."

"Soybeans are used to make bean curd or *tau fu*... Such curd may be sold fresh, dried, frozen, fried or preserved in oil... Dried bean curd skin (*fu chook*) is soaked in water, then combined with a number of ingredients to make monk's food or *tsai*, the meatless dish, served on New Year's Day. A thick white bean curd paste (*tau fu mui*) is used with green vegetables. *Nam yue* (a red bean curd), flavors meat." See also "tsai," (p. 58).

In the chapter on "Japanese Foods and Food Customs" (p. 59-69) is a section titled "Beans and Bean Products" (p. 61-51) which mentions Buddhist priests as vegetarians, edamame (the green soybean), miso and miso soup, bean curd, natto, soybean curd ("When fresh it is called tofu; when dried it is known as *koyatofu* or *koridofu*), aburage, and *inari-sushi* and shoyu. Page 62: "After tofu has been made there is a residue which the Japanese use, calling it kirazu (55). It is inexpensive, may be eaten by animals as well as humans. Sometimes the shops give it away with purchases of tofu." A recipe for Kirazu with vegetables (O kara) (with "5 cups kirazu {bean curd residue}," p. 199-200. "This is a very inexpensive dish as the kirazu may frequently be obtained free at the tofu factory"). Page 68: See sukiyaki.

The chapter on "Korean Foods and Food Customs" (p. 70-75) begins: "The Koreans comprise one of the smaller national groups living in Hawaii." The section on "Beans and Bean Products" (p. 72) mentions soy sauce, soybean curd. "Cooked rice and soybeans are allowed to ferment [to give meju], producing a product called *toichang*, much like Japanese miso. Toichang is an ingredient in hot red pepper sauce.

Recipes–Pages 139-40: Tofu shoyu soup (Tofu jiru). Miso soup with daikon (Daikon no miso shiru). Miso soup with milk (Miruku no miso shiru).

Page 266-67: Foods commonly used at the present time: Chinese, Japanese, Korean.

Katherine Bazore was born in 1895. Address: Chairman, Home Economics Dep., Univ. of Hawaii.

445. Becker, Joseph A.; Froehlich, Paul; Fraser, W.O.; et al. comps. 1940. Agricultural statistics 1940. Washington, DC: U.S. Government Printing Office. 737 p. Index. 24 cm. For soybeans and soy products see p. 299-311, 377, 383-84, 455-56, 459-60, 519, 523.
• ***Summary:*** This volume presents information formerly published [until 1935] in the statistical section of the Yearbook of Agriculture" (p. 1).

In this 1940 volume, tables concerning soybeans are on pages 299-311, 377, 383-84, 455-56, 459-60, 519, 523.

Page 301: Table. Soybeans: Acreage and production in specified countries, average, 1930-34, annual 1935-40. The countries in approximate descending order of production are: China (excluding Kwangsi Province; Guangxi Autonomous Region in southern China), Manchuria, United States, Chosen [Korea], Japan, Taiwan, Netherlands Indies, Rumania (assuming that Bessarabia accounted for 80% of the total), Bulgaria, Yugoslavia, and Hungary. The world total each year excludes the USSR.

Page 305: Table. The main countries exporting soybeans are China, Manchuria and the United States. The main countries importing soybeans in 1938 are Germany, Japan, Denmark, United Kingdom, Sweden, Italy, Netherlands and Canada.

Page 305: Table. The main countries exporting soybean oil are China, Manchuria, Denmark, Japan, and Sweden. The main countries importing soybean oil in 1938 are Netherlands, United Kingdom, Italy, Germany, United States, Belgium, Chile, France, Morocco, Norway, Algeria [a French colony], Austria, Czechoslovakia, Canada, USSR.

Page 308: Soybean production in specified countries in 1924-1939. The countries are United States, China, Manchuria, Chosen [Korea], Japan. Netherlands Indies.

Page 309: Soybean crushed, and production, imports and exports of soybean oil, cake, and meal, 1929-39. Soybeans crushed rose from 1.666 million bushels in 1929 to 44.648

© Copyright Soyinfo Center 2021

million bushels in 1939. Production of crude soybean oil rose from 13.424 million lb in 1929 to 416.111 in 1938. Soy oil was both imported and exported every year. Soybean meal and cake production increased from 40,000 tons in 1929 to 1,054,000 tons in 1938. There were small imports each year but no exports.

Page 377, 383-384: Fats and oils used in the manufacture of compounds [shortening] and vegetable cooking fats, United States, 1929, 1931-40. The main fat used was cottonseed oil, but soybean oil increased from 10.8 million lb in 1931 to 201.599 million lb in 1939. Imported palm oil was also used largely.

Page 455, 458-60: Tables. Oleomargarine: Materials used in manufacture, United States, 1924-1940. The main animal materials were oleo oil and neutral lard. The main vegetable oils were cottonseed oil (by far). Soybean oil increased from 11,000 lb in 1929 to 87.1 million lb in 1940. Coconut oil was also largely used. Address: U.S. Dep. of Agriculture, Yearbook Statistical Committee, Washington, DC.

446. Soybean collection at the N.I. Vavilov All-Russian Research Institute of Plant Industry (VIR) based on the log book of 1940. 1940.

• ***Summary:*** This list of soybean accessions at the VIR (St. Petersburg, Russia) in 1940 was sent by Irina Seferova, Soybean Collection Curator at the VIR. Based on that year's log book, it shows that the VIR had 4,014 accessions of various types (landrace, breeder resource, primitive line, advanced Cultivar, and a few wild forms) which are not individually designated. These come from 35 different countries, regions, etc. as follows: Africa 1. Africa, Congo 2. Africa, South Africa 6. Austria 1. Canada 14. Caucasus, Abkhazia (USSR) 21. Caucasus, Georgia (USSR) 31. Caucasus, North Caucasus (USSR) 9. Central Asia (USSR) 5. Ceylon (Sri Lanka) 2.

China 2,347.

China, Manchuria, Experimental Station Echo 547. Cuba 1. France 9. Germany 11. Guatemala 2. Hungary 4. India 37. Iran 1. Ireland 1. Italy 7.

Japan 171. Korea 49. Latvia 2. Lithuania 6. Mexico 1. Netherlands 1. Poland 4. Russia, European part (USSR) 29.

Russia, Far Eastern Region (USSR) 421. Russia, Siberia (USSR) 13. Ukraine (USSR) 14.

USA 233. Uzbekistan (USSR) 9. West Asia 3.

Total 4,014.

Note: This is the earliest document seen (July 2014) concerning the cultivation of soybeans in Latvia. This document contains the earliest date seen for the cultivation of soybeans in Latvia (1940). The source of these soybeans is unknown.

A separate table sent by Irena on 30 Nov. 2010 shows 13 major collections of soybeans. They are ranked on the table by number of soybean accessions. All of the entries are dated and some have multiple dates. Moreover, it is not clear whether that soybeans were collected during an expedition or whether they were sent to VIR for some reason. We will assume an expedition only when its leader is named.

(1) 1,859 accessions from Experimental Station Echo, Manchuria (China), Donor: A.D. Woeikoff [Aleksandr Dmitrievich Voeikov (1879-1944)- LC transliteration]. Years: 1923, 1929, 1931.

Note: According to a USDA periodical in March 1926, Woeikoff was director, Experimental Station, Echo" at "Tiehlingho, Kirin Province, Manchuria." This "Experimental Station. Echo" in Manchuria was operated by the old Chinese Eastern Railway.

(2) 529 accessions from Echo Experimental Station, Manchuria (China). Years: 1923, 1924, 1927, 1928, 1929, 1932.

(3) 232 accessions. VIR Expedition to Far East Region (USSR), led by Trofim Jakolevich Zarubajlo [Trofim IAkolevich Zarubailo] (born 1906). Year: 1932. Note: A post-graduate student of the VIR in 1932, he then became an employee of the VIR and was the leading expert in the genetics of cereal crops.

(4) 194 accessions. VIR Expedition to USA, led by D.N. Borodin, Head of the Division, Dep. of Applied Botany and Plant Breeding. Accessions from USA, Japan, China, Korea, and Russia. Years: 1921, 1922, 1923, 1924, 1925, 1926, 1928.

(5) 171 accessions. from Manchuria, Agronomical Department of the Chinese Eastern Railway, Vrachinskij [Vrachinskii]. Year: 1929. Vrachinskij is the family name of a person. Nothing more about him is known.

(6) 79 accessions. VIR Expedition to Japan led by Evgenija Nikolaevna Sinskaja [Eveniia Nikolaevna Sinskaia–LC transliteration] (Sinskaya). Year: 1928. Note: An employee of the VIR, Sinskaya (a woman) was one of the most talented botanists and plant breeders in Russia. She created her own scientific schools. An exceptional field researcher, experimenter and theorist, botanist, geographer, ethnobotanist, and environmentalist, Evgenia Nikolaevna was not only a good friend and active adherent of N.I. Vavilov, who selflessly helped him in carrying out his scientific and institutional programs, but she was also an outstanding follower, playing a significant role in the development of his ideas and concepts.

(7) 74 accessions from Manchuria Agricultural Society, China. Year: 1925, 1926.

(8) 66 accessions. VIR Expedition to Far East Region (USSR), led by M. Tchenkova. Year: 1929.

(9) 62 accessions from the Moscow Agricultural Exhibition, Russia. These accessions came from Russia, Ukraine, Caucasus, Central Asia. Year: 1923.

(10) 87 accessions. Expeditions to Italy (1927), China, Japan, and Korea (1929) led by N.I. Vavilov (See separate record for 1929).

© Copyright Soyinfo Center 2021

(11) Other, 661 accessions (1921-1940).

Photos show: (1) E.N. Sinskaja / Sinskaia (1889-1965). (2) Trofim Jakelovich Zarubajlo / Zarubailo (born 1906).

Note: "Today, the N.I. Vavilov Institute of Plant Industry in St. Petersburg still maintains one of the world's largest collections of plant genetic material. The Institute began as the Bureau of Applied Botany in 1894, and was reorganized in 1924 into the All-Union Research Institute of Applied Botany and New Crops, and in 1930 into the Research Institute of Plant Industry. Vavilov was the head of the institute from 1921 to 1940. In 1968 the institute was renamed after him in time for its 75th anniversary" (Source: Wikipedia, at Nikolai Vavilov, Dec. 2010). The VIR celebrated its 100th anniversary in 1994–www.vir.nw.ru. Address: St. Petersburg, USSR.

447. Deasy, George F. 1941. Geography of the United States soybean-oil industry. *J. of Geography* 40(1):1-7. Jan. [2 ref]

• ***Summary:*** Contents: Development of the United States soybean industry. Distribution of American soybean mills. Uses of soybean oil. Future of the United States bean soil industry,

Tables show: (1) "United States production of vegetable oils from domestic oil-yielding seeds." Cottonseed oil 1,678 million lb. Soybean oil 323 million lb. Linseed oil 157 million lb. Corn oil 137 million lb. Peanut oil 78 million lb. Olive oil 5 million lb. Tung oil 2 million lb. Thus, soybean oil ranks second only to cottonseed oil–but a distant second. The amount of soybean oil produced is only 19% as much as the amount of cottonseed oil.

(2) United States acreage and production of soybeans, 1924 to 1938. For even-numbered years gives: Total soybean acreage (increased from 1.78 million in 1924 to 7.79 million in 1938). Acreage harvested for soybeans (increased from 0.448 million to 2.898 million). Total production of soybeans (increased from 4.947 million bushels to 57.665 million). Soybeans crushed (increased from 0.307 million bushels to 48.886 million). Percent of total production crushed (increased from 6.2% in 1924 to 84.8% in 1938).

(3) Comparative conditions of the soybean industry in selected regions and states of the U.S., 1937. Defines and gives figures for 2 regions and 2 states: North-central states, southern states, Illinois, Mississippi. Gives for each: Percentage cut for hay, hogged off, and cut for beans. Yield of beans in bushels/acre. Total soybean production.

(4) U.S. factory consumption of soybean oil, 1938 (million pounds): Edible products: Shortening 137.133. Oleomargarine 39.885. Others 11.280. Inedible products: Paint and varnish 15.183. Soap 10.897. Linoleum and oilcloth 3.605. Miscellaneous products: Unclassified 5.399. Loss: (incl. foots) 14.046.

Bar charts show: (1) Estimated soybean production in leading countries, 1938: China, Manchukuo, United States, Chosen [Korea], Japan. (2) Estimated soybean production in leading U.S. states: Illinois, Indiana, Iowa, Ohio, North Carolina, Missouri, Others.

Maps show: (1) Total U.S. soybean acreage, 1934. Each dot represents 1,000 acres (2) Total U.S. soybean production, 1934. Each dot represents 5,000 bushels. (3) Location of soybean mills in the USA, Nov. 1939. Each dot represents a mill which processes soybeans, or is reported to be equipped or will be equipped for soybean crushing. Most of the mills are in the Midwest, or the central Atlantic seaboard. Address: Formerly Univ. of Cincinnati, Ohio.

448. *Soybean Digest.* 1941. World [soybean] production increases in 1940: Gains in Manchurian and European production offset losses in the United States. Trade drops. April. p. 2.

• ***Summary:*** "Preliminary information from countries reporting the 1940 soybean harvest indicates that total production was about 2 percent above the previous year, according to estimates received by the Office of Foreign Agricultural Relations. The crop in the United States was about 11 million bushels smaller and in Europe about 1 million bushels larger than in 1939. In Manchuria, official estimates indicate a 1940 crop slightly smaller but reliable trade sources place the production at approximately 15 million bushels larger than the small 1939 harvest. The crop in China was somewhat above the short 1939 harvest and was the largest in the past 4 years.

"Trade at Low Level: Total international trade in soybeans and soybean oil during 1940-41 (October-September) is expected to continue at a low level similar to that of the past season. Manchurian exports of soybeans and oil are expected to be somewhat larger than last year, while the United States shipments abroad will be much smaller. As to the importing countries, Japan will probably obtain the largest quantity, as in 1939-40. Germany, normally the largest soybean importer, hopes to secure as much as 15 million bushels during the 1940-41 season from Manchuria and European countries. Imports by other European countries are likely to be small.

"Carryover Small: Carry-over of soybeans on Oct. 1, 1940, was relatively small in the exporting countries, and in the importing countries it was smaller than a year earlier, especially in Japan and Germany. In the other European countries stocks have been small for the past two seasons.

"Prices for soybeans in the United States this season are averaging slightly lower than a year ago, while in Manchuria the Government monopoly is paying about 24 cents per bushel above last year. It is reported that last season the Manchurian farmers withheld a considerable proportion of their beans from the market because of the low purchase price. The Manchurian price for No. 1 grade mixed beans ex Dairen up to Jan. 31, 1941, was about $1.04 per bushel.

"The European war substantially reduced the international trade in soybeans and bean oil during the 1939-

© Copyright Soyinfo Center 2021

40 marketing season (October-September) as compared with previous years. A total of about 40 million bushels entered foreign trade during the marketing year as compared with 80 million during the 1938-39 season. In addition, international trade in soybean oil during 1939-40 amounted to approximately 55,000 short tons as compared with 80,000 short tons in 1938-39.

"Export Markets Closed: Exports of soybeans and soybean oil from the United States are expected to be much smaller during the current season as compared with the 1939-40 marketing year, when shipments abroad amounted to 11 million bushels of soybeans and 18 million pounds of oil. Last season, heavy purchases of American soybeans were made by European countries before the war broke out and later in the fall months, due to the existing shortage. The trade this season with these countries is almost entirely closed except with the United Kingdom and thus far there appears to be no demand from this market for beans or oil. The largest exports of soybean oil last year were made primarily to Cuba, Finland and Switzerland. Cuba is purchasing smaller quantities this season, and exports to European countries are expected to be small. The Manchurian soybean harvest for 1940 amounted to 141 million bushels as compared with 145 million bushels for the previous year, according to the official estimates. Trade sources in Manchuria, however, believe that the 1939 crop was over-estimated and that the harvest was one of the smallest in many years, amounting to only about 125 million bushels. Trade sources place the 1940 crop at 140 million bushels.

"Manchurian Acreage Drops: The 1940 planted acreage was placed at 9,459,000 acres as compared with 10,287,000 in 1939. The 8 percent reduction in acreage was the result of several factors such as, (1) the reluctance of farmers to plant a crop for which they considered the official price too low; (2) shortage of human and animal labor and the high cost of wages; and (3) lack of moisture during the early part of the planting season.

"The supply of Manchurian soybeans available for export during the 1940-41 marketing season is reported to be larger than last season and is estimated at 35 to 40 million bushels. It is expected that Japan will again obtain the largest proportion of these exports. Shipments to Germany may be somewhat larger this season, as it is reported that a German-Manchoukuo trade pact last September called for the exportation to that country of 11 million bushels of soybeans. It is expected that shipments will be made across Siberia and it is possible that some of this quantity may be taken in the form of oil. Recent information indicates that Japanese authorities are encouraging soybean-oil processing at Harbin and Hsinking and a reduction at Dairen.

"Chinese Crop Larger: The 1940 soybean crop in China was above the previous year as the result of more favorable growing weather, especially in North China where the harvest had been short during the 2 preceding years. Although China is the [world's] largest soybean producer, it is generally a net importer, obtaining small quantities of beans and oil from Manchuria.

"In the Danube Basin the 1940 production continued the upward trend begun several years ago. German companies operating in most of these countries guaranteed prices to growers before planting. The bulk of the exports from these countries has usually gone to Germany. About 80 percent of the Rumanian production was in Bessarabia; the area ceded to the Soviet Union, and it is not known how much of the production this season has been shipped to Germany."

A table shows: Soybeans: Production in specified countries. The countries are China, Manchuria, United States, Chosen [Korea], Japan, Taiwan, Netherlands Indies [Indonesia], Rumania (Earliest: 424,000 bu in 1935), Bulgaria (Earliest: 179,000 bu in 1936), Yugoslavia (Earliest: 36,000 bu in 1935), and Hungary (Earliest: 125,000 bu in 1939).

449. *Agricultural Gazette of New South Wales.* 1941. The soybean. 52(6):314. June.

• ***Summary:*** A half-page overview of the current status of soybeans worldwide. "First introduced to American agriculture in 1898, the soybean is now the basis of a multi-million dollar industry... According to the 1939 Census of Manufacturers, 47 manufacturing establishments in the United States were engaged primarily in the production of soybean oil, cake, and meal, the value of the products being 44,000,000 dollars."

Also discusses: Food uses of soybean oil (mainly in shortening and oleomargarine), lecithin, and soybean flour. Industrial uses of soy protein (acts like casein in plastics, paints, size for paper, textile dressing, and waterproofing). First record of cultivation in China in 2838 B.C. Manchuria is the world's leading soybean producer, with Chosen [Korea], Japan, and South China ranking high. Introduction to Europe in the 17th century. Tried in Germany, England, France, and Hungary. Germany is now the leader in making use of soybeans.

450. Green and Black: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. 1941. Seed color: Green and/or black.

• ***Summary:*** Sources: Morse, W.J. 1941. "Shanghaied... a super food." *Soybean Digest.* July. p. 4-5, 10. See p. 5. Green and Black is a late variety, maturing in 141 days or more.

453. Morse, W.J. 1941. Shanghaied... a super food. *Soybean Digest.* July. p. 4-5, 10. [10 ref]

DR. W. J. MORSE

• ***Summary:*** The super food is green vegetable soybeans from edible soybeans. "Attempts to secure seed of these food varieties from oriental countries through correspondence met with little success, due to the fact that the edible types were classified under another name than the soybean. During agricultural exploration work in the Orient from 1929 to 1931, many varieties of soybeans were found in Japan and Chosen [Korea] which were used solely as green vegetables or dry edible beans." These varieties have been under test for the past 8-9 years at various agricultural experiment stations throughout the United States.

A table shows 42 "edible varieties of soybeans classified according to maturity." Very early (100 days or less): Agate, Sioux. Early (101-110 days): Bansei, Chusei, Etum, Giant

© Copyright Soyinfo Center 2021

Green, Goku, Kanro, Kanum, Sac, Tastee, Waseda, Yellow Marvel. Medium Early (111-120 days): Fuji, Hakote, Hiro, Hokkaido, Jogun, Kura, Osaya, Sato, Shiro, Sousei, Suru, Toku, Willomi, Wolverine. Medium (121-130 days): Chame, Emperor, Funk Delicious, Illington, Imperial. Medium late (131-140 days): Aoda, Easycook, Hahto, Higan, Rokusun. Late (141 or more days): Green, and Black, Jackson, Jefferson, Nanda, Seminole.

"Most of these edible types have been found to be much superior to the commercial varieties in flavor, texture, and ease of cooking. Moreover, tests have indicated that the flour made from edible types has a better flavor than that made from commercial varieties. Some of the edible types have also been judged to be superior to commercial types in the manufacture of bean milk, roasted beans and other food products...

"One of the most promising uses of edible varieties of soybeans is as a green shelled bean and for this purpose the pods should be picked when the beans have reached the full size but are still green and succulent. The green beans resemble young, tender Lima beans and have a rich, distinctive and delicious flavor... The usual oriental way of cooking green soybeans is to boil the pods in water flavored with soy sauce or salt and serve them to be eaten from the pod."

In America, "Several commercial concerns have canned large packs of green soybeans, which have become quite popular."

Photos show: 1. Soybeans sprouts pushing up out of spherical earthenware pots at a market in East Asia. 2. A woman selling "soybean curd" ("the 'boneless meat' of millions of Oriental people") in a Korean market. 3. "In place of candy between meals, Japanese children often carry about a small bag of cooked [green] vegetable soybeans, break open the pods and lick the salty beans out with their tongues." 4. Roasted soybeans, which are used extensively in candies in Japan. 5. Portrait of Dr. [sic] William J. Morse. 6. Green vegetable soybeans (in the pods on plants, or shelled) being sold in a Korean farmers market. 7. "This Japanese farm girl has just pulled an armful of green vegetable soybean plants to prepare for market." 8. A Korean peddler with a large pack of green vegetable soybeans on his back.

Note: This is the earliest document seen (Nov. 2013) that mentions the soybean varieties Etum, Green and Black, Jackson, Jefferson, Kanum, Sac, Seminole, Tastee, Wolverine, or Yellow Marvel. Address: USDA Bureau of Plant Industry, Washington, DC.

454. *Washington Post.* 1941. Japan hems in Vladivostok, Soviet 'Doorway to Pacific.' Sept. 5. p. 11.
• ***Summary:*** A bulletin from the National Geographic Society explains that Vladivostok, which 75 years ago [i.e., about 1866] was a boisterous outpost of muddy streets, wooden shacks, saloons and gambling houses, is now a modern, busy city of about 206,000 inhabitants, and a Soviet air and naval base. The picturesque harbor, known as the "Golden Horn," is normally filled with ships. It has always been a link between the vast reaches of Siberia and the outside world, yet only a few miles from the border of Japanese dominated Manchukuo. A bit further south is Chosen [Korea], also dominated by Japan. And Japanese ships dominate the waters around the port.

"Vladivostock's harbor freezes over later in December and the ice lasts until mid-April." Ice-breakers keep the way open for steamers to enter and leave the port during that time.

"Warehouses along the waterfront [in Vladivostok] ordinarily are filled with soy beans and by-products, such as soy bean oil and soy bean cakes." These are the port's main export items, along with Siberian timber and dried fish.

455. Becker, Joseph A.; Froehlich, Paul; Jackson, D.; et al. comps. 1941. Agricultural statistics, 1941. Washington, DC: U.S. Government Printing Office. 731 p. For soybeans and soy products see p. 7, 299-305, 490, 494, 496, 519, 523. 24 cm.
• ***Summary:*** "This volume presents information formerly published (until 1935) in the statistical section of the Yearbook of Agriculture" (p. 1). "Export and import statistics of the United States include trade with the Philippine Islands. They also include any trade between foreign countries and Alaska, Hawaii, and Puerto Rico, but do not include shipments between continental United States and these possessions. Prior to January 1, 1935, the Virgin Islands of the United States were treated in the same manner as the Philippine Islands, but since that date the Virgin Islands are treated in the same manner as Alaska, Hawaii, and Puerto Rico." (p. 5). A bushel of soybeans weighs 60 lb and a gallon of soybean oil weighs 7.5 lb (p. 7). Note: No separate statistics are given for soybeans or soybean products grown in or exported to or from Alaska, Hawaii, Puerto Rico, or the Virgin Islands.

Table 392 (p. 299) gives U.S. soybean acreage statistics for the years 1924-1940, including: Acreage grown alone for all purposes, total acreage (incl. half the interplanted acres), acreage harvested for beans, yield per acre, production, price (dollars/bushel), farm value (in 1,000 dollars), foreign trade (imports and exports, year beginning in July). In 1924 for soybeans: Acreage grown alone for all purposes: 1,567,000. Total acreage: 1,782,000. Acreage harvested for beans: 448,000. Yield per acre: 11.0 bushels. Production: 4,947,000 bushels. Average price per bushel received by farmers: $2.46.

The corresponding figures in 1928 were: Acreage grown alone for all purposes: 2,154,000. Total acreage: 2,439,000. Acreage harvested for beans: 579,000. Yield per acre: 13.6 bushels. Production: 7,880,000 bushels. Average price per bushel received by farmers: $1.88.

Table 393 (p. 299) gives U.S. soybean production and

© Copyright Soyinfo Center 2021

farm disposition statistics for the years 1924-1940, including: Total production, used for seed (total, or home grown), fed to livestock, sold.

Table 394 (p. 300) gives U.S. soybean statistics for acreage, yield, production, and season average price received by farmers, by States, average 1929-38, annual 1939 and 1940. The states are: New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, Nebraska, Kansas, Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, Texas, and USA total.

Table 395 (p. 301) gives soybean statistics for acreage and production in specified countries, average 1930-34, and annual 1935 to 1940. The countries are China, Manchuria, United States, Chosen [Korea], Japan, Taiwan, Netherlands Indies, Rumania, Bulgaria, Yugoslavia, Hungary, and estimated world total.

Table 396 (p. 302) gives the average price per bushel of soybeans received by U.S. farmers each month and season average from 1930 to 1940.

Table 397 (p. 302) titled "Soybeans for seed" gives the average wholesale price per bushel at Baltimore and St. Louis, 1931-1941, each month from Jan. to May and average.

Table 398 (p. 302) titled "Soybeans for crushing" gives the average price per bushel, U.S. No. 2 Yellow, bulk, carlots, net track Chicago, 1933-40, each month from Oct. to Sept.

Table 399 (p. 303) gives statistics on amount of soybeans crushed, and production, imports, and exports of soybean oil (crude basis), and soybean cake and meal, USA, 1930-1940.

Table 400 (p. 303) gives the average price per pound of soybean oil (domestic crude) in tank cars, midwestern mills, 1929-1940, each month and yearly average.

Table 401 (p. 303) gives the average price per pound of soybean oil (domestic crude) in drums, New York, 1931-1940, each month and yearly average.

Table 402 (p. 304) gives the average price per ton of soybean meal (41% protein), at Chicago, 1930-1940, each month and yearly average.

Table 403 (p. 305) for soybeans and soybean oil, gives international trade (exports and imports), averages 1925-1934, annual 1938, 1939. For soybeans: Principal exporting countries–China, Manchuria, United States, total. Principal importing countries–Germany, Japan, Denmark, United Kingdom, Sweden, Italy, Netherlands, Canada, total. For soybean oil: Principal exporting countries–China, Manchuria, Denmark, Japan, Sweden, total. Principal importing countries–Netherlands, United Kingdom, Italy, Germany, United States, Belgium, Chile, France, Morocco, Norway, Algeria, Austria, Czechoslovakia, Canada, Union of Soviet Socialist Republics, total.

Table 659 (p. 490) gives U.S. exports (in pounds) of vegetable oils (incl. corn, cottonseed, linseed, cocoa butter, coconut, peanut, and soybean oil) from 1914 to 1939.

Table 617 (p. 455) gives statistics on oleomargarine–materials used in manufacture, USA, 1924-1940. Concerning soybean oil: Less than 500 lb were used in 1924 and 1925, but 33,000 lb were used in 1926. The first significant amount was used in 1930: 2.25 million lb. Note: Additional statistics on oleomargarine production and consumption in the USA are given on p. 454-57.

Table 660 (p. 494) gives U.S. imports (in pounds) of oilseeds (incl. soybeans {but no data given for 1918-1926}, sesame seeds, rapeseed) and vegetable oils (incl. olive oil, palm oil, palm kernel oil, peanut oil, perilla oil, rapeseed oil, soybean oil, and tung oil) from 1914 to 1939.

Table 662 gives imports of principal agricultural products (incl. soybean and soybean oil) into the United States, by countries, each year 1932-1940. The source countries for soybean (p. 519) are: Kwantung, Japan, China, Germany, other countries, total. The source countries for soybean oil (p. 523) are: Kwantung, Japan, China, Netherlands, other countries, total. Address: U.S. Dep. of Agriculture, Yearbook Statistical Committee, Washington, DC.

Its industrial outlets. Its economic interest]. Paris: Societe d'Editions Geographique, Maritimes et Coloniales, 17 rue Jacob, 6eme. ii + 200 p. Illust. 22 cm. [158 ref. Fre]

• ***Summary:*** Contents: Introduction. Part 1: Cultivation of soya. 1. The soybean. 2. Soybean cultivation worldwide. 3. The varieties of soybeans. 4. The requirements of the soybean crop. 5. Sowing soybeans. 6. The soybean during its vegetative stage. 7. Harvesting soybeans. 8. Mixed cropping and intercropping of soybeans. 9. The enemies and diseases of the soybean.

10. History of soybean cultivation in France (introduction in 1739 at Jardin des Plantes under direction of Buffon, 1850–National Society for Acclimatization, around 1880 MM Vilmorin-Andrieux, M. Paillieux, M.P. Olivier-Lecq, Messrs. Lechartier, Denaiffe, Dr. Le Goff, Boulanger & Dausse, Brioux, Semichon, Carle de Carbonnières, Rouest, de Guerpel).

11. The vegetative cycle of the soybean in France. 12. The soybean at the various French agricultural research centers (*les Centres de Recherches agronomiques français*) including Centre de Versailles, Station de Dijon, de Colmar, de Clermont-Ferrand, d'Antibes. 13. The possibilities of soya in France in terms of its cultivation.

Part 2: The nutritional value of the soybean. 1. The nutritional value of the soybean.

© Copyright Soyinfo Center 2021

Part 3: Utilization of soya. 1. Soybeans in the farm economy. 3. The soybean in human nutrition and in industry.

Part 4: The soybean from an economic viewpoint. 1. Commerce and trade in soybeans and soybean products up to Sept. 1939. 2. The present economic possibilities of the soybean in France. Conclusion. Bibliography. 16 illustrations. 8 maps.

The introduction begins: "In a letter written on 15 Jan. 1935, on board the *Chenonceaux* which was sailing toward Shanghai, Li Lu-Ying [sic, Li Yu-ying], president of the National Academy of Peiping (l'Académie Nationale de Péping) offered to furnish us with the translation of important documents in the Chinese, Japanese, and Russian languages concerning all aspects of soya. Let him find here the expression of our gratitude, because he introduced us to a plant, in which there is more interest abroad than in the country of its origin."

The publisher was formerly named Maison Challamel, founded in 1839.

Illustrations show: (1) The branch of a soybean plant, with the flowers and young pods, enlarged 3x. (2) The flower of a soybean plant as it is about to open, enlarged 5x. (3) A soybean branch with mature pods and leaves, enlarged 2x. (4) Two views of a soybean seed with parts labeled. C = chalaza (*chalze*). H = hilum (*hile*). M = micropyle (*micropyle*). R = radicle (*radicle*). A-H = hypocotyl axis (germ) (*axe hypocotylé*). G = raphe, bud, leaf-bud (*gemmule*). Enlarged 3x. Note: The raphe is a small grove extending to the chalaza, where the integuments were attached to the ovule proper.

(5) Microscopic view of a transverse section of the seedcoat: C.P. = palisade layer of cells (*cellules en palisade*). C.S. = hourglass cells (*cellules en sablier*). P.E. = spongy parenchyma (*parenchyme externe*). C.A. = aleurone layer (*cellules à aleurone*). P.I. = remains of parenchyma cells of endosperm or internal parenchyma (*parenchyme interne*). Enlarged 247x. (6) Cells of the epidermis facing the microscope. Enlarged 460x. (7) Microscopic view of a transverse section of a cotyledon, two views, showing starch grains (*grain d'amidon*), oil droplets (*oléolaste*), and aleurone grains (*grain d'aleurone;* high in protein). (7a) Six large maps of soy in Asia and in Oceania, in North America and in South America, in Europe and in Africa in 1939 (p. 12-36). (8) Nodules containing nitrogen-fixing bacteria on the roots of a soybean plant (p. 66). (9) Planting soybeans; a man walks behind a planter pulled by two horses (p. 84). (10) Cultivating soybeans; a man sits on a cultivator pulled by two horses (p. 89). (11) A field of long, straight, weed-free rows of soybeans in the United States. (12) Drying of soybean hay in shocks. (13) Harvesting soybeans; a man sits on a harvester pulled by two horses. (14) Threshing soybeans using a machine (p. 99). (15) Intercropping of soya and maize. (16) The soybean variety Lisbonne growing at the Central Station for Seed Trials (*Station Central d'Essais d Semences*) (p. 122). (17) Map of France with isotherm lines of July and a line showing the northern limit of maize cultivation (p. 134).

Tables: (1) Asiatic varieties: Chinese and Manchurian varieties (6 varieties), varieties from the British Indies (7), from the Dutch Indies (11), Japanese varieties (17).

(2). American varieties: Canadian varieties (7), U.S. varieties (40 varieties) (for each is given: Days to maturity, flower color, seed color, color of the oil, oil content, protein content, weight of 1,000 seeds in grams, seed yield (in kg/ha), yield of hay containing 15% moisture (in kg/ha)). (3) European varieties: German (7), Austrian (3), English (4), Italian (1), Polish (7), Czech (9), Soviet Russian (9).

Mineral needs of the soybean. Yield of two soybean varieties, with and without inoculation. Yield of three soybean varieties with and without inoculation. Germination percentages of 8 French soybean varieties at the Station Centrale d-Essais de Semences in 1938-39 (ranges from 91% to 100%). Variation in the composition of soybean hay at 4 stages of maturity. Weight of seeds vs. straw for 10 U.S. soybean varieties (the straw weighs 1.5 to 2.7 times as much as the seeds). Average yield of soybeans in four countries in 1933 (in kg/ha): Manchuria 1,200. Japan 1,000. Korea 650. China 950. Length of the vegetative cycle at four stations with 10 varieties in France (ranges from 98 to 157 days). Length of the vegetative cycle at four more stations with 16 varieties in France (ranges from 95 to 172 days). 18 varieties that completely matured their seeds at 2 stations in 1921 and in 1922. Oil and protein content of 7 French soybean varieties at Station de Clermont-Ferrand. The seed yield of 10 soybean varieties at the same station. The seed yield of 6 soybean varieties at Station d'Antibes. Six tables (p. 138-42) on the nutritional value of soybeans. Six tables (p. 148-61) on the utilization of soybeans in the farm economy and for feeding animals 2 tables (p. 162-42) on the soybean in the human diet and in industry. 5 tables (p. 175-42) in trade in soybeans and its by-products. 7 tables (p. 181-86) on the present economic possibilities of the soybean in France.

Chinese and Manchurian varieties soybean varieties (p. 48): Chu Yen Tou Erh, Kung-Chu-ling pai Mei, Pai Hoa Tso Tse, Su Li Huang, Ta Li Huang, Tieh Chia, Tou Tse.

Soybean varieties from the British Indies (*des Indes britanniques*) (p. 48): Behrum, Hto-nao, Hto-nang, Mirjanhat, Pekyat-pyin, Pe-Ngypi [pè-ngapi], and Santonauk. Note: According Thompstone & Sawyer (1914), some of the above names are the names of the yellow soybean in different parts of Burma.

Soybean varieties from the Dutch Indies (*des Indes néerlandaises*) (p. 48): Djepoen, Idjo, Ireng, Krawe, Mentik, Poetik, No. 16 sélectionné, No. 17 sélectionné, No. 27 sélectionné, No. 28 sélectionné, No. 29 sélectionné.

One variety from Indochina (p. 48) is Langson.

Soybean varieties from Japan (p. 50): Akasaya, Banseihikarikuro [Bansei hikari kuro], Chinseihikarikuro

[Chinsei hikari kuro], Gindaizu [Gin daizu], Ishikarishiro [Ishi kari shiro], Kanro, Kurosaya, Mitsuishidaizu [Mitsuishi daizu], Naktchadaka, Oyachi no. 2, Rankoshi no. 1, Shimoshirazu no. 1 [Shimo shirazu no. 1], Shirokotsubu, Shirotsurunoko, Tsurunoko, Wasehodaka / Waschodaka, Yoshiokatairin [Yoshio katairin].

Soybean varieties from Canada (p. 50): A.K. (Harrow), Brun du Manitoba, Soja jaune de Montréal / Montreal, Soja jaune de Québec / Quebec 92, Manchu (Hudson), Mandarin (Ottawa), O.A.C. No. 211. Address: Directeur interimaire, Station d'Essais de Semences (Ministere de l'Agriculture), France; In 1946 Chef de Travaux at this station.

457. La Choy Food Prods. 1941? Brief history of La Choy. 2 p. Undated. Unpublished manuscript.

• ***Summary:*** In 1941 Beatrice Foods acquired La Choy. This 1-page typescript originated at about that time.

"Archbold, Ohio, with a population of only 3,200 is the home of La Choy Food Products, largest producer of canned Chinese foods in the world–including China!

"The business actually was started in 1920, by Wally Smith and Ilhan New, who became friends while attending the University of Michigan." Smith, who owned a grocery store in Detroit, wanted to sell freshly grown [mung] bean sprouts. New, a Korean by birth, knew how to grow them.

"Sometime later the pair conceived the idea of canning bean sprouts in glass jars. The next logical step was to use metal cans, and this was accomplished in 1922, when the company was incorporated. New left the company shortly after 1930 and Smith was killed by lightning in 1937.

"After several moves, each time to larger quarters, the first La Choy plant was built in 1937 in Detroit." At the start of World War II, this plant was sold to the government and the firm moved to its present 25-acre site in Archbold, Ohio.

"Today, after several additions, including a new 42,000 square foot Frozen plant, La Choy houses approximately 8½ acres under one roof.

"'Chinatown USA' is more strategically located for the efficient and economical production of Chinese foods than a glance at a map would indicate. Just to the north are the famed celery beds of Michigan. La Choy is the largest single user of Michigan celery in the nation. More than 5,000 tons are used annually in the new process developed by La Choy which produces up to 50 tons a day of extra-fancy fine cut celery for chop suey and chow mein dishes.

"To the east is the famed Pennsylvania mushroom belt, and La Choy is among the largest users of fresh mushrooms in the nation. Archbold is the largest cattle auction center between New York and Chicago [Illinois] and a major poultry area. More than 100,000 beef cattle were sold here last year.

"The fertile farm country in and surrounding Fulton County yields many of the other necessary ingredients, while such items as flour and shortening for chow mein noodles readily are available from Toledo, only 40 miles distant, and Chicago, Columbus, Detroit, Cleveland and Cincinnati, merely a few hours away by fast freight.

"Into this Northwest Ohio town, located on the main line of the New York Central between Chicago and New York, flow bamboo shoots and water chestnuts from Formosa and mung beans from Peru, Brazil and Thailand as well as Oklahoma and Texas, and other exotic imports that are essential ingredients of Chinese delicacies."

Note: This is the earliest document seen (Sept. 2005) concerning the work of Koreans overseas with soy. Address: La Choy.

458. Miller, Harry W. 1942. Answering America's protein problem! *Soybean Digest.* Jan. p. 6.

• ***Summary:*** "Editor's Note: Dr. Miller, whom we here introduce to the readers of The Soybean Digest, is a leader of the soybean food industry. President of the International Nutrition Laboratory, Mt. Vernon, Ohio, manufacturers of Miller's Soya Foods, he has had a most interesting career.

"Graduating in medicine in Chicago [Illinois] in 1902, he went to China the next year as a medical missionary under the Seventh-day Adventist board. He spent 8 years in the interior of China, and then was transferred to the superintendency of the Washington Sanitarium and Hospital, Tacoma Park, D.C., where he remained from 1913 to 1925.

"Returning to China in 1925, he established several medical centers in that country and in Japan, Korea, the Philippines and the Malay Peninsula.

"Becoming interested in dietary problems, because his specialty, goiter surgery, was directly concerned with a dietary deficiency condition, and because of the high Oriental mortality rate due to malnutrition, he began studying the food products which might ease the situation.

"This led him to the soybean, because, he observed, malnutrition was not nearly so acute in those sections in which the soybean was an article of diet.

"In 1936 Dr. Miller established a food plant in Shanghai from which he manufactured milk from the soybean. As he puts it: 'This work was nicely underway when the Japanese invasion of Shanghai resulted in the complete destruction of the plant, and after a year of waiting I again returned to America and established in Mt. Vernon the International Nutrition Laboratory where we have specialized on the processing of the soybean, not only studying varieties best suited for human food, but methods of preparing the bean and also developing processing equipment, that will give us a more satisfactory product."

"Dr. Miller has an interesting statement regarding the use of Soya Milk in infant feeding: 'In this country nearly a score of babies that we are in touch with have either been started on Soya Milk or have been transferred to it very shortly after birth, and the number of users of Soya Milk for infants are increasing very rapidly. Our results of feeding

© Copyright Soyinfo Center 2021

large numbers of babies and children are to be found in the National Medical Journal of China.'"

"Soybean foods for human consumption have to date been scarcely available in America, and the question arises: Why bother to supplement a dietary which is already so abundant?

"Still, it would seem strange it the raw material which has been a mainstay in the Oriental diet for so many centuries could not be utilized in the American diet. It can be!

"That part of the American diet most often lacking is protein. Most animal proteins are cumbered with toxins, and most vegetable proteins are inadequate for nutrition.

"Soybeans the Answer: The soybean provides the answer to the protein problem. With a protein content of more than 40 per cent, it is the best source of protein which we have. Its protein is biologically equal to that of meats and animal foods, and it has the advantage of being free from toxins.

"The effectiveness of the soybean is strikingly demonstrated in China. Where vegetable protein is abundantly supplied in the diet as in Manchuria, and in North China, we have a stalwart race of people. However, in South China where the major products are oil and sugar we see dwarfed bodies and it is a rare exception to find in the warm climate among oil and carbohydrate feeders a single well-developed individual." A photo shows "The International Nutrition Laboratories, Mt. Vernon, Ohio, home of 'Miller's Soya Foods.'" The building is large, and appears to be constructed from bricks. Address: M.D., International Nutrition Lab., Mt. Vernon, Ohio.

459. Chevalier, Aug. 1942. Production mondiale de graines de Soja [World soybean production]. *Revue de Botanique Appliquee & d'Agriculture Tropicale* 22(245-246):98-99. Jan/Feb. [Fre]

• ***Summary:*** The world's leading soybean producers in the mid- to late 1930s, in terms of million tonnes produced, were: China 5.01, Manchuria 4.32, USA 1.57, Korea 0.507, Japan 0.367, and the Netherlands Indies [Indonesia] 0.288. Address: France.

460. A. 1942. Die europaeischen Oelfruechte: Sojabohnen erobern Europa [European oilseeds: Soybeans conquer Europe]. *Deutsche Landwirtschaftliche Presse* 69(16):158-59. April 18. [Ger]

• ***Summary:*** About the importance of soybean production in various countries of Europe, including areas planted and amount harvested.

While rapeseed, field mustard (*Rübsen*), and flax are among the age-old oil seeds of European humanity, the soybean only appeared in the field of vision of European peoples at the beginning of the twentieth century [sic, in the 1870s]. And it was even later that the step was taken for trials with the cultivation of soybeans in Europe. The homeland of the soybean is East Asia, where it has been cultivated in China, Manchukuo, and Japan since ancient times in the largest areas. In 1936, the soybean harvest amounted to 5,911,000 metric tons in China, 4,147,000 metric tons in Manchukuo, 492,000 metric tons in Korea, and 339,800 metric tons in Japan.

Article of World Trade Since Only 1908: For centuries, or indeed millennia, the soybean remained merely a valuable foodstuff of the East Asian peoples. Only in 1908 were the first 100 metric tons of soybeans brought to the London market by the renowned Japanese trading house Mitsui & Co. The attempts that were made here with the soybean for its industrial utilization led to such positive results that from this year forward, the soybean developed into a first-class article of world trade. During the years 1910-1913, average imports already amounted to 230,871 metric tons to the United Kingdom, 34,432 metric tons to Denmark, and 32,342 metric tons to Holland. During the years 1930-1934, the average imports of soybeans then amounted to 1,035,000 metric tons for Germany, 229,280 metric tons for Denmark, and 141,570 metric tons for the United Kingdom. Germany had thus become the main import country for soybeans. But in recent years, imports have not continued at the especially high average of 1930-1934. They amounted to 515,840 metric tons in 1935, 484,060 metric tons in 1936, 600,870 metric tons in 1937, and 782,900 metric tons in 1938. In addition, larger quantities of soybean oil were also brought in not only by Germany, but also by other European countries.

"The Soybean as a European Cultivated Plant: It is not surprising that with the great significance of the importation of soybeans into Germany, the attempt was made to also introduce this crop into our Fatherland, since in other European countries, particularly after the First World War and then increasingly since the beginning of the 1930s, the acclimatization of the soybean had begun.

The soybean belongs to the Papilionaceae family (*schmetterlingsblütig*) of plants. It grows upright or winding around itself. Leaves, stems, and pods are densely covered with soft brown hairs. The pods are rather broad and slightly curved. Many times they contain only one seed. The soybean seed is spherical or bean-shaped in the form of small peas or beans. The color of the seed varies greatly. In addition to yellow and yellowish-green seeds, there are also brownish-red and black varieties. The value of the seed lies not only in its oil, but above all also in its protein content. The amount of protein consists on average of 40%, in addition to 20% fat and 2% lecithin. The soybean finds application as both human and animal food, while the oil that is obtained is used for food and industrial purposes.

With regard to the soil, the soybean makes its great demands. Richer sandy soils, loam, and chalky soil especially appeal to it. But genuinely good harvest results have also been achieved on poor and [illegible word:

© Copyright Soyinfo Center 2021

*trockenen* = dry?] sandy soil. On the other hand, the soybean does not thrive on acidic, cold, or wet soils. It can consequently be cultivated on any soil type. While with regard to the soil, the soy plant is therefore genuinely capable of adaptation, it makes substantially high and absolute demands upon the climate. As a plant which is greatly in need of heat, it flourishes especially well in all areas with a sunny, warm climate. In particular, sunny, warm autumns are very necessary for its maturation. Sunny years will therefore always be good soy years. Its cultivation will therefore have success in Europe preferably in areas with a sunny, warm climate. With regard to fertilizing and care, the soybean is undemanding. Nitrogen fertilizing is not necessary, and in fact rather a disadvantage, since as a result of that, the maturation is delayed. The moderate administering of potash and Thomas slag (*Thomasmehl*) have proven to be useful. For grain, soy is a good preceding crop, and soy after soy has also proven itself well. According to more recent trials, the planting distance should not be below 40 cm. The sowing quantity amounts to 60 to 80 quintals per hectare [sic, 60 bis 80 *Doppelzentner pro Hektar*–translator's note: this equals 6,000 to 8,000 kilograms per hectare, and as this exceeds the yield (see below), it is presumed that what was meant was actually 60 to 80 kilograms per hectare]. The sowing period runs between early April and early May. Damage to the soy fields is caused above all else by mice, but then also by May bug grubs (*Engerlinge*) and wireworms (*Drahtwürmer*). The primary difficulty with the acclimatization in Germany consists of breeding varieties that mature sufficiently early yet still return an economic yield. To the greatest degree possible, the harvest should be carried out in late September. Efforts by breeders regarding those types of soybean varieties have been successful, but today they are still also by no means concluded. In spite of that, the cultivation of the soybean still plays a subordinated roll in Germany. Whether the soybean will be capable of still also becoming a significant factor in the fat and feed budget of Germany remains to be seen. Table 1

Translator's note: No explanation is given here of the meaning of the three symbols used in these tables. There is, though, a certain logic, and my guess (and it is only a guess) is this: "-" means few or no commercially producing soybean fields were planted that year in that country, "!" means data was not gathered, and "?" means data was gathered but it was not made available to us because it is in evil Bolshevik countries with which we are now at war.

Table 2. We in fact already said that sunny years supported soybean yields, while a rainy summer and above all a rainy autumn have a very unfavorable effect upon soybean yields. The rather large differences in the per hectare yields that are to be determined with the individual countries in the various years are to be traced back to this cause. On the other hand, the even larger differences between the yields in the individual countries have their roots in the different state of the agricultural operating techniques, a fact that indeed is to be observed not only with oil seeds, but with all agricultural crops.

Table 3

According to Wacker, the following were harvested in Germany at the experimental fields in Hohenheim: 1918: 7.72 quintals (100 kg), 1919: 5.51 quintals, 1920: 9.86 quintals, 1923: 9.46 quintals, and 1933: 10.90 quintals. In the Ostmark [today's Austria], average yields of 14 quintals per hectare were achieved in recent years, peak yields were at 25 to 30 quintals per hectare.

Note 1. This is one of the most recent documents seen written in Fraktur, a hard-to-read German Gothic script that was banned by the Nazis in the early 1940s. Continued.

461. Dies, Edward J. 1942. Tables (Document part). In: E.J. Dies. 1942. Soybeans: Gold from the Soil. New York, NY: The Macmillan Co. 122 p. April. 21 cm.

• ***Summary:*** Tables show: (1) U.S. soybean acreage, yield, and production, 1924-1941 (p. 5). During this time acreage has increased more than 12-fold from 448,000 to 5,855,000 acres. Yield as increased 88% from 11.0 to 20.7 bushels/acre. Production has increased more than 21-fold from 4.947 million to 106.712 million bushels.

(2) Soybean production in specified countries and estimated world total (p. 10-11). The countries are: China, Manchuria, United States, Chosen [Korea], Japan, Netherlands India [later Indonesia], Kwantung [Leased Territory], Taiwan, U.S.S.R., Rumania, Bulgaria, Yugoslavia, other Europe (incl. Poland, Czechoslovakia, and what was formerly Austria).

(3) Illinois soybean acreage, yield, and production, 1919-1941 (p. 25). Production (in bushels) increased from 30,000 in 1919, to 46,000 in 1920, to 167,000 in 1921, to 812,000 in 1922, to 1,431,000 in 1925, to 6,970,000 in 1930, to 24,012,000 in 1935, to 34,912,000 in 1940, to a peak of 49,128,000 in 1941.

(4) "Soybean varieties–Origin and varietal characteristics" (p. 38-47). For each variety is given: Place of origin, year introduced to USA, days to mature, flower color, pubescence color, seed characters (seed coat color, germ color, hilum color, seeds per pod, seeds per pound, oil percentage, protein percentage), use (de = dry edible beans, f = forage, gra = grain, gv = green vegetable).

Soybean varieties described in the table on p. 38-47 are: Agate, A.K., Aksarben, Aoda, Arisoy, Arksoy, Avoyelles, Bansei, Barchet, Biloxi, Black Eyebrow, Cayuga, Chame, Charlee, Chief, Chernie, Chestnut, Chiquita, Chusei, Clemson, Columbia, Creole, Delnoshat, Delsta, Dixie, Dunfield, Easycook, Ebony, Elton, Emperor, Etum, Fuji, Funk Delicious, George Washington, Georgian, Green Giant, Goku, Habaro, Haberlandt, Hahto, Hakote, Harbinsoy,

Hayseed, Herman, Higan, Hiro, Hokkaido, Hollybrook, Hongkong, Hoosier, Hurrelbrink, Illini, Ilsoy, Imperial, Ito San, Jogun, Kanro, Kanum, Kingwa, Kura, Laredo, Lexington, Macoupin, Magnolia, Mamloxi, Mammoth Brown, Mammoth Yellow, Mamredo, Manchu, Mandarin, Mandell, Mansoy, Medium Green, Midwest, Mingo, Minsoy, Missoy, Monetta, Morse, Mount Carmel, Mukden, Nanda, Nanking, Norredo, Ogemaw, Old Dominion, Oloxi, Ontario, Osaya, Otootan, Ozark, Palmetto, Patoka, Pee Dee, Peking, Pine Dell Perfection, Pinpu, Richland, Rokusun, Sato, Scioto, Seminole, Seneca, Shiro, Sioux, Sooty, Sousei, Southern Green, Southern Prolific, Soysota, Suru, Tarheel Black, Tastee, Toku, Tokyo, Virginia, Waseda, Wea, White Biloxi, Willomi, Wilson, Wilson Five, Wisconsin Black, Wood's Yellow, Yelredo, Yokoten.

(5) U.S. production and crushing of soybeans, and production of soybean oil and meal from 1924 to 1941 (p. 53, based on government reports). Domestic production of soybean oil, only 2.2 million lb in 1924, had increased almost 6-fold by 1929 to 13.424 million lb. Then in June 1930 the protective Smoot-Hawley tariff went into effect. By levying a tariff on imported soybeans and soybean oil, it stimulated domestic soybean crushing and production. Oil production (in million lb) jumped immediately, from 13.424 in 1929 to 34.688 in 1930 (even though the Great Depression had begun), to 208.9 in 1935, to 565.2 in 1940. Note: A semi-log graph of U.S. soy oil production vs. time shows that it increased at the most rapid rate from 1924 to 1935. This rate decreased slightly between 1935 and 1942, then decreased again from 1942 to about 1980.

(6) Soybean oil imported and exported (pounds to and from USA, from 1912 to 1940) (p. 58). The first soybean oil was exported from the USA in the latter half of 1919. At least 1 million pounds/year was exported from that time until 1940. The peak year was 1920, when 46.7 million lb were exported. Source: Department of Commerce, Bureau of the Census.

(7) Factory consumption of soybean oil by classes of products, 1931-1940 (p. 61). The classes are: Compounds and cooking fats [shortening], oleomargarine, other edible products, soap, paint and varnish, linoleum and oilcloth, printing ink, miscellaneous, foots and loss, total. In 1931 and 1932, and in most subsequent years, the leading class was shortening. In 1939 the top four classes were (in million lb): shortening 212.3, oleomargarine 87.1, other edible products 39.9, and paint and varnish 29.8. Source: Bureau of Census reports.

(8) Supplies of feed in 1939 (p. 78). Feed supplies are composed of feed grains (91.73% of the total), cereal by-products (5.16%, including wheat meal products, gluten feed, distillers and brewers dried), and oil and cake meals (3.10%, including cottonseed {1.55%}, soybean {1.04%}, linseed {0.32%}, and other 0.17%). Address: USA.

462. Dies, Edward J. 1942. Soybeans: Gold from the soil (Statistical tables and charts). New York, NY: The Macmillan Co. 122 p. April. Index. 21 cm. Revised ed. March 1943. 122 p. Includes index, Illust., 22 cm. [205 ref]

• ***Summary:*** Page 5: Soybean acreage and production, 1924-1941. United States crop. Soybean harvested for beans. Each crop year extends from Oct. 1 to Sept. 30. Acreage increased from 448,000 acres in 1924 to 5,855,000 acres in 1941. Yield per acre rose from 11.0 bushels in 1924 to a peak of 20.7 bushels in 1939. Production increased from 4,947,000 bushels in 1924 to 106,712,000 bushels in 1941. Sources: (1) Crops and Markets, USDA. (2) Illinois Crop Statistics, Circular 440-441. (3) Latest government reports, 18 Dec. 1941.

Page 10: Soybeans: production in specified countries, and estimated world total, in thousand bushels, excluding China. Estimated world production rose from 163.000 million bushels in 1922 to 266.700 million bushels in 1940. China production rose from 210.038 million bu in 1931 to 231.302 million bu in 1937. Manchuria production rose from 113.469 million bu in 1922 to a peak of 196.949 million bu in 1930, falling to 149.435 million bu in 1939. United States production rose from 4.947 bu in 1924 to 106.712 million bu in 1941. Chosen [Korea] production rose from 13.017 million bu in 1910 to 18.333 million bu in 1938. Japan production decreased from 17.855 million bu in 1909 to 13.473 million bu in 1937. Netherlands India [today's Indonesia] rose from 2.603 million bu in 1917 to 9.873 million bu in 1938. Kwantung production rose from 375 thousand bu in 1911 (with a gap between 1919 and 1924) to 650 thousand bu in 1937. Taiwan production decreased from 280 thousand bu in 1921 to 159 thousand bu in 1937. USSR rose from 2.060 million bu in 1936 to a peak of 10.384 million bu in 1932 falling to 2.504 million bu in 1934. Rumania production rose from 26,000 bu in 1934 to 2.572 million in 1939. Bulgaria production rose from 77,000 bu in 1934 to 827,000 bu in 1939. Yugoslavia production rose from 26,000 bu in 1934 to 213,000 bu in 1939. 1909-1941. Other European (Poland, Czechoslovakia, Austria) rose from 55,000 bu in 1932 to 60,000 bu in 1935. With many footnotes.

Page 19: Principal centers of soybean production in the USA. "Almost 90 per cent of all soybeans [in the USA] are harvested in Illinois, Iowa, Indiana, and Ohio. If three other states are included as shown on the map–Missouri, Michigan and Virginia–the total is 97 per cent. The size of the baskets is proportional to the volume produced.

Page 20: Principal centers of soybean processing [crushing] in the USA. "As Illinois produces about 52 per cent of the soybeans harvested for seed, Central Illinois is the center of soybean processing as shown on this map. The discs indicate relative importance of the processing centers. Total processing capacity in late 1941 probably exceeded 90 million bushels.

Page 25: Illinois acreage and production of soybeans for beans, 1919-1941. Acreage harvested increased from 3,000 acres in 1919 to 2.285 million acres in 1941. Yield, in bushels per acre, rose from 10.0 in 1919 to 21.5 in 1941. Production increased from 30,000 bu in 1919 to 49.128 million bu in 1941.

Pages 38-47: Soybeans: Origin and varietal characteristics. This excellent table contains 18 columns. Variety. Origin (introduction from what country, selection, or cross). Year. Days to mature. Flower color. Pubescence color. Seed characteristics: coat color, germ color, hilum color, seed per pad (range), seed per pound, percent oil, percent protein. Use (green vegetable, grain, forage). The varieties are: Agate, A.K., Aksarben, Aoda, Arisoy, Arksoy, Avoyelles, Bansei, Barchet, Biloxi, Black Eyebrow, Cayuga, Chame, Charlee, Chief, Chernie, Chestnut, Chiquita, Chusei, Clemson, Columbia, Creole, Delnoshat, Delsta, Dixie, Dunfield, Easycook, Ebony, Elton, Emperor, Etum, Fuji, Funk Delicious, George Washington, Georgian, Giant Green, Goku, Habaro, Haberlandt, Hahto, Hakote, Harbinsoy, Hayseed, Herman, Higan, Hiro, Hokkaido, Hollybrook, Hong Kong, Hoosier, Hurrelbrink, Illini, Ilsoy, Imperial, Ito San, Jogun, Kanro, Kanum, Kingwa, Kura, Laredo, Lexington, Macoupin, Magnolia, Mamloxi, Mammoth Brown, Mammoth Yellow, Mamredo, Manchu, Mandarin, Mandell, Mansoy, Medium Green, Midwest, Mingo, Minsoy, Missoy, Monetta, Morse, Mount Carmel, Mukden, Nanda, Nanking, Norredo, Ogemaw, Old Dominion, Oloxi, Ontario, Osaya, Otootan, Ozark, Palmetto, Patoka, Pee Dee, Peking, Pine Dell Perfection, Pinpu, Richland, Rokusun, Sato, Scioto, Seminole, Seneca, Shiro, Sioux, Sooty, Sousei, Southern Green, Southern Prolific, Soysota, Suru, Tarheel Black, Tastee, Toku, Tokyo, Virginia, Waseda, Wea, White Biloxi, Willomi, Wilson, Wilson Five, Wisconsin Black, Wood's Yellow, Yelredo, Yokoten. Note: This long table "Specially prepared by the Division of Forage Crops and Diseases, Bureau of Plant Industry, U.S.D.A.

Page 53: "United States crop production of soybean oil meal and soybean oil, 1924-1940." This valuable table is poorly titled. It has 5 columns: (1) Year. (2) Production of soybeans. Increased from 4,947 bu in 1924 to 106.712 million bu in 1941. (3) Crushings [crushed]. Increased from 307,000 bu in 1924 to 64.180 million bu in 1941. (4) Production of meal. Increased from 7,400 tons in 1924 to 1.5369 million tons in 1941. (5) Production of oil. Increased from 2.269 million pounds in 1924 to 565.169 million pounds in 1941.

Page 58: Soybean oil imported and exported, 1912-1940. Imports rose from 24.959 million lb in 1912 to a peak of 335.984 million lb in 1918, decreasing to 4.848 million lb in 1940. Domestic and foreign oil exported decreased from 34.803 million lb in 1919 (For 6 months beginning July 1) to 15.953 million lb in 1940.

Page 61: Soybean oil: factory consumption by classes of products, 1931-1940. Compounds [shortening] and vegetable cooking fats rose from 10,869 lb in 1931 to 212.317 million lb in 1940. Oleomargarine rose from 623,000 lb in 1931 to 87.106 million lb in 1940. Other edible products rose from 180,000 lb in 1932 to 39.980 million lb in 1940. Soap rose from 3.816 million lb in 1931 to 17.612 million lb in 1940. Paint and varnish rose from 6.256 million lb in 1931 to 29.828 million lb. Linoleum and oilcoth rose from 2.612 million lb in 1931 to 29.828 million lb in 1940. Printing ink rose from 33,000 lb in 1931 to 82,000 lb in 1940. Miscellaneous rose from 2.051 million lb in 1931 to 16.538 million lb in 1940. Foots and loss rose from 1.625 million lb in 1931 to 20.924 million lb in 1940. The total of these uses for soybean oil rose from 27.885 million lb in 1931 to 431.641 million lb in 1940.

Page 68: Diagram of uses of the soybean. The major categories are: Green soybeans, used as fresh vegetables or in canned vegetable salads. Dry soybeans, used for seed or to make bean sprouts, soup, soy sauce, roasted soybeans, boiled soybeans, stock feeds, vegetable milk [soymilk] (used to make liquid milk products, dry soy milk products, bean curds, soy cheese), debittered soybeans (used to make full fat soy flour, soy coffee, soy butter, soy cereal). Soybean oil meal, soybean flour, soy lecithin, crude soybean oil (used to make fatty acids, alkyd resins. glycerine, core oils, soft soaps, hard soaps, insecticides, and many non-food products mentioned above). Refined soybean oil (used to make food products–vegetable shortening, margarine, salad dressing, edible oils, frying oils). Address: USA.

• ***Summary:*** Soybean oil meal, hydraulic or expeller process, was also fed to cows for comparison. Address: Columbia, Missouri.

464. Miller, Harry W. 1943. Soybeans and the Orient. *Soybean Digest.* Sept. p. 18, 44.

• ***Summary:*** "It was my privilege during 23 years of residence in the Orient to travel very extensively through the provinces of China, and to acquaint myself with all eastern Asia relative to soybean production. I found that while the central and northern provinces of China including Manchuria are the principal soybean producing areas of the Orient, that soybeans are widely used by all the groups of Orientals, save the Filipinos, and the Malays, and are universally used by the Chinese, and that wherever they emigrate in any part of the world, the one universal food of the Chinese is soybeans, and not rice, as so often claimed.

"There are millions of the Chinese who do not live in the rice producing territories. The Chinese and many of

© Copyright Soyinfo Center 2021

the Oriental people have come to understand by common experience rather than scientific deduction that soy protein is an essential to livelihood and cannot with safety he dispensed with from their diet. Wherever in Chinese occupied territories soil and climatic conditions are at all favorable to the production of soybeans, they will be found as one of the stable crops. However the yield in the tropical portions of China is rather small. They have depended on importing beans from Manchuria and northern China. The same is true of the South Sea Islands.

"Foundation: Much that we have learned concerning handling soybeans and preparing them into food materials we must credit to the knowledge gained through studies made and travels in the Orient, chiefly in China, Korea, and Japan. Like their handling of many other things, they have developed the soybean culture and processing up to a certain point and there they stand. We have built upon their foundation, and have carried research in the agricultural field, as also processing methods several steps farther, and have made soya food products not only better but far more digestible, and therefore nutritionally more available, and found out that the bean can be made tasty as well.

"You may ask how are the Oriental people using the soybean. There are many ways. If you were to visit the Chinese markets during the late summer and early autumn months you would be able to purchase shelled green soybeans. You would also be able to purchase the unshelled beans, that is in the pods just like you buy peas in the pod. Some people prefer to purchase them in the pods, cook them in the pods in salt water, and then squeeze out the beans and eat them from the pod. There have been no canning facilities available to the Chinese for any of their products in years past, and so the use of the green soybean is only seasonable. You might expect that since the Chinese have stone mills everywhere to grind their wheat and their corn into flour and meal that they would be grinding their soybeans into a flour. But soy flour is largely an Occidental product. It would be very difficult for you to pick up in any of the markets of China a pound of soy flour.

"Curd: The Chinese have learned through long experience that the greatest value nutritionally from the soybean is obtained through a water extraction of its protein. This milky liquid after it is strained is coagulated into a cheese [tofu]. Ninety percent and possibly even higher of the nutrition the Oriental obtains from the soybean is taken in the form of this cheese. Of course they have many ways of dealing with this soft gelatinous curd, which has a very high water content. They press it into cakes, about the thickness of a large slice of bread. This then is placed in a brine solution or other flavored liquid, and later sliced up like we at times dice cheese. Again it is pressed into thin sheets that are about a sixteenth of an inch in thickness. These are also diced up and eaten like a relish or a salad.

"Another common product is a thin semi-transparent sheet of protein [yuba] made by a slow heating vat filled with this soya milk. A heavy scum will come to the surface, which they lift off at intervals and suspend to dry. These sheets are later on used as food wrappers. They can use these sheets which are pure protein, like we can use cellophane sheets, but instead of wrapping parcels with them they stuff them with certain vegetables, imitating the body and legs of a fowl, or the form of a fish, or they can represent almost anything in the way of an animal, and by submitting them to a little baking, give the same nice brownish hue by the use of a little oil, so you could hardly tell whether you were eating actual turkey or an artificial one.

"When you go to the market where the soybean producer delivers his finished products, you will see a great variety of foods made from soybeans. As I say, you can buy the bean curd in squares, or you can buy the patties, or you can buy the thin sheets of soya cheese, or you can buy these large semi-transparent sheets of soya protein. These in turn can be incorporated into many tasty and highly nutritious dishes, by the skill and ingenuity of the cook, and has also the likeness of meat in flavor and appearance. Naturally nutritionally we know of the high value of these proteins for a proper substitute for meat, fish, fowl, eggs, and the protein of animal milk.

"Of course the Chinese have as one of their big industries the making of oil from the soybean, and that is true of the Koreans and the Japanese. They heat the bean, grind it, and put it into wooden presses and extract the oil by driving wedges into their oil presses, bringing a tremendous pressure to bear upon the roasted beans. This oil is all used for edible purposes.

"The residue of the bean cake contains about 6 percent of oil, and has been exported in recent years to great extent. But the Chinese have in certain localities ground it up and used the bean cake meal for food, although much has been used in China and exported for fertilizer.

"The soybean is also extensively sprouted, and these sprouts are used in their vegetable food mixtures and eaten as bean sprouts.

"I shall not attempt at all to discuss the varieties of soybeans found in the Orient. I have seen almost every color, every shape and size, running from a small shot sized bean to the large jumbo sizes, such as we have in our edible list. All the beans that I have seen that come from India have been of a very small size. When we buy beans in China we go to the market and ask for soya beans. If we are not satisfied with what they have we go to another shop, and see if we can find a bean of superior size and quality. We never purchase soybeans in China by name of any variety.

"As is well known, China and most parts of the Orient grow from two to three crops per annum on the same ground. In some areas when they harvest a rice crop they plant a soybean crop on the same soil. In other areas when they harvest a wheat crop they put in a crop of soybeans.

© Copyright Soyinfo Center 2021

We believe in many of our central states, and certainly this would be true of the southern portions of our central states, that it would be quite practical to harvest a crop of peas, and disk the land, and plant and harvest a crop of soybeans" (Continued).

470. Delsoy: New U.S. domestic soybean variety. Large-seeded and/or vegetable-type soybean. Synonym: Edsoy (Morse 1948). 1944. Seed color: Yellow (straw), hilum dark brown.
• ***Summary:*** Sources: U.S. Regional Soybean Laboratory. 1944. "Southern States Soybean Planning Conference, U.S. Regional Soybean Laboratory, Stoneville, Mississippi, February 29 to March 3, 1944." *RSLM* (U.S. Regional Soybean Laboratory Mimeograph, Urbana, Illinois) No. 112. [March.] 14 p. "Dr. J. E. Adams brought up the question of the name, 'Edsoy', which had been assigned to the soybean variety, F.P.I. 85355 and which was introduced by the Delta Experiment Station. Dr. Adams read correspondence between a grower in the South, the A.E. Staley Manufacturing Company, Decatur, Illinois, and Mr. W.J. Morse which brought out the fact that the name, 'Edsoy' for that variety conflicted with the Staley Company's use of the name, 'Edsoy' for one of their food products. The Staley Company had used the name, 'Edsoy' for 13 years so the use of that word as a varietal name was clearly a case of infringement on the rights of the Company.

"Mr. Rigney made a motion, seconded by Mr. Manke, that the Conference recommend to the Delta Experiment Station that the variety, F.P.I. 85355 he renamed. Motion carried unanimously.

"Mr. Aamodt suggested that the Conference choose several names and let the Delta Experiment Station make the final decision.

"Several names were suggested. Finally the name 'Delsoy' was chosen and the representatives of the Delta Experiment Station agreed on that name for F.P.I. 85355."

Maturity, late; pubescence, gray; flowers, purple; pods, two- to three-seeded; shattering, medium; seeds, straw yellow with dark brown hilum, about 3,500 to the pound; germ, yellow; oil, 17.4 percent; protein, 45.2 percent; iodine number, 133."

Bernard, R.L.; Juvik, G.A.; Nelson, R.L. 1987. "USDA soybean germplasm collection inventory." Vol. 1. INTSOY Series No. 30. p. 10-11. Delsoy is in the USDA Germplasm Collection. Maturity group: VI. Year named or released: by 1943. Developer or sponsor: USDA. Literature: 13, 14. Source and other information: From the AES (Agric. Exp. Station), Suweon, Gyeongggi Do, South Korea, in 1930. Prior designation: PI 85355.

Note: During the 1990s several soybeans named Delsoy were registered, such as Delsoy 4210 (1992), Delsoy 4710, and Delsoy 5710. Address: USA.

471. *Country Gentleman.* 1944. How the Corn Belt struck oil. 114(8):20. Aug.
• ***Summary:*** This page has the large bold headline: "The U.S. Department of Agriculture page."

They call him "Soybean" Morse, and although his technical title at USDA is Principal Agronomist, he is more frequently described as "the daddy of the soybean in America, and when you say 'W.J. Morse,' everyone knows you are thinking about soybeans."

The soybean is now one of America's six largest crops in terms of farm acreage: only corn, wheat, hay, oats and cotton are grown on more acres than soybeans; 1943 were 195.9 million bushels were harvested from 10.82 million acres.

© Copyright Soyinfo Center 2021

During World War II, the soybean's great contribution to the USA has been oil. With the soybean, the nation has "struck oil in a big way–vegetable oil for shortening, margarine and salad oil, oil for quick-drying paints on battleships and planes, for soap, medicines, linoleum, oilcloth, printer's ink, glycerine, leather goods.

"War in the Far East cut the United States off from its former source of a billion pounds of fats and oils, but by 1943 the nation was already anticipating a yield of more than" 1¼ billion pounds of oil from one crop of soybeans. And after the oil is removed, the high-protein that remains is still very useful as a feed for livestock, a source of nutritious flour, and a material for plastics to take the place of metals that have gone to war.

Photos show: (1) W.J. "Soybean" Morse inspecting soy beans in Keijo (Seoul), Korea in 1929. (2) A combine and wagon full of soybeans. (3) Soybean oil being filtered for food use at a plant in Decatur, Illinois.

472. LaChoy Food Products. Div. of Beatrice Creamery Company. 1944. Genuine soy sauce (Ad). *Soybean Digest.* Sept. p. 12.

• ***Summary:*** This small black-and-white ad (2¼ by 3½ inches) shows a bottle of the soy sauce and states: "Famous cooks and expert chefs insist on La Choy Sauce not only in making genuine Chop Suey, Chow Mein, and other Chinese dishes, but also in frying steaks, chopped meat, meat balls and hashes–in making gravies and stews–for serving on the table as a condiment for steaks, chopped meat, roasts, chops, croquettes, spaghetti, fried eggs and sea food."

Note: This the first time this ad has appeared in *Soybean Digest.* It may have been run in response to the article titled "Lack of soy sauce worries Nisei workers" in the July 1944 issue of this magazine (p. 11).

This ad also appeared in the *Soybean Blue Book.* 1947. p. 72. However Beatrice was now "Beatrice Foods Company." Address: Archbold, Ohio.

473. International Institute of Agriculture. 1944. Agricultural commodities and raw materials produced and consumed in the different parts of the world 1934-1938. Villa Umberto, Rome, Italy: IIA. 229 p. Index. 24 cm.

• ***Summary:*** Concerning world soya production (worth $184 million gold), Asia [mainly China, Manchuokuo [Manchuria], Chosen [Korea], Netherlands Indies (Java and Madura), Japan, Kwantung, and Taiwan; based on 1939 IIA studies of world market #4] produces 89.6% (393.5 million bu of 60 lb each, worth $165 million), North America 9.4% (41.2 million bu, worth 17 million), USSR 0.6% (2.6 million bu, worth $1 million), and Europe 0.4% (1.8 million bu, worth $1 million).

Concerning world soya consumption (worth $184 million gold), Asia consumes 78.4% (worth $145 million), Europe 11.6% (worth $21 million), North America 9.3% (worth 17 million), USSR 0.7% (worth $1 million).

Between 1934 and 1938 soya production has increased greatly, rising 90% in Asia, 9% in North America, and 1% in the USSR and Europe. The biggest soya exporting continent is Asia, and the biggest importer is Europe. In Europe, Germany (at 24.3 million bushels, each 60 lb) imports more than all other European countries combined, followed by Denmark (8.8 million), the UK (4.8), Sweden (4.4), and Netherlands (3.7). Address: Rome, Italy.

474. Markley, Klare S.; Goss, Warren H. 1944. Soybean chemistry and technology. Brooklyn, New York: Chemical Publishing Co. vii + 261 p. Foreword by Edward Jerome Dies, President, Soybean Nutritional Research Council. Illust. Index. 28 cm. [684 ref]

• ***Summary:*** Contents: Part I: Foreword, by Edward Jerome Dies, President, Soybean Nutritional Research Council. Introduction. Composition and properties. Mineral constituents. Protein and other nitrogenous constituents. Enzymes. Carbohydrates. Glycosides: Saponins, phytosterolins, isoflavone glycosides. Pigments. Vitamins. Oil and oil-soluble constituents. Physical and chemical characteristics of soybean oils: Acetyl value (see hydroxyl number), acid value (see free fatty acids), break material (mostly phosphatides, pigments, and mucilaginous materials), color, congealing temperature, density, diene numbers, fatty acids, flash, fire and smoke points, fluorescence, free fatty acids, Hehner number, hexabromide number, hydroxyl number, iodine number, optical rotation, refining loss, refractive index, Reichert-Meissl number, saponification number (or Koettstorfer number), smoke point (see flash), specific heat, thiocyanogen number, titer, unsaponifiable matter, viscosity, miscellaneous data (Weight of soybean oil per gallon: 7.67 pounds. Weight of soybean oil per standard U.S. tank car: approximately 61,000 to 62,000 pounds. Volume of soybean oil per standard U.S. tank car, approximately 8,000 to 8,060 gallons).

Fatty acids and glycerides. Sterols and other unsaponifiable constituents. Oil-soluble pigments. Antioxidants. Phosphatides (p. 101-18): Applications– (1) Food modifier in oleomargarine, shortening, candies and confections, bakery, milk and other products. (2) Pharmaceuticals and cosmetics. (3) Textiles. (4) Leather. (5) Plastic compositions. (6) Soaps and detergents. (7) Special emulsifiers. (8) Petroleum products.

Part II: Development of the soybean processing industry. Grading and storage. Methods of processing soybeans. Processing by means of continuous presses: The Anderson expeller, the French screw press, operation of continuous presses. Processing by means of continuous solvent extractors: The Hildebrandt system, the Bollmann system [or Hansa-Mühle], extraction system of the French Oil Mill Machinery Company (so closely resembles the

© Copyright Soyinfo Center 2021

Bollmann system in most respects that a detailed description will not be given), the Allis-Chalmers extractor, the Ford extraction system, the Detrex continuous extractor (uses non-inflammable trichloroethylene), other solvent systems, solvents, hot alcohol extraction process, extractor design data. Hydraulic pressing. Miscellaneous processing methods. Soy flour. Cost of processing soybeans: Manufacturers of soybean processing equipment, soybean processing mills in the United States. Production and refining phosphatides. Processing soybean oil for food uses: Neutralizing and washing, bleaching, hydrogenation, deodorization, winterizing, shortening, margarine. Literature cited.

The Allis-Chalmers extractor (p. 180-82): An early edition (Fig. 20) consists of a vertical, cylindrical column containing "a series of horizontal circular plates, equally spaced and fixed to a central shaft which is slowly rotated by a gear-motor. The upper surface of each plate is wiped by a stationary scraper arm fastened to the inner wall of the cylinder. Slots are cut in the plates so that, during rotation, the stationary baffles sweep material, resting upon the disks, through the slots into the plate immediately below." Footnotes explain that this design is based on U.S. Patents issued to Michelle Bonotto in 1937, 1938, and 1939, and called the Extractol Process.

Figures (photos unless otherwise noted) show: (1) The soybean plant, in foliage and mature. (2) Graph of spectral transmittance and color of crude pressed soybean oils. 475. Miller, Harry W. 1944. The story of milk from the soya bean (Continued–Document part III). Mount Vernon, Ohio: International Nutrition Laboratory. 37 p. See p. 12-18.
• ***Summary:*** (Continued): "Encouraged to Produce a Vegetable Milk: Having arrived at these conclusions which were based on extensive feeding experiments, we set about to get milk from a vegetable cow. However, my colleagues shook their heads saying, 'You might make something that looks like milk, but will it have those living properties that fit the requirements of a growing life in the form of a human individual?' But I have only to remind them that in the early days we thought of vitamins as living principles that evaded analysis, causing reactions but perishing with attempts at investigation, subsequent years have erased this argument and we can now analyze vitamins as well as manufacture them, as they have a chemical formula.

"I could easily have become discouraged in trying to bring out a substitute for animal milk because of the well established dairy business in America where sixteen per cent of United States industry flourishes, except that all the while I had in mind the people of the Orient in behalf of whom I had dedicated my life for service as a young man. Millions die annually for the lack of a suitable balanced food beverage to take the place that animal milk occupies in the American dietary, and as many more suffer lifelong weakness and ills because of faulty nutrition, especially in the early years of life. I was also well aware that in America we have many who cannot take animal milk, either dislike it, are fearful of it, or are allergic to it, who are ill nourished for lack of a milk substitute. And even yet cow's milk is not available to all the inhabitants of the Americas.

"As I pondered over what a suitable milk food would mean to the Oriental races, where there was such a lack of that kind of food, I felt that humanity was throttled at its start. I was also aware of the dangers to health and life that lurk in the lacteal secretions of animals and the way milk is handled in dairy yielding countries. Consider also the economic food waste, in view of the enormous amount fed to animals and the little protein return. Think of what this well-processed vegetable protein would mean were it fed to the starving millions of this world. I determined to work out the problem of a vegetable milk. It occurred to me that if wool could be made direct from vegetable protein instead of feeding protein to the sheep, we could make milk without the digestive laboratory of the cow.

"I first investigated to see what had been accomplished, and discovered that two groups of child specialists, one in Baltimore, the other in Cleveland, had fed infants a gruel made from soy bean meal, and the reported results were very satisfactory. In America, all experimental feeding work was done with mixtures made from milling the soy bean into flour, although the fiber of the meal was a drawback. Yet because of the high nutritive value of soya protein and its alkalinizing properties, it possessed remarkable values as reported in infant feeding by these authorities.

"We made the acquaintance of two men prominent in soy bean work of the U.S. Department of Agriculture, Dr. W.J. Morse, Chief of the Soy Bean Division of the Department of Agriculture, and Dr. J.A. LeClerc. Chief Senior Chemist of the Bureau. These men filled me with inspiration, enthusiasm and information. Throughout the succeeding years, we have had several interviews, and both of these men have made frequent visits to our Nutrition Laboratory at Mt. Vernon, Ohio.

"My preliminary studies made me aware that I would be confronted with many problems in producing from the soy bean an easily digested, tasty, wholesome milk that would meet a popular demand.

"My thirteen years spent at the nation's capital as surgeon and Medical Superintendent of the Washington Sanitarium and Hospital gave me a preliminary foundation in research methods for the years to follow in China. These years, from 1913 to 1925 were synchronous with the time of the beginning of modern dietetics. [Elmer] McCullum at Johns Hopkins University in Baltimore was neighbor to us, and he was actively pursuing the study of vitamins and their dietetic value. I was intimately acquainted with this pioneer worker and in fact at the Government Bureaus in Washington there was a great arousement on the importance of dietetics and cooking advances, to which work I had ready access, as well as utilizing the marvelous Surgeon General's and the Congressional Library facilities, seeking the latest publications on food, processing and nutritional work.

"It was during this year I published my first book entitled, *The Way to Health,* which has enjoyed a wide circulation.

"During all these studies, my thoughts were focused on the Soy Bean, the world's great protein yielder, and how to best utilize it, and incorporate it into the American dietary as a substitute for meat, fish, milk, eggs and cheese. Early and late we were running experiments at the little food plant we erected in connection with the Washington Sanitarium and Hospital. We realized that the large things in soy bean utilization in America, as also in the Orient, remained to be worked out in the future, and that our work was the first real effort to be recorded relative to a soy bean milk suitable for infant feeding and as a complete beverage milk.

"Further Studies in China: Finally in 1925 the

© Copyright Soyinfo Center 2021

opportunity came for me to return to China. My employing organization, the Seventh-day Adventist Church, sent me to establish a sanitarium at Shanghai. During the early years after my return to China, my time was fully occupied with medical and surgical work and the building of the Shanghai Sanitarium and Clinic, and assisting in the establishment of numerous other medical units in different parts of the Orient. However, simultaneous with this work, my son and I began to carry forward the assembly of a soy bean plant at the Shanghai Sanitarium. My work necessitated my return to America for a brief period about every two or three years and this gave me the chance to discuss my problems with chemists as well as investigate suitable processing machinery.

"In my contacts, while traveling in China, Korea and Japan, I discovered that a milky looking solution, a water extraction of soya protein, oil and its contained vitamins and minerals, had been tried out in infant feeding in some hospitals, in some instances with satisfactory results, but for the most part with quite disappointing results.

"The method used in its manufacture in most cases was to soak the beans, grind them in a stone mill with a stream of running water and this milky solution was filtered through a cotton cloth and then boiled, sugar added, and various flavors tried out to cover the beany taste, but flavor control was not possible by the strongest essences. As I examined this milk, it was apparent that something must be done to overcome the beany taste, and I concluded the reason the people were using bean curd rather than drinking the milk from which the curd was made, was that it tasted better after it was coagulated than before. Further, it needed to be farther processed to make it more digestible, and until we could add sugar and additional oil to it, we could not have a balanced milk as is found in human milk.

"Being familiar with the process of constituting cow's milk from skim milk powder, and sweet butter, through melting the butter, mixing it with the dissolved milk powder, and then homogenizing it, I concluded that we could do the same with this water-extracted solution from the hydrated soy bean.

"Since I knew that soy milk was a colloid liquid just the same as animal milk, and would hold a suspension of emulsified oil, I lost no time in getting a colloid mill that would do this same work, and could now constitute a liquid of any formula of protein, fat and sugar, so the resulting solution would be a colloid liquid as animal milk. Yet, I was far from having a milk that gave satisfactory results as to digestibility and could be borne by infants without too great looseness of the stools; and while you could sweeten it up so babies would take it, the older group would take a sip and turn it aside because of its bitter taste. To get rid of that beanish taste seemed far off, but to process it so that it could be more digestible, I thought was surely possible. Much work had been done at Ames, Iowa, in experimental animal feeding. Not only did these experiments show that thorough cooking under pressure of soy beans raised the availability of soy protein to 95 per cent absorption, but that weight and growth records in feeding of pigs and fowls were far superior to those of animals fed ordinary cooked beans, and thorough processing caused a disappearance of digestive disturbances."

Note. This is the earliest English-language document seen (Dec. 2013) that contains the word "beanish" or the term "beanish taste" used as the word "beany" or the term "beany taste" are used today. (Continued). Address: Mt. Vernon, Ohio.

• ***Summary:*** Reprinted from: *Proceedings of the American Soybean Assoc.* 1930, p. 96-100. The article was originally titled "Soybeans in the Orient." One large photo shows Morse with several richly illustrated boxes of black miso [Hatcho miso]; smaller photos show abura-age [deep-fried tofu pouches], and tofu kasu [okara]. Address: Dairen, Manchuria.

479. Shelledy, F.H. 1945. Japanese trade studies: Soybeans. *U.S. Tariff Commission, Special Industry Analysis* No. 13. 6 p. May. [3 ref]
• ***Summary:*** Contents: Foreword. Introduction and summary. Description and uses. Production. Imports. Post-war problems.

This "report is one of a number which were prepared during 1944 and 1945 for the Foreign Economic Administration..." Most of the data "were taken from official and semi-official Japanese sources." Errors and inconsistencies in these data have frequently been detected.

"Japan is not important as a world producer of soybeans. It is, however, normally the world's principal soybean importer. Its annual production during 1928-39 was only 10 to 14 million bushels. By comparison, the production in the United States was 90 million bushels in 1939 and more than 190 million bushels in 1943 and 1944; the average annual production of soybean in Manchuria during the thirties was more than 150 million bushels annually.

"Prior to the present war Japan took most of the exportable surplus of Manchuria, the principal world exporter of soybeans, as well as substantial quantities from Korea, a country which produces almost twice as many soybeans as does Japan. During the 10 years 1928-1938, Japanese imports averaged 26 million bushels annually, approximately double its own production."

"If an annual per capita consumption of 0.5 bushels [30 lb] of soybeans were to be maintained in Japan in the post-war period," Japan would require a total supply of about 37 million bushels/year, based on a 1940 population of 73.1 million. An estimated 10-14 million bushels could be produced in Japan in the short term period after the war. The rest must be imported.

Uses of soybeans include miso, soy sauce or shoyu, and tofu. The main center of soybean production in Japan is the island of Hokkaido. The soybean is the principal oilseed imported into Japan.

Tables show: (1) Soybeans: Production, imports, exports, and apparent consumption, Japan Proper and Karafuto, 1928-39. Columns show: Production. Imports from Empire. Other imports. Total imports. Exports. Apparent consumption: Total and per capita. (2) Soybeans: Imports into Japan from principal sources, average 1928-32, annually 1933-39. The graph has two main parts: Quantity (1,000 bushels), and value (1,000 yen). Empire areas: Manchuria (incl. Kwantung), Korea, Formosa, total. Non-Empire areas. Grand total. Source: Monthly and annual returns of foreign trade of Japan, Korea, and Formosa. Address: U.S. Tariff Commission, Washington, DC.

480. Surrender of Japan after World War II (Important event). 1945.
• ***Summary:*** The surrender of the Empire of Japan on September 2, 1945, brought the hostilities of World War II to a close. The documents and terms of unconditional surrender were signed on board the battleship USS Missouri in Tokyo Harbor. The United States now stood astride the world as the only remaining Great Power.

The background to the surrender was:

By 1945, the Japanese had suffered an unbroken string of defeats for nearly two years in the South West Pacific, the Marianas campaign, and the Philippines campaign. The Allies captured the nearby islands of Iwo Jima and Okinawa in the first half of 1945. Okinawa was to be a staging area for Operation Downfall, the American invasion of the Japanese Home Islands. Such an invasion was dreaded by both sides; it was widely believed that Japan would fight to the bitter end and never surrender. Thus, the United States would have to fight, in enemy territory, for every inch, from Okinawa, on to Kyûshû, all the way to Tokyo. But the Japanese Imperial High Command was determined not to allow the allies to establish a beachhead on Kyûshû–Japan's southernmost main island. The strategy of making a last stand at Kyûshû was based on the assumption of continued Soviet neutrality.

1945 Aug. 6–The United States dropped an atomic bomb on the city of Hiroshima, hoping that the resulting destruction and devastation would cause Japan to surrender; it did not.

1945 Aug. 8–The United States dropped a second atomic bomb on the city of Nagasaki. Late in the evening of the same day, in accordance with the Yalta agreements, but in violation of the Soviet-Japanese Neutrality Pact, the Soviet Union declared war on Japan, and soon after midnight on August 9, 1945, the Soviet Union invaded the Imperial Japanese puppet state of Manchoukuo.

The combined shock of these events caused Emperor Hirohito to intervene.

1945 Aug. 15–In a recorded address broadcast across the Empire, Emperor Hirohito announced the surrender of Japan to the allies.

481. Ladejinsky, W.I. 1945. Agriculture in Japan: Prewar. *Foreign Agriculture* (*USDA Foreign Agricultural Service*) 9(9):130-42. Sept. [7 ref]
• ***Summary:*** The soybean is a staple food of the Japanese. Soybeans are also in demand for a number of industrial products, chief of which is soybean oil. The 1939 soybeans are estimated to have occupied 795,000 acres. Because of the competition from imported Manchurian soybeans, extension of mulberry-tree plantations prior to the 1930s,

© Copyright Soyinfo Center 2021

and increased acreage under orchards and vegetables, the soybean area declined from an annual average of 1,091,000 acres during the 5-year period 1920-24 to 808,000 acres in 1935-39, or by 26%. Production decreased from 18 to 13.5 million bushels. Despite the declining output, consumption of soybeans during the same period increased from an annual average of 32 million to about 44 million bushels. Production of soybeans in recent years has averaged about 30% of the country's consumption. The shortage of about 30 million bushels was made up by imports from Manchuria (80%) and Korea (20%). Address: Office of Foreign Agricultural Relations.

**Manufacturer's Name:** Korean Tofu Co.?
**Manufacturer's Address:** Los Angeles, California.
**Date of Introduction:** 1945.
**New Product–Documentation:** Mildred Lager. 1945. The Useful Soybean. p. 86-87. "In another part of the same city [Los Angeles], a Korean has found a market for a firmer cheese [tofu] and is already packaging and selling it to some of the best known restaurants of Hollywood, where it is served as soybean curd or custard."

483. Lautensach, Hermann. 1945. Korea: Eine Landeskunde auf Grund eiener Reisen und der Literatur [Korea: A geography based on the author's travels and literature]. Leipzig, Germany: K.F. Koehler Verlag. xv + 542 p. Illust. (black & white photos). Maps (part folded, part color). 24 cm. Series: Geographische Handbücher. [1038* ref. Ger]
• ***Summary:*** A superb, scholarly work, with a huge bibliography, printed just as Germany was losing World War II.

Chapter 6, titled "The anthropogeographical character of ancient Korea" (p. 141+) contains extensive information about agriculture and food. Page 154: In wealthier sites, the farm buildings enclose a courtyard, to which an entrance gate gives access (Fig. 21e, p. 151). Some enclosures are so complete that a square courtyard results. In some corner or other of the courtyard stand the huge brown earthenware jars, in which soy sauce (*Sojabohnensosse,* jap. *shoyu*) is prepare and stored.

Page 176-77: In East Asia, after cereal grains, pulses / legumes are the next most important crop. In Korea, by far the most important is the soybean (*Sojabohne,* jap. *daitsu* [*daizu*] = large bean) which makes few demands on the soil. Korea's climate is ideal for soybeans (Tanaka 1931, p. 18); it is even better than Manchuria's climate, because of the large amount of precipitation during the summer. Today, soybeans are an indispensable part of the various dry-field crop rotations. After planting of the paddies has finished, soybeans are planted on the ridges too; there they grow extremely well without being fertilized. Soybeans are grown throughout Korea, but least in the Kaema upland because of the warmth they require. In northern Korea, on dry fields, they are planted between the end of March and beginning of May. Toward the south, planting is delayed until the end of June. They are generally harvested in October, except in Chejudo, where they are not harvested until early November. Soybeans are the crop that is left standing the longest, and they are not harvested until their leaves have turned brown and started to fall.

Soybeans are used as a very nutritious food for both humans and horses. Also, cooked soybeans are used as a fertilizer for the rice paddies. Above all, though, the hot brown soy sauce (*Shoyusosse*), which is never lacking on any Korean or Japanese table, is made of them, using salt and pepper and a process of fermentation. Bean curd (*Käse,* jap. *tohu* [*tofu*]) and soybean paste (*Mus*, jap. *miso*) are also made of them."

Page 180: The place of soybeans (*Soja*) in rotations, such as soya / hemp is mentioned. The winter crops consist of wheat, barley, or rye; the summer crops of soybeans, other beans or cotton. Page 181 mentions soybeans as a summer crop. Page 196: Soybeans are planted on the bunds of the rice fields. Page 199. Those who farm in central Manchuria are likely to grow soybeans. Page 224: Soybeans are mentioned several times.

A fold-out map facing p. 400 shows the distribution of soybeans in Korea. They seem to be slightly more densely grown in the south than in the north.

Page 435: Soybean oil mills (*Sojabohnenmühlen*) are mentioned. Page 460: Discusses imports and exports of soybeans. The main beans exported from Korea to Japan are soybeans, amounting to a weight of 1.3 to 1.9 million dz. in 1939. Note: One dz (*doppelzentner*) = 100 kg. Exports to other countries was small. By comparison, Manchurian soybeans were exported to the northern harbors of Germany and England. In addition, a significant amount of Manchurian soybeans were imported to Korea (0.29 to 1.02 million dz.). Also, a significant quantity of soybean products made in Korea were exported to Japan (Soy oil up to 11,550 dz. and soybean cake up to 1.2 million dz.). Likewise, up to 3,210 dz of soy oil and up to 1.3 million dz of soya cake were imported to Manchuria from Korea.

Page 466-67: A comparison of soybean production in Korea and soybean production in Japan is given. 85% of the imports of soy oil to Japan came from Korea.

Page 473. Soybeans are grown in the deep valleys of Korea.

Facing p. 144: A photo shows a man carrying a large, empty, pottery soy sauce jar on a rack on his back.

Hermann Lautensach lived 1886-1971. Korean place names are the old ones in the Japanese system. Address: PhD, Prof. of Geography at the University of Greifswald [northeastern Germany].

484. Morris, Harriet. 1945. Korean recipes. Wichita, Kansas:

© Copyright Soyinfo Center 2021

Published by the author. 50 p. Illust. 23 cm.
• ***Summary:*** "Dedicated to the members of the Korea Club of Wichita, Kansas: Jeanette Walter, Marion Conrow, Walter Morris."

The word "sprouts" appears on 15 pages in this book, usually as part of the term "bean sprouts." A recipe for "Bean sprouts" (p. 23-24) provides clarity: "Directions for sprouting beans. Bean sprouts may be grown from two kinds of beans, the small green Chinese mung bean, or the larger yellow soy bean. One cup of dry beans will yield approximately 2 to 3 cups of sprouts. Beans that are old will not sprout well. Look over beans and remove any that are cracked or broken as these will not sprout. Wash beans well, put into a 2 quart large mouth jar and soak 12 hours. Pour off water, place jar on its side, raise the bottom of the jar several inches so that all water can drain off. Keep in this position until beans are sprouted. Three times a day, pour luke-warm water over the beans and drain. The beans should be kept damp but not wet. At night add a pinch of chlorinated lime to the water used to rinse the beans. Keep the jar in a dark place where air circulates freely. Sprouting time depends upon the temperature. In cooler weather 3 to 5 days are required, but in hot weather 2 to 3 days are sufficient. When sprouts have formed, wash well and remove the skins from the beans and also the hair-like end from each sprout. Use in recipes as directed.

Bean Sprouts (*Khong na-mool*).

4 cups bean sprouts. 2 green onions, 2½ tbsp. soy sauce, speck red pepper, 2 tbsp. prepared sesame seed (see recipe), 1 tsp. salt, 1½ tsp. oil.

"Wash fresh beans sprouts and remove the hair-like end from each sprout. Cover with boiling water and cook until tender. Drain. Add soy sauce, prepared sesame seed, oil, chopped onion (reserving the tops), red pepper, and reheat until the seasonings are all absorbed. When almost done, cut the onion tops in 1 inch lengths and add to the bean sprouts, cooking until tender. Season with salt."

Note: This is the earliest Korean cookbook seen (March 2014) outside Korea that mentions soyfoods. Address: Wichita, Kansas.

485. United States, Office of Foreign Agricultural Relations. 1945. Civil affairs handbook, Japan. Section 7, Agriculture. Washington, DC: Headquarters, Army Service Forces. xii + 195 p. Maps. 25 cm. Supplement (xiv + 236 p.) issued in 1945. [1 soy ref]
• ***Summary:*** A digital version of this book is available on HathiTrust. This Section 7 is one in a series of 17 sections about Japan, including: 1. Geographical and Social Background. 2. Government and Administration. 3. Legal Affairs. 4. Government Finance. 5. Money and Banking. 6. Natural Resources, etc.

This book offers many deep insights into Japan's agriculture in 1945 and before. For example, we read on page xi that shortly before the war: "Practically all of the sugar had to be imported from Formosa; two-thirds of the soy beans from Manchuria and Korea; and 20% of the rice from Korea and Formosa." Japan's hard-working farmers supplied the rest.

The book contains 57 tables, 14 figures, and one map (4 maps on one page, xiv).

Printed across the top of the title page: "Army Service Forces Manual M 354-7." On the same page below the title: "Headquarters, Army Service Forces, 1 April 1944."

Page 59 states: "The principal soybean foods used daily in Japanese life are soysauce, miso (red, white, black), tofu or bean curd, soybean milk, green vegetable beans [edamame], roasted beans, soy flour, natto, yuba (film from soybean milk when heated), and beverages (coffee substitute and tea mixture with roasted beans). Soysauce is extensively manufactured by large concerns throughout the Japanese Empire. It is used at every meal by the Japanese family, taking the place of salt and other condiments. Miso is a fermented product from rice or barley, salt, and soybeans, usually requiring from 6 to 12 months for curing. It is a daily breakfast dish in the form of soup with vegetables and it is also used to preserve vegetables, fish, and meat. Tofu, made in small factories throughout cities and villages, is used extensively in place of meat. It is used in the fresh or dried state in soups with vegetables, mixed with vegetables and fried as squares in deep fat, and also toasted. Soy flour is used with wheat flour in the making of various breads, rolls, buns, crackers, and pastries. The roasted flour mixed with sugar is used in making various forms of confections. The roasted beans are used in much the same manner as salted peanuts, and in the making of numerous candies and cakes. Soybean milk is made in the tofu factories and sold as fresh milk [Interesting!]. Natto is a fermented bean, occurring in the various forms though not used as extensively as miso and tofu.

"Japan imports large quantities of soybeans, bean oil, and bean cake from Manchuria. The beans are used largely in the manufacture of soysauce and miso. Only a small percent of the Manchurian beans is processed for oil and meal as there are but three or four bean oil mills in Japan. The beans imported from Chosen [Korea] are of much higher quality than the Manchurian beans and, therefore, are used entirely in the manufacture of miso, tofu, and other food products. Bean oil is used in the manufacture of shortening, salad oil, cooking oil, and various industrial products such as paints, enamels, varnish, soap, and waterproof goods. Bean cake is used largely (90 percent) as fertilizer though considerable quantities are used as cattle feed and in the manufacture of a cheap soysauce. In recent years bean cake has also been used in the manufacture of a wool-like fiber."

Pages 101 and 104, in the section on "Leguminous crops," state: "The principal legume crops produced are soy beans, other beans, peas and peanuts. The most important is

© Copyright Soyinfo Center 2021

soy beans. Soy beans are a staple food of the Japanese, and are used for soy sauce, bean paste and bean soup. They are also in demand for a number of industrial purposes, chief of which is soy bean oil.

"The total area of all leguminous crops in 1936 was 1,516,000 acres (includes 19,000 acres under peanuts) or 7.6 percent of the total cultivated area. The soy bean crop alone covered 807,000 acres. The 1939 area under all these crops amounted to 1,449,000 acres of which soy beans are estimated at 795,000 acres (Table 41, p. 105). Because of competition from imported Manchurian soy beans, extension of mulberry tree plantations prior to the 1930's, and increased acreage under orchards and vegetables, the soy bean area declined from an annual average of 1,091,000 acres during the 5-year period 1920-24 to 803,000 acres in the period 1935-39, or by 26 percent. Production followed suit, with a decrease from 18 to 13.5 million bushels. Despite the declining output, consumption of soy beans during the same period has increased from an annual average of 32 million bushels to about 44 million bushels. Production of soy beans in recent years has averaged about 30 percent of the country's consumption.

"The shortage of about 30 million bushels was made up by imports from Manchuria (supplying 80 percent) and Korea (20 percent). Next to rice, soy beans form the largest single imported foodstuff. From the Japanese point of view, the mitigating factor of this situation is that the colonies are the sole source of supply. This fact has led a Japanese to remark that from a practical point of view Japan is self-sufficient in soy beans. With respect to other beans, such as 'azuki' and 'broad' beans [*sora mame*], the ratio of domestic production to total consumption has been estimated at 55 and 85 percent, respectively. The condition that applies to imported soy beans applies to these beans as well, since they, too, originate in Manchuria."

The word "soybeans" appears on 35 pages in this book, "soybean" on 28 pages, "soy" on 15 pages (p. 104, 101, 59, 68, 92, 105, 137, 140, 147, xii, 55, 58, 223, 228, 233), "soysauce" on 6 pages, "bean paste" [miso] on 5 pages, "miso" on 5 pages, "tofu" on 4 pages (p. 59, 100, 58, 233), "soy flour" on 3 pages, "soybean milk" on 3 pages, "green vegetable beans" on 2 pages (p. 56, 59), "shoyu" on 2 pages (p. 97, 100), "natto" on 2 pages (p. 59, 100), "yuba" (film from soybean milk when heated) on 2 pages (p. 59, 100), "roasted beans" on 1 page (p. 59). Address: Washington, DC.

486. Lager, Mildred. 1946. The meat without a bone. *Soybean Digest.* April. p. 22.

• ***Summary:*** "To anyone interested in unusual foods soy cheese is indeed fascinating. While it will never become popular in this country it is worth knowing about and trying at least once.

"Soy cheese or curd is known to the Chinese as tofu and it has been aptly described by them as 'the meat without a bone.'... The bean curd or soy cheese is the coagulated casein of the soybean and is made from soy milk very much as we make cottage cheese. The result is a white, very soft, watery substance, that can be pressed into a cake or soft cube. It is an easily digested food, fairly high in protein, and can be used as a meat, egg, or fish substitute, as a cheese, or as a topping or dessert.

"Every Oriental settlement has its tofu factory or factories which supply the restaurants and markets with fresh cheese. The methods used in some of them are very crude and primitive but the result is an excellent cake of cheese. There is an interesting little place in the heart of new Chinatown in Los Angeles run by two old Chinese who claim no knowledge of English, and can't be bothered with curious visitors. They did, however, allow me to watch from a distance. A large size coffee mill run by a little motor ground the beans. The curds were cooked in a clean wash tub and the cakes were pressed between two boards held down by a wooden bar which was attached to the wall at one end and weighted at the other end with a pail of sand. Naturally their output was limited but their product was excellent. Here was the old world working in the midst of the new making an ancient food that was yet new and novel."

Describes how to make tofu at home (vaguely), how to store it, basic preparatory techniques, and serving suggestions. It is delicious as a dessert "Some ingenious cooks even use it for cheese cake." Canned tofu is more in demand than fresh because it is more widely available. "Canned it is known as soy cheese, soy food or soy curd and the taste, texture and moisture varies with the different brands."

"Soy cheese will never become popular in this country. A certain amount will always be used, however, by the vegetarian, especially by those who do not use any animal products whatsoever [i.e., vegans], and by those who have developed a taste for it. It is an unusual food that does not appeal to everyone. It is becoming more and more popular in corrective nutrition because it often fills a need in the special diet.

"'The meat without a bone' is one of the interesting variations of the versatile bean. This ancient food is gaining a toe hold in our American diet and is filling a dietary need for many persons."

A photo shows a woman in a Korean market selling cakes of tofu on a round woven bamboo tray. Address: Author of "The Useful Soybean" [California].

487. Morse, W.J. 1946. The Pacific story. Radio broadcast. NBC. Hollywood, California. June 2. John Baker OI, Radio Service. 4 p. transcript

• ***Summary:*** The broadcast [written by Morse, apparently to East Asia] begins: "This Pacific program means a great deal to me. It is an impressive justification of the late Dr. Charles V. Piper of the Department of Agriculture who was my boss

© Copyright Soyinfo Center 2021

nearly 40 years ago when I started working on soybeans." It was his vision of the possibilities in the United States of this great crop of the East that started the development that has made it a team mate for our native Indian earn. It was in 1907 that Dr. Piper said to me, "this plant has great possibilities for our agriculture and industry," He soon backed up his faith with action. Not only did we work on collecting new varieties from every possible source but he sent me out to look over cottonseed-oil mills as possible outlets for the flood of soybeans he felt sure would come.

"It has been my wish many times that Dr. Piper could have lived to see these later days, especially the present ones when the United States as a soybean producer has occupied second place, headed only by China. It is pleasing to us now that products of American-grown soybeans are a part of the bread that is returning across the Pacific to those people [in China] who gave us generously of breeding material.

"We began collecting new varieties and strains from the Orient about 1908. A few varieties had been brought over a hundred years before but during that century it was merely a garden oddity. In those years we were living beside an undiscovered gold mine, you might say. But now we know we have something–the most valuable of the many p1ant gifts out China and perhaps the most versatile plant known.

"When I recite what we consider the virtues of the soybean, it may sound to the people on the other side of the Pacific like a school boy at the supper table announcing his discoveries of the day. Nevertheless, this is a good place to say that on both sides of this ocean and in Europe, too, it really deserves its name of "Wonder Bean"–a valuable aid to good farming, a protein feed for livestock, a big-tonnage raw material for industry, and a nutritious human food that is winning a high place in the diet. The war greatly emphasized its usefulness.

"In the United States the acreage of this crop had reached sizeable proportions before the war and it had a place on the grain exchange–along with such mainstays of our life as wheat and corn. But in 1907, when Dr. Piper visioned its future, the total acreage in the United States was only 50,000, Three years ago it reached a peak of nearly 16,000,000 acres. The production of soybeans in 1917 was about 70,000 tons. By 1945 it had increased almost 100 fold.

"We needed the soybean–farmers, manufacturers, and consumers–and, with great merit to start with, it was made to fit more exactly into various uses.

"Testing and selection are going on now at perhaps a greater rate than ever before, using types and strains brought in by the thousands from China, Japan, Korea, and Manchuria. More than 15 years ago I spent 2 years in those countries. I have pleasant recollections of the people who proudly brought in their favorite beans from farms and village garden plots. We now have under test more than 2,500 varieties, types, and strains, with about 100 varieties commercially available. Some of them, bred or selected for the north country, mature in 75 days and some, suitable for southern states, take 175 days.

"Until recent years the farmer has looked on the soybean mostly as a forage crop, Of late years it has gained in food and industrial uses. Today more than 100 oil mills are crushing soybeans; 200 concerns are manufacturing soybean food products; and more than 100 manufacturers are turning out various industrial products, including plastics and oils for paint and other uses. Now it is a $500,000,000 industry.

"Not only has Federal and State research widened the fields of usefulness of the soybean, but recently there has been much research by commercial interests.

"The soybean food list includes scores of products but those now getting most attention are soy flour, grits, flakes, and meat substitutes. Soy flour's greatest usefulness is in adding value to other foods.

"In industry the soybean is on a good and broad foundation, with about 70 percent or our production processed by oil mills. Industry uses the oil for the manufacture of cooking fat and many industrial products. The remaining high-protein meal is used for stock feed, flour, plastics and other industrial products.

"Altogether we have learned a lot about the soybean–from its home countries of the Orient and through our own efforts–and it has become so important as to be almost indispensable. Our plant pot is really a melting pot." Address: USDA.

488. Marquis, Arnold. 1946. The Pacific story. Radio broadcast. National Broadcasting Company (NBC). Hollywood, California. June 2. 30 minutes. 23 p. transcript.
• ***Summary:*** This radio broadcast is a fascinating story–told by many voices–of how the Japanese scientifically developed soybean production, utilization, and export in their puppet state of Manchukuo, and, how the USA intends to capture the soybean export markets lost by the Japanese when they lost World War II.

The Chinese speak of the soybean this way: "It is the poor man's meat. It is the cow of China. It is meat without bones. The Japanese speak of it this way: If we could have held Manchuria, it would have guaranteed that Japan could never be starved out. American nutritionists speak of it this way: It is high in protein. It is rich in vitamins–in A, B-1, C, G, and E–and also in the blood-clotting vitamin K. Weight for weight it contains several times as much B-1 as beefsteak. And as for minerals: One-half cup of soy flour contains as much calcium as a whole cup of milk... [and] as much phosphorus as two cups of milk. And weight for weight, it contains as much iron as liver, twice as much iron as molasses, and three times as much iron as whole wheat flour. The soybean is a wonder food. One pound of soy beans is almost a complete one-day ration for an adult."

The USA is now developing two famine-relief foods based on soybeans. The first contains 50% soybean, plus

© Copyright Soyinfo Center 2021

split peas, wheat flour, and a little peanut-meal, onion, salt, and fish-oil. Four million pounds of this mixture and twelve million pounds of another soy-based mixture are being sent "to the famine areas of China." In other words, soybean are being sent from the USA to the land of their origin, "where they have been a mainstay for five thousand years."

Discusses: The growing of soybeans in Manchuria. The Japanese takeover and extension of their control via the South Manchuria Railroad, whose terminus is Dairen. The importance of Manchurian soybeans to Japan. The Japanese Central Laboratory at Dairen and its research on soybeans. The two Japanese agricultural experiment stations in Manchukuo, outside of Dairen and at Kungchuling [pinyin: Gongzhuling]. Development of the benzine [benzene] solvent extraction process for soybean oil, "until there were 200 large bean plants in southern Manchuria." Soybeans as a livestock feed in Manchuria. Use of soybeans as food in China: "Tofu is bean-curd... This is fermented tofu. It is very good. Tofu is eaten in several forms. Fresh, fermented, dried or frozen. Just about any way it is prepared, its food value is preserved... We also use the oil of the soy bean. And with the soy bean we make soy sauce." Many Asiatic peoples also use soybeans to "make bean milk and bean flour." "They roast them for confections [kinako]. They eat them green [green vegetable soybeans]. They sprout them [soybean sprouts] and they even make drinks of them.

Note 1. This is the earliest English-language document seen (Oct. 2011) that contains the term "fermented tofu.

Industrial uses of soybeans in America. How Dairen became Japan's great center of the soy bean industry in Manchuria, and the Mixed Storage System. "About 55% of the soybeans grown in Manchuria are used for human food."

"You see, its all tied together. The growing of the bean, the processing, the transportation, and the export. Since 1937, the economy of Manchuria has been developed for the benefit of Japan." The Japanese and the Bank of Manchukuo (which is an instrument of the powerful Mitsui and Mitsubishi financial combines) are "buying up all the soybean business" and trying to eliminate the major European companies that were exporting soybeans before the Japanese moved in, such as Dreyfus Co. (France), and Wassard Co. (Denmark). Although the Japanese claim that Manchukuo is an independent nation, other nations realize it is a puppet state. The Chinese Eastern Railway, which was built by the Russians and has its terminus at Vladivostok, is in competition with the Japanese-controlled South Manchuria Railroad for the soy bean business of Manchuria. The latter uses rebates (kickbacks) to try to eliminate competition.

In 1937, after 6 years of dominating Manchuria, Japan invaded China proper–using Manchuria to supply their troops. "By 1941, Manchuria was yielding some four million tons of soybeans. The Japanese controlled every pound of it. And by 1941 they had fostered the growing of soybeans in Korea, and also in Japan itself. Also, by this time, the Japanese had seized a good part of the soybean country of China proper. But by Pearl Harbor [7 Dec. 1941], the United States was also growing soybeans: Over 3 million tons in 1941. By 1945 it was nearly 6 million tons."

Now that the war is over, the Japanese have lost the entire soybean industry in Manchuria–including the laboratories, bean oil mills, Dairen, the South Manchuria Railroad, and the Bank of Manchukuo which controlled it. China, which now controls Manchuria, "will consume much of the soybeans which, before the war, were exported to European countries, and to Japan." The United States has begun to supply this soybean export demand, and in fact "is already shipping soybean products back to the Far East–to the famine stricken areas of China."

America Doctor: "So far most of our soybeans have gone for feeding livestock. But now we known what they can mean to man. Narrator: Now, in this great crisis, we are learning what the Chinese have known for thousands of years. Chinese: It is the poor man's meat. It is the cow of China. It is meat without bones... Announcer: This is the story of the wonder food and the part it has played in our time."

Next comes a 5-minute segment in which W.J. Morse of the USDA Bureau of Plant Industry (Beltsville, Maryland) talks about the significance of the soybean and its development, and the new Pacific Program. Then the conclusion: "For a reprint of this program, send ten cents in stamps or coin to University of California Press, Berkeley, California. The Pacific Story is written and directed by Arnold Marquis. The original musical score was composed and conducted by Thomas Peluse. Your narrator–Gayne Whitman... This program came to you from Hollywood. This is N.B.C.–The National Broadcasting System." Note 2. A cover letter accompanies this manuscript. It is from Arnold Marquis, Writer-Producer, The Pacific Story, to Mr. John Baker, Department of Radio, USDA, Washington, DC. The letterhead reads: National Broadcasting Company, Inc., A service of Radio Corporation of America, Sunset and Vine, Hollywood 28, California. [Phone]: 6161. Dated May 13, 1946. Address: USDA.

489. *Soybean Digest.* 1946. Heartsill Banks goes to Korea. Sept. p. 78.

• ***Summary:*** "Heartsill Banks, for the past 2 years manager of the soybean division for the Kansas City [Missouri] plant of Ralston Purina Co., has resigned to accept a position in charge of rice experimentation and breeding work for the War Department in the American occupied territory in Korea. Mr. Banks embarked for Korea September 3. He will be stationed at Seoul."

"Mr. Banks has been well known in the soybean industry for many years. Prior to his assignment in Kansas City, he was in charge of agronomy operations for Ralston Purina at

© Copyright Soyinfo Center 2021

Osceola, Arkansas. He was instrumental in developing the Ralsoy" soybean variety.

A photo shows Mr. Banks.

490. *J. of the American Society of Agronomy.* 1946. Fellows elect: William Morse. 38(12):1116-18. Dec.
• ***Summary:*** "William Joseph Morse was born in New York in 1884. He was granted the B.S. degree by Cornell University [Ithaca, New York] in 1907 and the same year began his studies with the U.S. Dept. of Agriculture where he is, at present, principle agronomist in charge of soybean investigations for the Division of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering. The U.S. Regional Soybean Laboratory, conducting research in twenty-four states is also under his direction.

"Although Mr. Morse has published many papers on his investigations on cowpeas, velvet beans and other miscellaneous legumes, his chief interest and work has been with soybeans. It may be appropriately stated that he is the father of soybean production in American agriculture. His many authoritative publications on varieties, culture and uses of the soybean attest to his outstanding work. From 1929 to 1931, he traveled through China, Japan, Korea and Manchuria collecting new varieties of soybeans and compiling data on cultural methods and uses for them.

"Mr. Morse was three-times president of the American Soybean Association, and has served the American Society of Agronomy for many years on the important committee of Varietal Standardization and Registration." A photo shows William Morse.

Note: This is the earliest document seen (June 2003) that uses the word "father" in connection with William Morse and soybean production in the USA.

491. *Soybean Digest.* 1946. From Heartsill Banks [in Seoul, Korea] (To the Editor). Dec. p. 24.
• ***Summary:*** "Not much news from over here. The soybeans, some 611,000 acres of them, are grown in small fields, planted, worked and harvested by hand.

"A rather small percent of them get to market commercially as each farmer eats a great many. They pull up stalks and all and bring them into the villages to let them be threshed by the women and children.

"Koreans also eat a lot of barley and millet, although rice predominates. Another national dish, the odor of which permeates every gathering of Koreans, is Kimchee, a sort of pickle or kraut made primarily of the huge Daikon radish and Chinese cabbage, combined in varying degrees with garlic, leeks, peppers, dried fish, chestnuts, et al." Address: Seoul, Korea.

492. Meals for Millions Foundation. 1946-1967. Meals for Millions Foundation Records, 1946-1967 (Finding aid for archival collection). Los Angeles, California: University of California at Los Angeles (UCLA). 48 boxes (24 linear feet). 1 oversize box.
• ***Summary:*** Collection No. 1107. Repository: UCLA Library, Dep. of Special Collections, Los Angeles. Physical location: Stored off-site at SRLF (Southern Regional Library Facility). Please contact UCLA for paging information.

"The Meals for Millions Foundation of Los Angeles was a non-profit organization dedicated to the eradication of hunger in the world through 'three-cent meals.' The plan for such a program was formulated by Clifford Clinton (of Clifton cafeterias in Los Angeles, California), who, with the assistance of Dr. Henry Borsook of Caltech organized the foundation in 1946. The basic product of the foundation, known as Multi-purpose Food, was a tasteless additive that could be mixed with virtually anything. Developed by Dr. Borsook, MPF was said to provide one-third of the daily vitamins, minerals, and protein needed by the average adult.

"Shortly after setting up the Foundation, Clinton brought in Florence Rose and Ernest Chamberlain to be co-directors and take over the day-to-day management. This collection or archive consists primarily of the office and personal files of Miss Rose, most of which she rescued from destruction when Meals for Millions began to change course in 1965. Florence Rose left the Foundation at that time and was then associated with Investors Overseas Services until her death in 1969.

"The collection came to UCLA indirectly (via Smith College [although Florence Rose's personal papers are still at Smith College]) from Ernest Chamberlain, close friend and confident of Miss Rose. The files have been alphabetically listed and their arrangement retained as originally filed. Consequently, a great deal of duplication exists throughout and the interrelationships of materials are often cloudy at best" (Quoted from the Biographical narrative on the website, July 2007). Organization: Arranged in the following series: 1. Alphabetical files of the Meals for Millions (MFM) Foundation (boxes 1-21); 2. Miscellaneous unsorted correspondence and ephemera (boxes 22-26); 3. Miscellaneous printed material (boxes 27-30); 4. MFM notebook files of printed material (boxes 31-37); 5. MFM projects in foreign countries (boxes 38-47); 6. Miscellaneous files re soybeans, MFM staff and financial information, newspapers (box 48); 7. Two records by Peggy Lee produced for MFM, photographs, People to people film (oversize box).

Boxes 38 to 47 are MFM projects in foreign countries or regions, listed alphabetically: Africa, Alaska, Argentina, Bolivia, Brazil, Ceylon, Chile, Finland, Germany, Haiti, Honduras, Hong Kong, Hungary, Iceland, India (5), Indonesia, Israel, Japan, Korea, Lebanon, Mexico, Pakistan, Paraguay, Peru, Philippines, South Vietnam, Taiwan, Tanzania, Thailand, Uruguay, Vietnam. Box 48 is oversize materials.

493. Illinois Business Review. 1946? The miracle bean. Radio broadcast. WILL. Urbana-Champaign. 13 page transcript. Undated.

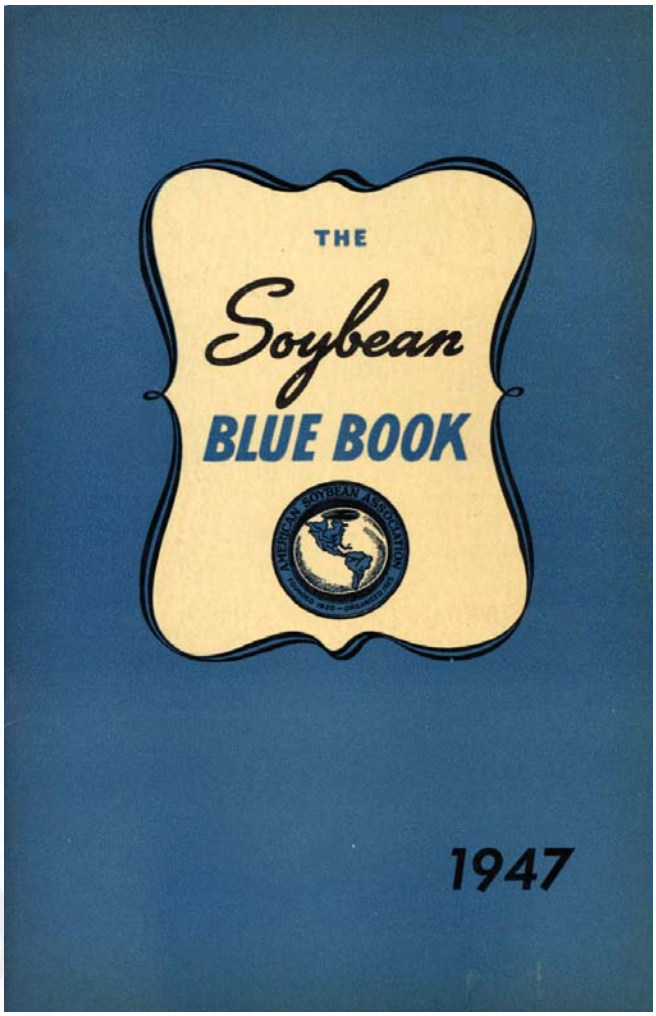
• ***Summary:*** This is "a studio presentation of the University of Illinois Radio Service, WILL, in Urbana-Champaign." "These programs are presented in cooperation with the Bureau of Business and Economic Research of the College of Commerce at the University of Illinois." "This afternoon [12:30] our narrator has a tale about 'The Miracle Bean.'

"Narrator: One might suppose that we're going to launch into the childhood fantasy of Jack and the Beanstalk. But our miracle bean is much more than a fable. It is a fabulous fact." "It goes by a name common to us all–the soybean... has experienced a Cinderella rise in favor since its first introduction into the United States. Within the past twenty years its importance has increased phenomenally."

Discusses: Fables of the origin of the soybean–a merchant caravan train besieged by bandits. "For centuries, Chinese emperors made a ritual of the first spring planting. The first reference to the soybean was made by the Emperor Shen Nung who rules nearly 3,000 years before Christ [sic].

"And shortly after the turn of the century a lanky young Cornell [Univ., Ithaca, New York] graduate reported for work at the [USDA] Bureau of Plant Industry in Washington [DC]. He was William Morse who was assigned to duty under Dr. C.V. Piper, talented plant scientist. Dr. Piper's pet project was the nurturing of a dozen types of soybean plants out at the Arlington Experimental Farm in Virginia. His enthusiasm soon caught fire in young Morse, and the two men looked forward together to the tremendous role they were certain their little bean would someday play in agricultural economy.

"As Dr. Piper would often turn and say to his young assistant: 'Young fellow, these beans are gold from the soil. Yes, sir, gold from the soil. One must truly stand in awe of their potential power in the life of the Western World.



"Bill Morse was to follow through and see the rich harvest of the seed Piper had planted. It took years of hard work against jeering opposition."

Then tells the story of the Morse's expedition to North China, Japan, Korea, and Manchuria, and his years of hard work after he returned to the USA. But: "The phenomenal rise of the miracle plant cannot be attributed to the efforts of a single man." There follows a brief history of the soybean industry in the United States, and the many food and industrial uses of the soybean

Note: The most recent date in the text is 1945.

494. *Soybean Blue Book.* 1947-1964. Serial/periodical. Hudson, Iowa: American Soybean Assoc. Annual. Titled Soybean Blue Book from 1947-1966; Soybean Digest Blue Book from 1967-1979; Soya Bluebook from 1980 to present.

• ***Summary:*** A directory and information book for the soybean production and processing industries–but with much greater emphasis on processing and utilization. One of the most valuable sources of worldwide information on soybeans. During the period from 1947 to the 1960s, the Blue Book was usually published in March or April of each year.

In the 1966 Blue Book (p. 28-29) are two full-page tables titled "World Soybean Production." The first gives acreage in 1,000 acres, yield in bushels per acre, and production in 1,000 bushels. The second gives hectarage, yield in kilograms per hectare, and production in 1,000 metric tons. Figures are given for: 1950-54 (average), 1955-59 (average), 1963, 1964, and 1965. Statistics are given for the following countries: North America: Canada, United States. South America: Argentina, Brazil, Colombia, Paraguay. Europe: Italy, Rumania, Yugoslavia, Other Europe (excluding USSR). USSR (in Europe and Asia). Africa: Nigeria, Rhodesia, Tanzania. Asia: Turkey, China (Mainland), Cambodia, China (Taiwan), Indonesia, Japan, Korea (South), Thailand. Estimated world total. Address: Hudson, Iowa.

U.S. style soybean gets world interest (News release). *USDA* (*magazine*) No. 1089-47. 1 p. May 19.
• ***Summary:*** "The soybean, a crop adopted from the Orient, has made such a good name for itself in the United States that it is attracting world wide attention.

"Twenty foreign countries were represented by the 50 scientists, business men, and government officials who journeyed during the past two years to Plant Industry Station, Beltsville, Maryland, to confer with W.J. Morse, head of soybean investigations for the U.S. Department of Agriculture. Some of these visitors remained for a year and traveled all over the country to study production, processing, and other phases of the soybean industry.

"During the past 3 years, Mr. Morse has filled around 160 requests from other parts of the world for soybean breeding strains. Some of the requests have come from the Orient where seed is needed to replace stocks seriously depleted and in some cases lost during the war.

"Mr. Morse is filling the requests with samples of improved, high-yielding strains developed by agricultural scientists in this country. He is also able to supply seed from samples he collected in other countries in pre-war years. For example, in filling a request from Korea recently, he included seed from the most promising strains of 2500 original samples he collected there in 1929 and 1930 and as kept viable by frequent growing."

496. *Soybean Digest.* 1947. To live: Japan must import more soybeans. May. p. 36.
• ***Summary:*** "The Manchurian soybean crop in large part holds the key to the economic health of the Japanese people. This situation is revealed in a special analysis prepared for the Foreign Economic Administration by F.H. Shelledy of the U.S. Tariff Commission... In the past the heavily peopled islands have grown only one-third of their needed soybeans. The rest have come from Manchuria, chief supplier to the world soybean trade, and to a smaller extent, from Korea. The soybean was one reason why the Japs over-ran Manchuria... Now, however, the Manchurians are growing a third fewer soybeans than they were before the war... Before the war Japanese farmers grew from 10 to 14 million bushels of soybeans annually. Most of their crop found its way to the island markets, being superior for food to the beans imported from Manchuria and Korea... But Japanese farmers used a large part of the crop as green manure, since they lacked animal manures. They also depended on the Manchurian soybeans as a source of fertilizer... Before the war the Japanese were importing 26 million bushels of soybeans annually...

"'Actually there appears to be little chance of any substantial increase in soybean production in Japan. If Japan is to have sufficient soybeans to supply its needs, it will have to import most of them,' Shelledy says."

497. Walsh, Robert M. 1947. Soybean production–Here and abroad: And possible competition from other oilseeds. *Soybean Digest.* May. p. 18-21.
• ***Summary:*** Editor's note: "It may be 10 or 15 years before world oilseed supplies become excessive, the author says."

Contents: Introduction: Soybean production concentrated in China, Manchuria, and USA, uses of soybeans oil. War-time role. Short during the war. Early postwar situation. Possible future developments. Long time [term] outlook.

"Before the war, Asia produced 400 million bushels of soybeans a year; the United States 56 million." China was the leading producer, with slightly over 200 million bushels/year–all of which was used domestically. Manchuria produced about 150 million bushels/year and was the world's chief exporter. "The United States, Korea, Japan, and the Netherlands Indies [today's Indonesia] were the only remaining producers of any consequence. Contrary to popular belief, output in southeastern Europe was extremely small."

In the USA, production grew from 5 million bushels in 1924 (mostly for seed use) to 23 million bushels in 1934, with an increasing percentage "going to oil mills for crushing. The severe drought of 1934 was a notable factor leading to the present day importance of soybeans as a cash crop in the United States. Soybeans proved to be more drought-resistant than corn. In 1935 farmers more than doubled their 1934 production." By 1939 production had reached 90 million bushels.

"Drought related shortages of lard in 1935-37 resulted in a rapid gain in the use of soybean oil in shortening." Between 1935 and 1939, soybean oil went from being used mostly in nonfood industrial products (paint and related products was the biggest use in 1935) to being used mostly in food products (such as shortening and margarine). Cottonseed oil was still the main liquid oil used in processed foods and linseed oil was still the main oil used in "drying-oil products."

"To sum up, soybean oil made notable gains in production and use during the late 1930's. This upward movement was sharply accelerated by the war which followed.

"War-time role: Throughout most of 1940 the United States had large supplies of domestic and imported oils, and prices were low. And our consumption of fats in 1941 was the largest in peace-time history. Real trouble began in 1942. Imports fell abruptly after the Japanese attack on Pearl Harbor. The United States had been dependent on Pacific sources for about half its imports of fats and oils. In the five years 1937-41, imports had averaged 2 billion pounds annually. From 1942 through 1946, yearly imports were less than half that amount. The major loss was in coconut oil," followed by palm oil from the Netherlands Indies, and tung oil from China. In addition, the U.S. had

© Copyright Soyinfo Center 2021

previously lost nearly 100 million pounds of olive oil from the Mediterranean region, and fairly large amounts of fish- and fish-liver oils from the European North Atlantic area.

During World War II, the U.S. government acted to increase domestic oil production and to ration supplies. Soybean production increased. "To induce larger output, AAA [Agricultural Adjustment Administration] restrictions on soybean acreage were partially relaxed in June 1941. The government offered to support prices of 1941-crop soybeans at approximately $1 per bushel. These actions, together with rising market prices, brought forth an increase of over 1 million acres in soybeans harvested for beans.

"An all-out war production program for oilseeds was launched in 1942. High production goals were set for soybeans, flaxseed, and peanuts... Large-scale increases in livestock production were fostered."

Production of soybean oil showed steady gains throughout the war, rising from some 500 million pounds in the 1940 season, to 1,200 million pounds in the 1942 season, and reaching a peak of 1,400 million pounds in 1945-46.

A graph shows "Soybeans harvested for beans: Production, crushings, and price, United States, 1924-46." The upper graph shows U.S. soybean production and crushings in millions of bushels. The lower graph shows the price received by farmers in dollars/bushel and the "comparable price (September 15)."

498. Hedge, Porter M. 1947. Washington Digest: Army buys more [soy] flour. *Soybean Digest.* June. p. 39.
• ***Summary:*** "The Army has ordered 75,000 long tons of soy flour for June, July, and August delivery for civilian feeding in Japan, the Ryukyu Islands [which stretch southward from Kyushu, Japan's southernmost main island], and Korea.

"Of the total 62,600 long tons are for Japan proper and the Ryukyu Islands; the remainder for Korea. The Korean shipment, and 12,500 long tons of the Japan quota are a substitute for pulses."

499. *Soybean Digest.* 1947. Worldwide trek to learn about soys. June. p. 23.
• ***Summary:*** During the past 2 years more than 50 scientists, plus businessmen and government officials, coming from 20 foreign countries, have travelled to the Plant Industry Station, Beltsville, Maryland, to confer with W.J. Morse, head of soybean investigations for the USDA. During the past 3 years Mr. Morse has filled about 160 requests from other parts of the world for soybean breeding strains. "For example, in filling a request from Korea recently, he included seed from the most promising strains of 2,500 original sample he collected there in 1929 and 1930 and has kept viable by frequent growing."

A small portrait photo (taken in about 1937) shows William Morse.

500. Food and Agricultural Organization of the United Nations. 1947. Soybeans: Area, yield, and production. *Yearbook of Food and Agricultural Statistics.* See p. 101-02.
• ***Summary:*** Under soybeans, gives region / continent and country, then statistics for soybean area, yield, and production for each soybean producing country. Statistics show that the following countries produced the following amounts of soybeans (measured in 1,000 metric tons) during the 1934-38 period (the earliest period given).

Europe: Austria 0.2. Bulgaria 11.6. Czechoslovakia 0.9. Hungary 0 (but 6.2 in 1940 and 1.3 in 1945). Italy less than 0.5 (but 0.01 in 1940 and 0.9 in 1945). Poland 0.5. Rumania [Romania] 11.7, Yugoslavia 1.5. Europe total: Former boundaries 550, present boundaries 260. USSR: Former boundaries 68.1, present boundaries 97.1.

America: Canada 5.5. United States 1,164.0. Total 1,170.0

Asia: China: China Proper 6,092.7, Formosa (Taiwan) 4.2, Kwantung 20.2, Manchuria 3,851.0. Indochina: Cambodia 0.4 (in 1937). Japan 325.1. Korea 518.6. Netherlands Indies [Indonesia]: Bali and Lombok 9.0, Java and Madura 236.4. Asia total: 10.60. Africa: Southern Rhodesia less than 0.5 (but 0.3 in 1942 and 0.2 in 1945).

World totals: Excluding USSR–Former boundaries 11.829. Excluding USSR–Present boundaries 11.800. Including USSR: 11.9000.

501. La Choy Food Products, Inc. 1947? Essential characteristics of genuine soy sauce, compared with synthetic or imitation substitutes (Leaflet). Archbold, Ohio. 3 panels each side. Each panel: 23 x 10 cm. Undated.
• ***Summary:*** Contents: Origin of Soy Sauce. Modern processes. Food values. Essential characteristics. Synthetic and imitation substitutes. La Choy Brown Sauce. Suggestions for using genuine soy sauce.

Note: This leaflet tries, quite deceptively, to present the viewpoint that traditional Chinese fermented soy sauce is inferior to La Choy's "genuine" HVP sauce.

"The Chinese method of preparing the sauce consisted of storing crushed soya beans in casks or wooden tanks, openly exposed to the elements for several months to ferment and mold, after which the liquid sauce was drained or pressed out and stored in vats or kegs.

"Modern processes: Although the Chinese are still using their crude methods, processors of genuine Soy Sauce in this country have greatly improved the process through development of enzymatic and hydrolytic methods of fermentation. The best grades of Soy Sauce are manufactured from whole or parts of soya beans. Parts of

© Copyright Soyinfo Center 2021

wheat or corn with water and salt, are often added to achieve a more desirable color and flavor. Such products are under laboratory control to achieve predetermined specifications and scientifically filtered and blended to evenly diffuse and suspend the solids and preclude precipitation of sediment to the bottom of the container... Genuine Soy Sauce is distinguished from other varieties of Chop Suey or table sauces by the presence of amino acids and purines..."

"Many imitations of Soy Sauce are on the market. Such synthetic sauces are ordinarily made from various grades of molasses, syrups, and caramel combined with water and salt to achieve and imitate the appearance and consistency of Soy Sauce." Address: Archbold, Ohio.

502. American Soybean Association. 1948. Soybean Blue Book. Hudson, Iowa: American Soybean Assoc. 112 p. Advertisers' index. 22 cm.

• ***Summary:*** See next page. Under the heading "Canadian production" are five tables (p. 44) with the following titles:

(1) "Production of soybean oil and oilcake in Canada." For each crop year (Aug. 1 to July 31) from 1945-46 to 1946-47 gives oil produced (pounds), and oilcake meal produced (pounds). Soybean oil production increased from 14,665,566 pounds in 1945-46 to 22,797,939 pounds in 1946-47. Source of data: Dominion Bureau of Statistics.

Note: This is the earliest document seen (Aug. 2019) that gives soybean crushing statistics for Canada.

(2) "Production of soybeans in Canada, 1942-1947." For each year gives acreage, yield per acre, and total production. Production grew from 725,300 bushels in 1942-44 to 806,000 bushels in 1947. (3) Production by Provinces. (A) Ontario. Soybean production in Ontario increased from 697,500 bushels in 1942-44 to 806,000 bushels in 1947.

(B) Manitoba. Soybean production in Manitoba decreased from 26,300 bushels in 1942-44 to 2,000 bushels in 1945. (No data for years since 1945).

(C) British Columbia. Soybean production in British Columbia was 4,500 bushels in 1943. (No data for years since 1943).

A table (p. 48) shows "Canadian consumption of soybean oil" (1938, 1944, 1945) for each of eight different uses. In 1938 some 2.4 million lb were used including 1.6 million lb in soaps and washing compounds. In 1944 some 11.2 million lb were used in slaughtering and meat packing.

Page 22: "World soybean production." Gives acreage, yield per acre, and production in bushels for 1935-39, 1945, 1946, and 1956 preliminary. The producers given are:

North America: Canada, United States.

Europe: Bulgaria, Hungary, Italy, Rumania, and USSR (Europe and Asia).

Asia: Turkey, China proper (22 provinces), Manchuria, Japan proper, Formosa, South Korea, Netherland Indies (Java and Madura [today's Indonesia]), Total World.

The three largest soybean producers (in million bushels) in 1946 were: United States 196.7. China proper 163.6. Manchuria 122.6. World: 512.8

Note: This is the earliest issue of the *Soybean Blue Book* that gives world soybean production statistics. Address: Hudson, Iowa.

503. Morse, W.J. 1948. Soybeans yesterday and today. *Foreign Agriculture* (*USDA Foreign Agricultural Service*) 12(5):91-95. May. Summarized in Soybean Digest, June 1948, p. 32.

• ***Summary:*** A good overview of soybeans and their history in China, Manchuria, Korea, and Japan (the principal regions of world soybean production), plus thoughts on their relatively recent introduction to the Western world.

"In China, the soybean is one of the leading and most ancient of crops, ranking fifth in extent of culture and occupying about 9% of the total cultivated area. Although grown everywhere in China, about 60% of the soybean acreage and production is confined largely to 3 northern Provinces, Shantung, Kiangsu, and Honan. China consumes practically all its production, estimates indicating 55% for food, 27% for oil extraction and other purposes, 10% for stock feed, and 8% of the total cultivated area of Manchuria and is a dominating factor in the life of that country. As a cash crop, it provides fully half the total volume of freight handled by Manchurian railroads. Estimates have indicated that from one-third to two-thirds of the production of soybeans was exported; 15 to 20% utilized for food, feed, and planting; and the remainder processed for oil and oil meal.

"Korea occupies third place among the soybean-producing countries of Asia. Acreage and production are confined largely to the central and northern areas, because southern Korea, growing chiefly cotton and rice, seems less well adapted to soybean-seed production. The entire seed production is used for food, stock feed, export, and planting, none being used for oil extraction.

"Japan, although a large producer of soybeans, has consumed all its own production and imported large quantities of seed from Manchuria and Korea. Since World War I, production of soybeans in Japan has decreased to some extent, more emphasis being placed on the greater production of rice. The proportion of soybeans used by Japan for various purposes was: Miso (soybean-rice fermented paste), 22%; soy sauce, 22%; oil and oil cake, 21.5%; bean curd, 15.5%; confections, 7.2%; forage, 6.2%; green manure, 2.5%; seed, 1.8%; green vegetable beans, 0.8%; and miscellaneous 0.5%.

"In the Soviet Far East the soybean is said to be one of the chief industrial crops and in some districts to constitute 20% of the cultivated area. Acreage and production have increased markedly since 1926, especially in the Khabarovsk territory.

"Previous to 1935 soybean oil in the United States was

*Preliminary. †Average of less than 5 years. ‡Acreage harvested for beans. §One year only. ¶Partly estimated. f/ Beginning with 1945 figures represent South Korea only. g/ Java and Madura. h/ Includes estimates for the above countries for which data are not available and for minor producing countries. Source of data: Office of Foreign Agricultural Relations, U. S. Dept. of Agriculture. Table published in **Foreign Crops and Markets**, Vol. 55, No. 25, p. 424. Prepared or estimated on the basis of official statistics of foreign governments, reports of U. S. foreign service offices, results of office research, or other information. Prewar estimates for countries having changed boundaries have been adjusted to conform to present boundaries, except as noted.

utilized chiefly in soap, paint, and varnish. Since that time, however, 70 to 85% of the soybean-oil supply has been used in the food industries... The soybean has become one of the most valuable, if not the most valuable, of China's gifts to

© Copyright Soyinfo Center 2021

the Western World."

Photos show: (1) Manchurian soybean in bags being loaded on a freighter at the Dairen wharves for shipment to European oil mills. (2) Two horses pulling a plow, and a 2nd man planting soybeans on ridged rows in Manchuria. (3) Soybean plants growing along the edges of rice paddies, as is common in oriental countries; the green beans will be used for home consumption. (4) Two Korean men threshing soybean plants in a courtyard with bamboo flails. "In Korea, as well as in many other oriental countries, bamboo flails are used in threshing soybeans." (5) A man with a sickle in a field of dried soybean plants. "Soybeans are harvested by hand in all the soybean-producing countries of the Orient." (6) A combine harvesting soybeans in the USA. It has "been one of the important factors in the economic production of soybeans in the United States." (7) "General view of a Chinese oil-mill yard in Manchuria, showing mill, storage of soybeans in osier bins, and steel tanks." Address: Principal Agronomist, USDA Div. of Forage Crops and Diseases, BPI [Bureau of Plant Industry], SAE [Soils and Agricultural Engineering], ARA, Beltsville, Maryland.

504. *Soybean Digest.* 1948. MPF [Multi-Purpose Food] use spreads. May. p. 19.
• ***Summary:*** "Over 10 million meals of Multi-Purpose Food have been shipped to the hungry in this country and abroad, reports Meals for Millions Foundation, Inc., 648 S. Broadway, Los Angeles 14, California, which is in charge of distribution."

"Distribution is worldwide, and has included, according to the Foundation, 'The Arctic to the Congo, from the bombed out East End of London to fareastern Korea, from the Navajo hogans of New Mexico and Arizona to the Villages of India.

"'A boxcar of a half-million meals of MPF rode the Friendship Train to Italy and France; 200,000 meals sailed on the California 'mercy ship,' the Golden Bear, to the Mediterranean;...'"

505. *Soybean Digest.* 1948. On tour of Orient [Dr. A.K. Smith]. June. p. 13.
• ***Summary:*** "To add to this country's knowledge of processing and preparing soybeans for food, Dr. Allan K. Smith of the oil and protein division, Northern Regional Research Laboratory, Peoria, Illinois, has left the United States for a 3-month investigation that will have covered Japan, Korea, and China before he returns next August. This extension of the Northern Laboratory's soybean research program has been made possible through provisions of the Research and Marketing Act [of 1946]. The information obtained will be the basis for studies on making soy food products more acceptable as a high-protein source in the American diet." A portrait photo shows Dr. A.K. Smith.

506. Cohn, Henry I. 1948. The Rickard Koreans. *Soybean Digest.* Aug. p. 13, 28.
• ***Summary:*** In 1941 the Dominion Experiment Station at Harrow, Ontario, received from Asia about 1 pound of seed of each of many traditional soybean varieties for experimental purposes. The station did little or nothing with the sample of one of the varieties that had unusually large seeds, probably thinking that it would require an unusually long maturity period.

W.G. Baldwin of Harrow, Ontario, a Canadian farmer not connected with the Experiment Station, obtained a sample of this large-seeded soybean, planted the seed in 1942, and discovered that it was a variety that yielded well and matured one week ahead of the variety Richlands.

E.T. Rickard of Champaign, Illinois, who owned farms in both Ontario and Illinois, saw the soybean growing in Canada, and brought 1 bushel to Illinois in 1942 and 8 bushels in 1943. Rickard gave three pecks of the original bushel to H.I. Green, a close friend, on the condition that they would be planted nearby where Rickard could observe them. P.A. Stone of Pleasant Plains was given some seed which was planted in 1944. Mr. Rickard first planted these on his farm in Alexander, Illinois, in 1944.

The unfolding story of the Rickard Koreans is told. A portrait photo shows E.T. Rickard in 1942; he died in 1947. Address: Manager Valley Farms, Carrollton, Illinois.

507. Banks, George Heartsill. 1948. South goes east [to Korea]. *Soybean Digest.* Oct. p. 16-18.
• ***Summary:*** Mr. Banks, formerly associated with Ralston Purina Co., recently returned from a governmental mission of almost 2 years in Korea. In this paper, presented at the American Soybean Convention in Memphis, Tennessee, he

© Copyright Soyinfo Center 2021

tells of soybeans in Korea, where there is no national debt, no income tax, and where women do all the work. South Korea is about the size of Arkansas. 75% of the land is steep and mountainous, and thus entirely unsuited for crops. On the remaining small area of arable soil struggle about 20 million Koreans. The farms are small; in some provinces they average less than 2.5 acres. In South Korea every farmer grows some soybeans but one has "to look hard and long to find even a small field of soybeans. They are grown in gardens, on the dikes in the rice-paddies, and among the trees. The most widely grown varieties are large-seeded yellow beans with a short, stiff stalk. Almost all of the beans are consumed at home. Soybean processing [i.e., crushing] plants as we know them do not exist... The Koreans eat soybeans in many ways, including soysauce, soy sprouts, soy curd, and green soybeans. They press out some oil in the home or farm village and use the oil for cooking and the meal for feeding farm animals." Rice is the predominant crop. "Korea, along with its neighbors in the Orient, is definitely a 'have-not' nation." They waste nothing, recycle everything, and use human wastes (night soil) for fertilizer. Agriculture is run by hand-power.

A portrait photo shows George H. Banks.

508. Dimmock, F. 1948. Korean soybeans (Letter to the editor). *Soybean Digest.* Oct. p. 7.

• ***Summary:*** Concerns an article titled "The Rickard Koreans" in the August issue of this magazine (p. 13, 28). The writer is interested in the origin of the Early Korean variety insofar as the Dominion Experimental Station at Harrow, Ontario, is concerned. Dimmock writes: "I was in charge of corn and soybean breeding work at this station from 1924 to 1929. In 1924 I received envelope samples of seed of several lots of soybeans and one of them was labelled 'Early Korean,' China. I do not remember how these envelopes came into my possession, but I grew all the seed in short rows in 1924, sufficient to have enough for testing purposes in 1925."

"These tests were run for several years. I left Harrow to come to Ottawa in 1929 and they were still being conducted at that time. During this period, I made two selections which were licensed as varieties in Canada, one from the A.K. variety, which was named A.K. (Harrow) and the other from Mandarin, which was named Mandarin (Ottawa). Both of these varieties are still being grown here.

"Early Korean was among the highest yielders in our tests. It was strong in the straw, but was rather short for a fairly late variety. It was not quite as late as A.K. (Harrow), but neither was it as tall and it did not yield quite as well. I, therefore, selected A.K. (Harrow) as the better variety for southwestern Ontario and Mandarin (Ottawa) as an early variety for central and eastern Ontario, where the season is shorter.

"I had several times thought of releasing 'early Korean' as a variety, but there was practically no interest in Canada in growing soybeans at that time and even until the beginning of the war in 1939 the total acreage did not average more than 9,000 to 10,000 acres annually. During the war period and since its close the acreage of soybeans has shown a steady increase until this year 1948, it is estimated to be about 100,000 acres.

"As your article was not clear on the origin of the Early Korean variety, I thought that you might like to know something of its early history at Harrow, Ontario." Address: Central Experimental Farm, Dep. of Agriculture, Ottawa [ONT, Canada].

509. Kurakake, T. 1948. Japan Association [Japan Soybean Association] (Letter to the editor). *Soybean Digest.* Dec. p. 10.

• ***Summary:*** "The Japan Soybean Association was founded on March 4, 1946 for the purpose of increasing production of soybeans, improving varieties and increasing the rational utilization of soybeans.

"As is well known, soybeans are an Asiatic crop which have been utilized as food for centuries. Before the war, Japan relied on importation from Manchuria and Korea for a major part of its supplies, but since the termination of hostilities, these sources have been cut off. Consequently, Japan has to rely on its own production and also on importation from other sources. This other source is the United States, whose soybean history is relatively new but which has expanded so rapidly that it has become the largest producer in the world. Since the end of the war, Japan has imported 42,569 tons as of October 10, 1948, by which she has been able to fill the minimum requirement.

"The Japan Soybean Association is planning to have a Soybean Exhibition on January 20, 1949 at one of the leading department stores in Tokyo and we would like to have if possible, some exhibits or literature from your Association. Expansion of soybeans in the industrial field in the United States is tremendous and we would like to know as much as possible about the production and use of soybeans in the United States.

"We shall appreciate it if you can help us with this exhibition and also keep in close touch with you." Address: Secretary, The Japan Soybean Assoc., Chuo-ku, Tokyo.

510. Food and Agricultural Organization of the United Nations. 1948. Soybeans: Area, yield, and production. *Yearbook of Food and Agricultural Statistics–Production.* See p. 101-02.

• ***Summary:*** Under soybeans, gives region / continent and country, then statistics for soybean area, yield, and production for each soybean producing country. Statistics show that the following countries produced the following amounts of soybeans (measured in 1,000 metric tons) during the 1934-38 period.

© Copyright Soyinfo Center 2021

Europe: Austria 0.2. Bulgaria 11.6. Czechoslovakia 0.9. Hungary 0 (but 1.3 in 1945). Italy less than 50 metric tons (but 0.9 in 1945). Poland 0.5. Rumania [Romania] 11.7, Yugoslavia 1.5. Europe total: 27.0.

USSR: (97.1).

North America: Canada 5.5. United States 1,164.0. Total 1,170.0

Asia: China: China Proper 6,092.7, 3,851.0, Taiwan (Formosa) 4.2. Indonesia: Bali and Lombok 9.0, Java and Madura 236.4. Japan 325.1. Korea 518.6. South Korea 0 (but 122.2 in 1945 and 130.6 in 1946). Philippines 0 (but 0.2 in 1946). Siam [later Thailand] 3.6. Turkey (but 0.4 in 1945). Asia total: 11,070.0.

Africa: Nyasaland 0 (but 0.4 in 1946). Ruanda-Urundi 0 (but 0.9 in 1947). Southern Rhodesia less than 50 metric tons (but 0.2 in 1945). Uganda 0 (but 2.6 in 1946). Union of South Africa 0 (but 1.5 in 1945).

World totals (Excluding USSR): 12,300.0.

Note: This is the earliest document seen (Nov. 2007) that gives soybean production or area statistics for Turkey or for the Middle East. This document contains the earliest date seen for soybean production or area statistics for Turkey or for the Middle East (1945).

511. Japan Year Book 1946-48. 1948. Tokyo: The Foreign Affairs Association of Japan. 614 + 314 p. See p. 291, 367, 376. 22 cm.

• ***Summary:*** See next page. The Preface indicates that this book was published in about Dec. 1948. The editor's name is not given. World War II ended on 2 Sept. 1945.

Page 291. A full-page table shows "Annual yields of cereals and vegetables" (area in *chobu*, yield in *kan*, production in *koku*). For soy beans (dried):

2.299 million koku in 1943
2.072 million koku in 1944
1.321 million koku in 1945
1.565 million koku in 1946.

In 1946 production of azuki beans was 16.7% that of soy beans.

Page 367. "Soy-bean Cake: This is another item of fertilizer which was imported into this country before the war, principally from Manchuria. Of the demand for some 1,000,000 tons, 60 percent was imported in the form of soy-bean cake and 40 percent in the form of soy-bean."

Page 376. "Flavors: Oriental flavors are produced in considerable quantities as indispensable for Japanese cooking, of which soy, or Japanese sauce and miso, or soybean paste are important items.

"The domestic production of soybeans being insufficient, Japan imported before the war or in 1941-45 twice as much soybeans as domestic production from Manchuria and Korea to meet the home consumption of soy and miso."

Three tables (p. 376) show (1) Soybean imports [to Japan] during 1940-1944. These imports are from Manchuria, Korea, Central China, and total. (2) Production of soybeans in Japan 1943-1946, area planted, yield and production of dried soybeans. (3) Soybean allocations by kind [end use] in 1941 and 1944. The end uses are miso, soy sauce, staple food [beans eaten as beans], other food, chemical [industrial], fodder, and others.

512. Smith, A.K. 1948. Microorganisms collected in China, Japan, and Korea. 7 p. Unpublished typescript.

• ***Summary:*** Dr. Smith collected 100 samples in Shanghai (58 samples), Nanking (13), Hangchow, Canton, Tokyo, Noda (near Tokyo, Japan), Korea (7).

513. Smith, Allan K. 1949. Oriental use of soybeans as food: With special attention to farming practices. Notes on Oriental farming practices. I. China. *Soybean Digest.* Feb. p. 15-17.

• ***Summary:*** Contents: Introduction. Farming conditions. Oilseed production. "On a visit to China, Japan, and Korea during the summer of 1948, the author as a representative of the Northern Regional Research Laboratory, was given the opportunity of studying the methods of Oriental people in using soybeans as food and to collect microorganisms used in fermenting soybeans and other fermentable products."

"In Japan, the natural resources and the food processing sections of the Supreme Command of the Allied Powers furnished guidance and transportation in seeking information."

In China, nearly 90% of the people are farmers. "Agriculture is their most important industry." In north China, the crops (including soybeans) are similar to those in the USA. In "south China there is less diversification and the principal crop is rice."

"The high density of population in China dictates a vegetarian diet for most of the people, especially her peasants. I was informed by the best authorities that customarily the peasants of China eat meat only three times a year, on their three great holidays, the Dragon Festival, the Autumn Festival, and their New Year's celebration." The Chinese diet is very well balanced.

Note: This article is the cover story. And this is the first issue of Soybean Digest with a photograph on the cover; it shows a girl selling soy sprouts in Canton, China. Address: Northern Regional Research Lab., Peoria, Illinois.

514. Culbertson, Raymond E.; Smith, Allan K. 1949. Oriental uses of soybeans as food: With attention to fermented products. Notes on Oriental farming practices. V. Korea. *Soybean Digest.* June. p. 15-18, 20, 22.

• ***Summary:*** Contents: Introduction. Breeding work. Topography. Land use. Soybean varieties. Climatic relations. Soils of Korea. Cultural practices. Marketing. Soybeans as foodstuff. Soya sauce. Green pods on the bush. Bean sprouts. Parched beans. Curd (soybean curd [tofu]) and milk.

Kochuchang. Other uses.

"Soybeans have been grown in Korea for many centuries. One can speak in terms of centuries; Korea's calendar year is now 4281 in contrast to our 1949.

"Reportedly, soybeans were brought to Korea from China 2,000 to 3,000 years ago in the customary exchange of gifts between the ruling houses. Furthermore, according to the records, the Pakja Dynasty with its capital at Puyo, Chung Chong Nam-do, compelled the people to harvest and store soybeans for both food and seed.

"Since the high density of population in Korea limits livestock production, it is only natural that soybeans should be grown and utilized in supplying much of the protein needed in the diet of the people.

"At present Korea is divided into two zones separated by the 38ºN Parallel. In the north, with the area occupied by the Russian forces, no recent information on soybeans is available. South Korea is now a republic with the United States occupation forces present for security purposes and the Economic Commodity Administration to assist in rehabilitating the country.

"Korea has the village system of farming. Farmers live in small villages, with their lands within walking distance of their homes. The village system, together with isolation caused by mountains and streams makes transportation and exchange of products difficult, and has contributed to the selection and development of many varieties of soybeans of considerable merit. These varieties for the most part are relatively pure and of many colors and sizes: green, red, brown, black, purple, yellow, cream, and gray, all of which may be found at the same time in one market place in Seoul, the principal market in Korea.

"Production figures for South Korea show that, over the years, 8 to 10 percent of the land is planted in soybeans and

© Copyright Soyinfo Center 2021

the yields range from 8 to 14 bushels per acre. These yields appear low but are explained by Korean farming practices. It is the custom to seed small grain in rows in the fall of the year with sufficient space between the rows to permit interplanting with soybeans in May or early June before the grain is harvested.

"Prior to World War II, North Korea planted (1940-44 averages) slightly more than 905,000 acres of soybeans annually which yielded some 7,700,000 bushels. During the same 5-year period South Korea was planting 626,000 acres which yielded a little over 5 million bushels. The latest available figures (1947) for South Korea show a production of 4,480,000 bushels from 662,000 acres.

"Breeding Work: During the period of Japanese control of Korea, much of the breeding work on soybeans was in North Korea. The Japanese built about 15 Agricultural experiment stations throughout the country... As far as can be ascertained, no plant breeding work with soybeans is now being done in South Korea. However, variety testing and selection of good strains is being carried out at several experiment stations at both the provincial and national level.

"The leading varieties in South Korea have resulted from rigorous selection, mostly by farmers, over a long period" [see Table 1].

Concerning food uses of soybeans in Korea: "Soya sauce:... is found on the tables of all Koreans, where it is used quite generally on rice, sukiaki [sukiyaki], fish, chicken, and other meats and for the flavor it adds to the soup. It is a very popular appetizer. Most families make soya sauce and are allocated 2.7 kilograms of salt per person annually for this purpose. Yearly consumption is about 6 liters per person. In addition to homemade soya sauce, a supply is also available from many small factories making it. There are more than 10 plants in Seoul, the capital city. Making soya sauce in the home starts about January or February. It is the custom at this time to take a batch of beans and boil them in water until soft, following which they are mashed and formed into a ball, placed in a rice-straw bag and hung up in a heated room to ferment for a 3-month period. Following fermentation, the ball is cut open, broken into pieces and allowed to dry in the sun. When dry, water and salt are added, inoculant (yeast) introduced and the mixture allowed to stand in an earthen crock 2 to 3 months. The liquid is then poured off, boiled about 2 hours and filtered, following which it is considered to be sauce. The sediment remaining in the crock is known as paste. This is used primarily for making soup. In both home and commercial production of soya sauce parched and browned wheat or barley is frequently used in conjunction with the soybeans.

"Green pods on the bush: It is common practice to market early beans on the bush. The plants are pulled, dirt shaken from the roots and the leaves removed. The braches are tied with a string (usually hemp) and the plants are taken to market where they are sold by the bunch. The housewife prepares them for eating by picking off the pods and boiling, and the plant stem is used for fuel.

"Bean sprouts: Bean sprouts are much in demand especially during the winter months. They are used in combination with meat, Chinese cabbage, spinach, turnips, soups and various other cooked dishes. Sprouts are nourishing and supply much-needed vitamins to the Korean's usual polished rice diet. In some instances the beans are left on the sprouts, in others they are removed. The beans are sprouted in central places and usually peddled in two-wheeled, man-drawn carts. Sprouting requires about a week. They are sold on a weight basis.

"Parched beans: For parching, soybeans are simply placed in a pan over a fire and heated slowly until the skin breaks and part of the beans are slightly blackened. They are eaten like peanuts or mixed with other foods. Most varieties are quite palatable and well liked for parching. Note: The Korean name for parched soybeans is *kong*.

"Curd and milk: Soybean milk is consumed in Korea but not so extensively as in China. The milk is made in a manner similar to the Chinese method which was described in an earlier report.

"A large percentage of the soybeans' growth in Korea are consumed as soybean curd. In addition to the huge quantities made at home, curd is also made in literally hundreds of small factories. In Seoul alone there are more than a hundred. Small units, which on the average employ five men, can work up about 10 bushels of soybeans daily.

"Kochuchang: Practically every Korean family makes kochuchang. Boiled [soy] beans are mashed and hung up in sacks to cure well for 2 or 3 months. This material [meju] is then broken up, dried in the sun, and ground to a fine powder, usually in an old type hand-operated stone mill. Red peppers are ground fine, the lot is mixed and salt and water added, then it is allowed to stand in crocks 2 to 3 months. To prepare kochuchang for the table, it is taken from the crock and boiled with the addition of ground meat and sugar, if the latter is available."

Note: This is the earliest (and only) English-language document seen (April 2021) that uses the word "kochuchang" to refer to Korean-style red pepper and soybean paste (miso).

Photos show: (1) A man standing in a field of sorghum interplanted with soybeans in Korea. (2) A Korean woman examining different varieties of soybeans in woven baskets in the market place in Seoul, Korea (Aug. 1948). (3) A boy carrying a wooden bucket on each end of a wooden shoulder pole. The buckets are used for transporting night soil to the land in Korea. (4) Soybean curd (cut into cakes) and vegetables in the market place at Seoul, Korea (Aug. 1948).

An outline map of South Korea and its provinces shows the principal varieties of soybeans grown, the section where each variety is grown, acreage and production. A chung or chungbo is 2.45 acres, and a suk is 5 bushels. The

© Copyright Soyinfo Center 2021

yields appear very low but this may be due to the custom of interplanting soybeans with other crops.

Tables show: (1) The 15 chief varieties of soybeans grown in Korea. For each is given: The name of each variety (romanized, with a translation of each word). Days to maturity. Flower color. Stem length. Color of seed coat and hilum. Weight of 1,000 seeds. Yield per acre (37.7 to 14.0 bu/acre). Rank in test. Year approved (1921-1939). For example: Chang Tan Paik. "Chang Tan" is the name of a town in Korea; Paik means "white."

(2) Analytical data for improved varieties of soybeans on the basis of the size of the bean. The 3 sizes are large, medium, and small. Examples of locations are: Southeast Korea. Northeast Korea. Central Korea. Southeast Korea. Address: Northern Regional Research Lab., Peoria, Illinois.

515. Smith, Allan K. 1949. Oriental methods of using soybeans as food: With special attention to fermented products. Notes on Oriental farming practices. *USDA Bureau of Agricultural and Industrial Chemistry.* AIC-234. June. 40 p.

• ***Summary:*** Page 1 states: "The text of this bulletin, with slight revisions, is as it appeared serially in *The Soybean Digest,* issues of February through June, 1949, although many additional photos appear herein. It is processed with the publisher's permission." Note: An enlarged 65 page edition was issued in July 1961.

Photos show: (1) Nine people in a field cultivating soybean with hoes near Nanking, China. All of these workers but one are women. July 1948. (2) "The three-man shovel, Korean version of the turning plow. The motive power is supplied by the mean holding the ropes." (3) A man and donkey threshing wheat with a stone roller. (4) A water buffalo and man pumping water from the rice fields. All parts of the pump and elevator are made of wood. Near Nanking, China, July 1948. (5) Windmill used for pumping water. The sails or vanes are mats woven from grass. (6) Children with baskets of soybean sprouts and inflated Chinese national currency in the market place at Canton, China. Aug. 1948. (7) Soybean milk for sale on the streets of Canton, China. Aug. 1948. It is in bottles, carried using a shoulder pole. (8) A wedge press for oilseed operations at Canton, China. Preformed disks of the flaked or ground meal are inserted in the slot and turned clockwise in the hollow log; pressure is applied with wooden wedges. July 1948. 516. Nagata, Tadao. 1949. Daizu no natsuaki daizu sei ni kansuru kenkyû. I. Natsuaki daizu sei ni yoru daizu hinshu no bunrui [Studies on the growth habit of so-called summer versus autumn soybeans. I. Classification of varieties with respect to said habit]. *Nippon Sakumotsu Gakkai Kiji* (*Proceedings of the Crop Science Society of Japan*) 18(2/4):131-34. Oct. 30. [Jap; eng]

• ***Summary:*** "Abstract: Many varieties, 136 in total, conected [sic, collected] from Japan, Korea, China and U.S.A. were used. Seeds were sown at 6 succeeding periods from April to September. Dates of germination, beginning and end of flowering, and maturity were recorded. With these data, the following 3 duration were calculated; A. Flowering days from germination to beginning of flowering,

© Copyright Soyinfo Center 2021

| Types | Classes | (I) | (II) | (III) |
|---|---|---|---|---|
| Summer | S I | < 5.9 | 0.2—0.5 | 2.0—4.0 |
| | SIp | 〃 | 0.5—1.2 | 3.5—4.8 |
| | SII | 6.0— 7.9 | 0.2—0.6 | 2.0—4.0 |
| Inter-mediate | MIII | 8.0— 8.9 | 〃 | 〃 |
| | MIV | 9.0—10.9 | 〃 | 〃 |
| Autumn | A V | 11.0—12.9 | 〃 | 〃 |
| | AVI | 13.0—14.9 | 〃 | 〃 |
| | AVII | >15.0 | 〃 | 〃 |

B. Flowering duration–from beginning to end of flowering, C. Growing duration–from germination to maturity.

"By using the above 3 items (A, B, C), the classification of summer vs. autumn types of varieties were tried in respect to the following 3 ecological characteristics; (I) The rate of shortening of the flowering days due to the delay of seeding periods calculated by assuming the mode of change of the flowering days according to the seeding periods to be 1 linear. (II) Relative length of flowering duration to flowering days, B/A. (III) Relative length of growing days to flowering days, C/A. As shown by the following table we can distinguish firstly 3 types of Summer, Intermediate and Autumn, secondarily 3 classes in Summer type (SI, SIp, SII), 2 classes in Intermediate type (MIII, MIV), and 3 classes in Autumn type (AV, AVI, AVII)."

A large table shows these relationships. Address: Laboratory of Crop Science, Faculty of Agriculture, Kyoto Univ., Japan.

517. Kurakake, T. 1949. Soybeans in Japan. *Soybean Digest.* Oct. p. 18, 20.

• ***Summary:*** "Though soybeans have been grown for centuries in Japan the tendency has been to neglect them due to a lack of ingenuity among farmers in improving varieties, to the fact that government laboratories did not take measures to improve them, and to the fact that growth was rather satisfactory even when they were allowed to grow naturally.

"It is very difficult to find out the number of varieties in Japan, but the Japanese Soybean Association estimates the number at more than 1,000. The reason for this large number is assumed to be that they appeared naturally during the long span of time over which they were grown in the various localities.

"Experiment Stations: In Japan, each prefecture has its own agricultural experiment station, and each experiment station selects varieties that are most suitable for the prefecture and encourages the farmers to grow them. There are about 170 of these recommended varieties. Of the above, about 10 are the result of cross breeding carried out at the experiment stations; about 50 to 60 are by selection and the remainder are produced naturally.

"The characteristics of good varieties in Japan have been: resistance to disease, high yield and a good taste when roasted. However, recently soybeans have been looked on as a source of oil because of the shortage of fats and oils, and soybeans with high oil content are in great demand.

"Japanese soybeans are classed as summer, autumn and intermediate types according to the planting and maturing periods. Summer type varieties are planted in April and May. The flowers bloom with the high temperatures of the early summer, and the beans can be harvested in late July or early August. The period from planting to harvest is from 90 to 100 days.

"It seems that the summer varieties are generally heat-sensitive and have relatively low photo-sensitivity. They are widely grown in the plains of western and eastern Japan and in Hokkaido. Most of the varieties grown in Japan are of this type. Usually they are small-seeded.

"The autumn type soybean in contrast to the summer type is highly photo-sensitive and has almost no heat sensitivity. It is planted from the middle to the latter part of June. Flower bloom is accelerated as day length is shortened after mid-summer. The beans are harvested in November. The time from planting to harvest is more than 130 days. Varieties of this type are usually grown in the western part of Japan where it is relatively warm. But the acreage is comparatively small.

"Varieties of the intermediate type are in between the summer and autumn types. Planting is from May to June. They have photo- and heat-sensitivity to about the same extent, and require from 100 to 130 days to mature. This type is grown widely in northern Japan with the exception of the mountainous districts of eastern Japan and Hokkaido, and the number of varieties is next to the summer type.

"The total soybean acreage and production in Japan has been declining since about 1910, which was the peak. The acreage during the latter part of the 1880's was more

© Copyright Soyinfo Center 2021

than 400,000 chobu [1 chobu = 1 chô = 2.45 acres] with a production of over 300,000 tons. Acreage and production gradually increased to about 460,000 chobu and 500,000 tons. However, with this as the peak, acreage and production have gradually decreased so that since the Pacific War acreage has been 220,000 chobu and production 200,000 tons. With the decrease in acreage and production there was also a decrease in yield per area planted.

"During the same period, from the 1880's to just before the Pacific War, the yield of rice, wheat and barley increased from 180 to 200 percent, but that of soybeans fell from 20 to 30 percent from the peak period. The reduction in yield shows to what extent the farmers neglected improvement of varieties, while the government was inactive and without progressive policies.

"Were unprofitable: Another reason for the decline is that soybeans were an unprofitable crop for farmers. Japan began to import large quantities of cheap Manchurian and Korean soybeans during the 1890's. As a result the farmers in Japan were compelled to sell their soybeans at a cheap price. At about the same time the capitalistic economy began to develop in Japan with the gradual evolution of exchange economics. Japanese farmers quit planting unprofitable crops and changed over to more profitable ones. Soybeans were replaced with mulberries for silk raising, orchards, vegetables and sweet potatoes.

"Soybeans were always sold at about 60 percent of the price of rice and at about the same price as fertilizer. Actually much of the soybean crop in Japan was formerly used as fertilizer.

"However, in spite of the fact that soybeans were an unprofitable crop, they did not disappear entirely from the farms in Japan. Farmers continued to plant them not as a commercial crop but for their own consumption. Only the excess above their own needs was sold on the market.

"The districts where soybeans are grown most widely are areas where agrarian economics is most backward–in the mountainous areas of Tohoku, Hokuriku or Kanto and in the Kyushu area. In the advanced agricultural areas they are limited to the banks of rice paddies, roadsides or plots around the houses. In other words, the existence of soybeans indicates feudalism in Japan. Under such conditions there is no opportunity to improve varieties to fit specific farms. Here lies the answer to the question of why the soybean declined in importance year after year but still continued to exist.

"The rise and fall of soybeans in Japan has a very close relation with the importation of foreign soybeans, which has increased six-fold since 1897.

"The principal exporters of soybeans to Japan were Manchuria and Korea. Quantities imported by Japan gradually increased from about 200,000 tons during the 1910's to 800,000 tons following 1928. As a result of this large quantity of cheap soybeans, domestic soybeans were almost neglected.

"However, defeat in war caused a great change in the soybean picture in Japan. Japan lost Manchuria and Korea and the importation of soybeans from these territories was completely cut off. As a result, Japan faced a grave fats and oils and protein shortage.

"Total imports of soybeans since the war have been less than 10 percent what they were before the war.

"Formerly, the greater part of the soybean meal obtained after the extraction of the oil was used as fertilizer or livestock feeds; but soy bean oil meal and soy flour imported from the United States are now used for making miso and shoyu. This indicates the critical shortage of soybeans."

Note: This is one of the most interesting articles we have ever seen on the history of soybeans in Japan from the late 1800s until 1949. Address: Secretary, The Japanese Soybean Assoc., Tokyo, Japan.

518. *Vegetarian News Digest* (*Los Angeles*). 1949. Health in the news: The soy bean–wonder food of many uses. 1(9):21. Sept/Oct.

• ***Summary:*** "Allan K. Smith of the Northern Regional Research Laboratory, Peoria, Illinois, recently returned to the United States from the Orient where he learned of countless uses for soy beans. In China, Japan and Korea he found soy beans being fermented, ground, and processed in various ways. In its motherland, Smith discovered, the soybean is a source of flour and cake, oil, bean sprouts, vegetable milk, various sauces and pastes, curd, cheese, and several other foods." Describes how soy milk is made in China. One restaurant that Smith visited prepared more than 25 different dishes from soybeans.

519. Haswell, James M. 1949. Top farm researcher retires from U.S. post: turned soybeans to gold. *Detroit Free Press* (*Detroit, Michigan*). Nov. 30. p. 13. Wednesday.

• ***Summary:*** "William J. Morse, who made the soybean a source of wealth to America, will retire from the Department of Agriculture Wednesday." For 42 years he did plant research for USDA. "Few men living have contributed more to American farming.

Two decades ago, Morse explored the farming areas of China, Korea, and Japan for almost three years. He returned to the United States with hundreds of new soybean varieties. From among these varieties, Morse supplied researchers and farmers with soybeans adapted to various American localities, soybeans with greater oil content and soybeans that were better to eat.

The soybean was little more than an Oriental curiosity before Morse's trip.

Morse, who now lives in Washington, D.C., has been honored many times for his successful promotion of and research on soybeans. He now plans to use his retirement time to finish a book he is preparing on soybean foods. Address: Of our Washington Bureau.

© Copyright Soyinfo Center 2021

520. *Packer* (*The*). 1949. William J. Morse, soybean pioneer, retires from USDA. Dec. 17.

• ***Summary:*** Beltsville, Maryland, Dec. 16–William J. Morse, pioneer in soybean development and a world authority on the crop that now produces 200,000,000 bushels a year, has retired as an active USDA official, but plans to retain his lifelong interest in the subject by finishing another book, this one on soybean foods."

Note: Perhaps this is the book mentioned many times in the Log of the Dorsett-Morse expedition to East Asia, 1929-31.

After 22 years' research with soybeans, Mr. Morse visited China, Japan, Korea and Manchuria about 20 years ago in search of various types of soybeans and other crop plants. He returned after two years with hundreds of varieties, many of which contributed to the improvement of American strains. His research led the way to making it the important food, feed, and industrial crop of today.

"Mr. Morse has received numerous awards for his research, and was given an honorary life membership in the American Soybean Association. He is co-author of the book, 'The Soybean,' written in 1923, and still the standard work on the subject."

521. *Soybean Digest.* 1949. W.J. Morse retires after 42 years. Dec. p. 30.

• ***Summary:*** "William J. Morse, known throughout the world, but particularly in the United States and the Far East, for his work in soybean development here, retired Nov. 30 after 42 years in the U.S. Department of Agriculture. A native of Lowville, New York, and a graduate of Cornell University, he went to the Department in 1907 just at the time the Bureau of Plant Industry was making plans to carry on research in the growing of this crop.

"The plant, introduced from time to time from China, Manchuria, Korea, Japan, and other parts of Asia, had been known here for a century, but had increased to only a few thousand bushels a year. Now, after the long period of search and research, it is highly productive, with varieties suitable for various areas, is grown to the extent of 200 million bushels a year, and is listed on the grain exchanges. Most of the great increase has come in the past 20 years, much since the beginning of the production stimulus of World War II.

"Twenty years ago, after having put in 22 years of research in the Department, Mr. Morse spent 2 years exploring for soybeans and other crop plants, and looking for lore and farming practices, in China, Japan, Korea, and Manchuria. He returned with hundreds of varieties, many of which contributed to the improvement of the strains already here.

"By his development work he supplied the country with varieties suitable for various localities, increased the oil content of some–a big factor in the industrial use of this crop, and made other varieties better for food use. He stimulated the development of the vegetable soybean in this country. The soybean had been little more than a curiosity until research in the Department, largely by Mr. Morse, led the way to making it the important food, feed and industrial crop of today. In 1947 the Department gave Mr. Morse a Superior Service Award and the same year the American Soybean Association, of which he was three times president, gave him an honorary life membership. Mr. Morse has published more than 75 bulletins and articles on soybeans and is co-author of *The Soybean*, published in 1923 and still the standard work on the subject, often referred to as 'the soybean bible.' On his retirement he plans to finish a book on soybean foods.

"The records of the Department provide many statements of his superiors indicating good reasons for the success of his work: 'A most able man, highly efficient and productive–painstaking and industrious'... 'brought about the use of the soybean as human food in this country'... 'has marked ability in obtaining enthusiastic and harmonious cooperation.'

"Mr. Morse and his wife live at 6809 Fifth St., N.W., Takoma Park (Washington) D.C."

523. Lehman, Samuel G. 1950. Purple stain of soybean seeds. *North Carolina Agricultural Experiment Station, Bulletin* No. 369. 11 p. Feb. [5 ref]

• ***Summary:*** "Introduction: The purple stain disease was first

© Copyright Soyinfo Center 2021

reported in 1921 in Korea [by K. Suzuki] where it appeared as a purple discoloration of the seeds. A few years later (2) it was shown that this discoloration is the symptom of a disease caused by growth of a fungus in the seed coats.

"In the United States, the disease was first recognized in Indiana in 1924 (3), and North Carolina in 1927 (4). It has since been found in Illinois, Maryland, Delaware, Virginia, South Carolina and probably occurs to some extent in most other states where soybeans are grown. Other names which are sometimes used for the purple stain disease are 'purple blotch,' 'purple speck,' and 'purple seed stain.'"

"Summary: The purple stain disease of soybeans was first recognized in North Carolina in 1927. Since that time it has become much more prevalent and now occurs in harmful proportions in some parts of the state.

"It is caused by a fungus which survives in infected seeds and spreads from plant to plant by means of wind-blown spores. The disease affects seeds, pods, stems, and leaves but is most easily recognized on seeds where it produces a pink or purple stain of the seed coat.

"In all but a very small proportion of infected seeds the fungus is confined to the seed coat. It is doubtful that the disease reduces the value of soybean seed for milling purposes.

"Infected seeds germinate almost as well as normal seeds, but seedlings from infected seeds are likely to be stunted or killed after emergence from the soil. Diseased seedlings are the primary source of spores which infect leaves, stems, and pods later in the season.

"Soybean seed, whether visibly diseased or not, should be treated with a fungicidal seed protectant before planting. Arasan, or Spergon may be used for this purpose. Apply two ounces of Arasan or Spergon to each bushel of soybean seed. Arasan SL and Spergon SL may be applied as a slurry.

"Some varieties of soybeans are more susceptible to purple stain than others. Ogden usually has a much higher percentage of diseased seeds than Roanoke. Farmers who wish to grow the Ogden variety should plant seed that shows no purple stain." Address: Prof. of Plant Pathology, Raleigh, North Carolina.

524. Fletcher, Merna Irene. 1950. Changes in world soybean production in 1949. *Soybean Digest.* June. p. 20-21, 28.
• ***Summary:*** The USA is again the world's largest soybean producer, followed by China and Manchuria. All three countries reported smaller soybean crops in 1949 than in 1948. Production in Canada continues to increase, as it has for the past 6 years. Canada's average yield per acre was 25.1 bushels/acre or nearly 3 bu/acre higher than the U.S. average. Brazil is the only other country besides Canada in the Western Hemisphere with recorded soybean production for 1949. Brazil produced an estimated 1 million bushels in 1949, which is double the figure for 1947. Slightly more than half the 1948 crop was exported. European production continues to decline. The only country reporting during 1949 was Italy, which had only 52,000 bushels, compared with 107,000 in 1948. Production in the USSR is increasing. "The extensive research program begun several years ago is no doubt bearing fruit, particularly in the Soviet Far East where Balzac (*Economic Geography of the USSR*, American edition) reports a big development in the Amur-Ussuri River Valley.

"The major decline in world production occurred in Asia, more specifically in Manchuria and China... No figures have come out of North Korea since 1946. Previously it was the great producing area of the country. South Korean production continues to show marked increase. The 1949 crop of 6,654,000 bushels is 1.7 million bushels more than was produced in that area in 1948. The average production for Korea from 1935-39, when most of production was in the north, was 17,654,000 of which less than 2 million bushels were produced in South Korea."

In Africa, Tanganyika reported only 36,000 bushels, less than half the 1948 crop. The Union of South Africa reported 80,000 bushels, the largest soybean crop ever produced there.

525. Miso Manufacturing Experiment Administration Committee. 1950. Miso jôzô shiken hôkoku [Report of the experiments on miso manufacturing, May 1950]. *Shokuryo Kenkyujo Kenkyu Hokoku* (*Report of the Food Research Institute*) No. 4. p. [iii] + 1-84 + 1-90 + 1-32. Sept. English translation (32 p.) is bound at the end of Issue No. 4. [Jap; Eng]
• ***Summary:*** The first three parts of this article (177 p.) are in Japanese and the last part (32 p.) is a detailed English summary.

Contents (English summary): 1. The circumstances which led to make the miso manufacturing experiments: The general aspects of raw materials for miso, the circumstances which led to set about the experiment work.

2. Experiment methods and experimental results: The experiment methods, marking by means of functional testing (frequency curve, analysis of variance and minimum differences required for significance among average marks, discussion), chemical analysis (raw materials, chemical analysis of defatted soy-beans, non-defatted soy-beans, and corn-meal, denaturation of protein in defatted soy-beans, enzymic digestion of defatted soy-beans), finished goods (miso) (general analysis, correlation between the analytical results and the functional testing results, nitrogenous compounds, judgment for finished goods by dividing into 3 grades, analysis made by excluding the disparity among manufacturing plants, judgment for the results of finished goods, by manufacturing plants (minimum significant difference–2.39)).

3. Conclusions: Premises, 50% koji products, 100% koji products, 150% koji products.

4. Discussion. 5. Appendix–Experiments on a laboratory

© Copyright Soyinfo Center 2021

scale: Object of experiments and outline thereof, koji-making experiment, conclusions.

In the years before World War II, annual consumption of soybeans in Japan was not less than 1,000,000 tonnes (metric tons), of which 300,000 tonnes were grown in Japan and the remainder was imported from Manchuria and Korea. Out of this 1,000,000 tonnes, about 700,000 tons are estimated to have been consumed as foods or seasonings; approximately 250,000 tonnes were used as raw materials for miso, which is one of Japan's most important seasonings.

Concerning miso consumption in the years just before World War II, exact figures are not available, but it can be roughly estimated at about 150 million *kan* (1 kan = 8.27 pounds), or a little more than 2 *kan* (ca. 16.5 lb) per person per year.

In those days, miso was made to suit public tastes in the various regions of Japan, and there were various kinds of miso according to the region. Miso can be grouped into three basic types: soy-bean miso (*Mame miso*) salty miso, and sweetish miso. Describes briefly how each of the three types was made. One table (p. 2) shows the ingredients used to make each of these three types: (1) Soy-bean miso: Soy-beans 10 *koku* = 1,800 liters. Salt 110 *kan* = 909.7 lb = 413.5 kg. Ripened miso 1,000 *kan* = 8,270 lb = 3,759.1 kg.

(2) Salty miso: Soy-beans 14.0 *koku* = 2,250 liters. Milled rice or milled barley 7.0 *koku* = 1,260 liters (made into koji). Salt 185 *kan* = 1,530 lb = 695.4 kg. Ripened miso 1,650 *kan* = 8,270 lb = 3,759.1 kg.

(3) Sweetish miso: Soy-beans 12.8.0 *koku* = 2,304 liters. Milled rice or milled barley 15.7 *koku* = 2,826 liters (made into koji). Salt 94 *kan* = 777.4 lb = 353.4 kg. Ripened miso 1,700 *kan* = 14,059 lb = 6,390.5 kg.

As late as 1941, due to food shortages, miso was brought under Japanese government control; from that time until the end of the war, miso production gradually decreased. Starting in about 1944 only one type of miso was made for all the regions of Japan–a type of salty miso. 100 *kan* of miso was made using 34 *kan* of soy-beans, 16 *kan* of milled rice or barley, and 15 *kan* of salt. Efforts were made to shorten the fermentation time by using a quick ripening method [a heated or warm environment].

At the end of World War II, Japan was unable to import soy-beans from Manchuria [and, to a lesser extent, Korea]. This dire soybean shortage led to a sharp decrease in miso production; Japan started to use defatted soybean meal and defatted soy flour (imported from the USA) in place of whole soybeans, and sweet potatoes or imported corn instead of some rice or barley, to make miso. The quality of miso dropped. The experiments described in this report represent an attempt to improve miso quality scientifically, mainly by investigating how to use defatted soybean meal to make better quality miso. Address: Food Research Inst., Shiohama 1-4-12, Koto-ku, Tokyo, Japan.

526. Heller, David. 1950. The rise of the soybean. *Farm Quarterly* 5(3):30-33, 126-27. Autumn.
• ***Summary:*** A good review of soybean production in the USA, past, present and future.

Photos show: (1) "The father of the soybean, William J. Morse, inspecting a large basket of soybeans in a remote Korean village." He is squatting, dressed in a white driving cap and black overcoat. (2) A Michigan farmer holding up two varieties of soybeans. The bushy plant in his left hand is the new Hawkeye, whereas the thin one in his right is Earliana [Earlyana]. Plant breeders have worked with soybeans for half a century to develop beans for every use. (3) Farmers in a village in East Asia; taken by the Dorsett-Morse expedition. After centuries of isolation, each community had its own soybean varieties, and many of these were given to W.J. Morse. (4) Men driving two tractors weeding soybeans planted in long, straight rows like corn. The beans do best when planted like this in fertile soil. (5) Experimental paints are tested on these outdoor panels at the Northern Regional Research Lab., Peoria, Illinois. Soybean oil is less expensive than linseed oil and makes good paint. (6) A combine harvesting a field of soybeans. The mulch it leaves can add as much as 16 pounds of nitrogen to the acre and protect against soil erosion. Address: Washington Post.

(3) Net exports or imports of soybeans (million bushels) by major exporting and importing countries, 1909-1913 and 1922-1948. China and Manchuria (combined) dominate

© Copyright Soyinfo Center 2021

world soybean exports from 1910 to 1940, with the peak year being 1929 (100 million bushels) and with more than 50 million bushels being exported every year from 1926 to 1939. But by 1941 exports as fallen to almost zero. The only other exporter was the USA, which had its first net soybean exports in 1932 (4.2 million bu); this rose to a peak of 10.5 million bu in 1939 then dropped to almost zero during World War II. Europe was the largest a net importer of soybeans from 1910 to 1948; the peak years were 1929 and 1933, when 62.6 million bushels were imported. Japan was the second largest net importer of soybeans from 1910 to 1948; the peak year was 1938, when 29.8 million bushels were imported. The Netherland Indies (today's Indonesia) is the only country from Southeast Asia in this table. The country imported 2.0 million bushels in 1913. Imports steadily decreased from 4.2 million bushels in 1922 to less that 50,000 bushels in 1936. Then the country switched to being an exporter, with 400,000 bushels in 1937, and averaging about 300,000 bushels per year from 1937 to 1941. Trade stopped during World War II (1942-1947) then resumed again in 1948 with 200,000 bushels of exports. Other countries mentioned in Table 3 include Korea, Formosa, United Kingdom, Germany, France, Belgium and Luxembourg, Netherlands, Denmark, Norway, Sweden, Italy, Danubian countries (Yugoslavia 1931-39, Bulgaria 1934-45, Rumania 1935-38).

(4) Net exports or imports of soybean oil (million pounds) by major exporting and importing countries, 1909-1913 and 1922-1948. (5) Net exports or imports of soybean cake and meal (thousands of metric tons) by major exporting and importing countries, 1929-1948. (6) Net exports or imports of soybean oil and soybean in terms of oil (million pounds) by major exporting and importing countries, 1909-1913, 1922-1948.

(7) Net exports or imports of soybean cake and meal and soybeans in terms of meal (thousands of metric tons) by major exporting and importing countries, 1929-1948. (8) Apparent consumption of soybean oil and soybean cake and meal by principal European countries, 1929-1938 (based on tables 3-7). (9) Soybean acreage grown in the United States for all purposes (equivalent solid acreage), by states and groups of states, 1924-1948 (1,000 acres).

(10) Soybean acreage harvested for beans in the United States, 1924-1948 (1,000 acres). (11) Soybean production in the United States, by states and groups of states, 1924-1948 (1,000 bushels). (12) Soybean supply and disposition in the United States, 1924-1948 (1,000 bushels).

(13) Acreage and production of soybeans, soybeans processed for oil and meal, and soybean oil produced in the United States, 1924-1948. (14) Soybean oil production, trade, (imports and exports), stocks (crude basis), and domestic disappearance in the United States, 1910-1948 (1,000 pounds; compiled from reports of the Bureau of the Census). (15) Soybean oil utilization by classes of products in the United States, 1931-1948. Food products: Margarine, shortening, other, total. Nonfood products: Soap, paint and varnish, other drying oil products, miscellaneous non-food products, loss, incl. oil in foots, total. Total domestic disappearance. One table is in 1,000 lb.; a 2nd is in per cent of total.

(16) Supply and utilization of soybean protein products (meal basis) in the United States, 1921-1947 (1,000 metric tons). For each year is given: Estimated production, imports or soybean cake and meal, total supply, exports of soybean cake and meal. Domestic utilization in: Full-fat soybean flour, low- and medium-fat soybean flour, soybean glue for softwood plywood, soybean glue for hardwood plywood, other uses (largely feed for livestock).

A map (p. 90) shows soybeans harvested for beans in the USA, 1944. Each dot represents 2,000 acres.

A graph (p. 105) shows tonnage of high-protein feeds fed to livestock, 1926-1947. Within this are four graphs for: Soybean cake and meal, other oilseed cake and meal (mostly cottonseed), tankage and meat scraps, fish meal, dried milk products, gluten feed and meal, and (beginning 1935) brewers' and distillers' dried grains, and total.

A graph (p. 66) shows world soybean production from 1922 to 1949. The data is from Table 2. Within this are graphs for USA and for East Asia (incl. China, Manchuria, Korea, and Japan).

One bar chart (p. 73) shows domestic consumption and net exports of soybeans and soybean oil, in terms of oil (million lb.), by principal consuming countries, annual average, 1929-1938 (Based on tables 2-4. Oil equivalent of soybeans calculated at 8.4 pounds per bushel). By far the biggest consumer is China. By far the biggest exporter is Manchuria. Others: Japan, Germany, United States, Korea, Netherlands Indies, United Kingdom, Netherlands, Denmark, Other Europe (except U.S.S.R.).

Another bar chart (p. 74) shows domestic consumption and net exports of soybeans and soybean meal, in terms of meal (1,000 metric tons), by principal consuming countries, annual average, 1929-1938 (Based on tables 2, 3, 5, and 7. Meal equivalent of soybeans calculated at the rate of 0.02117 metric tons per bushel). The biggest consumer is China, followed by Japan. By far the biggest exporter is Manchuria. Other small exporters: Germany, United States, Korea, Formosa, Netherlands Indies, Denmark, United Kingdom, Other Europe (except U.S.S.R.). Address: Bureau of Agricultural Economics, USDA, Washington, DC.

528. Burtis, E.L. 1950. World soybean production and trade: Historical summary (Document part). In: K.S. Markley, ed. 1950. Soybeans and Soybean Products. Vol. I. New York: Interscience Publishers or John Wiley & Sons. xvi + 1145 p. See p. 61-63. [17 ref]

• ***Summary:*** "World soybean production and trade have passed through three major stages of development. In the first

© Copyright Soyinfo Center 2021

phase, extending from prehistoric times to 1908, soybean production and trade were confined almost exclusively to eastern Asia. Uncultivated species of soybeans still grow wild in North China, Manchuria, and Korea. Apparently culture of soybeans as an agricultural crop originated in that area, and spread first to Japan, Formosa, southern China, Indo-China, Siam, the northern border districts of India, and the Netherland Indies.

"In North China, Manchuria, Korea, and Japan, soybeans have long been a major crop. They are mentioned in ancient Chinese writings as one of the five sacred grains. Farther south, soybeans are less important both in agriculture and in the diet.

"A lively coastwise trade in soybeans, soybean cake, and soybean oil was carried on between Manchurian and southern Chinese ports for centuries before Chinese ports were opened to foreign ships in the mid-1800's. Exports of soybeans and soybean products from Manchurian ports to Japan increased rapidly in the late 1800's, especially after China made special trade concessions at the end of the Sino-Japanese war in 1895. Japanese import demand for soybeans and soybean cake was strong, and the population of Manchuria was growing rapidly. Opportunities in Manchuria attracted a steady stream of agricultural workers from northern China after restrictions on immigration to Manchuria were relaxed by the Chinese government in the third quarter of the 19th century.

"The second stage of development in soybean production and trade, extending from 1908 to 1939, was marked by large exports of soybeans and soybean oil from Manchuria to Europe. The beginning of this trade was an indirect result of the Russo-Japanese War in 1904-1905. Food requirements for Japanese troops stationed in Manchuria had led to an increase in production of soybeans. When these troops were withdrawn, a surplus of soybeans developed. At the same time, the Japanese acquired a substantial interest in the Manchurian export trade through their lease of the South Manchurian Railway and development of the port of Dairen at the southern end of the railway.

"Japanese firms in 1908 made several shipments of Manchurian soybeans to England, where the soybeans were found to be a suitable source of oil for soap manufacture and meal for use in mixed feeds for livestock. Nearly all previous shipments of soybeans from the Orient to Europe had arrived in an unsatisfactory condition largely because of poor shipping practices. Exports of Manchurian soybeans to Europe increased rapidly after 1908. At first these shipments went to England, but by 1910 to other European countries also, especially Germany, Denmark, and the Netherlands. After an interruption during World War I, trade with Europe continued to grow, reaching a peak in the late 1920's and early 1930's. Soybeans were one of the leading materials processed by the expanding oilseed-processing industry in Europe.

"Large exports of soybean oil from Manchuria to Europe also developed, beginning about 1910 and reaching a peak in 1926. Soybean-processing capacity in Dairen grew along with this trade; the oil mills in Dairen produced largely for export and by 1924 accounted for about half the total soybean-processing capacity located along Manchurian railroads. Exports of Manchurian soybean cake also were large in the 1920's and 1930's, but the cake was too high in oil and water content to stand the tropical sea voyage to Europe and therefore went mainly to Japan, Formosa, and Korea.

"The growth of imports of Manchurian soybeans and soybean oil into Europe was the natural consequence of an active European import demand for fats and oils and protein concentrates, and a vast immigration from China into the relatively empty but fertile Manchurian farmlands during the 1920's.

"The third and present stage in the world history of soybeans is marked by the pre-eminence of the United States in production and processing of soybeans for oil and meal. This phase began in 1940 when war disrupted the trade between Manchuria and Europe. Exports of soybeans from Manchuria to Europe had not been resumed by 1948, except for small quantities moving through northern China ports.

"Soybeans were very little grown before 1910 as an agricultural crop in the United States. Production first began to assume commercial importance during World War I; it showed a steady upward trend in the 1920's and early 1930's, expanded rapidly after 1936, and in 1942 rose sharply to a new high level in response to strong wartime demand for domestic sources of fats and oils and oilseed meal. Soybean acreage and production were well maintained through 1948. Soybeans are well adapted to the climate and soils of the Corn Belt and to the crop rotations and mechanized farming practiced in the Corn Belt.

"Since the early 1920's the soybean-processing industry in the United States has actively carried on research to improve methods of processing soybeans and soybean products and to develop new uses and markets. Mill capacity has always been ample for the increasingly large output available for processing, except early in World War II, when steel and other materials needed for new additions were reserved for more urgent war uses. The United States soybean-processing industry now stands first in the world in size and in technical knowledge and ability." Address: Bureau of Agricultural Economics, USDA, Washington, DC.

(The Kampong, Sept. 1949). Preface. 1. Early American agriculture: Methods and terminology, colonial introductions, introductions of the eighteenth century, contributions of individuals, public experimentation and exploration (Trustee's Garden of Georgia in Savannah laid out in 1733 by General James Oglethorpe to grow silk, rice, and indigo, contribution of Royal Botanic Gardens at Kew–founded in 1760, Sir Joseph Banks director for 48 years, sends first professional plant hunter, Francis Masson, to Africa in 1772 for 3 successive years, plant explorer David Nelson, Captain William Bligh and the mutiny on the *Bounty* intended to introduce the seedless breadfruit tree into the West Indies as a food for slaves, the work of John Ellis). 2. Search for new crops 1770-1840: Introductions by statesmen (Benjamin Franklin, George Washington, Thomas Jefferson), work of agricultural societies, Dr. Henry Perrine. 3. Federal promotion of crops: The Treasury Circular of 1819, the Treasury Circular of 1827, assistance of the Navy (The Perry Expedition to Japan and James Morrow), Diplomatic assistance. 4. Leadership of the Patent Office 1836-62: First agricultural appropriation (Oliver Ellsworth, head of the Patent Office during this period, was instrumental in securing the appropriation of $1,000 in 1839), work of the Patent Office (and Commissioner Ellsworth), agriculture under the Department of the Interior (Ellsworth, Charles Mason, D.P. Holloway, D.J. Browne, distribution of seeds incl. supply of foreign seeds from the seed firms of Vilmorin-Andrieux in Paris [France], Charlwood and Cummings in London [England], Ernst Von Spreckelsen and Co. in Hamburg [Germany], and William Skirving in Liverpool [England], seed distribution curtailed), separate crop histories (tea and Robert Fortune, sorghums for sugar), miscellaneous introductions. 5. The commissionership 1862-69: Aims and methods of the commissioners (Isaac Newton, Horace Capron, Frederick Watts, William Le Duc, Norman Colman), international exchange of plants. 6. Main importations: Wheat and small grains, oats, fiber crops, grapes, citrus fruits, tea. 7. Lesser importations: Sugar crops, fruits, vegetables, tropical plants, pasture and forage crops, trees. 8. Plant introduction under Rusk and Morton: Distribution of seeds and plants, promotion of special crops, the division of pomology, fiber and forage crops. 9. Bonanza years: Problems facing agriculture, work of plant explorers (Fairchild and Lathrop, Niels Hansen, Mark Carleton, Seaman Knapp). 10. Plant introduction of the twentieth century: Search for new crops, introductions by Meyer, significant introductions 1901-13, the war years [World War II], looking to the future.

Benjamin "Franklin's name is linked with the history of three field crops which achieved economic importance: upland rice, broom corn [broomcorn], and soybeans... He became enthusiastic over the soybean as a result of his membership in the French Academy of Sciences. Soybeans sent from China to France as early as 1740 were grown after 1779 in the famous Botanic Garden of Paris. From France, Franklin sent some of the seeds to the United States, but the soybean did not find a favorable reception until the technology of the twentieth century demanded it" (p. 14).

"O.F. Cook, in 1898, began the 'Inventory of Plants Introduced" in which numbers were assigned to each new item and information given on its origin, nature, value, and cultivation" (p. 110).

Chapter 10–"Introductions of the twentieth century. David G. Fairchild took charge of the Office of Foreign Seed and Plant Introduction in 1897, and held that post, except for tours of exploration, for twenty-seven years. Under his leadership the Office set up an efficient system for disseminating plants, and experts in different parts of the country were employed to locate new plant materials. In 1902 Fairchild's division came under the jurisdiction of the new Bureau of Plant Industry. Three other divisions–the Arlington Experimental Farm, Congressional seed distributions, and tea investigations–were established at the same time. When the Bureau of Plant Industry was organized in 1900, it was the first official agricultural organization of its kind devoted exclusively to plant introduction. In addition to the four branches listed above, there were divisions concerned with physiology and pathology, botany, grass and forage plants, pomology, and the experimental gardens and grounds. Under Beverly T. Galloway, the Department's leading plant pathologist, more than two hundred employees were engaged in plant work... The Arlington Farms and Potomac Flats were located in Washington, DC, and an eighty-acre garden at Chico, California" (p. 120).

One of America's outstanding plant explorers, Frank N. Meyer, made four trips to Asia over a period of 12 years (1905-1918) and sent back more than 2,500 introductions. His four trips and important plant discoveries on each are summarized. "On his last trip to China in 1918, Meyer disappeared from the deck of a steamer plying the Yangtze River. There is some indication that he may have committed suicide, for his letters reveal that the mental and physical hardships of his lonely existence may have broken his will to live" (p. 122-23). An excellent photo (facing p. 124) shows Frank Meyer.

There was a shift in emphasis from introduction to breeding, hybridization, and selection after William A. Taylor succeeded Galloway in 1913 and during the 1920s.

"Soybeans from Asia are probably the most outstanding plant introductions since the Kharkov and durum wheats. Economic products of the soybean plant, now a major field crop, include hay, forage, food and feed products, and oil for many industrial uses. Recent introductions of the soybean have been merged by breeding, into new, superior plants with little resemblance of the original.

"Interest in the soybean as a commercial crop began with the introduction of three varieties from Japan in 1900. Nearly three hundred varieties were obtained in China,

© Copyright Soyinfo Center 2021

Japan, and India in 1909. The Department recommended soybeans as a crop that could be substituted for cotton in the South.

"In 1910, twenty soybeans from a group of 350 under test were selected for wide distribution. Three hundred varieties received from Korea and northern Manchuria in 1914 were expected to extend soybean cultivation northward in America...

"The distribution of soybeans was a prominent feature of crop seed distribution after 1914, Estimated value of the crop of 2,500,000 acres was $23,917,500. Because of its contributions to the new industry, the Bureau of Plant Industry claimed credit for half its value. Ryerson, in 1933, stated that all but three of the twenty varieties of soybeans then in cultivation were found by the Office of Plant Introduction.

"When it became clear that the soybean would be a major crop, the Department decided to send two explorers to search the soybean areas of Japan, Sakhalin, Manchuria, Korea, and China to make sure our farmers would have the best varieties. After two years of work, P.H. Dorsett, of the Division of Plant Exploration and Introduction, and W.J. Morse, of the Division of Forage Crops and Diseases, returned with almost three thousand varieties" (p. 135).

Table 1 (p. 57) shows seed distributed by the federal government 1862-89. The number of packets grew from 306,304 packets in 1862, to 1.2 million in 1863, to 2.22 million in 1975, to 3.62 million in 1884, to a peak of 4.667 million in 1885. The annual appropriation to fund this distribution work, which began with $25,000 in 1870, grew steadily to $100,000 in 1885. Address: Assoc. Prof. of Social Sciences, Central State College, Iowa.

532. Morse, W.J. 1950. History of soybean production: 5. World distribution (Document part). In: K.S. Markley, ed. 1950. Soybeans and Soybean Products. Vol. I. New York: Interscience Publishers or John Wiley & Sons. xvi + 1145 p. See p. 10-14.

• ***Summary:*** "The production of soybeans, which for many centuries was confined to the countries of Asia, spread rapidly after World War I to the western world, and since World War II practically all leading nations have become more and more interested in the culture and production of the crop. Agricultural experiment stations throughout the world have become engaged in the development of varieties suited to their soil and climatic conditions through introduction, selection, and hybridization. Successful results have been

© Copyright Soyinfo Center 2021

obtained in many countries and, in a few, acreage and production have increased to the extent that the crop has become an important factor in that nation's agriculture. This is especially true of the United States, Netherland Indies, Rumania, U.S.S.R., Austria, Bulgaria, and Poland.

"The principal zones of soybean production in the Orient are China, Manchuria, Korea, and Japan. In Manchuria, the soybean occupies about 25% of the total cultivated area and is a dominating factor in the economic life of the country. As a cash crop it provides fully half the farm income in the north and more than half the total volume of freight handled by the railroads. It is estimated that from one- to two-thirds of the production of soy beans is exported; 15 to 20% is utilized for food, feed, and planting, and the remainder is used for oil extraction.

"In China, the soybean is one of the principal and most ancient of crops, ranking fifth in extent of culture and occupying about 9% of the total cultivated area. Although grown everywhere in China, about 60% of the soybean acreage is confined to three northern provinces, Shantung, Kiangsu, and Honan. China consumes practically all of her production, estimates indicating more than 50% for food, 27% for oil extraction and other purposes, 10% for stock feed, and 8% for planting.

"Korea occupies third place among the soybean-producing countries of Asia. Acreage and production are confined largely to central and northern Korea, as southern Korea, which grows principally cotton and rice, seems to be less suited to the successful production of soybeans. The entire Korean production is used for food, stock feed, planting and export, and none is used for oil extraction.

"Japan, although a large producer of soybeans, has consumed all her production and has imported large quantities from Manchuria and Korea. Acreage and production of soybeans in Japan have decreased since World War I and greater emphasis has been placed on increased production of rice. The proportions of soybeans used by Japan for various purposes are: 'miso' (soybean-rice fermented paste), 22%; soy sauce, 22%; oil and oil cake, 21.5%; soybean curd [tofu], 15.5%; confections, 7.2%; forage, 6.2%; green manure, 2.5%; seed, 1.8%; green vegetable beans, 0.8%; and miscellaneous, 0.5%.

"In the Soviet Far East, the soybean is said to be one of the chief industrial crops and in some districts constitutes 20% of the cultivated area. Acreage and production have increased markedly since 1926, especially in Khabarovsk territory, the largest seed-producing area.

"South of China, the soybean is cultivated to some extent in the Netherland Indies, India, Siam, Cochin China, Philippines, and Australia. Until 1932, the production of soybeans in the Netherland Indies was not sufficient to meet the domestic demand. Since then, acreage and production have gradually increased until soybeans began to be exported to Holland about 1936. The soybean has been widely cultivated for a long time by the natives of the hilly regions from the borders of Afghanistan eastward to Burma, to northern Siam, and French Indo-China. The crop in India has been grown for its forage and food value rather than for commerce. Although successful results have been obtained in some of the provinces with varieties of good oil content, the growing of the crop as an oil seed does not appear to have been popular with the native farmers. In Australia successful results with American varieties have greatly increased acreage and production, especially in the states of Queensland, New South Wales, and Victoria.

"Although attempts to grow soybeans in European countries have extended over many years, it is only within the past few years that there has been any appreciable production. At present, production is confined largely to European U.S.S.R., Bulgaria, Yugoslavia, Austria, Rumania, and Czechoslovakia, production being largest in Rumania, Bulgaria, and Yugoslavia. In the development of adapted varieties, some progress has been made in Sweden, Poland, Netherlands, and Hungary. Because of the economic importance of the soybean, scientists of the U.S.S.R. have carried on extensive experiments with it, especially in the development of adapted varieties and utilization. At present, the principal areas of production are Ukraine, Moldavia, and certain regions in the North Caucasus.

"Experiments have been conducted with the soybean in nearly all regions of Africa but as yet it is an unfamiliar crop to the majority of African farmer. It has been grown successfully in the upland, midlands, and coastal districts of Natal [South Africa] and throughout Gambia, Nigeria, Egypt, the Gold Coast Colony, and also in the corn- and cotton-growing districts of the Belgian Congo.

"Although the soybean has been the subject of considerable experimental work in practically all countries of the Americas, little progress has been made in commercial culture except in the United States and Canada."

Note: This is the earliest document seen (Oct. 2010) that clearly refers to soybeans in Afghanistan, or the cultivation of soybeans in Afghanistan. This document contains the earliest clear date seen for soybeans in Afghanistan, or the cultivation of soybeans in Afghanistan (long before 1950). The source of these soybeans is unknown. Address: 6809 Fifth St. N.W., Washington, DC; formerly Principal Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering, USDA, Beltsville, Maryland.

533. Morse, W.J. 1950. History of soybean production: 20. Other enemies [of the soybean] (Document part). In: K.S. Markley, ed. 1950. Soybeans and Soybean Products. Vol. I. New York: Interscience Publishers or John Wiley & Sons. xvi + 1145 p. See p. 56-57.

• ***Summary:*** The section rabbits and woodchucks as soybean pests is similar to that in *The Soybean* (Piper & Morse, 1923,

© Copyright Soyinfo Center 2021

p. 288). "... dusting or spraying with an arsenical poison (calcium arsenate) has prevented serious damage from rabbits.

"In many sections, deer have done much damage to soybean fields... In many of the localities from Mukden to Harbin and eastward to Antung, Manchuria, and in northern Korea many of the farmers plant hemp or perilla for about 20 to 30 feet at the ends of the rows of the soybean fields to prevent animals from doing injury to the fields.

"Pigeons, when numerous, will cause considerable injury to soybean plantings by picking off and eating the cotyledons just as the seedlings are emerging, or picking out the planted seeds from the rows. In North and South Dakota pheasants have done considerable damage to soybean fields, eating the seedlings as they appear and the seeds as the plants matured." Address: 6809 Fifth St. N.W., Washington, DC; formerly Principal Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering, USDA, Beltsville, Maryland.

534. Morse, W.J. 1950. History of soybean production: 9. Varieties and variety improvement (Document part). In: K.S. Markley, ed. 1950. Soybeans and Soybean Products. Vol. I. New York: Interscience Publishers or John Wiley & Sons. xvi + 1145 p. See p. 17-23.

• ***Summary:*** "Varieties of soybeans are very numerous [especially in East Asia], no doubt because of the fact that the soybean seems to be peculiarly sensitive to changes of soil and climatic conditions." Differences in behavior of the same pure-line variety in different locations are often so striking that it is difficult to believe that the variety is the same.

In China, soybean varieties are quite numerous and "are classified according to color, size, shape, time of planting, method of planting and use. The local names of varieties differ in different localities so that it is very difficult to obtain a variety which is widely known." There has not been much organized research on soybean varietal improvement in China. "The University of Nanking has done more work of this kind than any other organization."

Although many soybean varieties are grown in Manchuria, only three types are distinguished: yellow, green and black. This has apparently been found adequate for commercial purposes. In detail, these three groups are:

(1) Hwang Tou–yellow beans. (a) Pei Mei (white eyebrow, pale hilum). (b) Chin Huang (golden yellow or golden round). (c) Hei Chi (black belly), dark hilum. These three varieties are highly prized for the quality of their oil, but Pei Mei and Chin Huang are also valued for the soybean curd [tofu] made from them.

(2) Ching Tou–green beans. (a) Green with yellow germ or cotyledon. (b) Green with green germ or cotyledon. The green bean with the yellow germ yields more soybean curd but of an inferior quality compared to that of the yellow varieties. The green bean with the green germ is preferred for making sprouts.

Hei Tou or Wo Tou–black beans. (a) Ta Un Tou (large, black), green germ. (b) Hsia Un Tou (small, black), yellow germ. (c) Puen Un Tou (flat, black), yellow germ. The Ta Un Tou is used for oil, the Hsia Un Tou for oil and Horse feeds, and the Puen Un Tou for salted fermented soybeans [fermented black soybeans].

"Most of the varieties grown by Manchurian farmers consist of a mixture of varieties of which more than 90% are yellow-seeded types." The distribution throughout Manchuria of the various types is discussed. Native Korean soybean are classified into eight different groups.

Since 1898 the USDA had brought into the United States more than 10,000 introductions from China, Manchuria, Korea, Japan, India, Netherland Indies [Indonesia], South Africa, and several European countries.

Table 1 (two pages) shows the "Characteristics of soybean varieties most generally grown in the United States," arranged into seven groups from very early to very late maturity. For each variety in every group is given: Seed color (black, brown, green, olive or greenish yellow, straw yellow), hilum color (black, brown, dark brown, light brown, pale), seeds per lb., oil %, protein %, iodine value (range: 119 to 140), pubescence color (gray, or tawny), flower color (purple, white, or purple & white), shattering (little, medium, or much), and use (commercial {grain or oil and meal}, forage, or vegetable). The groups are: (1) Very early: Agate, Capital, Cayuga, Flambeau, Goldsoy, Habaro, Kabott, Mandarin, Mandarin 507, Mandarin (Ottawa), Minsoy, Ontario [developed in USA], Pridesoy, Sac.

(2) Early: Adams, Bansei, Earlyana, Hawkeye, Illini, Kanro, Lincoln, Manchu, Manchu 3, Manchu 606, Manchukota, Mendota, Montoe, Richland, Seneca.

(3) Medium Early: Chief, Dunfield, Hokkaido, Hongkong, Jogun, Mandell, Mingo, Mukden, Scioto, Viking.

(4) Medium: Aoda, Boone, Funk Delicious, Gibson, Kingwa, Macoupin, Mount Caramel, Patoka, S100, Virginia, Wabash, Wilson.

(5) Medium late: Arksoy, Arksoy 2913, Haberlandt, Laredo, Ogden, Ralsoy.

(6) Late: CNS, Mamloxi, Mammoth Yellow, Palmetto, Roanoke, Tanner, Tokyo, Volstate, Woods Yellow.

(7) Very late: Acadian, Avoyelles, Gatan, Otootan, Pelican, Seminole, Yelnando.

"Varieties now grown in the United States may be divided into three general groups, namely commercial (grain), vegetable, and forage. Varieties for commercial seed production are preferably yellow-seeded and are used largely for processing for oil, meal, and soybean flour, but these varieties may also be used for forage purposes if heavier rates of seeding are used. The varieties used principally for forage and green manure are the black- and brown-seeded varieties, which for the most part are low in oil but yield a

© Copyright Soyinfo Center 2021

finer and heavier forage than the commercial and vegetable varieties.

"The term 'vegetable varieties' has been applied to varieties introduced from oriental countries where they are used solely as green vegetable or dry, edible soybeans. In extensive tests of the quality of the green and dry beans made by the Bureau of Human Nutrition and Home Economics, Department of Agriculture, and by departments of home economics of various agricultural colleges, the vegetable varieties have proved much superior to the field or commercial varieties in flavor, texture, and ease of cooking. Many of these vegetable types have been found through experiments to be superior to commercial types for soybean milk, soybean flour, soybean curd, salted roasted soybeans, and other food products. (See Chapter XXV). The varieties used for processing and forage purposes usually do not cook easily and have a raw 'beany' flavor. Nearly all vegetable varieties cook easily and have a sweet or bland nutty flavor. The most suitable vegetable varieties are those with straw-yellow, greenish-yellow, or green seed, although a few black, brown, and bicolored varieties do have superior qualities as green shelled beans. Vegetable varieties, ranging in maturity from 75 to 175 days, have been developed for all soybean-producing areas in the United States.

"Several commercial companies have canned large packs of the green shelled beans of the vegetable varieties. Quick-frozen green shelled beans alone and in succotash have been placed on the market by several companies, the frozen product being highly satisfactory in color, texture, and flavor. For canning or quick freezing in the green stage, the yellow- and green-seeded varieties make a more attractive product than the black-, brown-, or bicolor-seeded varieties. Vegetable varieties have also become quite popular with the home gardeners and many seedsmen in various sections handle two or more varieties" (p. 22).

Listed from very early to very late, vegetable varieties include: Agate, Sac, Bansei, Kanro, Mendota, Hokkaido, Jogun, Aoda, Funk Delicious, and Seminole. Address: 6809 Fifth St. N.W., Washington, DC; formerly Principal Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering, USDA, Beltsville, Maryland.

535. Eichberg, Joseph. 1950? The lecithin story–with a moral (Continued–Document part II). [Long Island, New York]. 10 p. Undated.

• ***Summary:*** (Continued): "These are some of the lines along which research can proceed. Another treatment involving hydroxylation has already resulted in a market for considerable quantities of lecithin at prices almost three times more than the same users, namely, bakers or bakery supply manufacturers, pay for the limited quantities of conventional lecithin purchased.

"Hydroxylation enhances the affinity for water, which is impeded in the ordinary commercial grade by the presence of the relatively large amount of carrier oil; however, there is still room for improvement in odor and taste. While special water-dispersible lecithins have been offered on the basis of adding to ordinary lecithin a minor amount of a powerful detergent, wetting agent, an emulsifier or combination of same, it is believed that permanent, substantial progress will more likely come through suitable treatment or modification of the lecithin per se. Not all such treatments involve chemical change for there are many possibilities in solvent fractionations.

"Using water and starting with the undried crude lecithin emulsion, procedures can be applied to cause separation of the bulk of the soybean oil leaving a sort of lecithin hydrate. This de-oiled hydrate appears to provide a valuable emollient action in soaps and shampoos where it does not affect clarity or aggravate rancidity problems (as happens if free soybean oil is present). It is also possible in such a water system to treat the crude lecithin emulsion without removing the oil in such a way as to wash out most of the naturally occurring carbohydrate and thereby materially increase the heat stability. This carbohydrate-reduced lecithin when heated directly or in oil solution does not show the darkening at temperatures around 200ºF. which at times proves a handicap with conventional lecithin.

"Classical solvent fractionation of crude or commercial lecithin preparations involves the use of acetone or alcohol or both.

"Extraction of ordinary soybean lecithin with acetone removes the oil and leaves the insoluble phosphatide complex behind. This process was used commercially as early as 1933 to make a cocoa butter lecithin for the chocolate industry–the natural carrier of liquid soybean oil was replaced by higher melting point cocoa butter. Since then, similar purified grades with other carriers adopted to various purposes have been developed and while the volume is not large as yet, profit margins on these special grades are inherently mere interesting than in the care of the run-of-the-mill lecithin which serves as the starting point.

"It is not necessary to add a carrier to the acetone purified phosphatides. This tan waxy substance may be dried directly [as] convenient in the form of a granule. The cost of producing granular phosphatides in purified form, usually about 95%, is such that use up to now has been limited, for the most part, to dietetic and pharmaceutical applications. Forty or fifty years ago in Europe, there was a vogue in lecithin for therapeutic purposes for a time but it seems to have been based more on wishful thinking than on sound clinical data. It is to be hoped that this mistake is not repeated here in attempting to exploit the interesting possibilities held out by the nutritive and physiological properties of soybean phosphatides–indeed, this is not likely in view of the rather strict regulation enforced today by the Food and Drug Administration and the Federal Trade

© Copyright Soyinfo Center 2021

Commission.

"Already a not inconsiderable volume of purified granular phosphatides is being sold in retail packages through drug channels, health food stores and most of these over-the-counter sales have resulted more from popularization than from any recognition of the virtues of lecithin by the medical profession; if lecithin is to have a real future in this field it is essential that the work already done on specific problems–such as skin disorders, fatty infiltration of the liver and vitamin A metabolism be greatly extended by fundamental clinical research under competent medical direction in conditions such as arthritis. The early hopes for lecithin in high blood cholesterol (hypercholesterolemia) atherosclerosis and cardio-vascular disease have not yet been realized and call for more study, much more, and perhaps a new approach in view of the fact that lipotropic agents, generally have not proved their value in practice and do not appear to be much used by cardiologists, while internists have reported that a diet adequate in protein does not benefit particularly by supplementation with lipotropic agent (such as choline, methionine, betaine or inositol) in liver insufficiency. It is important to remember that while the soy phosphatide complex possesses lipotropic activity of a high order, it is much more than a mere lipotropic agent.

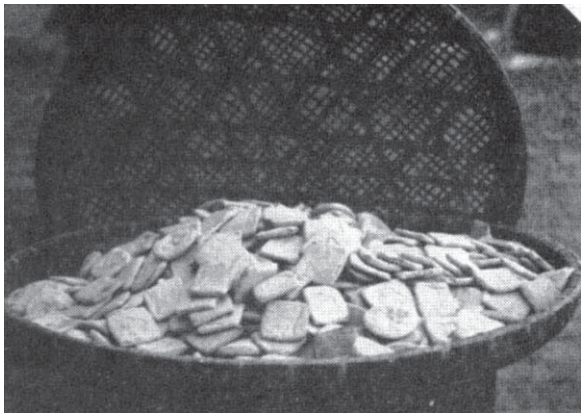
"Future studies in the medical field should include an evaluation of the component fractions, essentially lecithin 'cephalin' and phosphoinositide, of the natural phosphatide complex. Such fractions. will undoubtedly also find commercial use and at prices reflecting a legitimate margin of profit. Extraction of ordinary commercial (oil-containing) lecithin with acetone can be followed by extraction with ethanol to produce alcohol soluble and alcohol insoluble fractions. Nearly all of the inositide goes into the alcohol insoluble while the soluble fraction is richer in phosphatidyl choline (lecithin). The two fractions, like the acetone insoluble complex, can be conveyed in different carriers depending on the end use. Furthermore, the chemically treated or water treated modifications above referred to can be subjected to these solvent purifications.

"Much applied research will be needed to develop data on new grades and find applications, but investment in this research is justified by the profits to be made. For example, enough glamour surrounds lecithin for the most poetic advertising man, but no soap manufacturer would feature lecithin unless supplied with some positive claim to make and evidence to back it up. A start has been made in recent laboratory tests, with animals where the skin was examined microscopically after treatment with standard soybean phosphatides and two specially prepared grades and decided differences were observed. There is a need in the cosmetic field for fewer generalizations on the subject of lecithin and more experimental data, but considering the relatively small volume no one is willing to make the outlays if all he can expect is to sell some thousands of pounds of conventional lecithin at virtually no profit.

"A processor cannot fix the price at which he buys his beans or sells his meal and oil and he is governed as much or more by forces without than within his industry. But in the case of lecithin, he could figure his cost on it in a normal way as one of the three primary products of processing, add a reasonable markup and then try to merchandise his product. However, as long as some processors are willing to sell on price and without regard to profit, the sale of conventional lecithin will continue to be pretty much of a 'rat-race' relieved occasionally by an unexpected external event such as the temporary shortage created by the Korean war [1950-1953]. There is the hope that demand for ordinary lecithin will increase, even though the present economics predict little promotion by the industry, as where a new or wider uses is found involving large quantities. Several occurrences of this sort simultaneously can soak up the existing surplus and firm up prices, although the industry has a lecithin production potential of about [?] lbs.

"There is reason to believe that applications for a large tonnage of regular commercial lecithin can still be found in the petroleum industry and that an increasing tonnage can be channeled into the feed industry and that these consumers are able and willing to pay a cent or two a pound more for lecithin to make the business profitable to the producers and distributors. The value of lecithin in milk replacers for young animals and in facilitating the absorption and utilization of vitamin A may be cited. The experimental demonstration that higher melting point fats are more digestible when lecithin is added should interest the Armed Forces in adding lecithin to emergency rations containing fats melting above body temperature (incidentally, commercial lecithin costs a good deal less than these hydrogenated fats).

"In fine, it can be said that we in 'lecithin' need morale as well as morals and that as for a moral we must realise that the future lies in imagination and scientific research and development rather than in chance and serendipity, always remembering that in spite of the accomplishments of the past 25 years, we have only scratched the surface."



Note 1. At the end of the document is written in by hand: "Obtained from his son, Joe Eichberg junior, Nov. 1999."

Note 2. The date of this undated document must be 1950 or later due to mention of the Korean War [1950-1953]. Address: President, American Lecithin Co, Inc., Elmhurst, Long Island, New York.

536. Morse, W.J. 1951. What's in a name? *Soybean Digest.* Jan. p. 22-24.

• ***Summary:*** "Ancient Chinese literature recording the advice of agriculturists on the best varieties of soybeans to plant under different soil and climatic conditions and the utilization of certain varieties for specific purposes, indicates that the soybean was perhaps one of the oldest crops grown by man [sic]. Varieties of soybeans are very numerous

© Copyright Soyinfo Center 2021

in oriental countries, especially Korea. There during agricultural explorations by the United States Department of Agriculture in 1929 to 1931 more varieties showing a wider range of color, size, and shape of seed and plant characters were found than in China, Manchuria, and Japan.

"The soybean is peculiarly sensitive to changes of soil and climatic conditions and this explains undoubtedly to a very great extent why practically every locality in the soybean regions of eastern Asia has its own varieties. Explorations in small villages in China and Korea revealed that nearly every family had its own favorite varieties for different uses.

"It is noteworthy that of the large number of varieties introduced into the United States from the Orient the same variety has rarely been secured a second time unless from the same locality. Obviously, centuries of experience aided by natural crossing and selection have brought about the development of the vast number of varieties for special purposes under local conditions in China, Korea, and Japan.

"Prior to the introduction of numerous varieties of soybeans by the Department in 1898, not more than eight varieties had been grown in the United States. The culture of these was limited to a few well-defined areas. During the past 50 years the Department has made several thousand introductions of soybeans from China, Korea, Manchuria, Indonesia (Java), and India, representing many hundreds of distinct types.

"This large collection, ranging in maturity from 75 to 200 or more days, has shown wide differences in color, size, shape, composition and quality of seed, plant characters, utilization, and in adaptation to the various soil and climatic conditions in the United States.

"In a recent review of all introductions received from eastern Asia, it was noted that a large number of those from China, Korea, and Japan were sent in under their native varietal names, the translation of which revealed some very interesting and perplexing names. It was interesting to note among the oriental names three–Chief, Chestnut, and Hawkeye–that breeders in the United States have assigned to varieties developed for their own local conditions.

"The many peculiar oriental varietal names of soybeans suggested the title of this article. It was thought that American soybean breeders and growers would be interested in knowing the sort of varietal names soybeans have in other parts of the world.

"It is obvious that the oriental breeder or grower, in naming some of the varieties, must have been in a poetic frame of mind in assigning such names as 'Heaven's Bird,' 'White Spirit of the Wind,' 'Flower Garden,' and 'Clasped Hands.'

"The large number of varietal names is quite understandable as they indicate various seed and plant characters, temples, villages, prefectures, animals, birds, uses, and occasionally a breeder's name. This will be noted in the following lists and selected classification of varieties.

"It is not to be assumed that these lists of names represent all of the varieties grown in these countries. In fact, they are only a selected number from the varieties introduced into the United States during the past 50 years. It was interesting to note that some of the Chinese varietal names were the same as those in Chinese literature dating back 100 years ago."

"Selected classification of Chinese soybean varieties:

"Seed Color: Black Belly, Chicken's Foot Yellow, Crow's Eye Yellow, Crow's Skin Green, Flesh Yellow, Musk Deer's Skin Yellow, Parrot Green, Raven's Eye Yellow, Tiger Skin.

"Seed Size: Great White, Large Black, Large Green, Large White Eyebrow, Small Golden.

"Seed Shape: Flat Black Golden Round, Large Round Black, Pearl Shape, Round Pearl, Small Round Green.

"Hilum (Seed scar): Flowery Eyebrow, Large White Eyebrow.

"Maturity: August Green, Autumn Azure, Burst Pods in Six Months, Eighth Month White, Fifth Month Yellow, Melon Ripe, Midsummer Yellow.

"Pods: Five Month Broad Pod, Four Grain Green, Four Grain Yellow, Iron Pod Green, Three Bean Pod, White Podded Green.

© Copyright Soyinfo Center 2021

"Leaf: Long Large Green Leaf.

"Pubescence: Hairy Green, Red Hair Green, Sixth Month White Hairy, Yellow Hair Green.

"Utilization: Black Curd, Follow Rice, Round Cattle Feed, Vegetable.

"Odd Names: Entwined Silk, Moon Tooth, Sparrow's Cackling, Unknown Water."

"Selected classification of Korean varieties:

"Seed Color: Barbarian Blue, Black Chestnut, Castor Bean Skin, Golden, Indigo, Lacquer Black, Red Striped, Rich Black, Widower (Black and White), Yellow Dragon's Eye.

"Seed Size: Big Green, Large Black, Small Blackeye, Small Blue.

"Flower: Early White Flower, Large White Flower, White Flower Pure Yellow.

"Hilum: Chotan White Eye, Green Eye, Purple Mouth, Rensen Brown Eye, Small Blackeye, White Eye.

"Maturity: Aid For New Land, Black Sprout, Black Vegetable, Edible, Millet Friend, Plant In Millet, Plant in Wheat, Plant Between Crops, Rainy Season, Roasting, Sprout.

"Habit: Climbing.

"Leaf: Bamboo Leaf.

"Birds: Crow's Early, Domestic Geese, Pigeon, Skylark, Swallow, Water Rail.

"Animals: Deer, Horse, Mouse, Red Rat, White Horse.

"Village: Anpen, Chotan, Tansen.

"Superior Varieties: Great Happiness, Plentiful, Prolific, Rich, Rich and Virtuous.

"Odd Names: Beheaded, Clasped Hands, Cow's Knee, Flying Fish, Flower Garden, Peaceful, South Sea, Spirit of the Wind, Turtle Nest, White Priest's Foot, Wild Boar's Hip."

"Selected classification of Japanese varieties:

"Seed Color: Black Autumn, Black Saddle, Brown Spotted, Green Fool, India Ink, Mink Skin, Pretty Flesh Color, Silver White, Yellow Jewel, Yellowish White Blackeye.

"Seed Size: Large Green, Large Jewel, Large White, Large White Ring, Small Blackeye, Small Bullet, Small White.

"Seed Shape: Gingko Seed Shape, White Ball, Water Caltrop Shape.

"Hilum (seed scar): Blackeye, Green Eye, No Eye, White Eye, White Mouse Eye.

"Pods: Black Eye Long Pod, Black Pod Gold, Four Seeded Yellow, Fox Pod, One Seed, Red Pod, Three Seeded Pod, Two Seeded Pod, Yellow Pod, White Pod.

"Pubescence: Early Smooth, Green Non Hairy, Half Smooth, Middle Season Smooth, Naked Devil, Non Hairy, Smooth White, Smooth Devil, White Hair.

"Stems: Fan Shape Stem, Red Stalk, Single Stalk, White Stem.

"Leaf: Five Leaf Saddle, Monbetsu Long Leaf.

"Habit of Growth: Akita Bunch, Bunching Maiden, Doesn't Touch The Earth, Dwarf, Very Bunched Pods.

"Maturity: August, Black Autumn, Early Gold, Middle Season, October, Very Early Abundant, Yellow Fall, Midseason Fox, Through Frost, White Autumn.

"Utilization: Devil Chaser [for roasted soybeans–irimame], Forage, Miso, Natto, Paddy Field Boundary, Produces in Shady Places, Soy Sauce, White Sprout.

Superior Varieties: Abundance, Abundant Pods, Brings Treasure, Early Increase, Excessive Yield, Fortune, Heavy Yield, One Hundred Percent Good, Small, Fortune, One Thousand Pod.

"Animals: Early Fox, Mink, Mouse, Small Donkey, Tiger.

"Birds: Crane's Friend, Dove, Dove Killer, Sparrow, Wild Duck, Wild Goose, Young Crane.

"Persons: Bingo's White, Chichanari, Hachiya.

"Prefectures (states): Aizu, Chiba, Echigo.

"Shrines: Goshanari, Miyashiro, Zankonji.

"Villages: Chizuka, Hachirihan, Iwakiri.

"Odd. Names: Covered with Frost, Bright Country, Elder Brother, Enter Priesthood, Heaven's Bird, Old Woman's Cane, Pretty Girl, Through the Water, Under The Snow, White Dog's Foot."

Photos show: (1) Bean curd [tofu] cakes being sold by vendors on streets in Peking, China. In the Orient special varieties of soybeans are used in the manufacture of bean curd and many other soy products. (2) Korean farmers' market day held weekly in the small villages. This offers a rich source of soybean varieties. (3) Japanese farm girls planting seed of the Azemame (Paddy Field Boundary Soybean) variety on the land bounding a rice paddy. The beans are used in making miso (salty soy paste), soy sauce, and other foods for human consumption.

Note 1. This is the earliest English-language document seen (April 2021) that uses the term "salty soy paste" to refer to miso.

Note 2. This is the earliest English-language document seen (Nov. 2020) that mentions Azemame. Address: Retired Principal Agronomist, Div. of Forage Crops and Diseases, Bureau of Plant Industry, Soils, and Agricultural Engineering, Agricultural Research Administration, U.S. Dep. of Agriculture, USDA.

537. Stuart, John. 1951. Korean develops food supplement: High-protein and cheap soya mix is called essential to Far Eastern diet. *New York Times.* Oct. 21. p. 133.

• ***Summary:*** Kim Mix is a low-cost soya food supplement of high protein value, based on soybean flour or meal, now being manufactured by the Soya Corporation of America, as was announced yesterday. It was developed by Dr. Ho Jik Kim while working for his doctoral degree at Cornell University in New York. Dr. Kim, himself, lived on this food for two months after satisfactory completion of extensive

© Copyright Soyinfo Center 2021

experiments with it in animal diets. Dr. Kim, who is now an advisor to the Syngman Rhee Government in Pusan, Korea, has recommended that the government make "large purchases to supplement the desperately protein-short diets of his countrymen" as Korea recovers from World War II.

In addition, according to Dr. Armand Burke, president of the Soya Corporation, several governments in the Near East are experimenting with the soy product in mass feeding trials, while in the United States institutional and school nutritionists have been experimenting with "its inclusion in the diets of their charges to supplement short supplies of high cost meat."

"Dr. Burke describes the product as one built on the Horvath patents which his company owns and on which it has spent years of development." The process improves the flavor, stability, and shelf life of the product.

• ***Summary:*** Narratives by eminent Koreans, translated by Hugh Heung-wu Cynn (of New York City). In the chapter titled "Treatment of reactionaries" (p. 80+), the personal story of Chul-Hoe Koo (one of Korea's best-known newspaper reporters) explains that a Communist functionary from the Police Office had come to his house and told him to come with to the Security Police Office, where he was questioned and accused of being a reactionary and a "traitor to the nation." After taking him down to the basement, his examiner wrote up his case (p. 82-83). "Breakfast had been skipped, but after a while we were given a ball of bean and barley and a chestnut-size doen-jang [bean cheese {sic, soybean paste} of salty taste]. Suddenly, while we were eating, an examiner got up and savagely slapped the face of the man next to me. 'Aren't you going to tell the truth, you scoundrel?' he yelled."

Note: This is the earliest English-language document seen (March 2009) that uses the word "doen-jang" (or doen jang) to refer to Korean-style soybean jang (miso). Address: 1. Sociologist, Rutgers Univ., Air Force team.

539. Morse, W.J.; Cartter, J.L. 1952. Soybeans for feed, food, and industrial products. *Farmers' Bulletin* (*USDA*) No. 2038. 41 p. Feb. Supersedes Farmers' Bulletin No. 1617 (Morse 1930, 1932).
• ***Summary:*** Contents: Importance of the soybean and its byproducts. Direct use of soybeans on the farm: Soybean hay (for dairy cattle, beef cattle, horses and mules, sheep, swine, poultry), soybeans for pasturage (hogging down soybeans, sheep, beef and dairy cattle, poultry on soybean pasturage), soybean for soilage, for silage, for soil improvement, for livestock feed (feed for swine, dairy cattle, beef cattle, horses, sheep, poultry, wild game {quail, pigeons}), soybean straw (feeding value, fertilizing value).

Soybeans processed for meal and oil: Processing methods, meal for livestock (for dairy cattle, beef cattle, poultry, swine, sheep, dogs {in dog-food industry}, rabbits, fur-bearing animals, quail and pheasants), meal as fertilizer, for industrial purposes, in food products, use of oil (in food products, industrial uses such as paints and varnishes). Soybeans and products for human consumption: Vegetable soybeans, dry soybeans ("Other uses of the dry soybean {principally of oriental origin} are in the preparation of soybean milk, soybean curd, soybean sprouts, beverages, salted, roasted soybeans), soy flour, grits, and flakes, Oriental soybean foods, soy milk, soy curd, soy sauce, soy sprouts, soy beverages. Miscellaneous uses of the soybean: Honey production (the soybean as a honey plant, soy flour for honey bees), soy flour and grits in dog food, soy flakes in brewing beer, soy flour for insecticides.

Under "Soybean utilization," page 3 notes: (1) The roots and coarse stems are used as fuel in China, Manchuria, and Korea. (2) In many parts of China the plants, when 3 to 4 inches high, are used as greens. (3) In Manchuria and Korea, the leaves are cured and smoked as tobacco.

Under "Soy milk," page 38 states: "The ground soybean pulp or mash [okara] left after separating the liquid from the solid material is still of good nutritive quality, but it has very little flavor. It can be dried and made into flour for human food, combined with foods of more pronounced taste, or used for animal feed."

Under "Soy curd" [tofu], page 38 states: "Chinese and Japanese markets and restaurants in many cities in the United States sell fresh soy curd. Several firms in the United States can soy curd."

Under "Soy sprouts," page 40 states: "Soybeans and several other species of beans, especially the mung bean, are sprouted and used as a green vegetable in the Far East. Soy sprouts (fig. 18, D) can be produced successfully in the home, and a year-round fresh vegetable that may be used raw or cooked can be obtained by sprouting soybeans in a flower pot, a glass fruit jar, or a strainer.

"In producing sprouts, select a stock of clean, bright beans of the latest crop. Any of the field varieties may be used, but the yellow-seeded varieties have less conspicuous skins, though black-seeded varieties, such as the Cayuga, Peking, Wilson, and Otootan, seem to germinate more quickly and uniformly. Carefully hand-pick the seed, discarding everything except the clean, whole beans. Wash the beans thoroughly, cover with lukewarm water, and allow them to soak for a few hours (or at most overnight) until they are swollen. Place the beans in a container and cover them with dampened cheesecloth. Rustproof wire-mesh screening or cheesecloth can be used to cover the bottom of the container to allow for drainage. In using a glass fruit jar, cover the top with a piece of cheesecloth and tie it on securely. Invert the jar and place it in a dark spot at room

© Copyright Soyinfo Center 2021

temperature.

"Tilt it slightly so that excess water can drain away promptly. Pour plenty of water on the beans 3 to 4 times a day, thereby insuring thorough washing. The beans may be sprinkled each evening with chlorinated lime solution (1 teaspoon of calcium hypochlorite dissolved in 3 gallons of water) to keep down mold growth and spoilage. Chlorinated limewater is not needed to kill fungus growth if the seed is of good quality. In 3 to 4 days the sprouts will be 1 to 2 inches long and ready to use. Bean sprouts increase about six times their original volume. The commercial production of soy sprouts proceeds along the same, lines, except that larger sprouting tanks or trays are used and the process is more carefully controlled.

"Soybean sprouts can be used in many ways and are cooked and served with the bean attached. They are a fair source of thiamine, riboflavin, and ascorbic acid. The sprouts may be served raw in salads, cooked in various ways, and used in such dishes as omelets, stews, fricassees, and chop suey. They are very tender and lose their crispness if put into hot dishes more than a few minutes before serving.

"A few companies have successfully canned soy sprouts [in the USA]. The New York (Cornell) Agricultural Experiment Station found that sprouts lend themselves admirably to quick-freezing." Address: USDA.

540. Fukui, J.; Ono, H. 1952. Nihon ni okeru daizu [Ecological studies on Japanese soy-bean varieties. II. Relationship between the ecological types and other characters]. *Kanto Tosan Nogyo Shikenjo Kenkyu Hokoku* (*J. of the Kanto-Tosan Agricultural Experiment Station*) No. 3. p. 49-73. May. [10 ref. Jap; eng]

• ***Summary:*** Experiments were carried out in 1946 and 1947 to clear up the varietal distinctions of soy-beans. The number of varieties used as material were 204 collected from Manchuria, Korea, America and different localities of Japan. These varieties were grown in the Konosu Agricultural Experimental Farm. Studies were made on the variations among the varieties as regard to various characters bearing on the selection and classification of varieties, and on the relationship between 9 ecological types classified from the standpoint of the periods from germination to blooming and from blooming to ripening (as shown in Table A) and other characters. In this study, it was observed that there was a close relation between these ecological types and some other characters. In 1a type, the culmweight, culm-length, culm-diameter, location of the lowest node setting flower-bud, number of branches, branch-length and blooming period show the smallest, and these gradually increase following the order Ib, IIa, IIb etc. The 100 seed-weight was the smallest in the type of the short period from blooming to ripening, and it shows larger values in the types of the longer period. Furthermore, it was found that in Ia type, there are many varieties of weak vegetative growth, but varieties of strong vegetative growth increase following the order Ib, IIa, IIb etc.

"The reason why such results occur seems to be concluded as follows; in Ia and Ib types showing low sensibility to short-day treatment, a conversion from vegetative growth to generative growth arises more rapidly than in IVc and Vc types showing high sensibility." Address: Konosu, Saitama, Japan.

541. Hirano, Mitsuo. 1952. Using American soybeans in the Japanese economy. *Soybean Digest.* Sept. p. 28-29.

• ***Summary:*** Contents: Introduction. The soybean situation and its supply and demand in Japan. The soybean oil milling industry in Japan. The Japanese soybean industry and American soybeans. Conclusion.

The main purpose of the writer's present trip to the USA is to make a careful study of the American soybean market.

Soybean production in Japan gradually increased from 210,000 metric tons in 1880 to a peak of 540,000 tons in 1921. Thereafter production declined as imports from Manchuria rapidly rose. In 1945, the year that World War II ended, production in Japan was only 180,000 tons, but as a result of government policy aimed at increasing food production, it had risen to 440,000 tons by 1951. However most of this production is transformed into foods, so Japanese oil mills have had to depend almost entirely on exports for their raw material. In 1952 exports are expected to be about 350,000 tons.

The earliest Japanese government records of soybean imports show that in 1897, 131,000 tons were imported from Manchuria. That amount increased each year, reaching a peak in 1944 when approximately 930,000 tons were imported. However since the end of World War II, the pattern of Japanese soybean imports has changed dramatically. The United States and the West replaced Manchuria as the main source of Japanese soybean imports. At first, imports were made by the Japanese government from China and by the Occupation Forces from the USA under the GARIOA program. But imports from China was made increasingly difficult by the expansion of the Communist sphere of influence. Finally, in 1950, with the outbreak of the Korean War, soybean imports from China came to a complete stop. Since then, American soybeans have dominated the Japanese market.

From the late 1800s, the Japanese oil milling industry used mostly Manchurian soybeans. From the end of World War I (in 1918) until about 1925, many large soybean crushing mills were constructed in Japan. Just before World War II, in about 1940, the nine large solvent plants in Japan had a crushing capacity of 970,000 tons/year. World War II reduced this to six mills with a capacity of 490,000 tons. Since 1948, many smaller mills have been constructed; in 1951 there were 38 soybean oil extraction mills with a total capacity of about 1.2 million tons.

"I believe that the phenomenal increase in the production of soybeans in the United States is an accomplishment unequalled by anything in the agricultural history of the world... I firmly believe that it could not have been attained without the untiring efforts of the American farmers, agriculturists, government agents, and the American Soybean Association." With Communist forces entrenched in China, Manchurian soybeans are unavailable to Japan at the present time. So Japan is very grateful for this in U.S. production. However there is one problem–quality. Although Japanese oil millers buy Yellow No. 2 grade, the soybeans that arrive in Japan are of much inferior quality. The main problem is that they contain much more foreign material than is allowed–4 to 6% rather than 3% of pebbles, weeds, pebbles, sand, and dirt.

"American soybeans will continue to play as important role as a source of supply for the Japanese oil industry." However there will soon be growing competition from China. A portrait photo shows Mitsuo Hirano. Address: Managing Director of Hohnen Oil Co., Ltd. and President, Assoc. of Oil and Fat Manufacturers, Japan.

542. *Changing Times: The Kiplinger Magazine.* 1952. Meals for the hungry, 3 cents each. 6(10):28. Oct.
• ***Summary:*** "When you see pictures of miserable little waifs in Korea, or of the bare-boned hungry in India, you get a little twinge. You wish there were something you could do to help, something you could afford.

"There is, indeed–thanks to the efforts of a nonprofit organization called Meals for Millions, which has devised a wonderful and inexpensive way for you to provide a person with a meal. Three cents buys a packet of Multi-Purpose Food–MPF–a dry soybean meal product that has been enriched with vitamins. It provides all the nutritive and bulk requirements of a full meal (excluding vitamin C, which is unstable when cooked).

"MPF can be cooked with water in 10 minutes and eaten plain, or added as a nutritious food stretcher to stews, soup, meat loaf, and other dishes.

"More than 20 million meals have been distributed throughout the world since Meals for Millions was set up six years ago by Clifford E. Clinton, Los Angeles restaurant man, as a 'practical challenge to world hunger.'

"The address of Meals for Millions Foundation, Inc., is 648 Broadway, Los Angeles 14, California."

543. Morse, W.J. 1952. Some export history (Letter to the editor). *Soybean Digest.* Nov. p. 30, 32.
• ***Summary:*** "I have read with interest your editorials on the export beans." During the 1930s, American soybeans were cleaner, of better color, and better quality than Manchurian soybeans. This was one reason that European mills preferred to buy soybeans from the USA rather than from Manchuria, and "would pay 5 cents more per bushel for American soys."

During the early 1930s: "In Japanese-held Manchurian territory and Korea, the Japanese soybean inspectors did a pretty thorough job of inspection. All of the beans I saw from those places–and I saw plenty–were clean and seemed to be of good quality. Of course these beans were taken largely by the Japanese mills and the Chinese mills in Manchuria. The Korean beans all went to Japan and were mostly used for food products. The Japanese soy sauce factories used the Manchurian beans."

Now Mr. Morse laments: "I just cannot see why with all our good modern machinery we send such trashy beans abroad. Must be a colored gentleman in the woodpile somewhere!" "It is quite obvious that if America wants to hold the European market they must ship something beside trashy beans."

Note: Tuckahoe, N.Y. was just a mailing address. Before Eastchester got its post office, W.J. Morse resided on Interlaken Drive, Tuckahoe 7, New York. Both Tuckahoe and Bronxville are villages in the town of Eastchester, New York. Address: Tuckahoe, New York.

544. INEAC. 1952. Soja [Soybeans]. *Institut National pour l'Etude Agronomique du Congo Belge, Rapport Annuel* (*Gembloux, Belgian Congo*) 436 p. For the year (l'exercice) 1951. See p. 188, 286, 318-19, 335, 348, 362, 371, 381-82, 403-04, 413. [Fre]
• ***Summary:*** In the section on Division of Food Plants (*Plantes Vivrières*) (p. 177+), the subsection on improvement of soybeans (p. 188) discusses collections of varieties (84 total), and hybrids. A table gives details on 11 selections, including genealogical number, origins, color of seed coat, weight of 100 seeds (in gm), and yield (in kg/ha).

In the section on the Lower Congo, Experimental Station of Vuazi (p. 277+), the subsection on soybeans (p. 286) notes that the 16 varieties in the collection, originating in Yangambi, are well adapted to the ecological environment of the Station. Varieties C 2126 and K 92/6222 yielded 629 and 523 kg/ha of seeds respectively (99 days of vegetation).

The section on the Cotton Selection and Experimentation Service, Experimental Station of Bambesa (p. 309+), the subsection on soybeans (p. 318-19) states that the vegetative development of these soybeans does not seem to have been affected by the lack of rain; in soils of average fertility, they gave excellent yields. Also discusses the collection of varieties and varietal trials; from seven varieties, the highest yield was 1,741 kg/ha of seeds.

In the section on the Center of Boketa (Ubangai), also in the Cotton Service (p. 331+), the subsection on food plants (p. 335) discusses soybeans (yields of two late and two early varieties), peanuts, and rice.

The section on the Experimental Station of Gandajika, also in the Cotton Service, in the edible plants group (p. 342+) has a subsection on soybeans (p. 348) states that from a collection of 22 white seeded and 7 black seeded soybeans,

© Copyright Soyinfo Center 2021

the highest yield was 1,420 kg/ha. Bambarra groundnuts are also mentioned.

The section on the Sector of the South, Experimental Station of Keyberg (p. 363+), the subsection on industrial crops–soybeans (p. 371) states that the varieties Otootan, Otoxi, Bilton, and Biloxi gave low yields in four repetitions.

The section on

The section on the Cotton Selection and Experimentation Service, Experimental Station of Bambesa (p. 309+), the subsection on soybeans (p. 318-19) states that the vegetative development of these soybeans does not seem to have been affected by the lack of rain; in soils of average fertility, they gave excellent yields. Also discusses the collection of varieties and varietal trials; from seven varieties, the highest yield was 1,741 kg/ha of seeds. the Station of Trials at Kiyaka (Kwango), also in the Sector of the South (p. 375+), in the subsection on soybeans (p. 381-82), has a table showing the yields of 5 varieties in two seasons; the highest was 1,067 kg/ha.

The section on the Stations of Ruanda-Urundi [Rwanda-Burundi], Station of Trials at Rubona (p. 397+), the subsection on Food Plants–soybeans (p. 403-04) shows modest results. A tables shows yields (in kg of dry seeds per ha) of the following, in descending order of yield: Jogun (1.486), Imperial, Dixie, Easy Cook, Palmetto, Tokyo Vert, Hahto Vert, Chosen Yoshin (1.255 [Chosen = Korea]), Nanda, Emperor, Wood's jaune, Illini, Jaune d'Eala, Hollybrook, Harbinsoy, Huang Tou (1.026).

The section on the Station of Trials at Kisozi, also in Ruanda-Urundi (p. 411+), in the subsection on soybeans (p. 413) states that there are 31 varieties in the collection. Yields were (kg/ha of seeds): Mansoy 647, Haberlandt 630, Tokyo Yellow 550, Harbinsoy 324, and Mukden 220.

Peanuts (*Arachides*), bambarra groundnuts (*Voandzou; Voandzeia subterranea*), rice, maize, and Job's tears (*coix*) are also discussed in this annual report.

545. *Soybean Digest.* 1953. 23 million meals of Multi-purpose food. March. p. 19.
• ***Summary:*** "Nearly 23 million 3-cent meals of the 'Multi-Purpose' food have been distributed on the hunger fronts of the world, according to a report issued by the non-profit Meals for Millions Foundation, Los Angeles...

"More than 1¼ million meals, the report states, have gone to feed Korean refugees (813,000 meals since last June). Shipments to India total 3,880,000 meals of which nearly a million have been shipped since June. Popularity of the food has been enhanced by development of special native recipes printed in the Korean and Tamil languages.

"Significant shipments have gone to the Middle East, Hong Kong, Formosa, Burma, Africa, Arabia, Japan, Philippines, Latin America, Europe, and Caribbean and South Pacific Islands.

"World-wide distribution has been through 133 American relief and religious agencies and health departments of foreign governments...

"For further information or to make contributions contact Meals for Millions Foundation, 648 South Broadway, Los Angeles 14, California."

Note: This is the earliest document seen (Dec. 2007) concerning soybean products (soy flour) in Arabia [this term usually refers to the Arabian Peninsula, but in this case it may well refer to Saudi Arabia]; soybeans as such have not yet been reported. This document contains the earliest date seen for soybean products in Arabia (March 1953); soybeans as such had not yet been reported by that date.

546. *Soybean Digest.* 1953. The cover picture: Soy sauce popular. June. p. 9 + cover.
• ***Summary:*** About La Choy soy sauce. La Choy Food Products (Archbold, Ohio), a division of Beatrice Foods Co., states that its "Chinese foods have approximately tripled in volume since World War II, and soy sauce has more than kept pace."

"People are not only using soy sauce on their Chinese foods and in various Chinese recipes, but are also finding that it makes a delicious sauce on steaks, chops, roasts, and hamburgers. Many people like to marinate their steaks in the sauce before cooking as well as use the soy sauce in gravies, stews, and chops."

La Choy is now in the midst of the largest advertising campaign in the company's history. It includes over 50 radio stations, plus *Saturday Evening Post* and four national women's magazines.

Photos show: (1) Cover: A bottle of La Choy Soy Sauce in the midst of a table set with both Chinese and American dishes (chop suey), ingredients (sprouts, mushrooms), and utensils (knife, fork, and small wok). (2) A small photo of a small dispenser of soy sauce with egg foo yong [egg foo young] (p. 9).

547. Costello, Michael. 1953. Meals for Millions: This crusading Californian is showing how the problem of world hunger can be licked. *Reader's Digest* 63:126-28. July. Condensed from *The Christian Century,* 70:602-04, May 20,1953.
• ***Summary:*** The colorful story of Clifford Clinton (an illustration shows his portrait), Henry Borsook, Multi-Purpose Food (based on soybean grits), and Meals for Millions Foundation, Inc. To aid the Foundation and its humanitarian work, "Clinton donates office space in one of his Los Angeles cafeteria buildings (located at 648 S. Broadway, Los Angeles 14, California). To reach it one passes through a dim 'landscaped' dining room with pools, grottos, singing birds and organ music, then up innumerable stairs, through a bakery and a carpentershop, and arrives finally in a bustling, crowded office. Here orders come from individuals, churches, social and governmental agencies.

© Copyright Soyinfo Center 2021

The Multi-Purpose Food business is handled by a small staff headed by a bouncy, enthusiastic woman named Florence Rose."

"Four million Multi-Purpose meals have gone to India, three million each to China and Japan, two million each to Germany and Korea, one million to France." Some 333,000 people in Lebanon, 250,000 people in the Philippines, and several hundred thousand in Austria and Greece have been saved from hunger by Multi-Purpose meals. Shipments have gone to the Vatican for distribution to Italian poor, to migrant labor camps in California and Arizona, to the Navajo and Hopi Indian reservations. The largest buyer and distributor is the Roman Catholic Church, followed by the Friends Service Committee.

Note: This is the earliest document seen (Feb. 2001) concerning soybean products (Multi-Purpose Food containing soy grits) in the Vatican; soybeans as such have not yet been reported.

to Koreans, the priest said, was the Meals for Millions Foundation, Inc., 648 G. Broadway, which prepared and ships a concentrate that may be mixed with any available food–without altering its taste–or used separately as a nourishing, strength-producing and stomach-filling substance."

This food is especially helpful because it enables individuals to eat the foods they are accustomed to, but it stretches scant supplies. Special recipes are available for most parts of the world.

Americans can help by making donations to Meals for Millions and other similar organizations.

550. Oyenuga, V. Adenuga. 1955. Nigeria's foods and feeding-stuffs: Their chemistry and nutritive value. *Univ. of Ibadan, Faculty of Agriculture, Technical Bulletin* No. 1. 53 p. March. 2nd ed. 1959 (65 p.). 3rd ed. 1968 (vi + 99 p.). [64* ref]

• ***Summary:*** The Introduction begins: "There are more than eight million head of cattle and approximately the same number of sheep and goats in Nigeria." There is also a large and rapidly increasing number of pigs, donkeys, asses, horses and camels, and a large number of fowl, ducks, turkeys, guinea-fowl and other domestic birds.

A table (p. 12-13) gives the average chemical composition (per cent. of dry matter) of various feeding stuffs used in Nigeria, including the scientific name of the feed, the calculated digestible nutrients, and various values calculated from the digestible nutrients (per 100 lb. of dry food). For example: Soya bean: *Glycine max,* Merr. (see Errata), 93.23% dry matter, 44.08% crude protein, 40.81% true protein, 19.10% ether extract [oil], 5.71% crude fibre, 26.05% nitrogen free extract, 5.06% total ash, and 4.40% silica free ash. 39.23% digestible crude protein, 36.32% digestible true protein, 16.81% digestible (oil) ether extract, 4.17% digestible fibre, 17.45% digestible nitrogen free extract. Nutritive ratio 1.54. 'V' correction factor 98, protein equivalent 35.22, starch equivalent 90.46, total digestible nutrient 91.99.

The section (p. 44-46) titled *"Glycine max* Merr. (The soyabean)" states: "Soyabean has not been successfully in Nigeria or in any other part of West Africa, where its cultivation in native agriculture seems totally unknown."

Footnote: "Within the past few years, however, soyabean has become fairly well established in Nigeria. Just under 9,000 tons of soyabeans were exported in 1953-54 (*Nigeria Trade Journal,* Vol. 3, No. 1. 1955)."

"Climatically West Africa would appear a suitable area for soyabean production and the importance of the crop in commerce as well as its high nutritive value seem sufficiently great to justify the amount of labour and money that may be necessary in any determined attempt for its successful establishment. China (particularly Manchuria), Korea, Japan and the United States are the world's leading producing countries. The crop is also grown in the Philippines, Siam [Thailand], and the East Indian islands [probably today's Indonesia]."

Discusses the use of soyabeans for food, feed, and as a forage crop (including soilage and hay crop), its chemical composition (see table 8, p. 45), and the biological value of the protein of soyabean oil meal. Conclusion: "Soyabean and soyabean oil meal." Address: B.Sc., Ph.D., A.R.I.C. [Associate of the Royal Inst. of Chemistry?], Lecturer in Animal Nutrition, University College, Ibadan, Nigeria.

551. *Soybean Digest.* 1955. 1954 world [soybean] crop hit new record. April. p. 20. [1 ref]

• ***Summary:*** See next page. A large table shows soybean "acreage, yield per acre, and production in specified countries of the world, averages 1945-49 and annual 1953-54."

According to the 2nd estimate of USDA's Foreign Agricultural Service, world soybean production established a new record in 1954; 742.8 million bushels were harvested, up 14% over 1953. Over 80% of the increase was accounted for by the United States. Most of the remaining increase occurred in China-Manchuria. In 1953 China produced 198 million bushels and Manchuria produced 134 million. In 1954 Manchuria's production statistics were included with those of China, the total being 350 million bu. Canada also set a new record with 5.065 million bu harvested. Also mentioned (with production statistics for 1953 in bushels) are Italy (35,000), Yugoslavia (155,000 avg. 1945-49), Other Europe (565,000) USSR (NA), Turkey (125,000), Indonesia (10,839,000), Japan (15,777,000), South Korea (4,995,000), Taiwan (Formosa) (640,000), Thailand (743,000), Brazil (3,242,000), Tanganyika (25,000), Nigeria (the biggest producer in Africa with 140,000 to 150,000 bu for export), and the Union of South Africa (68,000).

In Brazil, soybeans are produced in the states of Rio Grande do Sul and Sao Paulo. Average soybean acreage (harvested acres) in Brazil: 1945-1949: 23,000 acres. 1953: 148,000 acres. 1954 (preliminary): 162,000 acres. Average soybean yield in Brazil: 1945-1949: 19.0 bu/acre. 1953: 21.9 bu/acre. 1954 (preliminary): 22.7 bu/acre. Average soybean production in Brazil: 1945-1949: 446,000 bushels. 1953: 3,242,000 bushels. 1954 (preliminary): 3,674,000 bushels. "Brazil's harvest at 3.5 million bushels was up 13% from the year before. Some 2.6 million bushels were expected to be available for either crushing or export. The much-publicized program to increase soybean planting in Sao Paulo has so far met with discouraging results. This reportedly is due to the farmers' dissatisfaction with the earnings derived from soybeans compared with cotton and some other crops and to a shortage in Sao Paulo of combine harvesters."

Note: This is the earliest document seen (Jan. 2005) that gives soybean production or area statistics for Brazil.

Prepared or estimated on the basis of official statistics of foreign governments, reports of agricultural attaches and other United States representatives abroad, results of office research, or other information. Prewar estimates for countries having changed boundaries have been adjusted to conform to present boundaries, except as noted.

552. Owen, June. 1955. News of food–Chinese dishes: Oriental foods are now being prepared for take-home trade. First supermarket that features Chinese items opens its doors. *New York Times.* June 15. p. 27.

• ***Summary:*** A good, early history of Jeno Paulucci and his company Chun King Sales. "Several years ago, when Jeno F. Paulucci was traveling about the country as sales representative for a food company, he noted that virtually every city and town of any size had a Chinese restaurant or one that claimed a Chinese cuisine."

Mr. Paulucci, age 37, is a native of Minnesota. Growing up in Hibbing, Minnesota, he helped his mother with her Italian catering business.

Eight years ago, in an improvised Quonset hut in Duluth, Minnesota, Mr. Paulucci and 20 employees started canning chow mein. Today his company, Chun King Sales, produces twenty products and is the largest plant for the production of oriental foods in the country.

Mr. Paulucci's products are meant for Americans. not for people of Chinese ancestry.

Another young man with a commercial interest in Chinese foods is Raymond C. Tong. He recently opened China Food Fare, the first supermarket in New York City dealing in oriental groceries (at 20 East Broadway, Chinatown). His customers are mainly those of Chinese ancestry; his store sells "bean curd and what may be the widest selection of soy sauces" in New York City. These sauces are made in Hong Kong, Japan, Korea, and the USA. The two basic types are light and dark. "The light is used in cooking and in marinating foods." The dark is meant to be used at the table, to be sprinkled on dishes as each person desires. Mr. Tong says that a fine soy sauce is neither too bland nor too salty. It should have a good savory or meaty flavor.

556. Johnson, Herbert W. 1956. Re: Soybean variety Pando. Letter to Mr. R.L. Bernard, Urbana, Illinois, and Dr. C.R. Weber, Feb. 6. 1 p. Typed, with initials on letterhead.

• ***Summary:*** "Dear Dick and Bob: I am sending you under separate cover some seed of the Pando variety named by the Horticultural Department of New Hampshire in 1949. The original seed was brought from Korea in 1947 by Professor Meader of the Hort. Dept. at New Hampshire.

"I supposed Dick will want to add this variety to his variety collection and Bob may wish to evaluate it for vegetable purposes. It is reportedly quite similar to Sac. If either of you grow this variety in 1956, I shall appreciate your opinion as to how closely it resembles Sac."

Handwritten note by Richard Bernard (Sept. 1999) on letter in pencil: "This is all that is in the 'Pando' folder. Probably the same as PI 159764." Address: Research Agronomist, Forage and Range Section, United States Dep.

558. INEAC. 1956. [Soyabeans]. *Institut National pour l'Etude Agronomique du Congo Belge, Rapport Annuel* (*Bruxelles*) 567 p. For the year (l'exercice) 1955. See p. 113-14, 400, 414, 444-45, 514-15, 525. [Fre]
• ***Summary:*** All these soybean trials were conducted in the Belgian Congo (today's Zaire). In Part 3, the Research Center at Yangambi, under 4. Division of Food Plants (p. 113-15) the early soybean varieties Otootan, Palmetto, and SH162 yielded over 1,200 kg/ha of soybeans, but the more productive, late-maturing variety trials were complicated by soil fertility variations.

In Part 6, the Northern Sector, under 1. Experiment Station at Gandjika (p. 400) SHE81, Otootan, and SHE35 yielded about 800 kg/ha, while under 2. Experiment Station at Kiyaka (p. 414) 8 Java 3334 and K92/6/2/2/3 outyielded Otootan 70.

In Part 8, the Katanga Sector, under 1. Experiment Station at Keyberg (p. 444-45) soybean varieties 34 S 51 and SH 031 had yields of 1,073 and 1,071 kg/ha respectively.

In Part 10, the Ituri Sector, under 2. Experiment Station of Mt. Hawa (p. 514-15), yields of 1,046 to 1,167 kg/ha were obtained at two seasons for several varieties, while yields of up to 9,300 kg/ha of green forage were collected in other trials from Haberlandt, Mammoth, etc.

In Part 11, the Ruanda-Urundi [Rwanda-Burundi] Sector, under Part 1, the Agronomic Research Station at Rubona (p. 525-26), soybean yields of over 2,000 kg/ha were recorded in the first season (trial 1) for 7 varieties, while in trial 2 the varieties Dixie, Easy Cook, Nanda, Palmetto, Imperial, Yogun [Jogun] and Chosen Yoshin [Chosen = Korea] gave yields of 1,854 to 1,431 kg/ha. In the second season, yields ranged from 1,976 kg/ha to 1,104 kg.

Also discusses: Peanuts (*Arachides*), bambarra groundnuts (*Voandzou; Voandzeia subterranea*), rice, maize, and Job's tears (*coix*) in this annual report.

559. *Times of India* (*The*) (*Bombay*). 1957. Confectionery & foodstuffs. Aug. 20. p. 18.
• ***Summary:*** The foods of Japan have changed noticeably since World War II. The islands of Japan, whose combined area is 15% smaller than that of California, are much much too small to grow enough staple food crops (such as rice) to feed the 80 million inhabitants. So Japan, which has been shorn of its overseas empire (Korea, Taiwan, Manchuria, etc.) has now become a major importer of wheat flour, and the number of bread eaters has been rapidly increasing.

Great efforts have also been made to incorporate more protein into the daily diet. "Scientists today have begun to view time-honored seasonings like miso and soy sauce, made largely from soybeans, from a new angle."

The most popular confections are *namagashi* which are traditional Japanese. They include *yokan* (hard red bean paste) [made from azuki beans].

• ***Summary:*** Two kinds of *Aspergillus oryzae* were isolated from Korean soybean meju and wine kokja. Microscopic and physiological characteristics were investigated. Five kinds of powerful amylolytic moulds and four kinds of powerful proteolytic moulds were isolated.

Note: This is the earliest document seen (May 2021) with the word "meju" in the title or in the document. Address: National Industrial Research Institute, Seoul, Korea.

564. Hong, S.S. 1957. [On the amino acid composition of Korean soy sauce]. MSc thesis, Seoul National University. [Kor]*
• ***Summary:*** Soysauce is one of the important condiments used by oriental peoples. There are various types of soy-sauce, such as Chinese, Korean, Japanese and amino acid soy-sauce. The author has detected the kinds of amino acids contained in the Korean soy-sauce by means of paper chromatography. The result of qualitative analysis

© Copyright Soyinfo Center 2021

of amino acids of Korean soy-sauce by means of paper chromatography led to the following conclusion.

1. The amino acids found in the Korean soy-sauce are as follows: alanine, arginine, aspartic acid, glutamic acid, leucine, lysine, phenylalanine, proline, serine, threonine and valine.

2. The amino acids found in the amino acid soy-sauce are as follows: alanine, arginine, aspartic acid, cystine, glutamic acid, leucine, lysine, phenylalanine, proline, serine, threonine, tyrosine and valine.

3. The 11 types of these amino acids found in the Korean soy-sauce are similar to the kinds of amino acids found in the Japanese soy-sauce. Address: Seoul, Korea.

565. Lee, T.Y. 1957. [A study on carotene. II. Variation in carotene content of red pepper and its processed foods (kochojang) during storage]. *Bulletin of the Scientific Research Institute* (*Seoul, Korea*) 2:15-22. [Kor]*

• ***Summary:*** Red pepper sauce can retain as much as 90% of its carotene content after one year storage. This may be due to the presence of antioxidants in the sauces. Address: Section of Food and Nutrition, The Scientific Research Institute M.N.D. Korea, Seoul, Korea.

566. Pohjakallio, O.; Antila, S. 1957. Eräiden soijalajikkeiden fotoboilogisista ominaisuuksista [Photoperiodic characters of some bred strains of soyabeans]. *Maataloustieteelinen Aikakauskirja* 29(3):113-20. [3 ref. Fin; ger]*

• ***Summary:*** Two Swedish soybean varieties (Fiskeby 843-15-4 and Fiskeby 846-2-1) and one Korean variety (Pando) were studied for their response to different photoperiodic treatments. All proved to be approximately neutral in relation to daylength. With low light intensity, there was considerable etiolation, especially in the Fiskeby varieties, but the time at which flowering occurred was only slightly affected by changes in light intensity. Even with very little light (only 25% of the light outdoors), ripe seeds developed. On the basis of these experiments, and of others conducted at the Wiik Experiment Farm, Helsinki (Tables 6-7) it is concluded that in the south of Finland, light conditions have hardly any effect upon success in growing the almost daylength-neutral soybean varieties concerned. Results confirm Rudorf's finding that the northern limit for growing the Fiskeby soybean varieties is governed by low temperature.

Note 1. Criswell and Hume (Oct. 1972, p. 657) state that Pohjakallio and Antila (1957) have "presented evidence that at least some early maturing soybean varieties tested were nonsensitive to photoperiod."

Note 2. This is the earliest document seen (Aug. 2018) that (in translation) contains the term "daylength-neutral" or the term "almost daylength neutral" in connection with the soybean. Address: Phytopathological Inst., Univ. of Helsinki.

567. Miyamoto, Kazuo. 1957. A nisei discovers Japan. Tokyo: Japan Times. [x] + 282 + [4] p. See p. 181. Illust. Port. No index. 20 cm.

• ***Summary:*** The author, a physician and American citizen, lived with his wife and two children for two years in Japan between 1937 and 1939 "just after the beginning of the China Incident." He spoke and wrote Japanese fluently.

Page 7: On 29 Sept. 1937, after just arriving in Japan, they enter Tokyo. He notes that prices are high, protein consumption is therefore insufficient, and the general population seems undernourished. Beans, including soya beans, ought to be used more extensively. Except for misoshiru [miso soup] and natto, they are apparently not widely used. He suggests that the government welfare department develop and publish soy recipes for the health of the people.

Page 48: On 8 Feb. 1938 on a trip into Yusawa, Niigata, in northeastern Japan, he went skiing. For lunch at a inn he had "natto with lots of onions to erase the odor."

On a train from Ueno station, Tokyo, he has breakfast in the diner of miso-shiru [miso soup], tsukemono [pickled vegetables], and rice for 25 *sen.*

Page 129: In Aomori at the hotel for breakfast they enjoy delicious eggplant fried in butter with shoyu, pepper, and pieces of chiso [beefsteak leaves].

Page 171: At Aoyama hot springs in Hokkaido, caught in a blizzard, he has a bento [Japanese box lunch] from the hotel that includes miso-shiru.

Page 181: On 21 March 1938 they are at the port of Shimonoseki, Japan (in southwestern Honshu, just north of Kyushu, in Yamaguchi prefecture, facing the Tsushima Strait). He notes that many people pass through this port on their way to Chosen [Korea] and Manchukuo [Manchuria].

Shimonoseki is known for its *fugu* or balloonfish (also called globefish or swellfish) for it is here that the largest catch in Japan is taken each year.

They found an eating place, Fujitomo, that served the delicacy. The raw sliced meat was arranged on a huge platter in three rows of semi-circles, so thinly sliced that it was transparent. "The above were dipped in a sauce prepared with murasaki, lime and onions. Tai, considered the king of fishes, must be allotted second place to this delicacy..."

Note 1. The word "murasaki" means purple in Japanese, and is still used in sushi shops and other specialty eating places to refer to soy sauce.

Note 2. This is the earliest English-language document seen (April 2012) that uses the word "murasaki" to refer to soy sauce.

The balloonfish is so poisonous it can kill a person; the toxin is contained in the ovaries. "At Shimonoseki, the season comes to an end at the end of March for then the spawning season begins and the danger of poisoning becomes greater."

Page 201: On a trip to Korea he enjoys *manul zany,*

garlic pickled in shoyu.

In April 1955, the family returned to Japan to visit new relatives. Near Furukawa, in northeastern Japan, they inspected a "miso and shoyu factory."

Also discusses: Nori (p. 128). Wakame (seaweed, near Idzu / Izu) (p. 276). Address: Honolulu, Hawaii.

568. Smith, Allan K. 1958. Use of United States soybeans in Japan: Hamanatto (Document part). *USDA Agricultural Research Service*. ARS-71-12. iii + 36 p. April. See p. 29-31. April. Illust. 28 cm.

• ***Summary:*** "Hamanatto: Hamanatto, sometimes spelled hamananatto, is made by fermenting whole soybeans. Hamanatto is produced in a limited area in Japan in the vicinity of Hamanatsu [sic, Hamamatsu in Shizuoka Prefecture, central Japan]. Hamanatto should not be confused in any way with natto. The only resemblance between the two products is that both are made by fermenting whole soybeans. Hamanatto has a pleasant flavor resembling miso or shoyu but is sweeter. Factors unfavorable to the popularity of hamanatto seem to be its very dark color (black) and its rather high cost. Hamanatto is said to cost four times as much as miso.

"Hamanatto is reported to have come to Japan by way of Korea about 350 years ago at the time of the Japanese invasion of that country. Natto means 'contributed beans' and hamanatto was contributed to the Japanese warriors. The process is reported to have originated in Buddhist temples where it was developed as a source of protein. The ancestors of the people owning the Yamaya Brewery and the Saito Mido Plant of Hamanatsu [sic] are said to have inherited the process from the Buddhist monks.

"In making hamanatto the beans are soaked in water for 4 hours and steamed without pressure for 10 hours. The cooked beans are spread on the floor for cooling to 30ºC. Koji prepared from roasted wheat or barley is sprinkled over the beans to cover their surface. The Japanese are very particular to cover the entire bean surface. The inoculated beans are placed in trays in a fermenting room for about 20 hours; during the fermentation the beans acquire a good coating of green mold. When taken from the fermenting room they are covered with a sticky material and must be separated and dried in the sun to about 12 percent moisture. This can be accomplished in one day if the weather is warm and sunny. At one factory the beans are carried to the roof for drying.

"The dry beans are placed in wooden buckets [kegs, bound with bamboo hoops] that have a capacity of about 15 gallons. Strips of ginger are placed in the bottom of the buckets before adding the beans and the salt water to cover them. A [wooden] cover that fits inside the bucket is placed over the beans and a very heavy weight placed on the cover. Rough stones estimated to weigh about 100 pounds are used for weights. Figure 18 [a photo] shows the buckets with the stone weights used during fermentation, which requires 6 to 12 months and must include one full summer. During fermentation the beans acquire a dark reddish color that is not unpleasing. After fermentation is completed and the beans are dried in the sun, they turn black. Hamanatto contains about 11 percent salt, said to be the cause of their turning black. Hamanatto will keep at room temperature for 1 year or longer.

"The makers of hamanatto, now using only Japanese soybeans, prefer a very select grade grown only in Hokkaido because they are large, are uniform in size, and are free of foreign matter. They claim to pay ¥4,500 for 60 kg. of specially selected beans; an equal quantity of U.S. [soy] beans would cost them ¥3,000. On this basis the relative cost per 60-pound bushel of Hokkaido and U.S. soybeans is $5.65 and $3.80, respectively.

"An analysis [of Hamanatto] supplied by the Yamaha Brewery is as follows: Water 39 percent, total nitrogen 3.8 percent, water-soluble nitrogen 2.6 percent, reducing sugars 7.0 percent, total sugars 10 percent, crude fiber 12.5 percent, ash (including 11 percent sodium chloride) 12 percent, volatile acids 0.015 percent, total acids 1.2 percent, and pH of water suspension 5.1. The composition of hamanatto probably varies considerably.

"If hamanatto could be produced in dark red rather than black color and the process modernized to bring the cost more in line with other fermented soybean products, it should have much wider acceptance and use."

Note 1. This is the earliest document seen (Nov. 2011) stating that Hamanatto [fermented black soybeans] were made at Yamaya temple in Hamamatsu.

Note 2. This is the earliest document seen (Jan. 2012) that uses the word "sticky" (or "stickiness," etc.) to describe Hamanatto. Address: Head of Meal Products Investigations, Oilseed Crops Lab., Northern Regional Research Lab., Peoria, Illinois.

569. Choi, S.H.; Haw, K. 1958. [Biochemical studies on Korean fermented foods. VII. A study on biochemical process during the fermentation of "kanjang"]. *Report of the National Chemical Laboratory, Seoul, Korea* 7:11. [Kor; eng]*

570. Choi, S.H.; Haw, K. 1958. [Biochemical studies on Korean fermented foods. VII. A study on biochemical process during the fermentation of kanjang]. *Report of National Chemistry Laboratories* (*Korea*) 7:11-13. [Kor]*

• ***Summary:*** In order to confirm the biochemical process of the fermentation from soybean to Maiju [Meju; soybean koji] and of the fermentation from Maiju to Kanjang and Dainjang [Doenjang], the nitrogen distributions of soybean, Maiju, Kanjang, and Dainjang are studied on protein nitrogen, peptide nitrogen, amino nitrogen and volatile nitrogen. And the contents of amino nitrogen, peptide nitrogen, and true

© Copyright Soyinfo Center 2021

protein nitrogen to the total nitrogen of soybean, Maiju, Kanjang, and Dainjang are shown in table I and the ratios are shown in table 2 and the figure. According to the results indicated in the tables and figure, the following conclusions are summarized:

1. The main biochemical process at the fermentation from soybean to Maiju would be the degradation from protein in soybean to peptide compounds in Maiju.

2. The main biochemical process at the fermentation from Maiju to Kanjang and Dainjang would be the degradation from peptide compounds in Maiju to amino nitrogen compounds in Kanjang and Dainjang.

3. However, because the protein nitrogen indicated as the ratio of protein nitrogen to total nitrogen content is higher in Dainjang, it is assumed that there might be two kinds of proteins in soybean; one is the protein which could be converted to peptides at the Maiju fermentation and to amino nitrogen compounds lastly at the Kanjang fermentation. The other is the protein which would not be affected at these fermentations at all, remaining as the protein nitrogen in Dainjang, one of the finished products.

4. It can be indicated that the process from Maiju to Kanjang and Dainjang would be due to the fermentation as indicated by Haw and Choi. Address: National Chemistry Laboratories, Seoul, Korea.

571. Chung, T.S.; Kim, C.J.; Whang, K.S. 1958. [Enzymological studies of the fermented soybean products. IV. Amino acid composition of natto proteins]. *Kwayon Huibo* (*Bulletin of the Scientific Research Institute, Korea*) 3(1):83-87. [Kor]*

573. Hahn, Y.S.; Park, B.D. 1958. [Studies on the manufacture of soy sauce. II. On *Aspergillus oryzae* in Korean soybean meju and wine kokja mould]. *Report of the National Industrial Research Institute* (*Seoul, Korea*) 8:75-82. [Kor]*

• ***Summary:*** In a previous paper, pioneer work with the genus *Aspergillus* in Meju [Korean soybean koji] and wine Kokja was reported. This is a continuation of that work. 24 kinds of long-type conidia head and 21 kinds of round-type conidia head were isolated in the genus *Aspergillus* from Kokja. Five results are given.

1. The long type has longer sporangiophores and smaller vesicles than the round type, and the former's sterigmata is in a single line, while the latter is in a double line.

2. The propagative velocity of the round type is faster than the long type, and spore formative velocity of the long type is faster than the round type.

4. In general, the amylolytic power of the long type is stronger than the round type, therefore the researchers the molds distributed in Kokja consist of almost entirely the long type. They obtained 4 superior round types and 6 superior long types.

5. The proteolytic power of the round type is generally stronger than that of the long type. They obtained superior round types. Address: National Industrial Research Institute, Seoul, Korea.

574. Cowan, J.C. 1958. Progress in the technology of soybeans. In: R.T. Holman, W.G. Lundberg, and T. Malkin, eds. 1958. Progress in the Chemistry of Fats and Other Lipids. London, New York, Paris, Los Angeles: Pergamon Press. Vol. 5, p. 51-90. [70 ref]

• ***Summary:*** Contents: 1. Introduction (During the past 20 years, the USA has become the world's leading producer of soybeans. In the USA, soybean production has come in three stages, starting in the 1930s). 2. Soybean production (In the 1920s, development of new soybean varieties led to a major increase in soybean production). 3. Storage and handling of soybeans. 4. Grading. 5. Removal of oil from the soybean: preparation of flakes, solvents, extraction equipment and processing, filtration-extraction, pre-pressing of soybeans.

6. Removal of solvent from flakes: desolventizer toaster, flash desolventizing, cost of processing soybeans. 7. Edible soybean oil: Refining, bleaching, cavitation in the processing of soybean oil, hydrogenation of soybean oil, flavour reversion of soybean oil. 8. Other soybean products: phosphatides, polyamide resins (contains many chemical formulas), epoxy soybean oil, fatty alcohols. 9. Analysis of soybeans: oil colour, oil content of soybeans, effects of heat treatment. 10. Future possibilities.

Note: This article was written before the widespread interest in low-tech East Asian soyfoods (such as tofu, miso, soy sauce, tempeh, soymilk, natto, etc. at Peoria and in the USA).

Tables: (1) World soybean production, acreage and yield (1945-1955). Countries included: Canada, United States, China (estimate), Manchuria (estimate), Indonesia, Japan, Korea (South), Brazil.

(2) Soybean grades: No. 1, 2, 3, 4 and sample. These grades were established by an Act of Congress in 1949.

(3) Characteristics of soybean oil extracted by different solvents.

(4) Effect of flash desolventizing on loss of nitrogen solubility.

(5) Cost of processing soybeans in cents per bushel, itemized for the various steps, and with 3 different mill sizes (the bigger the mill, the lower the processing cost).

(6) Pressure refining.

(7) Results of comparative tests with different bleaching processes with soybean oil. Three methods are analyzed:

575. Motoyama, Tekishu. 1958. Inshoku jiten: Miso [Encyclopedia of food and drink: Miso (Document part)]. Tokyo: Heibonsha. 604 p. [Jap]

• ***Summary:*** Miso is a fermented soybean seasoning which is an indispensible food in every Japanese kitchen. Miso is prepared by mixing soybeans, polished rice or barley and salt, and subjecting them to the fermentation action of koji and the propagation of salt-resistant micro-organisms.

Origins: In ancient Chinese records dating about 200 B.C. it is recorded that miso's predecessor was called "kuki" and originated in the western provinces of China. Kuki was transmitted to Japan via the Korean peninsula and arrived during the Yamato period (300 to 645). By the year 701, the first year of the Emperor Monmu, the regulations for the government "Bureau of Sho" had already been established and both the administrative staff and the materials to be provided had been chosen.

Miso also has a deep historical relationship with Buddhism and the original kuki is the present day Temple Nattô (*tera nattô*). When direct communications were opened between Japan and China, the great Chinese Zen master Ritsuzo Ganjin brought a type of black kuki to Japan in the year 753. Afterwards, this became known as Asuka Miso or Horo Miso. When miso first came to Japan, it was called both *komabishio* (literally: "high. elegant soy sauce") and miso (literally: "secret ancestor") however it was apparently not clearly distinguished from soy sauce as it is at present.

Before the Heian period (794 to 1185) it was written as *mi-hishio* meaning "pre-hishio" or "pre-soy sauce." Future generations added the symbol meaning "mouth" to the left side of the character meaning "pre" to make the present character "mi" of miso which has the general meaning "flavor." They then changed the character pronounced *hishio* meaning "soy sauce" into the present character "so" of miso which has the general meaning "throat."

576. *FAO Production Yearbook.* 1958--. Serial/periodical. Rome, Italy: Food and Agricultural Organization of the United Nations. Yearly. ca. 350 p. Supersedes the Yearbook of Food and Agricultural Statistics, Part I (1947-1957), which was superseded by Production Yearbook (1958-1975).

• ***Summary:*** Under soybeans, gives region/continent and nation, then statistics for soybean area, production, and yield for each soybean producing nation during the following time periods: 1948-1952, 1955, 1956, 1957. Regions and nations

© Copyright Soyinfo Center 2021

listed in the 1958 edition are: Europe: Czechoslovakia, Hungary, Italy, Romania, Yugoslavia.

U.S.S.R.

North and Central America: Canada, United States.

South America: Argentina (in 1948-52 1,000 hectares produced on average 1,000 metric tons of soybeans per year. This remained unchanged in 1955-1957), Brazil (in 1948-52 53,000 hectares produced on average 57,000 metric tons of soybeans per year. Production rose to 115,000 metric tons in 1955, 122,000 in 1956, and 132,000 in 1957).

Asia: Cambodia, China-Mainland, China-Taiwan, Indonesia-total (Java and Madura, Other islands), Japan, Korea-South, Philippines, Ryukyu Islands, Thailand, Turkey.

In 1948-52, Turkey produced 2,000 metric tons of soybeans on 2,000 ha; yield: 860 kg/ha. Production in Turkey increased to 4,000 metric tons in 1955, then 5,000 metric tons in 1956. Note: This is the earliest document seen (Dec. 2007) that gives soybean production or area statistics for Turkey or for the Middle East. This document contains the earliest production or area statistics seen for Turkey or the Middle East.

Africa: Belgian Congo (production in villages), Ethiopia and Eritrea (Fed. of Ethiopia) (starting with 5,000 tonnes {metric tons} in 1948-1952), Nigeria (Fed. of), Rhodesia and Nyasaland (Fed. of Nyasaland), Ruanda-Urundi (production in villages), Tanganyika, Uganda (recorded sales), Union of South Africa (farms and estates).

World total (excluding U.S.S.R.). Regional totals: Europe, North America, Latin America, Near East, Far East, Africa.

Note that statistics for given years (e.g. 1948-52) may change as time passes; apparently this yearbook is periodically updating its statistics.

577. Callan, Mary Ann. 1959. Meals–Aid to millions. *Los Angeles Times.* June 7. Part IV. The Family. p. 1, D. Sunday.
• ***Summary:*** A dynamic little woman, Miss Florence Rose, operating with a small work force out of an unpretentious office on 7th street in Los Angeles, is busy making friends overseas for the United States. Miss Rose is the executive secretary of the Meals for Millions Foundation, and she works at their national headquarters. In 12 years the Foundation has shipped more than 56 million 3-cent meals to 100 countries abroad.

Multipurpose Food, developed by Caltech is now produced in the USA in Oxnard, California, primarily from soybean meal. The funds for sending the food abroad now comes from donations. India has produced MPF from peanut meal.

"Overseas women's groups in Brazil, Ethiopia, Greece, India, Japan, Korea, the Philippines, Taiwan, and Viet-Nam have received the friendship food for distribution–in quantities from 500 to 100,000 tons."

Note: This is the earliest article on soy seen (Aug. 2002) in the *Los Angeles Times.* Address: Times staff writer.

578. Williams, Robert R.; McGanity, William J.; Combs, Gerald F.; Kertesz, Z.I. 1959. A nutrition survey of the armed forces of the Republic of Korea. *J. of Nutrition* 68(1 Suppl):1-80. June. See p. 12-13. [42 ref]
• ***Summary:*** An endless variety of soups (which are thick like U.S. stews) are served, mostly in winter; they usually contain some soy products. Seaweed is a delicacy, used in cooking or served with soy sauce. A recent survey based on food disappearance, conducted by the USDA Foreign Agricultural Service, calculated average civilian calorie intake at about 2,058 per day, of which 81% comes from cereals, 5% from meat, fish, eggs, and milk, 4% from oilseeds, oils and fats, 4% from white and sweet potatoes, 2% from fruits and nuts, 1.6% from vegetables and seaweed, and 1% from sugar (p. 8).

The typical formula for Korean Army soup, in grams per man for one meal, is: Cabbage 70, soybean curd [tofu] 30, soybean mash [probably soybean paste, doen jang] 30, large white radishes [*daikon, Raphanus sativus*] 30, red pepper mash [kochu jang] 10, salt 10, onion 3, melchi (small dried fish) 2, and red pepper powder 1 (p. 9).

The section titled "Soybeans and soybean products" (p. 12-13) states: "Soybean products are extensively used in the Korean diet and by the ROK Armed Forces." Soybean curd (Japanese: tofu), which is precipitated with calcium or magnesium salts, is used almost daily in making thick soups. It is also "fried in deep fat and used in a composite ROK Army food called 'seasoned vegetable and bean curd' containing small fish (12%), soy sauce (23%), bean curd (25%), seaweed (16%), dry radish (14%), and red pepper, sugar, and cottonseed oil. This latter product was observed in one ROK Army mess only."

Soybean sprouts are a favorite and very nutritious civilian food in Korea, but their "use in troop feeding is limited, presumably because of the low germination of the soybeans available at the time of our visit."

Fermented soybean sauce is a widely used and nutritious seasoning.

"Seasoned soybeans are a delicacy much liked by Koreans and obtained by boiling soybeans in sweetened soybean sauce. The weight proportions used in the preparation are said to be cooked and roasted soybeans 70%, soybean sauce 25%, and sugar 5%.

"Soybean mash [*doen jang*] and pepper mash [*kochu jang*] are fermented foods popular in this part of East Asia. Barley is cooked. allowed to cool and then treated at about 90ºF for one day with a commercially prepared enzyme made from *Aspergillus oryzae.* [i.e., barley koji is made]. The barley is then milled together with cooked soybeans and salt, and fermented in concrete tanks for about 3 months. The finished paste-like product is rich in amino acids and protein and is extensively used directly and in cooking. Pepper

© Copyright Soyinfo Center 2021

mash is a similar preparation which contains in addition 10% powdered red pepper." Address: National Institutes of Health, Bethesda, Maryland.

579. Lee, K.Y.; Lee, C.Y.; Lee, T.Y.; Kwon, K.W. 1959. Chemical changes during germination of soybean. II. Carbohydrate metabolism. *Seoul University Journal, Biology and Agriculture Series* (*Seoul, Korea*) 8:35-44. Sept. (Chem. Abst. 54:697d). [12 ref. Eng; kor]
• ***Summary:*** When soybeans germinated (sprouted), the oligosaccharides stachyose and raffinose, which existed in the dormant seed and which contain galactose, disappeared rapidly. The sucrose content also decreased. A paper chromatogram of the sugars in a soybean hydrolysate (stripped of fats and free sugars) gave six spots, identified as ribose, arabinose, fructose, glucose, galactose, and maltose. Fig. 8 shows postulated carbohydrate metabolism in a germinating soybean.

Note: This is the earliest English-language document seen (Oct. 2020) that contains the word "oligosaccharides" (or "oligosaccharide"). Address: Dep. of Biochemistry, College of Medicine.

580. Nagata, Tadao. 1959. Studies on the differentiation of soybeans in the world with special regard to that in Southeast Asia. II. Origin of culture and paths of dissemination of soybeans as considered by the distribution of their summer vs. autumn soybean habit and plant habit. *Nippon Sakumotsu Gakkai Kiji* (*Proceedings of the Crop Science Society of Japan*) 28(1):79-82. Sept. Summarized in Soybean Digest, Feb. 1962, p. 26. [24 ref. Eng]
• ***Summary:*** Contents: Introduction. Clines established on combination of the summer vs. autumn soybean habit and plant habit. Ecotypes identified by the habits and their distributions in the world. A consideration on the origin of soybean culture. Some considerations on the paths of dissemination.

To illustrate the soybean's paths of dissemination, the author first establishes a system of four clines, based on the assumption that origin of soybean culture was in north and central China and moved into Manchuria, Japan and Southeast Asia (fig. 1). Each cline is identified by including summer vs. autumn soybean habit and plant habit (vining vs. nonvining). (1) The Manchurian cline (soybeans moved northward from China into Manchuria) is characterized by an increasing occurrence of special nonvining types which have a long relative flowering period and long relative growing period. (2) The Japanese full-season crop cline (soybeans moved from north China into Korea, and from there they were subsequently disseminated to central and northern Japan) is characterized by soybeans of the normal type having a short relative flowering period and a long relative growing period. Called *Aki-daizu* (autumn type), these soybeans are cultivated as a full-season crop in these regions and belong, more or less, to the short-day type. Historically we note that Korea had direct contact with China Proper, and especially with North China, during the Han dynasty (200 B.C. to the 3rd century A.D.). (3) The Japanese short-season crop cline (soybeans moved from central and south China, through Formosa [Taiwan] and Loochoo [Ryukyu Islands, incl. Okinawa]) is characterized by soybeans of the normal type having a short relative flowering period and short relative growing period. These short-season soybeans are designated as *Natsu-daizu* (summer type), since they are sown in the spring, mature early, and occasionally show very high protein content. However another (and more likely) path of introduction of short season crop soybean to Japan would have been directly from central China to south Japan, especially to Kyushu. Historically, we note that Japan had frequent contact with China before and during the Nara period (6th to 8th century A.D.). Recently soybean seeds were found in the *Shôsô-in*, which was established during the Nara period to store important materials (including medicinal herbs introduced from China). Moreover, these soybeans were identified as the short-season summer type akin to those grown in Kyushu and the Ryukyu Islands. (4) The Indo-Chinese cline (soybeans moved from central and south China, down through Southeast Asia [Vietnam, Laos, Thailand, Cambodia, Malaysia] to Indonesia) is characterized by an increasing occurrence of consistent vining types. Address: Hyogo Agricultural College, Japan.

581. *Soybean Digest.* 1959. Father of U.S. soy crop passes. W.J. Morse. Sept. p. 75.
• ***Summary:*** "William J. Morse, age 75, who had better claim than any other man to the title of founder of the soybean crop industry, died of a cerebral hemorrhage early in the morning of July 30 [1959] at his home in Eastchester, N.Y.

"Mr. Morse was known throughout the world and particularly in the United States and the Far East for his work in soybean development in the U.S. Department of Agriculture.

"He was one of the founders of the American Soybean Association and three times president. He was one of the first men to be elected an honorary life member of the Association.

"He was born in Lowville, N.Y., and attended Lowville Academy, then received his BSA from Cornell University [Ithaca, New York].

"Mr. Morse went to USDA in 1907 just at the time the Bureau of Plant Industry was making plans to carry on research in the growing of soybeans.

"The plant, introduced from time to time from China, Manchuria, Korea, Japan, and other parts of Asia, had been known here for a century, but had increased to only a few thousand bushels a year. Now, after the long period of search and research, it is one of the nation's leading crops, totaling over half a billion bushels a year.

© Copyright Soyinfo Center 2021

"Thirty years ago, after having put in 22 years of research in the Department, Mr. Morse spent 2 years exploring for soybeans and other crop plants in China, Japan, Korea, and Manchuria. He returned with hundreds of varieties, many of which contributed to the improvement of strains already here.

"By his development work he supplied the country with varieties suitable for various localities, increased the oil content of some–a big factor in the industrial use of this crop–and made other varieties better for food use. He stimulated the development of the vegetable soybean in this country. The soybean had been little more than a curiosity until research in USDA, largely by Mr. Morse, led the way to making it the important food, feed, and industrial crop of today.

"In 1947 USDA gave him a Superior Service Award.

"He published more than 75 bulletins and articles on soybeans and was co-author of The Soybean, published in 1923 and in print until very recently.

"Burial was at Mt. Hope Cemetery, Hastings-on-Hudson, N.Y. He is survived by a sister, Gladys H. Morse, Lowville, N.Y.; a daughter, Mrs. Walter A. Thalman, Eastchester, N.Y., and three grandchildren.

"Mrs. Morse died last Dec. 23."

A large, excellent portrait photo (taken in the 1940s) shows William Morse in his later years.

587. Bush, Lewis William. 1959. Land of the dragonfly. London: Robert Hale. 224 p. Illust. Index. 23 cm.
• ***Summary:*** Chapter 20, titled "Mainly About Food," notes (p. 162-63) that sukiyaki is "cooked with soy, water, sugar, vegetables, bean curd..." And sashimi is "dipped in soy..."

"Miso is indispensable in Japanese cookery and is a paste made from beans and fermented rice, used for soups–particularly at breakfast, for preserving, and also as a condiment."

Buddhism was well established in China and Korea by the fourth century and was introduced into Japan between A.D. 500 and 600. Note: It may very well be that the cultivation of soybeans and their use in food, including fermented foods, were then introduced into Japan.

588. Thompson, Edna. 1959. The yoga cook book. New York, NY: Philosophical Library. 156 p. Index. 19 cm.
• ***Summary:*** The Yoga diet, as presented here, is not vegetarian. This book contains recipes for meat (liver, heart), fish, and shellfish. "Yogans" are said to eat at least some food each day which carries the life principle (fresh, raw food), to prefer whole foods in modest amounts, to avoid inert demineralized foods (such as white flour and white sugar), and alcohol. Yoga is not a religious movement; its followers practice self discipline in eating, without fasting. The rear dust jacket states: "This book banishes the idea that the modern Yogin as an ascetic with caveman dietary habits." The true Yogin regards his food as sacred and has heightened powers.

Soy-related recipes include: Soybean soup (p. 18). Shoyu sauce (soy sauce, p. 26). "Auxin" salad (freshly sprouted mung beans sprinkled with soy oil, etc., p. 48). Eggs foo yung (with bean sprouts, water chestnuts, green onion, celery, 4 beaten eggs, salt to taste. "Brown desired size patties of the mixture in soy oil." Serve with a brown sauce made with cornstarch, soy sauce, monosodium glutamate, sugar, and salt. p. 58-59). Vegetable sukiyaki

© Copyright Soyinfo Center 2021

(with Tofu {bean curd} and shoyu sauce, p. 65). Soyburgers (with mashed cooked soybeans, p. 66). Vegetable chop suey (with soy oil, bean sprouts, and soy sauce, p. 68). Korean soybean noodles (made with soybean flour, p. 72). Soy spoon bread (with soy flour and soy oil, p. 97-98). Making soy bean cheese (tofu, coagulated with vinegar, p. 104). Yoga puddings and desserts (white flour is replaced by soy flour and lard is replaced by soy oil, p. 114). Chinese sweet soy beans (p. 122). Manchurian soy bean milk drinks (p. 136).

Also discusses: Japan yokan cakes (with red beans [azuki], p. 116-17). Oat peanut butter wafers (p. 123). Red bean cake (Korea, with red kidney beans [azuki], p. 131-32).

589. Spears, Robert G. 1960. Nature's miracle bean. *Times of India* (*The*) (*Bombay*). Feb. 14. p. 7.

• ***Summary:*** "The author is a member of the Agricultural Mission at the U.S. Small Industries Exhibition now on view in Bombay. The Soyabean Council of America, Inc. has a very interesting section at this Exhibition."

The article begins: "The soyabean is among the most valuable foods known to man, because of its high protein and fat content." The USA is the world's largest producer and exporter of soyabeans. Most of the soybeans produced in the USA are yellow in color. The protein quality of the soyabean is higher than that of other legumes.

"Body-building: It is well known that soyabean eaters [such as Japanese, Chinese, and Koreans] are of greater stature and have more stamina than people who subsist largely on rice, millet, or other grains."

In many countries soyabean curd [tofu] and milk furnish good nutrition. The soyabean can be fermented to yield various sauces and seasonings, pressed to yield oil for cooking, sprouted to furnish a fresh green vegetable that is rich in vitamins, only ground dry to make a flour (soyaflour) that is used in baked goods and confections. During the early 20th century the soyabean first became important and popular in the Western World.

Many countries now buy U.S. soyabeans and make them into "their own soya foods."

Note: This is the earliest article or ad seen (Aug. 2010) in *The Times of India* that contains the term "soya foods." Today soya bean oil is used in the manufacture of more than 50 food products in the United States.

590. Nagata, Tadao. 1960. Studies on the differentiation of soybeans in Japan and the world. *Memoirs of the Hyogo University of Agriculture* (*Agronomy Series 4*) 3(2):63-102. March. Agronomy Series No. 4. [101 ref. Eng]

• ***Summary:*** In these pioneering, innovative, and fascinating studies, the author uses mainly physiological and morphological data to point out the paths of dissemination of the soybean from China to the rest of the world. He has been studying the subject since 1944 and this is his most definitive publication to date.

Nagata shows that two morphologically different ecological clines can be distinguished in the population of cultivated Japanese soybean varieties: a full-season crop cline and a short-season crop cline.

Note: Clines consist of ecotypes or forms of species that exhibit gradual phenotypic and/or genetic differences over a geographical area.

He also shows that these two clines were introduced separately into Japan from different geographical regions. The full-season cline from north-central China through Korea and the short-season cline from central-south China through Taiwan, the Ryukyu Islands, and into southern Japan.

Contents: Introduction. 1. Classification of soybeans by their degree of summer vs. autumn habit: Reduced rate of period of flowering by delay of time of planting, relative flowering and relative growing period in comparison to the period of flowering. 2. Classification of soybeans by their plant habit [e.g. vining and twining, transmitted from the wild form; determinate vs. indeterminate]: Vining habit affected by the time of planting, determinate vs. indeterminate growth habit and the relation to the vining habit. 3. Interrelation among the summer vs. autumn soybean habit, plant habit and other characters: Interrelation between the summer vs. autumn soybean habit and the plant habit, interrelation of the relative flowering period and relative growing period to the determinate vs. indeterminate growth habit and seed size. 4. Geographical distribution of soybeans in Japan: Distribution of summer vs. autumn soybean habit, distribution of relative growing period of summer soybean and intermediate types, distribution of plant habit.

5. Geographical distribution of soybeans in the world: Distribution of summer vs. autumn soybean habit, distribution of the relative flowering period and relative growing period of summer soybean and intermediate types, distribution of plant habit. 6. The clinal tendencies of soybean distributions and genecological differentiation occurring along with the spreading: Clines established with summer vs. autumn soybean habit, clines established with plant habit, clines established on combination of the habits and their ecotypic significance. 7. Some considerations on the origin and dissemination of cultivated soybeans: Origin of culture, paths of dissemination. General conclusions: Origin of soybean culture, dissemination of soybean, ecological differentiation of soybeans.

The distinction between summer and autumn soybeans is an old one in Japan, dating back to the Edo period (1600 to 1868); it seems to have originated from analogous terms used in old China. The summer soybean is planted early, in April, and harvested in July to August, as a short-season crop in southwestern Japan, including the islands of Kyushu and Shikoku, and in the Kinki district [around Kyoto, Osaka, Nara, and Wakayama]. By contrast, the autumn soybean type is planted later, in June or July, and harvested in November

© Copyright Soyinfo Center 2021

to December in southwestern Japan. However a reliable criterion for distinguishing summer and autumn types has not been established to date (p. 65). The author believes one criterion is the rate of reduction of the number of days to flowering by the delay of planting time. This is shown clearly by the graph in figure 1. When autumn, intermediate, and summer soybeans are planted on April 5, they take about 102, 68, and 43 days to flower respectively. However when they are planted on Aug. 13, they take about 32, 22, and 25 days to flowering. Thus the change in the number of days to flowering is largest in the autumn soybean and smallest in the summer soybean.

Although maturity is the most important character dividing soybeans into maturity groups in the USA, this system is not used much in Japan since it is difficult to distinguish there between the many varieties of soybeans differing from one another in earliness or lateness.

The author divides all Japanese soybeans into four main types and ten sub-types: Summer soybean type (with 3 sub-types), intermediate type (with 2 sub-types), autumn soybean type (with 3 sub-types), and tropical soybean type (vining).

"Relative flowering period" and "relative growing period" are two key concepts that are hard to understand. Each can be calculated by dividing (1) the number days from the beginning to the end of flowering, or (2) the number of days from emergence to maturity, by (3) the number of days from emergence to flowering. Summer soybeans have relatively long lengths of both periods and autumn soybeans have relatively short lengths.

Concerning vining habit, soybeans may be divided into 3 types: Consistent vining, variable vining, and nonvining. The earlier the first two types are planted, the greater the degree of vining they show. Plants with a consistent vining habit are always indeterminate, whereas those with a variable vining habit are always indeterminate. Those with a non-vining habit are usually determinate, but about 10% may be indeterminate. Summer soybean rarely show vining. Indeterminate growth habit is accompanied by stem elongation after the beginning of flowering.

Table 9 shows that summer soybeans have a longer relative flowering period and longer relative growing period than autumn soybeans. Yet (contrary to the text) table 10 seems to indicate that summer soybeans have smaller (lighter weight) seeds than intermediate or autumn soybeans. Thus large-seeded soybeans are most likely to be of the autumn type.

Table 11 shows that the soybeans grown in Hokkaido (Japan's northernmost main island) are mostly summer soybeans; they are planted in early May and harvested in October. No autumn type soybeans are grown in Hokkaido. In the nearby northeast prefectures (Tohoku) intermediate type soybeans predominate. Autumn type soybeans are most widely grown in the Kinki and Chûgoku regions of central and south Japan. In the far south of Japan, summer- and intermediate type soybeans predominate.

Table 13 shows regional distribution of soybeans with respect to their seed sizes. The largest soybean came from Kantô; 60 gm per 100 seeds. The next two largest came from Tohoku and Kinki; 35 gm per 100 seeds.

Figure 9 (p. 82) shows that worldwide (especially in the USA, Europe, and East Asia), the soybeans grown at far northern latitudes (above 40º north latitude) tend to be summer soybeans (short season crop) with a long relative flowering period, a long relative growing period, and a special non-vining habit or normal habit. Autumn soybeans tend to be grown at more southerly latitudes. Most soybeans grown between the equator and 20º north latitude are tropical or autumn type soybeans with a vining habit.

Note: The author makes no attempt to correlate edamame (green vegetable soybeans) with a certain type, habit, or seed size. Address: Sasayama, Hyogo-prefecture.

591. Tiner, Hugh M. 1960. Meals for Millions: A 3-cent 'lunch' fights hunger and malnutrition. *Rotarian* (*The*) 96(5):51. May.

• ***Summary:*** Tells the story of Clifford Clinton, Meals for Millions, and MPF (Multi-Purpose Food). Describes how many different Rotary Clubs in the USA have sent MPF overseas for use in relief and rehabilitation projects in Costa Rica, Portugal, Greece, Korea, Mexico, Ceylon, Hong Kong, and India. "Last year $247,000 poured into the Foundation's headquarters on Seventh Street in Los Angeles and sent 'meals' on their way to the hungry.

"But the chief aim of the Foundation is to aid Governments in developing their own versions of MPF, using food products of their regions. An Indian version, based on peanuts, is already in production, and the building of nine plants has been authorized for this purpose. A soy-based MPF is being produced in Brazil. Research is going ahead in the Philippines to develop MPF-type food with fish and coconut meal, in Mexico with soy, in Iraq with sesame and dates, and in the South Pacific with coconuts. Independent, self-supporting Meals for Millions affiliates are active in Brazil, Burma, Ceylon, Formosa, Hawaii, India, Israel, Japan, Mexico, Pakistan, the Philippines, and Thailand, studying, interpreting, and expanding the program." Address: Former president, George Pepperdine College; Past Distirct Governor, Rotary International; Rotarian, San Diego, California.

• ***Summary:*** Mentions *meju*–fermented soybean koji from Korea.

594. Korea: Its land people, and culture of all ages. 1960. Seoul, Korea: Hakwon-Sa, Ltd. 718 p. See p. 114, 602. Illust. (part color). No index. 26 cm.

• ***Summary:*** This large book contains a comprehensive view of Korean history and culture, with each chapter written by one or more Korean specialists and illustrated by hundreds of photos. Unfortunately, the book has no index.

A photo on an unnumbered page inserted 2 pages after p. 112, titled "Jars for food storage" shows a Korean woman with several of these jars. The caption reads: "Every home prepares such various earthenware jars for storing food such as soy-bean-sauce, doenjang (soy-bean-paste), kochujang (pepper sauce) and kimchi.

Note 1. This is the earliest English-language document seen (April 2021) that uses the word "doenjang" to refer to Korean-style soybean jang (miso).

In the section on "Agricultural products," table 3 (p. 246), titled "Food supply and demand schedule for Fiscal 1959 throughout South Korea" gives the requirement for "Soybean sauce and cakes" as 768,000 *sok.* Under supplies, the "Bean crops of 1958, estimate, were 1,291,000 *sok.* An Appendix, (p. 714) shows that 1 *sok* (a unit of capacity) = 180.391 liters or 47.600 gallons.

Title 12, "Manners and customs" notes (p. 600): "... the farmers' wives in the country still know nothing more than the traditional *kimchi* and rice with some inexpensive fish cooked with home-made soybean sauce... The unique Korean foods–the *kimchi*,... soybean sauce and soybean mash are still the most important diets of both the rural and urban people and they are still prepared at home by the housewives despite the possibility of more efficient factory mass production."

The section titled "Food and dwelling," under "The main and side dishes" states (p. 602): "Other essential foods are bean paste and soybean sauce, both of which are used to make soup and flavor other side dishes of all kinds. The bean paste and the soybean sauce are as a rule prepared at each home. The beans are first cooked, then mashed and rolled into balls about 5 inches in diameter. The balls are then fermented for several days, finally to be immersed in salt water, to turn the salt water into soybean sauce. The residue balls of the fermented beans, an the other hand, become the soybean paste. Being for the most part prepared at home, rather than mass produced in factories on a commercial basis, the soybean sauce and bean paste of each house taste different. Since the two home-made foods find their way into almost all kinds of side-dishes, to be mixed with meat, seafoods, and vegetables, the soybean sauce and [soy] bean paste have a decisive say in the taste of all the foods prepared at each particular home."

*Kong-namul* and bean sprouts are mentioned on p. 606. Nori (*kim*) is called "paper food."

Chapter 17, "Literature: An outline of Korean literature, its heritage," includes a discussion of many early works.

An excellent "Chronology chart of Korean history compared with world history" appears on pages 715-18. At the rear is a color fold-out map of Korea.

In the section on "Proverbs" we read (p. 660): In Korea, "reservation is more frequently encouraged, and especially volubility is strictly warned against as in the sayings: 'Talkative families turn their sweet soybean sauce into bitters.' 'Go to the home of sweet soybean sauce, but not to the home of sweet words.'"

Note 2. This is the earliest English-language document seen (April 2012) that contains the term "sweet soybean sauce."

595. Meals for Millions Foundation. 1960. Friendship Food for a Hungry World: Distribution summary. Los Angeles, California. 29 p. Undated. 28 cm.

• ***Summary:*** See next page. "The world-wide travels of the '3 cent meal' of Multi-Purpose Food, September 1946 to June, 1960 [13 years and 9 months]: 62 million meals [distributed] including 3,429 relief shipments to 127 countries through 210 cooperating agencies."

This 29 page typewritten booklet contains a complete listing of all the shipments of MPF over 14 years, from September 1946 through June 1960. However no dates are given for shipments to individual countries.

Contents: What is the Meals for Millions Foundation? Multi-Purpose Food (MPF): What it is, what it does. Index of countries. Distribution totals (Sept. 1946–June 1960). Acknowledgment.

The index of countries lists the "Country," the "American Agencies or Denominations Cooperating and/or Served," the "Number of Lbs." and the "Distributing and Recipient Agencies." Under each country is the number of shipments and the number of pounds shipped.

In the Index, the countries are listed alphabetically by region and within each region alphabetically by country, as follows (however in the body of the booklet they are listed alphabetically by country name). Countries receiving more than 50,000 lbs. (25 tons) will be noted: Africa: Angola, Belgian Congo (52,657 lb), Camerouns [Cameroon], Egypt, Eritrea, French Equatorial Africa, Ghana, Kenya, Liberia, Libya, Mauritius Is., Morocco, Mozambique, Nigeria, Republique du Congo [Congo-Brazzaville], Rhodesia, Sierra Leone, South Africa, Tanganyika, Tunisia, Uganda.

Asia–Near East: Iran, Iraq, Israel, Jordan, Lebanon (56,910 lb), Oman, Persian Gulf, Turkey.

Asia–Far East: Afghanistan, Borneo (divided among Indonesia {73%} to the south, Malaysia, and Brunei), Burma, Cambodia, Ceylon, China (358,957 lb; 1946-1951), Goa, Hong Kong (238,760 lb), India (1,394,707 lb; 742 shipments. Note: Indian MPF became available in 1956,

and shipments from the USA were discontinued; 558,072 lb of Indian MPF were made; 410 shipments), Indonesia, Japan (535,250 lb), Korea (1,254,225 lb; 489 shipments), Laos, Macao, Malaya, Nepal, Okinawa (20,616 lb), Pakistan (83,292 lb), Philippines (122,103 lb), Taiwan (46,089), Thailand, Vietnam.

Asia–Pacific Islands: American Samoa, Caroline Islands, Fiji Islands, Guadalcanal, Hawaii, Marshall Islands, New Hebrides.

Europe: Austria (82,159 lb), Belgium, Czechoslovakia, England, Finland, France (124,996 lb), Germany (206,185 lb), Greece, Hungary, Italy, Luxemburg [Luxembourg], Netherlands, Poland, Rumania, Spain, Switzerland, Trieste, Yugoslavia.

Europe–North Atlantic Islands: Cape Verde Islands, Madeira Island.

Latin and Central America: British Honduras, Canal Zone, Costa Rica, El Salvador, Guatemala, Honduras, Mexico, Nicaragua, Panama.

South America: Bolivia, Brazil (198,581 lb), Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay, Venezuela.

Caribbean Area: Cuba, French West Indies, Haiti (110,231 lb), Jamaica, Puerto Rico, St. Lucia, Virgin Islands.

North America: Alaska and Aleutian Islands, Canada (51,836 lb), United States (146,635 lb; American Indian relief, Migrant relief, School lunch and institutional projects {Clifton's Golden Rule Cafeteria donated 12,500 lbs}, Miscellaneous).

Additional countries reached through overseas parcels only: Argentina, Cyprus, Denmark, Malta, New Zealand, Norway, Nyasaland, Pitcairn Island, Saudi Arabia, Scotland, Sudan, Sweden, Trinidad.

At the end of all the countries (p. 28) is a box titled "Total Relief Distribution": 3,249 shipments [or perhaps 3,429], 6,412,256 pounds [3,206 tons, or 229 tons a year average for 14 years], 51,298,048 "meals" of MPF. On the next page are the details of the "Distribution totals."

There is also a special acknowledgment at the back to the U.S. Navy and the U.S. Naval Air Reserves "for their cooperation in transporting approximately 200,000 lbs. of M.P.F. during 1959-1960. Operation Handclasp, a people-to-people project of the U.S. Navy, originating in San Diego, has carried shipments to the Far East and to South America. Planes of the U.S. Naval Air Reserves have carried emergency supplies of MPF to disaster areas, such as flood victims in Nagoya, Japan, and to earthquake victims in Agadir, Morocco."

Note: The countries receiving the most MPF by weight are (in descending order of amount) are: India, Korea, Japan, China, Germany, France, Philippines, and Haiti.

A photo shows the cover of the 29-page summary document. This photo and photocopy of the document were sent to Soyinfo Center by Chris Dodson of Freedom from Hunger Foundation, Davis, California (Nov. 2010). Address: Los Angeles, California.

596. Reischauer, Edwin O.; Fairbank, John K. 1960. East Asia: The great tradition. Boston, Massachusetts: Houghton Mifflin Co. xiii + 739 p. Illust. Index. 23 cm. First published 1958. [150+* ref]

• ***Summary:*** A masterful history of the subject, focusing on political history. Contents: 1. The setting of East Asian history. 2. Early China: The birth of a civilization. 3. Classic China: The golden age of Chinese thought. 4. The first Chinese empire: The Ch'in and Han dynasties. 5. The "barbarian" challenge and the regeneration of the empire. 6. The late T'ang and Sung: The golden age of Chinese culture. 7. China and the "barbarians": The Mongol empire. 8. State and society under the Ming. 9. Traditional China at its height under the Ch'ing (incl. Manchu Conquest, Tibet). 10. Traditional Korea: A variant of the Chinese cultural pattern. 11. Early Japan: The absorption of Chinese civilization. 12. Feudal Japan: A departure from the Chinese pattern. 13. Tokugawa Japan: A centralized feudal state. 14. East Asia on the eve of modernization.

Page 12 states that "many of the principal crops and animals of East Asia, notably rice, the soy bean, the chicken, the water buffalo and the pig, seem to have come from hot and humid Southeast Asia." Note: As of 1995 the soybean is thought to have originated in northeast China, not in Southeast Asia. Address: Harvard Univ.

597. Smith, Allan K. 1961. Oriental methods of using soybeans as food. With special attention to fermented products and notes on Oriental farming practices. *USDA Agricultural Research Service.* ARS-71-17. 65 p. July. Illust. 27 cm.

• ***Summary:*** Contents: Part I: China. Introduction. Farming conditions in China. Oilseed production. Soy sauce in China. Sweet flour paste–Tien mien chang [chiang]. Soybean or vegetable milk (incl. Willis Miller and the Henningsen Produce Co. in Shanghai). Yuba. Soybean curd or tofu. Soybean cheese [fermented tofu]: Chee-fan ("cheese" + "small cube"), tsüe-fan ("drunken cheese"), hon-fan ("red cheese"). Fen-T'iao from mung beans. Fermented soybeans [fermented black soybeans]. Vinegar fermentation process.

Note: This is the earliest document seen (Oct. 2011) that uses the term "tsüe-fan" ("drunken cheese") to refer to a type fermented tofu.

Part II. China–Chinese Institutions. Henry Lester Institute (in Shanghai; Dr. Bernard Read). Academia Sinica (headquarters in Nanking). China Vegetable Oil Corporation (CVOC, Shanghai). The China Oils and Fat Industries Ltd. (Shanghai). National Bureau of Industrial Research. Catholic University (Fu Jen, at Peiping). Yen Ching University (Peiping). Agriculture Experiment Station (Peiping).

Part III: Japan. Introduction. Production of miso in Japan. Soy sauce in Japan. Trends in soy sauce

production. Part IV: With Raymond E. Culbertson. Korea. Introduction. Breeding work. Soybean varieties. Climatic relations. Soils of Korea. Topography. Land use. Cultural practices. Marketing. Soybeans as foodstuff. Soy sauce. Acknowledgment.

Page 19 states: "The China National Government has taken an active interest in soybean milk for use by its army. Mr. Willis Miller, with offices and business connections with the Henningsen Produce Company in the Dollar Building (7th Floor) at 51 Canton Road, Shanghai, had just completed, at the time of my visit, the building of a soybean milk plant for the Chinese Government. The process is patterned after that of the International Nutritional Laboratories at Mt. Vernon, Ohio, for making a powdered or spray-dried milk. Mr. Miller also was supervising the installation of a vegetable canning plant for the same purpose."

The text of this bulletin was previously published, serially, with slight revisions, in *Soybean Digest,* from Feb. to June 1949. Address: Northern Utilization Research and Development Div., Peoria, Illinois.

598. Cho, H.O. 1961. [Studies on the increased production of amylases and proteases by combination of raw materials of koji for soy sauce and soy bean paste]. MSc thesis, Graduate School, Seoul National University. [Kor]*
• ***Summary:*** Previous studies of the koji starter for soy-sauce and soybean paste, which are the main condiments in Korea, indicated that the amylases and protease activities of the koji differ by that kind of substrate, whether soybean or barley.

In order to try to increase those enzyme activities, koji was prepared by various combinations of soybeans and barley with the following results.

1. Koji prepared from the combination of soybean, barley and wheat at the ratio 4-6 to 6-4 to 2 was greatly superior to that prepared from a single substrate with respect to alpha-amylase, saccharifying and protease activities.

2. Variation of alpha-amylase, saccharifying and protease activities depending on the combination of raw materials, showed similar tendencies on the whole.

3. The possibility of improving the processing of soysauce, and soybean paste by the use of koji prepared from different substrates was discussed. Address: Seoul, Korea.

599. Food and Agricultural Organization of the United Nations. 1961. Soybeans: Area harvested, yield, and production. *FAO Production Yearbook* (*Rome, Italy*) 15:116.
• ***Summary:*** Name changes: "Korea, South" is changed to "Korea, Republic of." "Congo (ex-Belgian)" is changed to "Congo (Leopoldville)."

600. Chang, K.H.; Lee, K.H.; Park, S.O. 1962. [Studies on koji for soy sauce brewing. I. Isolation of *Aspergillus* species]. *Report of the Army Research and Testing Laboratory* (*Seoul, Korea*) 1:40-45. [Kor]*
• ***Summary:*** 1. Four hundred eighty species of *Aspergillus* were isolated from koji, Meju (fermented soy bean) and soil which were collected from 56 sources / locations in South Korea.

2. Four hundred eighty strains of *Aspergillus* were screened for protease, saccharogenic amylase, and dextrinogenic amylase productivity and activity.

3. Three strains of *Aspergillus oryzae*, S56-9, S-10, and M17-2, were selected as having the best enzyme activity among all of these. Address: Army Research and Testing Laboratory, Seoul, Korea.

601. Chung, Y.S. 1962. [Microbiological studies on soysauce: Isolation and identification of bacteria from soysauce brewed by the conventional process]. *Misaengmul Hakhoe Chi* (*Korean J. of Microbiology*) 1:30-37. [Kor]*
• ***Summary:*** Ten strains of aerobic bacteria and two strains of microaerobic bacteria were isolated from soy sauce which had been brewed by the conventional process. The following bacteria were identified by studying their morphological and physiological characters. *Bacillus punillus* R-2; *Bacillus subtilis* var., *aterimus* S-1, *Bacillus licheriformis* var-S-2, *Bacillus subtilis* T-1, *Sarcina maxima* T-2, *Pediococcus acidi lactici* Z-2, *Bacillus citreus* var., *soya B* Z-5, T-2 and Z-5 of the isolated bacteria were found to grow well even in the 24% salt medium, and Z-5 was more vigorous than T-2 though stinking. S-1 produced black-brown pigment from the medium containing various kinds of carbohydrates and the medium of soysauce which are available to S-1. Address: Army Research and Testing Laboratory, Seoul, Korea.

602. Hahn, Y.S.; Park, B.D.; Chun, K.S. 1962. [Studies on the manufacture of soy sauce. IV. On the genus *Rhizopus* and *Mucor* in Korean wine kokja]. *Report of the National Industrial Research Institute* (*Seoul, Korea*) 11:52. [Kor]*
• ***Summary:*** As part of these ongoing studies on Korean wine kokja, the researchers isolated 15 kinds of the genus *Mucor* and 16 kinds of the genus *Rhizopus* from other regional wine kokja by the same methods used previously. A detailed discussion of similar variables is given. Address: National Industrial Research Institute, Seoul, Korea.

603. Hahn, Y.S.; Kim, K.J. 1962. [Studies on the manufacture of soy sauce. V. On the genus *Rhizopus* and *Mucor* in Korean soybean Meju]. *Report of the National Industrial Research Institute* (*Seoul, Korea*) 11:140-52. [Kor]*
• ***Summary:*** As part of these ongoing studies on the same subject, the researchers isolated 8 kinds of the genus *Rhizopus* 25 kinds of the genus *Mucor* from Korean soybean Meju. Their properties were examined morphologically and physiologically.

1. Extinctive temperature: Most of the genus *Rhizopus* were 60 to 70ºC and most of the genus *Mucor* were 70 to

© Copyright Soyinfo Center 2021

75ºC.

2. Propagative optimum pH: The genus *Rhizopus* were 2.5 to 7.0 and the genus *Mucor* were 4.0 to 6.5.

3. The multiplication of the genus *Mucor* in carbohydrates as a nutrient source was weak or did not occur, but the genus *Rhizopus* were good in all kinds of carbohydrates and R-32 [*Rhizopus*], R-36, and R-37 were especially superior. On many nitrogen compounds, genus *Rhizopus* multiplied well, and always better than the genus *Mucor.*

4. Liquefied action of gelatin: M-37 [*Mucor*], M-38, and M-52 finished the reaction in the short time of 25-30 minutes. Address: National Industrial Research Institute, Seoul, Korea.

604. Meals for Millions. 1962. People to people (Color motion picture). Los Angeles, California: Meals for Millions. 16 mm. Summarized in Soybean Digest, June 1962, p. 28. *

• ***Summary:*** According to Soybean Digest: "After a year of film making in Africa, India, Korea, Hong Kong, Hollywood and Pasadena, the Meals for Millions 16-mm motion picture in color, 'People to People,' has been completed. Narration is by film star Eddie Albert and the theme song by Peggie Lee.

"The film tells the history and scope of the Meals for Millions program in feeding hungry people with the 3¢ meal, MPF. The film presents in person sequences showing Dr. Albert Schweitzer at his African hospital at Lambarene [Gabon], and the late Dr. Tom Dooley relating his experience in Laos with Multi-Purpose Food.

"Available without fee to any group choosing a Meals for Millions project or for $10 rental including surface mail delivery. For further information write Soybean Digest 6c, Hudson, Iowa."

Note: Also shows Clifford Clinton, Dr. Henry Borsook, Florence Rose. As of March 1984 the film is still available from Meals for Millions. Address: Los Angeles, California.

605. Cartter, Jackson L.; Hartwig, Edgar E. 1962. The management of soybeans. *Advances in Agronomy* 14:359-412. [174 ref]

• ***Summary:*** Contents: I. Introduction: World production (958,275,000 bushels in 1960), United States production trends, utilization (processing to obtain oil and meal, hay and green manure). II. Soil and climatic adaptation: Areas of production in the United States, soil requirements, climatic adaptation (effect of temperature on plant growth, effect of temperature on composition of seed, effect of light on plant growth, effect of photoperiod on flowering and maturity, effect of soil moisture on growth). III. Time of planting and varietal adaptation: Effect on plant characters (maturity, plant height, lodging, seed quality, size of seed, seed yield), effect on composition of the seed. IV. Planting methods and equipment: Seedbed preparation (conventional, minimum tillage, deep tillage), row width and planting rate (row width, planting rate), double cropping (after fall-sown grain crops, after peas), special methods of planting, types of equipment. V. Rotation practices and erosion control: Effect on soybean yields, effect on the following crop, effect on weed population, soil residues from herbicides, erosion control. VI. Weed control: Effect of planting time on plant growth and weed competition, methods of cultivation, chemical weed control (pre-emergence herbicides, post-emergence herbicides). VII. Seed quality and seed treatment: Factors affecting seed quality and germination, seed treatment. VIII. Nutrient requirements: Nitrogen requirements and nodulation (effectiveness of nodulation as a source of nitrogen, methods of inoculation, survival of bacteria in the soil, effect of seed treatment on inoculation, effect of nitrogen applications), liming and pH levels (pH and plant development, calcium and magnesium requirements), phosphorus, potassium, trace elements, fertilizer practices and recommendations. IX. Water requirements and utilization: Water needs in relation to plant growth and development, irrigation and soil management. X. Growth-regulating chemicals. XI. Harvesting: When to harvest, harvesting methods. XII. Seed storage. XIII. Discussion.

The USA now produces about 57% of the world's soybeans, followed by China (PRC; about 33%), Indonesia, Japan, Korea, USSR, Brazil, and Canada, in that order. By 1920, U.S. production was 3,000,000 bushels and the leading states were North Carolina, Virginia, Alabama, Missouri, and Kentucky–North Carolina producing 55% of the total. By 1931, the center of production had shifted to the North Central States, where it is at present.

Note: According to Google Scholar, this is the 3rd most widely cited article (cited by 172) of which E.E. Hartwig is an author. Address: 1. United States Regional Soybean Lab., Urbana, Illinois; 2. Stoneville, Mississippi.

606. Kitamura, S. 1962. [Applied botany]. Tokyo: Asakura Book Co. See p. 261. [Jap]*

• ***Summary:*** Soybeans were introduced to and grown in Korea sometime between 30 B.C. and A.D. 70.

607. Miller, Harry W. 1962. Traditional methods of processing and use of soy liquid and powdered milk. In: USDA Northern Regional Research Laboratory, ed. 1962. Proceedings of Conference on Soybean Products for Protein in Human Foods. Peoria, IL: USDA NRRL. iii + 242 p. See p. 149-56.

• ***Summary:*** "It is a new day when so many important sponsoring organizations join in evaluating the suitability of the protein of the humble soybean to meet the nutritional needs of the human subject, and to study practical ways of extending its benefits in protein deficient diets.

"In August 1940, I presented a paper entitled 'The Role of the Soybean in Human Nutrition' before the American Soybean Association at Dearborn, Michigan, and predicted

© Copyright Soyinfo Center 2021

that the day would come when we would find an awakened interest in this country in utilizing soy products as a part of the American menu. I believe we are rapidly approaching that goal, There is now an awakening in many lands to the needs of better nutrition, and it is timely that study and research be given to how we can utilize the values of the soy protein for universal race betterment.

"Soybeans have for centuries been the chief protein supplier in the heavily populated areas of Southeast Asia. It is well to examine methods of processing and utilization as practiced in the Orient. However, the per capita utilization of soybeans has been far below their needs, ranging from 15 to 50 pounds per annum in countries like China, Japan, and Korea, largely due to the inability of agriculture to keep pace with population.

"It was in these soy-producing and-utilizing countries that I had the opportunity over more than half a century to observe their methods of preparation, and to check the results in the feeding of soy products. Considerable leafy vegetables, stems and 'roots' have to a certain extent supplemented the diet with protein, so that adults of mature age probably get adequate protein. However, the appalling infant mortality and adolescent protein deficiency diseases have stressed the need for increased rations such as may be supplied by the soybean.

"Protein has its greatest contribution during the growing years of life. Three times the amount of protein per unit of body weight is needed the first year of life compared with the adult. During adolescence and the teenage years twice the amount of protein is required till they attain their normal body weight as in after life. If individuals are well grown with ample biologic protein their chances for long life expectancy are enhanced.

"With the infant's short intestinal tract and its immature digestive juices, foods have to be reduced to liquids to be usable. Consequently, a liquid food beverage, if supplied in sufficient quantity and quality, enables normal growth to proceed rapidly. Without it, growth is stunted; anemia, infection follows and many do not survive these years of inadequate food intake. Those that survive childhood often die early in life of degenerative diseases.

"The need of liquid nourishment following birth is evident from the fact that all mammals, including the human, have no provision for taking solid food, so as a starter food a lacteal secretion is by nature supplied, and to meet the need of the growing years of the human, various animal milks have been used. However, the supply is meager in the Afro-Asiatic countries.

"My attention was called to soybeans as a dietary food upon reaching China and living on Chinese cuisine. It was some 20 years later, in 1925, that I embarked on the development of a liquid beverage from the soybean. Considerable progress has since been made in improvement of such a food beverage and its use. However, it is only a few areas where nutritional use is made of soy milk, and much remains to be done in its improvement and distribution to combat malnutrition.

"The Oriental approach to processing the soybean is entirely opposite to that of the west. Western countries process the soybean by grinding it into fine flour after dehulling, and screening through very fine 200- or 500-mesh screens, or shall we call it, the milling operation. While in lands where soybeans have been used for centuries, they first hydrate the beans, or as we call it, use the wet-milling operation.

"In Eastern countries interest in soybeans has been primarily in its protein content, while the West has vied for its oil. It was my good fortune that I began my study of the soybean in the Orient where soybeans were used for human food, rather than for animal rations. Soaking the hard, dry bean was the first procedure, and it then is ground into a milklike slurry. The whole soybean is given a water soak for 8 hours, or after dehulling a water bath for 2 hours. In either case the bean doubles its original weight by water intake. It is then ready for the milling operations. This is accomplished with stone buhr mills, or disintegrators, that break up the continuity of the fiber, and expose its nutrient particles of protein, oil, carbohydrate, vitamins, and minerals to a water wash. The water-soluble nutrients are separated from the fiber portion by filtration. The amount of water used in the slurry mix, its temperature, whether hot or cold, and also the quality of beans, determines the ratio of soluble nutrients to those still clinging to the fiber.

"In fact, there are numerous techniques to be observed to get the dispersible protein and other nutrients in the highest soluble amounts. Beans differ, as also the aging of beans. The nutrient yield is greatest immediately after harvest time. Long heat exposure in warm climates, makes for less solubility. A proper soak is of great importance; then next the grinding of the beans. A small stream of water to give a tearing, rubbing action so as to thoroughly expose all soluble ingredients is preferred to a mill with a cutting action to mince into fine particles. Before filtration this slurry should be agitated and heated, which will yield an additional 10 percent to the soluble ingredients. Several methods of filtration, such as a shaking screen, a plate and frame pres, vacuum drum filters, or centrifuges of various types can be used. A re-grind of the fiber cake and a second extraction makes possible an extra 5 to 8 percent recovery of the solubles. A possible 92 percent of protein with other nutrients in proportion has been attained by grinding and filtration methods. In practical plant operations we expect 60 to 80 percent protein recovery of the original bean. This leaves considerable nutrients in the fiber or pulp, which is then used for stock feed.

"The milky solution thus extracted is used either for cheese curds of various types, or is formulated and processed into a beverage milk–liquid or powdered. Soybeans are used

© Copyright Soyinfo Center 2021

in different countries in making a savory sauce, called Soy Sauce; a soup base as in Miso, or as a fermented bean as Japanese Natto. They are eaten as immature green beans in pod or shelled and are very delicious.

"Soy Milk: Trials have been made in the past to utilize soy milk by the Asiatics but for lack of proper processing methods such milk, as filtered and not formulated, was neither tasty nor nutritionally acceptable, giving rise to very unpleasant digestive responses. I have repeatedly asked in parts of China, Japan, and Korea why it was not used as a beverage, always with the same answer, that it gave rise to intestinal disturbances. So a cheese curd is used instead of milk. Curdling it into a cheese, through the use of calcium salts, vinegar or other coagulative agencies, has resulted in many savory food products. Heating this milk extract causes a scum film [yuba] to form, also very tasty, and the remaining portion is curdled and made into cheese [tofu] cakes of varying dimensions and density. All such sheets and blocks of curd receive a second cook, or are fermented, which seems to render them more digestible.

"Soy cheese or curd is easy to market and very popular, being tastily flavored and combined in the Chinese cuisine as a meat, fowl, and fish replacer. The Japanese report 70 different forms or dishes utilizing soybeans, and the Chinese even more. Out of 1 pound of soybeans they make 4 pounds of curd called Tofu.

"While we have spent some time in Indonesia we have had little experience with Tempe–a fermented soybean food product.

"My contributions had to do with developing an easily digested and highly nutritious soy milk, and processing it sufficiently to render it acceptable to both infants and adults. The extract from the bean which is rich in protein can be formulated as desired with added fat, carbohydrate, minerals, and vitamins. These properties can be varied or formulated to that of human milk, or any other type of animal milk. The final product can be made in a single strength, or condensed to double strength and canned, or spray-dried as a powder.

"Our first work in developing a formulated soy milk dates back 56 years ago when we secured a Disper mill [Dispermill], or homogenizer, to constitute a formulated liquid. This soy milk was first used in the Shanghai Sanitarium and Hospital as a table beverage for nurses, helpers, staff, and patients of the institution, and later to the baby and children's ward of the Shanghai Clinic and Hospital. Here we had baby boarders, infants kept under observation on soy milk feeding for up to 2 years. The results of this feeding was reported in the China Medical Journal of 1957. Many other farmed out research studies were made, such as at the indigent hospital in the Philippines; at the Tokyo University, and the Ohio State University in America.

"Results on the Ohio State study are shown in Figure 1.

"The first commercial development was a soy milk dairy established in Shanghai in 1935, the process used was in-bottle sterilized milk, formulated to the standard of cow's milk; also a chocolate milk; and a soy-acidophilus milk, which was extensively marketed all over the city of Shanghai up until the plant was destroyed in 1937 by the bombing of Shanghai.

"A soy milk powder plant was also fabricated there, using a local made Grey Jensen spray dryer, which also came to an end in the same way at the same time.

"There are many technical problems involved in producing a satisfactory nutritional beverage from the soybean to simulate milk, which in the few moments we have would be impossible to enter into. These are gradually being solved, such as improved color, taste, stability, condensing as a double strength canned milk, and as an instant soluble powdered soy milk. On vacuum pan evaporation, due to the viscosity of soy milk, concentrating to more than 30 percent solids is the limit, as compared with animal milk at 45 percent solids. However, generally speaking, once a water extraction soy milk is obtained the same methods and equipment used by the dairy industry are applicable to produce it in various forms for marketing" (Continued). Address: M.D., Director Emeritus, International Nutrition Research Foundation, 11503 Pierce Blvd., Arlington, California.

608. Brandemuhl, William. 1963. Soybean history: aspects of Buddhist influence. Anthropology Dept., University of Wisconsin, Madison. 15 p. Jan. Unpublished manuscript. 28 cm. Summarized as "Early Soybeans Were Spread by Buddhists" in Soybean Digest, July 1963, p. 21. [52 ref]

• ***Summary:*** This research paper (which is not a thesis) was prepared for Anthropology 150a, taught by Dr. R.J. (Robert) Miller. Contents: Purpose of study. Method of study. Botanical history: Naming the soybean, the *Glycine ussuriensis* case, other genetic evidence, claim on the origin of the soybean. Initial utilization. Botanical dissemination. Soybean history–non-botanical: Legend, recorded Chinese soybean history, concluding notes on soybean origin and cultivation history. Buddhist influence on the development of the soybean: Soysauce or shôyu, miso, tofu, natto, ancient soybean food products, the soybean grows.

"Another principal concern of this paper is the Buddhist connection to soybean development. The introduction of soybeans, although an approximation at the very best, coincides quite closely with the spread of Buddhism in Japan. As shown later, Buddhism has a very close connection with soybean history and in many product sectors of soybean development, may have created or at least popularized them" (p. 1).

"Contrary to the above statement I submit the following data which I believe can easily be documented: 1. Emperor Shen-nung is a mythical character (letter from Herbert W. Johnson, Research Agronomist, USDA / ARS [Agricultural Research Service] Crops Research Div., Beltsville,

© Copyright Soyinfo Center 2021

Maryland, 30 Aug. 1962). 2. Emperor Shen-nung was a legendary character who cannot be pinpointed to a date of 2838 B.C. (letter from Jung-pang Lo, Research Asst. Prof., Far Eastern and Russian Inst., Univ. of Washington, 6 Sept. 1962). 3. Shen-nung is a mythical ruler, never living at the date attributed to him or at any other date (letter from Edward H. Schaefer, Professor of Oriental Languages, Univ. of California, Berkeley, 6 Sept. 1962). 4. A work attributed to Shen-nung is called *Shen nung pen Ts'ao Ching* but since it contains many Han Period facts (around the beginning of the Christian era) it is believed to be a Post-Han work. This work is first mentioned by T'ao Hung-ching (who edited it) early in the 6th century A.D. (Jung-pang Lo). 5-6. The *Pen Ts'ao Kang Mu* was written by L. Shih-chen (1518-1593) in A.D. 1596 or 1597 (Jung-pang Lo, Schaefer)... 9. The word 'Shiyu' cannot be found in Chinese dictionaries. The name for the soybean in China being 'Ta-tou,' meaning big bean (Jung-pang Lo)."

"Concluding notes on soybean origin and cultivation history: *The Book of Poetry* (Shih-ching) mentions boiling shu (pulse) and the *Erh-ya* (a Chou period lexicon, authorship attributed to Confucius or his disciples) mentions Jung-shu. Kao yu, the commentator, remarked that the Jung-shu (pulse of the Hu people) which was also known as Ta-tou (the soybean). Jung was a term used by the Chinese in the Chou period for the non-Chinese people of the North and Ju was a term used by the Chinese people of the North and West. This would seem to indicate that the soybean was introduced to China from the non-Chinese people of the North. Also supporting this is the *Chou-shu* by Hsi meng, in which there is a reference to Shan-jung shu (pulse of the Jung people of the mountains). A commentator explains that the Shan-jung were tribes in the Northeast (Manchuria).

"The Kuang-Tzu contains a passage saying that after Duke Huan of Chi (7 B.C.) defeated the Shan-jung the Jung-shu came to be known throughout China. Chia su-hsieh (5 A.D.) in his book *Ch'i-min Yao-shu* (Ts'tung-shu Chi-ch'eng, editor) quoted the *Shen-nung pen Ts'ao* as saying that Ta-tou (the big bean) was the Hu-Tou (Hu peoples' bean) which Chang Ch'ien brought back from his exploration of central Asia in the first century B.C., there being two varieties. In the Han period both Ts'ui shih and Fansheng in their books on farming techniques mention cultivation of the Ta-tou and its use in famine relief. The *Pen Ts'ao Kang Mu* (1596), mentioned earlier, has a long discourse on the medical properties of the Ta-tou (Jung-pang Lo)."

"Buddhist influence on the development of the soybean: Although references to the Buddhist influence on soybean development are particularly sparse I believe Buddhism deserves credit for initiating the spectacular expansion of soybean utilization in Japan which triggered utilization in the rest of the world. The Buddhist connection is certainly true if oil utilization is excluded. Below lie the reasons for my belief.

"Buddhism was introduced into Japan around 500-600 A.D. (Bush 1959, p. 28-29). Among the priests the traditional hate of flesh was present and agriculture of the field type was encouraged by the government (Tezuka 1936, p. 13). The introduction of soybeans fits well into this historical development. The recent finding of soybean seed in *Shôso In* (Japan) which was established in the Nara era for the storing of legumes of that era that were introduced from China (Nagata 1960, p. 97) proves as does the record of ceremony and taxation system of the Nara era (Nagata, p. 75) that soybeans did exist in Japan at that time.

"Soysauce or more properly shôyu, the now renowned Japanese flavoring, is said to have originated during the Chou dynasty (1134-246 B.C.) (Komiya 1955, p. 14) and was introduced into Japan when Buddhism was being established although not becoming popular until 1300 (Joya 1951, p. 31-33).

"Miso, soybean paste, is a much used breakfast and soup dish in Japan that was introduced to Japan from China or Korea (Horvath 1927, p. 83). It was definitely used by the priests when they first entered Japan, in fact they popularized it among their new vegetarian converts (Joya, p. 21-23).

"An ancient Chinese book states that the Philosopher Hamintze, a prince of the Han dynasty, was the inventor of Tofu or soybean curd (Horvath, p. 6) while another source attributes the tofu innovation to the Chinese Philosopher Whai Nain Tze (Piper & Morse 1923, p. 234). The manufacture of soybean curd (tofu) was started in China in 164 B.C. during Emperor Hwai Wen's reign by Liu An, duke of Hwai Nan. Liu An was a great friend of the Buddhist monks and it seems quite likely that he made this bean curd to provide a change or delicacy to break the monotony of the monastic ration." Note: Whai Nain = Huainan. Liu An was the duke (*tze*) of Huainan. So all of these people are one and the same person.

"Tofu was introduced into Japan from Korea for the first time during the Toyotomi government (Horvath, p. 73) and was undoubtedly introduced into Japan from China by the Buddhists (Piper & Morse, p. 234) being used for their daily food before it was generally used (Horvath, p. 73).

"The true Buddhist monk was carried through the period of childhood growth on a rather heavy diet of bean curd (Horvath, p. 17). Even the naming of soybean curd has its esoteric connotations as the Classical Chinese name for tofu is Li chi which probably means morning prayer (Horvath, p. 72).

"Natto, a sort of vegetable cheese prepared from soybeans has long been used by the Buddhists and is now used extensively by the Japanese (Piper & Morse, p. 224).

"Buddhism seems to have been a major reason for the development of Japan for main soybean products. With the existence of these products Japan opened the world to soybeans." Address: Univ. of Wisconsin, Madison, Wisconsin.

610. Meals for Millions. 1963. Friendship food for a hungry world. Distribution of relief shipments, September 1946–May 15, 1963. 215 West 7th Street, Los Angeles 14, California. 4 p. Undated. [2 ref]

• ***Summary:*** Total distribution of MPF (Multi-Purpose Food) up to 15 May 1963 was 12,830,416 pounds, comprising 102.6 million meals. Countries receiving over 20,000 pounds, in descending order of amount received, were: India (1,979,748 lb), Korea (1,356,110), Japan (541,102), Hong Kong (394,259), China (358,957, stopped in 1951), Brazil (312,244), Germany (206,185), United States (183,366), Philippines (146,943), Haiti (139,823), France (126,022), Pakistan (101,041), Congo (86,101), Austria (82,159), Tanganyika (77,997) Mexico (65,722) Burma (63,554), Taiwan (58,639), Lebanon (56,910), Canada (51,836), Ceylon (38,428), Israel (38,280), Jamaica (38,171), Greece (38,133), Vietnam (37,524), Italy (36,768), Indonesia (35,873), Jordan (33,375), Hungary (33,165), New Guinea (31,535), Gabon (27,704), Liberia (27,187), Okinawa (23,640), Malaya (23,454), Morocco (22,736), Chile (22,721), Iran (21,482), Peru (21,374), Honduras (21,168), Bolivia (20,860), Nepal (20,626), Borneo (20,053).

The following countries (listed alphabetically) were early recipients of soy-based Multi-Purpose Food from Meals for Millions, and were late in introducing soybeans to the country: Bahamas (received 6 shipments totaling 2,079 lb between 1 July 1960 and 31 Dec. 1962). Basutoland [Lesotho] (received 2 shipments totaling 1,539 lb between 1 July 1960 and 31 Dec. 1962). Bolivia (received 2 shipments totaling 1,634 lb between Sept. 1946 and 30 June 1960). British Honduras (received 5 shipments totaling 11,319 lb between Sept. 1946 and 30 June 1960; renamed Belize in about 1975). Cape Verde Islands (received 1 shipment of 2,007 lb between Sept. 1946 and 30 June 1960; independent since 1975). Caroline Islands (received 2 shipments totaling 2,008 lb between Sept. 1946 and 30 June 1960; renamed Federated States of Micronesia in 1986). Central African Republic (received 1 shipment of 2,025 lb between 1 July 1960 and 31 Dec. 1962). Eritrea (received 1 shipment totaling 2,025 lb between Sept. 1946 and 30 June 1969). Fiji Islands (received 2 shipments totaling 2,052 lb between Sept. 1946 and 30 June 1969). Finland (received 1 shipment of 2,040 lb between Sept. 1946 and 30 June 1960). Gabon (received 3 shipments totaling 17,660 lb between Sept. 1946 and 30 June 1960). Guam (received 3 shipments totaling 4,995 lb between 1 July 1960 and 31 Dec. 1962). Guadalcanal ([later part of the Solomon Islands] received 1 shipment of 513 lb between Sept. 1946 and 30 June 1960). Iraq (received 3 shipments totaling 8,122 lb between Sept. 1946 and 30 June 1960). Jordan (received 9 shipments totaling 28,839 lb between Sept. 1946 and 30 June 1960). Liberia (received 10 shipments totaling 21,949 lb between Sept. 1946 and 30 June 1960). Luxemburg [Luxembourg] (received 1 shipment of 5,130 lb between Sept. 1946 and 30 June 1960). Marshall Islands (received 1 shipment of 739 lb between Sept. 1946 and 30 June 1960). Mozambique (received 3 shipments totaling 7,641 lb between Sept. 1946 and 30 June 1960). New Hebrides [later Vanuatu] (received 1 shipment of 513 lb between Sept. 1946 and 30 June 1960). Oman (received 4 shipments totaling 10,659 lb between Sept. 1946 and 30 June 1960). Panama (received 1 shipment of 96 lb between Sept. 1946 and 30 June 1960). Samoa (American) (received 6 shipments totaling 6,480 lb between Sept. 1946 and 30 June 1960). Somali (received 1 shipment of 270 lb between 1 July 1960 and 31 Dec. 1962). Swaziland (received 1 shipment of 621 lb between 1 July 1960 and 31 Dec. 1962). Tonga Islands [Kingdom of Tonga, independent since 1970] (received 5 shipments totaling 6,723 lb between 1 July 1960 and 31 Dec. 1962). Virgin Islands [USA] (received 2 shipments totaling 2,113 lb between Sept. 1946 and 30 June 1960). Western Samoa [independent since 1962] (received 1 shipment of 1,026 lb between 1 Jan. 1963 and 15 May 1963).

Other countries which received MFM shipments by 15 May 1963 are: Afghanistan, Algeria, Angola, Argentina, Basseterre [Probably refers to the island, Basse-Terre (or Guadeloupe proper) which is the western half of Guadeloupe, separated from the other half, Grand-Terre, by a narrow channel. As of 1994 Guadeloupe is a French Overseas Department. Probably not the seaport on St. Christopher Island, capital of St. Christopher-Nevis–since that is not a country], Belgium, Cambodia, Republic of Cameroun [Cameroon], Canal Zone, Colombia, Costa Rica, Cuba, Czechoslovakia, Dominica, Dominican Republic, Ecuador, Egypt, El Salvador, England, Eritrea, Ethiopia, French West Indies, Gambia, Ghana, Goa [former Portuguese possession; annexed by India in 1962; became a state of India in 1987], Grenada, Guatemala, Haute Volta [Upper Volta, later Burkina Faso], Iraq, Kenya, Laos, Libya, Macao, Madeira Islands [autonomous region of Portugal in east Atlantic Ocean, 600 miles due west of Casablanca, off the coast of Morocco], Mauritius Islands, Montserrat [island in the West Indies], Netherlands, Nicaragua, Nigeria, Northern Rhodesia [later Zambia], Nyasaland [later Malawi], Oman, Paraguay, Persian Gulf, Poland, Puerto Rico, Ruanda Urundi, Rumania [Romania], Ryukyu Islands, American Samoa, Santa Lucia [probably Saint Lucia island in the Caribbean], Sicily, Sierra Leone, South Africa, Southern Rhodesia [later Zimbabwe], Spain, Surinam [Suriname], Switzerland, Thailand, Trieste [Italy], Tunisia, Turkey, Uganda, Uruguay, Venezuela, Yugoslavia.

Note: This is the earliest document seen (March 2021)

concerning soybean products (soy flour in MPF) in British Honduras [Belize], Cape Verde, Caroline Islands, Eritrea, Iraq, Lesotho, Liberia, Macao (May 1963), Marshall Islands, New Hebrides [Vanuatu], Oman, Samoa (American), Tonga, or Western Samoa. Soybeans as such have not yet been reported in these countries.

This document contains the earliest date seen for soybean products (soy flour in MPF) in Bolivia (June 1960), British Honduras (June 1960), Cape Verde (June 1960), Central African Republic (Dec. 1962), Eritrea (June 1960), Iraq (June 1960), Lesotho (Dec. 1962), Liberia (June 1960), Marshall Islands (June 1960), New Hebrides (June 1960; Vanuatu), Oman (June 1960), Samoa (American) (June 1960), Tonga (Dec. 1962), or Western Samoa (May 1963). Soybeans as such had not yet been reported by that date in these various countries. Address: Los Angeles, California.

611. Strayer, George M. 1963. Development of the Japanese market for soybeans: The first and largest U.S. market development project for soybeans and soybean products. *Soybean Digest.* May. p. 13, 16.

• ***Summary:*** A good historical overview of the American Soybean Assoc. soybean program in Japan, from Strayer's speech presented at the Agricultural Trade with Japan conference in Chicago.

"For a long period of years Japan has produced a sizable tonnage of soybeans, a part of them in the northern island of Hokkaido, and a part of them grown on the other islands largely on the dikes or dividers around the rice paddies. But these supplies were not adequate to fill their needs, so considerable tonnage was imported from China and Manchuria each year.

Note: By 1886 Japan was producing 11.5 million bushels of soybeans a year; most were consumed as food (Tamari 1886).

The conquest of the Red Force [Red Army] in China, followed by the Korean episode [Korean war], cut off these Chinese supplies. The American military government shipped supplies of U.S. soybeans to Japan in the years immediately following World War II, as a source of protein for the Japanese people. The Japanese were also importing soybeans from Manchuria during these years, and at the same time Japanese interests owned processing facilities in Korea and in Dairen and Port Arthur of Manchuria. The Korean episode ended all that, and Japan found herself badly in need of a source of supply for her protein.

"During this same period things had been happening on American farms. At the start of World War II we were the world's largest net importer of fats and oils. The sea lanes were cut off, and we doubled and redoubled our soybean production as a means of supplying our requirements of fats and oils. We increased soybean production from 60 million bushels to over 180 million bushels during the war years. We learned what soybean oil could do in human foods and in industry, and what soy protein could do in contributing to economic livestock production. So, in the years since the war ended we have continued to increase soybean production from 180 million bushels per year to a predicted 725 million bushels in 1963. Today we are the world's largest net exporter of fats and oils and oil bearing materials.

"Early export troubles: As this process was going on Japan was restoring her economy, putting her people to work, increasing their incomes and their demand for food. Soybeans were being purchased from the United States but they were produced and handled mechanically, delivered in bulk, and the Japanese buyers were not accustomed to this type of handling and production nor happy with our beans. When I first went to Japan in 1955 we had a market for about 250,000 metric tons of soybeans but we were in trouble. I spent 6 weeks contacting the trades people, seeing for myself just what problems confronted us. A gentleman from the grain grading branch of the U.S. Department of Agriculture joined me, so that agency might understand our soybean sales problems. When we came home we agreed to try to do something about the situation.

"Exporters were appraised of the situation in meetings at export ports. Growers were told what the Japanese market demanded. Sampling and grading was tightened up. Japanese buyers were taught how to buy on our federal grade basis to get the desired quality. A Japanese firm was employed to make impartial samplings and grade determinations on the basis of our U.S. federal grades on cargoes as they arrived in Japan. By focusing much attention on our problems and their solutions we solved them–today U.S. soybeans are not only accepted but preferred in the Japanese market by most buyers, especially the oilseed crushers. Our quality is better, the oil content higher, our supply more dependable.

"In 1955 Japan was buying about 250,000 tons of soybeans per year from us. This seemed to be only a small portion of the potential, for per capita consumption of both oil and protein was far below levels necessary for proper nutrition. In early 1956 the American Soybean Association signed a contract with Foreign Agricultural Service to use some Japanese yen accrued under Public Law 480. A contractual working arrangement was worked out with the five trade groups in Japan representing the major users of soybeans plus the importers, and an office was established in Tokyo in April 1956. A campaign to increase per capita consumption of soybean food products was launched, using a variety of approaches.

"Working closely with the Ministry of Health, the Ministry of Agriculture, with private promotional organizations and with the miso, tofu, shoyu and oil trade groups a concerted campaign was carried on the educate the Japanese housewife on the functions of protein and oil in the human diet, and with the necessity of providing proper amounts of both in the meals prepared for her family. Very naturally, the Japanese, who had used soybeans for centuries,

© Copyright Soyinfo Center 2021

turned to soybean food products because of availability, price, and knowledge of how to use them."

Today Japan buys 1.2 million tons–42 million bushels– of U.S. soybeans a year, "and we visualize further increases to nearly double those figures by 1970."

"Last year Japan paid U.S. farmers about $100 million for soybeans."

612. Chang, C.H. 1963. [Free sugars in ordinary Korean soysauce]. *Theses Seoul Municipal College of Agriculture.* p. 35-37. [Kor]*

• ***Summary:*** Ordinary Korean soysauce samples obtained from several homes in Seoul were analysed for free sugars by the paper partition chromatography method.

Galactose, glucose, arabinose and xylose were detected in ordinary soysauce.

In descending order of abundance of free sugars: Galactose, arabinose, xylose, and glucose. Address: Seoul Agricultural College, Seoul, Korea.

613. Chang, C.H. 1963. [Studies on chemical composition and free amino acids in ordinary and improved Korean soysauce]. *Theses Seoul Municipal College of Agriculture.* p. 212-23. [Kor]*

• ***Summary:*** Korean soysauces were prepared by the ordinary and improved method; analysis indicated the following results:

(1) Substances influencing taste, such as amino acids, organic acids, and reducing sugars, were found more in improved soy sauce than in ordinary soy sauce.

(2) The fact that much ammonia nitrogen is contained in ordinary soy sauce was one of the most important elements. Therefore, it is necessary for *meju* [Korean soybean koji] to be improved.

(3) Amino acids in ordinary soy sauce, which were identified by two-dimensional paper chromatography and colorimetric methods, were found to be aspartic acid, glutamic acid, serin, alanine, tyrosine, valine, phenylalanine, leucin, lysine, histidine, proline, cystine, and methionine.

(4) Amino acids in improved soy sauce, which were identified by two-dimensional paper chromatography and colorimetric methods, were found to be aspartic acid, glutamic acid, serin, alanine, tyrosine, valine, phenylalanine, leucin, lysine, histidine, proline, cystine, methionine, and threonine.

(5) The total free amino acids were not different from each other, especially in quantity, but methionine and histidine are found more in improved soy sauce than in ordinary soy sauce. Address: Seoul Agricultural College, Seoul, Korea.

The occurrence of coliform organisms in several samples of soybean mash, soy sauce, and red pepper mash]. *Report of the Army Research and Testing Laboratory* (*Seoul, Korea*) 2:47-50. [Kor]*

• ***Summary:*** The presence of coliform bacteria in or on foods depends on many environmental factors, each of which must be determined separately for each food item. When a correlation is found to exist between unsanitary methods of food production and the presence of *Escherichia coli* in the finished product, the presence of confirmed fecal strains of coliform organisms can be interpreted as having sanitary significance. Address: Food Div., Army Research and Testing Laboratory, Seoul, Korea.

617. Kim, Y.H.; Kim, Z.U. 1963. [Effects of the ratio of raw materials on the quality and taste of soy sauce. I. Studies on the changes of enzymatic activities and chemical components during koji preparation with various ratios of raw materials]. *J. of the Korean Agricultural Chemical Society* 4:17-22. [Kor]*

• ***Summary:*** Changes of enzymatic activities and chemical components during koji preparation of soy sauce with various ratios of soy beans and wheat were studied as the first step in checking the current ratio of raw materials for improved soy sauce and determining the proper ratio for them with respect to its quality and taste. The following results were obtained.

(1) The protease in the dried koji were mainly composed of one part which was active at the neutral pH (about 6.0) range, while other parts that were active at acid and alkaline

© Copyright Soyinfo Center 2021

pHs were inferior. The more wheat in the koji, the stronger the protease activities at acid and neutral pH and the weaker at alkaline pH.

(2) The activity of enzymes increased rapidly in early stages, then gradually in later stages protease and beta-amylase rapidly throughout except the drying of alpha-amylase during the course of koji preparation. The greater the amount of wheat as a raw material, the stronger the protease and the beta-amylase activity.

(3) Reducing sugars, amino nitrogen, and total nitrogen were increased, while total sugar was decreased during the course of koji preparation.

(4) The more wheat used as a material, the more reducing sugar and total sugar there was. While the total nitrogen was decreased, no noticeable differences were observed in the amino nitrogen among the dried kojies. Address: College of Agriculture, Seoul National University, Suweon, Korea.

618. Lee, K.H.; Chang, K.H. 1963. [Studies on koji for soy sauce brewing. II. On the optimum conditions of growth and identification of *Aspergillus* species]. *Report of the Army Research and Testing Laboratory* (*Seoul, Korea*) 2:24-25. [Kor]*

• ***Summary:*** These experiments concern the identification, growth conditions, and lethal temperatures of three previously-identified superior strains of *Aspergillus* species, which were isolated from the soils and Meju (fermented soy bean [koji]) in Korea.

The results obtained in light of the manual of Raper and Thom for identification of the *Aspergilli* show that the three strains of *Aspergillus* species all pertain to the *Aspergillus flavus oryzae* group.

The optimum temperature, pH and the lethal temperatures of the three species have been measured. Address: Army Research and Testing Laboratory, Seoul, Korea.

619. Song, S.H.; Kim, J.H.; Lee, K.H.; Chung, Y.S.; Chang, K.H. 1963. [Studies on the preservation of soy sauce. I. Isolation of the pellicle forming yeasts from soy sauce]. *Report of the Army Research and Testing Laboratory* (*Seoul, Korea*) 2:32-37. [Kor]*

• ***Summary:*** Soy sauce is one of the most widely used seasonings for Korean foods. About 4.5 million liters per year is consumed by the military alone. The quality of soy sauce is often made to deteriorate by harmful microorganisms, especially yeasts which form a film or pellicle on the surface of the sauce during long-term storage. At the end of deterioration, the sauce gives off an offensive odor and a thick pellicle grows on the entire surface of the sauce; then it goes bad and rots. Many investigators have reported on this problem. In this study, the harmful yeasts are isolated from soy sauce in military storage and their microbiological characteristics are identified. Such yeasts have been identified as *Hansenula anomala* group, *Zygosaccharomyces japonicus* group, and another group of *Zygosaccharomyces.* Address: Food Div., Army Research and Testing Laboratory, Seoul, Korea.

620. Song, S.H. 1963. [Studies on the preservation of soy sauce. II. The pellicle forming yeasts as influenced by fungicides]. *Report of the Army Research and Testing Laboratory* (*Seoul, Korea*) 2:38-42. [Kor]*

• ***Summary:*** The quality of soy sauce is often made to deteriorate by harmful microorganisms, especially by yeasts which form a film or pellicle on the surface of the sauce during long-term storage. At the end of deterioration, the sauce gives off an offensive odor and a thick pellicle grows on the entire surface of the sauce; then it goes bad and rots.

Heretofore many fungicides such as capric acid [decanoic acid], benzoic acid, esters of benzoic acid, vitamin K compounds, sorbic acid and surface active agents (Tweens and Emulgens) have been applied in order to prevent growth of the yeasts–regardless of their effects on human health.

These experiments found the following fungicides (and their minimum concentrations) to be effective against pellicle forming yeasts: Vitamin K group (0.05%). Esters of p-hydroxy benzoic acid (0.007%). Sorbic acid (0.05%). Emulgen-106 (0.1%). Capric acid (0.003%).

In addition, the following mixtures are effective: Emulgen-106 + p-hydroxylbutyl benzoate; Vitamin-K3 + Emulgen-106; and sorbic acid + benzoic acid. Address: Food Div., Army Research and Testing Laboratory, Seoul, Korea.

621. Cartter, Jackson L.; Hartwig, Edgar E. 1963. The management of soybeans. In: A.G. Norman, ed. 1963. The Soybean. New York: Academic Press. x + 239 p. See p. 161-226. [209 ref]

• ***Summary:*** Contents: 1. Introduction: World production, United States production trends, utilization (processing to obtain oil and meal, hay and green manure). 2. Soil and climatic adaptation: Areas of production in the United States, soil requirements, climatic adaptation (effect of temperature on plant growth, effect of temperature on composition of seed, effect of light on plant growth, effect of photoperiod on flowering and maturity, effect of soil moisture on growth). 3. Time of planting and varietal adaptation: Effect on plant characters (maturity, plant height, lodging, seed quality, size of seed, seed yield), effect on composition of the seed. 4. Planting methods and equipment: Seedbed preparation (conventional, minimum tillage, deep tillage), row width and planting rate (row width, planting rate), double cropping (after fall-sown grain crops, after peas), special methods of planting, types of equipment. 5. Rotation practices and erosion control: Effect on soybean yields, effect on the following crop, effect on weed population, soil residues from herbicides, erosion control. 6. Weed control: Effect

© Copyright Soyinfo Center 2021

of planting time on plant growth and weed competition, methods of cultivation, chemical weed control (pre-emergence herbicides, post-emergence herbicides). 7. Seed quality and seed treatment: Factors affecting seed quality and germination, seed treatment. 8. Nutrient requirements: Nitrogen requirements and nodulation (effectiveness of nodulation as a source of nitrogen, methods of inoculation, survival of bacteria in the soil, effect of seed treatment on inoculation, effect of nitrogen applications), liming and pH levels (pH and plant development, calcium and magnesium requirements), phosphorus, potassium, trace elements, fertilizer practices and recommendations. 9. Water requirements and utilization: Water needs in relation to plant growth and development, irrigation and soil management. 10. Growth-regulating chemicals. 11. Diseases: Foliar, root and stem, seed. 12. Insects and spider mites: Leaf feeders, above-ground stem feeders, pod feeders, root feeders. 13. Nematodes: Root knot, cyst, others. 14. Harvesting: When to harvest (moisture content of seed, chemical defoliation, losses from respiration after maturity), harvesting methods (historical, combine harvesting). 15. Seed storage. 16. Discussion.

The USA now produces about 57% of the world's soybeans, followed by China (PRC; about 33%), Indonesia, Japan, Korea, USSR, Brazil, and Canada, in that order. By 1920, U.S. production was 3,000,000 bushels and the leading states were North Carolina, Virginia, Alabama, Missouri, and Kentucky–North Carolina producing 55% of the total. By 1931, the center of production had shifted to the North Central States, where it is at present.
